INDEX

BIOLOGY Volume-1

■ **Diversity in the living world 4-36**
- ♦ Defining Properties of Living Organism 4
- ♦ Diverseness in the living world 6
- ♦ Taxonomic Categories 7
- ♦ Taxonomical AIDS 22
- ♦ Binomial Nomenclature 28

■ **Biological Classification 37-144**
- ♦ Categorization of Organisms and Kingdom System 37
- ♦ Monera 47
- ♦ Protista 84
- ♦ Fungi 113
- ♦ Plantae 128
- ♦ Animalia 132
- ♦ Note on viruses, Viroids, Prions and Lichens 133

■ **Plant kingdom 145-249**
- ♦ Basic Classification of Plant 145
- ♦ Algae 156
- ♦ Bryophytes 179
- ♦ Pteridophytes 188
- ♦ Gymnosperms 199
- ♦ Angiosperms 216
- ♦ Life process of plants and Alternation of Generation. 238

■ **Animal kingdom 250-397**
- ♦ Basis of Classification 250
- ♦ Porifera 274
- ♦ Coelenterata (Cnidaria) 283
- ♦ Ctenophora 292
- ♦ Platyhelminthes 296
- ♦ Aschelminthes 303
- ♦ Annelida 311
- ♦ Arthropoda 316
- ♦ Mollusca 332
- ♦ Echinodermata 339
- ♦ Hemichordata 344
- ♦ Chordata 345
- ♦ Urochordata 356
- ♦ Cephalochordata 357
- ♦ Cyclostomata 358
- ♦ Chondrichthyes 359
- ♦ Osteichthyes 365
- ♦ Amphibia 366
- ♦ Reptilia 372
- ♦ Aves / Birds 380
- ♦ Mammalia 384

■ **Morphology of Plants 398-536**
- ♦ Root and Regions of Root 398
- ♦ Modification of Root 403
- ♦ Stem and its Modification 411
- ♦ Leaf and types of Leaf and its Modification 419
- ♦ Venation and Phyllotaxy 428
- ♦ Inflorescence and its type 430
- ♦ Flower and Symmetry of Flower 440
- ♦ Part of Flower 449
- ♦ Aestivation 460
- ♦ Fruit 465
- ♦ Seed and Structure of Seed 476
- ♦ Plant Family 486

■ **Anatomy of Flowering Plants 537-600**
- ♦ Tissue 537
- ♦ Meristemetic Tissue 539
- ♦ Permanent (Simple and Complex) Tissue 547
- ♦ Epidermal, Ground, Vascular Tissue System 563
- ♦ Dicot and Monocot Root 580
- ♦ Dicot and Monocot Stem 584
- ♦ Dicot and Monocot Leaf 590
- ♦ Secondary Growth 591
- ♦ Spring and Autumn Wood 597
- ♦ Heart and Sap Wood 599

■ **Structural Organization in Animals 601-670**
- ♦ Tissue 601
- ♦ Epithelial Tissue and Junctions 604
- ♦ Connective Tissue 615
- ♦ Muscle Tissue 622
- ♦ Neural Tissue 624
- ♦ Earthworm 626
- ♦ Cockroach 640
- ♦ Frogs 660

@apna_pdf

■ **Cell : Structure and Functions..... 671-786**
- ♦ Cell : The Unit of Life.....671
- ♦ Cell Theory 677
- ♦ Outline of Cell.....680
- ♦ Types of Cell 682
- ♦ Prokaryotic Cell 683
- ♦ Eukaryotic Cell.....688
- ♦ Cell organelles to understand its Structure and Functions 697
- ♦ Cell Membrane and Cell Wall.....707
- ♦ Endomembrane System.....724
- ♦ Mitochondria.....742
- ♦ Plastid.....754
- ♦ Ribosome and Cytoskeleton.....762
- ♦ Cilia and Flagella 770
- ♦ Centrosome and Centrioles 774
- ♦ Nucleus and Microbodies.....777

■ **Biomolecules 787-829**
- ♦ Analysing and Composition 787
- ♦ Structure of Amino acid and its Properties.....791
- ♦ Lipid and its Function 796
- ♦ Nitrogenous Base 800
- ♦ Primary and Secondary Metabolites.....802
- ♦ Protein and its Structure 806
- ♦ Nucleic Acid 811
- ♦ Polysaccharides 814
- ♦ Nature of Bond.....818
- ♦ Concept of Metabolism and Living State.....819
- ♦ Enzymes and Enzyme Action.....820
- ♦ Factor Affecting Enzyme Activity 826
- ♦ Nomenclature of Enzyme and its Classification 827
- ♦ Co-Factor 828

■ **Cell cycle and Cell Division 830-869**
- ♦ Cell cycle.....830
- ♦ Phases of Cell Cycle.....833
- ♦ Cytokinesis.....848
- ♦ Significance of Mitosis.....849
- ♦ Meiosis.....853
- ♦ Phase of Meiosis and its Significance 858

■ **Transport in Plants 870-916**
- ♦ Method of Transport 870
- ♦ Plant-Water link (connection) and Imbibition.....872
- ♦ Water Potential.....876
- ♦ Transport of Water and its Pathway 882
- ♦ Osmosis and Plasmolysis.....892
- ♦ Transport of Mineral Nutrients 900
- ♦ Transpiration.....904
- ♦ Phloem Transport : Flow from source to sink.....912
- ♦ Mass Flow Hypothesis.....916

■ **Mineral Nutrition.....917-951**
- ♦ Study about the mineral requirements of plants 917
- ♦ Essential Mineral elements and Criteria of Essentiality.....918
- ♦ Deficiency Symptoms of Essential Element 921
- ♦ Macro and Micronutrient and its Function.....924
- ♦ Technique of absorption of elements 932
- ♦ Metabolism of Nitrogen and Nitrogen Cycle.....933
- ♦ Biological Nitrogen Fixation 935
- ♦ Nodule Formation and fate of Ammonia 947

■ **Photosynthesis in higher plants 952-984**
- ♦ Photosynthesis and its Experiment 952
- ♦ Where does photosynthesis takes place 958
- ♦ Pigments Involved in Photosynthesis 961
- ♦ Light Reaction.....964
- ♦ Transport of Electron 968
- ♦ Chemoosmotic Hypothesis 970
- ♦ C_3 and C_4 Pathway 971
- ♦ Know about ATP and NADPH.....979
- ♦ Photorespiration 981
- ♦ Factor Affecting Photosynthesis 983

■ **Respiration in Plants.....985-1009**
- ♦ Plants Breathing and Cellular Respiration 985
- ♦ Know about glycolysis.....990
- ♦ The Fermentation 994
- ♦ Aerobic Respiration 997
- ♦ Krebs Cycle.....999
- ♦ ETS and Oxidative Phosphorylation.....1003
- ♦ The respiratory Balance sheet 1007
- ♦ Amphibolic pathway 1007
- ♦ Respiratory quotient.....1007

■ **Plant growth and development 1010-1040**
- ♦ Plants Growth 1010
- ♦ Phase of Growth and Development 1014
- ♦ Plants growth regulators 1016
- ♦ The photoperiodism 1024
- ♦ Plant hormones 1030
- ♦ Plasticity 1038
- ♦ Vernalisation and seed dormancy 1039

@apna_pdf

01 DIVERSITY IN THE LIVING WORLD

A. Defining Properties of Living Organism

1. Pheromone is

(a) a product of endocrine gland
(b) used for animal communication
(c) messenger RNA
(d) always protein

Rajasthan PMT-2009
Punjab MET-2009
UP CPMT-2009
AMU-2002

Ans. (b) : Pheromones are chemical substance produced by animals, including humans remains uncertain, which are used to communicate with other of the same species. These chemicals are often released into the environment and detected by other animals through the sense of smell and triggering a specific behavioral response.

2. The difference between holophytic nutrition and holozoic nutrition is?

(a) Holophytic is autotrophic nutrition, while holozoic is ingestion of solid organic food
(b) Holophytic is autotrophic nutrition, while holozoic is the utilization of energy on oxidation of substances
(c) A complete uptake of nutrition is holophytic and synthesis of the food on their own is holozoic
(d) Synthesising their own food is holophytic and depending on their chemicals in the environment, it is called holozoic

TS EAMCET-10.08.2021 Shift-I

Ans. (a) :

Holozoic Nutrition	Holophytic Nutriton
(i) Holozoic nutrition is a type of heterotrophic nutrition	(i) Holophytic nutrition is a type of autotrophic nutrition.
(ii) Holozoic nutrition is found in animals	(ii) Holophytic nutrition is found in plants.
(iii) Holozoic nutrition uses an organic carbon source.	(iii) Holophytic nutrition uses an inorganic carbon source.
(iv) E.g. Amoeba, humans, dogs etc.	(iv) E.g. Green plants, Cyanobacteria, Algae etc.

3. The Technically complicated feature of all living organisms _____

(a) Growth (b) Metabolism
(c) Irritability (d) Reproduction

AP EAMCET-05.10.2021 Shift-I

Ans. (c) : The technically complicated feature of all living organisms is irritability means they are able to sense their environment and respond to environmental stimuli which could be physical, chemical or biological.

- Metabolism is sum total of all biochemical reactions metabolism shown by all living organisms without any exception isolated metabolic reaction in vitro are surely living reaction.
- Growth and reproduction are not diagnostic feature of living organisms because growth can be shown by non living organism eg- formation of stone by the deposition of sand particle which is not a true growth.
- Sum sterile organism like mules, worker bees are not able to produce their offspring.

4. Identify the wrong statement among the following.

(a) All living organisms of present, past and future are linked to one another
(b) Cellular organelles properties are similar due to the interaction of molecular components
(c) Organisational complexity will be lower in hierarchy of the organisms
(d) All organisms have consciousness

TS EAMCET-09.08.2021 Shift-I

Ans. (b&c) : To varied degree, all living things-past, present and future-are connected to one another through the sharing of a common genetic material.

• All organism, prokaryotic and the most advanced eukaryotes have a form of consciousness that allows them to perceive and react to environmental cues. Thus it is believed that consciousness is the characteristic that distinguishes all living things.

Hence, option (b) and (c) are the wrong statements.

5. Mark the decreasing order of complexity in the given living systems

(A) Cell **(B) Organ**
(C) Tissue **(D) Biosphere**

(a) A > B > D > C (b) D > B > C > A
(c) A > C > B > D (d) B > C > A > D

TS EAMCET-12.05.2017

Ans. (b) : The decreasing order of complexity in the living system, they can be arranged as-

Biosphere > organ > tissue > cells

Atom → molecule → Biomolecule → Cells → Tissue → Organ → Organ system → Organism → Population → Biosphere (Include Atmosphere, Lithosphere, Hydrosphere) It shows increasing order of complexity.

@apna_pdf

6. Metabolism, replication and homeostasis are the main characteristics of

(a) eukaryotes (b) prokaryotes
(c) organisms (d) viruses

AMU-1997

Ans. (c) : Metabolism, replication and homeostasis are the main characteristic of organisms.
Metabolism– It is a defining feature of all living organism without exception. All plants, animals, fungi & microbes exhibit metabolism.
Homeostasis– It is refers to the ability of an organism to maintain the internal environment of the body within limits that allow it to survive.
Replication– DNA replication is one of the most basic processes that occurs within a cell of an organism.

7. The type of nutrition where organisms engulf food materials is

(a) Saprozoic (b) Autotrophic
(c) Holozoic (d) Saprophytic
(e) Parasitic

Kerala PMT-2009

Ans. (c) : The **Holozoic** nutrition is a kind of heterotrophic nutrition that is characterised by engulfing food in the form of solid as well as liquid.
Eg. Amoeba show most prominent example of holozoic nutrition.
Saprozoic - The organism which feed on dead and decaying materials.
Autotrophic - The organism which synthesize their food in presence of sunlight.
Eg- Green plant and chemoautotrophic bacteria.
Parasitic - The organism which feed on other organism. eg, Pathogenic bacteria, Fungi, Protozoa etc.

8. During endocytosis,

(a) the cell digests itself
(b) the cell engulfs and internalises materials using its membrane
(c) the cell enables the extracellular digestion of large molecules
(d) the cell divides its cytoplasm during mitosis

Karnataka CET-2009

Ans. (b) : Endocytosis is a cellular process in which substance are brought into the cell. The term includes to similar process they are phagocytosis (cell eating / engulfs) and pinocytosis (cell drinking).
Exocytosis is a process for moving large molecules out of the cell to the cell exterior.

9. The living organisms can be unexceptionally distinguished from the non-living things on the basis of their ability for:-

(a) Growth and movement
(b) Responsiveness to touch
(c) Interaction with the environment and progressive evolution
(d) Reproduction

AIPMT-2007

Ans. (c) : Metabolism is a defining feature of all living organisms without exception. All organism therefore are ' aware' of their surroundings i.e. consciousness.
Hence, metabolism and consciousness are defining feature of living organism without any exception.
• Non living thing do not interact with the environment and they do not evolve.

10. Biological organization starts with:-

(a) Atomic level
(b) Submicroscopic molecular level
(c) Cellular level
(d) Organismic level

AIPMT-2007

Ans. (b) : The living organism are arranged from single organism to complex.
• The cell is the basic unit of all living organisms.
• The biological organization starts with the submicroscopic molecular level.

11. Many elements are found in living organisms either free or in form of compounds. One of the following is negligible is living organisms

(a) Silicon (b) Magnesium
(c) Iron (d) Sodium

JIPMER-2014

Ans. (a) : Silicon element is used as the semiconductor. Silicon is not free in nature but it does occurs as oxide and silicate whereas magnesium, iron and sodium are present in the living organism as ion.
Silicon is essential to plant life but is often found in minute quantities in human body.

12. On the basis of nutritionally wild type organism, which does not require any additional growth supplement is known as :-

(a) Holotype (b) Auxotroph
(c) Prototroph (d) Phenotype

CMC Ludhiana-2009
AIPMT-2004

Ans. (c) : A micro-organism that has the same nutritional requirements as the parent organism. Phototrophs are organism that use light as their source of energy to produce ATP and carryout various cellular processes.
• An autotroph is an organism that produces complex organic compounds using carbon from simple substances such as carbon dioxide generally using energy from light or inorganic chemical reactions.

13. Ants locate sucrose by

(a) Using a strong sense of smell
(b) Using keen sense of vision
(c) Physical contact with sucrose
(d) Sensing the particular wavelength of light emitted/reflected by sucrose

KVPY (SA)-2010

Ans. (c) : Ants can smell food using their antennae, which can detect minute odours but sugar actually do not have a smell. Therefore, when the scout worker ants locate sugar while foraging, they take a piece back home to the colony while doing this the ant will leave a chemical trial which the other ants can follow.
Hence, ants locate sucrose by physical contact with sucrose.

@apna_pdf

14. Pheromones when secreted upon the skin surface, its odour generally affects:
(a) skin colour
(b) genitalia
(c) breast
(d) mutual behaviour of members of a species

JCECE-2002

Ans. (d) : The odour of pheromones affects the mutual behavior of member's of species because pheromone is a substance which is secreted by an individual on the skin surface to sexually attract an individual of another sex.

B. Diverseness in the living world

15. Reason of diversity in living beings is
(a) mutation
(b) long term evolutionary change
(c) gradual change
(d) short term evolutionary change

Manipal-2013
BHU PMT (Screening)-2010

Ans. (b) : Evolution gives rise to new species which is responsible for diversity in living beings.
- Evolution is a slow process of gradual change occurring in organism leading to the formation of new species. Organisms living in different environments would adapt and slowly change over time. This ultimately leads to the formation of new species. When this happens continuously, large number of species are formed leading to diversity in organisms.

16. The first organisms to appear on earth were
(a) photoautotrophs (b) chemoautotrophs
(c) chemoheterotrophs (d) coacervates

AMU-1997

Ans. (c) : The first organisms to appear on earth were chemohetrotrophs. Early chemohetrotrophs did not have the capability of using carbon dioxide from their surroundings to make their own organic compounds. They directly consume organic compounds. They directly consume organic molecules for both a source of carbon as well as energy.

17. The book Micrographia was written by :
(a) Huxley (b) Robert Hooke
(c) Fritsch (d) J. D. Hooker

BCECE-2002

Ans. (b) : The book **"Micrographia"** was written by Robert Hooke. The book Micrographia was the first important work on microscopy, the study of minute objects through a microscope first published in 1665.
- J.D. Hooker along with George Bentham, published **Genera Plantarum** having their natural system of classification.
- Fritsch give comprehensive classification of algae.

18. Philosophic Zoologique was written by :
(a) Lamarck (b) De Vries
(c) Mendel (d) Spencer

BCECE-2003
UP CPMT-2001

Ans. (a) : Philosophic Zoologique was a book written by French naturalist Jean- Baptiste Lamarck in 1809 in which he outlines his theory of evolution now known as Lamarckism.
- De Vries- wrote the book species and varieties and their origin by mutation.
- Mendel wrote the book experiments on plant hybridization.
- Spencer was an English sociologist who wrote the book the principle of psychology.

19. Organisms which obtain energy by the oxidation of reduced inorganic compounds are called
(a) Photo autotrophs (b) Chemoautotrophs
(c) Saprozoic (d) Coproheterotrophs

AIPMT-2002

Ans. (b) : The organisms which obtain energy by the oxidation of reduced inorganic compounds are called **chemoautotrophs**. When the reductants obtains from the environment in inorganic form then organism are chemoautotrophs.
- **Photoautotrophs** make their food by photosynthesis using the energy of sun.
- **Saprozoic organism** obtain food from the dead and decaying matter.

20. Out of 1.7 million species of living organisms known to us, insects contributes to about
(a) 0.7 million (b) 70000
(c) 70 lakh (d) One lakh

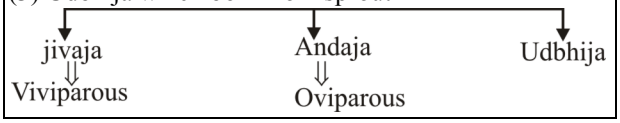
CMC Vellore-2012

Ans. (a) : According to present data, it reveal that 1.7 million living organisms are known to science, in which 1.2 million are animals and 0.5 million are plants. However, Insects have 0.7 million species.

21. In vedic times, living organisms were classified into following number of classes:
(a) 2 (b) 3
(c) 4 (d) 5

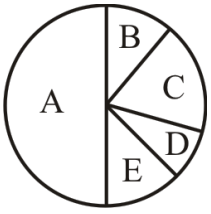
BCECE-2015

Ans. (b) : In vedic (Ancient) time, living organisms are classified into three main categories namely-
(1) Jivaja which born from womb that is viviparous.
(2) Andaja which born from egg. That is oviparous.
(3) Udbhija which born from sprout



22. Given below is the representation of the extent of global diversity of vertebrates. What groups does the portions represent?

VERTEBRATES



@apna_pdf

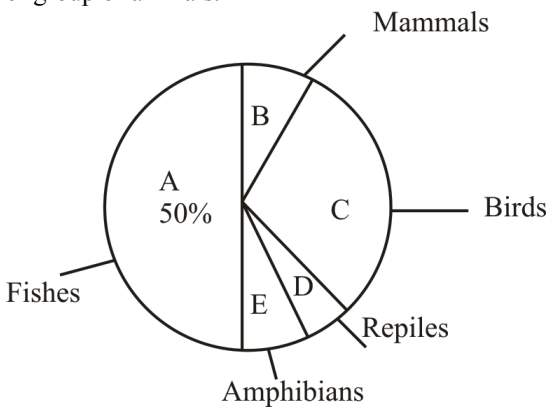
	A	B	C	D	E
(a)	Mammals	Birds	Fishes	Amphibians	Reptiles
(b)	Fishes	Mammals	Birds	Reptiles	Amphibians
(c)	Birds	Reptiles	Fishes	Mammals	Amphibians
(d)	Fishes	Amphibians	Mammals	Birds	Reptiles

Karnataka CET-2015

Ans. (b) :

Fishes	Mammals	Birds	Reptiles	Amphibians

Fishes covers about 50% of global diversity then it follow by birds about 35% – 40% then followed by other group of animals.



C. Taxonomic Categories

23. The basic unit of classification is

(a) species (b) taxon
(c) category (d) sub-species

J&K CET-2013
JIPMER-2011
BVP-2009,2010
Uttarakhand PMT-2009
J&K CET-2011 VMMC-2009
J&K CET-2008
CG PMT-2007
AIPMT-2003
AIIMS-1990,2000
Rajasthan PMT-1996,1997

Ans. (a) : A species is a group of similar organisms that are capable of interbreed and produce fertile offspring. The basic unit of classification is species constitute a group of phenotypically similar organism with common ancestry that can interbreed freely to produce fertile progeny and Hence, species is considered the basic unit of classification.

24. The term taxonomy was coined by

(a) De Candolle (b) Linnaeus
(c) John Ray (d) Bauchin

Tripura JEE-2018
J&K CET-2011
BVP-2010

Ans. (a) : The term 'taxonomy' was coined by A.P de Candolle. AP de Candolle was a Swiss Botanist and he also proposed a natural method to classify plants.
- The term 'Systematic' was coined by Linnaeus.
- The term family, genus and species was given by - John Ray (1663).

25. Taxon is the unit of:

(a) order (b) species
(c) taxonomy (d) genus

J&K CET-2013
BHU PMT-2002
Haryana PMT-2000
AIPMT-1996

Ans. (c) : Taxa (sing-taxon) are the different groups or Categories used in classification. Each taxon represents a category or rank in classification. Taxon is the unit of taxonomy. The term, 'taxon' was given by Adolf Meyer (1926).
- Such as species, family or class.
- Species is the lowest level of classification

26. A group of plants or animals with similar traits of any rank is

(a) species (b) genus
(c) order (d) taxon

BVP-2012
MGIMS Wardha-2007
AIPMT-1992, 1991

Ans. (d) : A group of plants or animals with similar traits of any rank is taxon. All the organism belonging to a similar taxon share similar traits. For example, the basic level of classification is species followed by genus, family, order, class, phylum or division in ascending order.

27. Species is a

(a) group immediately below a phylum
(b) closely related interbreeding population
(c) taxonomic division of similar genera
(d) closely related non-breeding population

Manipal-2012, 2011
AFMC-2002

Ans. (b) : John ray gave the term 'species' in 1693.
- Population of closely related inter breeding individuals is called species.
- Each species is reproductively isolated from other species.
- One species can be differentiated from other closely species on the basis of distinct morphological differences.
- The number of known and describe species range from 1.7 - 1.8 million.

28. A taxon is

(a) a group of related organism
(b) a taxonomic group of any ranking
(c) a group of related species
(d) a group of related genus

VMMC-2014
CG PMT-2007
DUMET-2006
Rajasthan PMT-2001
AIPMT-1992,1990

@apna_pdf

Ans. (b) : A taxon is term used for any taxonomic unit that is recognized or defined by atleast one of the nomenclature codes. The taxa at different hierarchial levels are species, genus, family, order, class, phylum and kingdom.

29. Biological concept of species is mainly based on

(a) reproductive isolation
(b) morphological features only
(c) methods of reproduction only
(d) morphology and methods of reproduction

HP CET-2012
Rajasthan PMT-2008
UP CPMT-2008

Ans. (a) : Biological concept of species is mainly based on reproductive isolation is proposed by Ernst Mayr.
Reproductive isolation is defined as the inability of a species to breed successfully with its related species because of the behavioral, geographical, physiological or genetic barriers or differences.

30. Select the correctly matched pair of organisms with their order.

(a) Mangifera, indica : Primata
(b) Triticum, aestivum : Sapindales
(c) Musa, domestica : Diptera
(d) Homo, sapiens : Poales

Karnataka CET-20.05.2023

Ans. (c) : Musca domestica is the biological name of housefly. It is most common fly species found in house. It is a common insect of family muscidae and order diptera. It belongs to the class insecta and phylum Arthropoda.

31. Potato and Brinjal differ in this taxon

(a) Species (b) Genus
(c) Family (d) Order

AP EAPCET-11.05.2023, Shift-II

Ans. (a) : Each category, referred to as a unit of classification, represent a rank commonly termed as taxon.
Brinjal and potato belong to the same genus solanum, but two different species. The main criteria for defining two species is that they can not cross or interbreed and produce fertile offspring.

32. Read and find the correct statement from the given below

(A) Species is a group of individual organisms with fundamental dissimilarities.
(B) Few similar characters are assigned to a higher category in a division.
(C) A decrease in number of common characters is observed from species to kingdom.
(D) Lower taxa shares more characters within the members.

(a) ABC (b) ACD
(c) BCD (d) ABD

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : Taxonomic categories from species to kingdom have been show in ascending order starting with species.
As we go higher from species to kingdom, the number of common characteristic goes on decreasing.
Few similar characters are assigned to a higher category in a division.
Lower taxa share more characters within the members.

33. Match List I with List II :

	List I		List II
A.	**Heroin**	**I.**	**Effect on Cardiovascular system**
B.	**Marijuana**	**II.**	**Slow down body function**
C.	**Cocaine**	**III.**	**Painkiller**
D.	**Morphine**	**IV.**	**Interfere with transport of dopamine**

Choose the correct answer from the options given below :

(a) A-III, B-IV, C-I, D-II
(b) A-II, B-I, C-IV, D-III
(c) A-I, B-II, C-III, D-IV
(d) A-IV, B-III, C-II, D-I

NEET (UG) 07.05.2023

Ans. (b) : The main effects of **heroin-**
- Intense pleasure and pain relief.
- Relaxation, drowsiness and clumsiness.
- Confusion.
- Feelings of detachment.
- Slow down body function.
- **Marijuana** - Smoking weed has triggered heart attacks and to a higher risk of strokes and heart failure in people with underlying heart disease.
- **Cocaine** - The pain killing effects work by blocking the transmission of pain impulses from the nerves to the brain, allowing it to be used as a local anesthetic.
- **Morphine** is used to relieve severe pain, such as pain caused by a major trauma or surgery, labour pain in child birth or cancer pain.

34. Assertion (A): Species is dynamic.
Reason (R): It is the basic unit of classification
The correct option among the following is

(a) (A) is true. (R) is true and (R) is the correct explanation for (A)
(b) (A) is true. (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-31.07.2022 Shift-II

Ans. (b) According to it "species is always changeable" there are many changes occur in species time to time. Changes always occur in characters of species from one generation to the next generation, and these changes are called as evolution.
Dynamic concept of species put forwarded by Lamarck.

@apna_pdf

• It is assemble a group of phenotypically similar organism with common ancestry - that can interbreed freely to produce fertile progeny.
Hence, species is considered as basic unit of classification.

35. Identify the organism with correct sequence of taxa in hierarchy from the following.

(a) Homo – sapiens – Mammalia – Chordata – Hominidae
(b) Triticum – vulgare – Poales – Monocotyledonae – Spermatophyta
(c) Domestica – Musca – Muscidae – Diptera – Insecta
(d) Sapindales – Dicotyledonae – Mangifera – indica – Anacardiaceae

TS EAMCET-31.07.2022 Shift-II

Ans. (c) : The correct sequence of taxa of Housefly in hierarchy from the following is -

Kingdom — Animalia
↑
Phylum — Arthropoda
↓
Class — Insecta
↓
Order — Diptera
↓
Family — Muscidae
↓
Geneus — Musca
↓
Species — domestica

36. Theory and practice of identification, nomenclature and classification of organisms is called

(a) Morphology (b) Anatomy
(c) Taxonomy (d) Ecology

TS EAMCET-30.07.2022 Shift-I

Ans. (c) : Taxonomy is the theory and practice of identification, nomenclature and classification of organisms and includes all plants, animals and microorganisms of the world. The father of taxonomy is Carolus Linnaeus (1707 – 1778).

37. Assertion (A) : Species is dynamic.
Reason (R) : Species are in a continuous process of adapting to the conditions of their surrounding environments.
The correct option among the following is

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-31.07.2022 Shift-I

Ans. (a) : Species is dynamic in nature due to various reason like mutation, environmental effect, variation in geographical distribution etc.
Species are in a continuous process of adapting to the conditions of their surrounding environments.
Hence, both are correct and reason is correct explanation for assertion.

38. A group of individual organisms with fundamental similarities is called as

(a) Genus (b) Family
(c) Species (d) Order

AP EAPCET-11.07.2022 Shift-I

Ans. (c) : A group of individuals organisms with fundamental similarities is known as species.
Species is a group of organisms that can reproduce naturally with one another and create fertile offspring.

39. The hierarchical arrangement of taxonomic categories in descending order is

(a) Kingdom, phylum, class, order, family, genus, species
(b) Kingdom, division-phylum, order, family, genus, species
(c) Kingdom, class, phylum, order, family, genus
(d) Division, kingdom, class, phylum, order, family, genus, species

NEET-2022
AMU-2012

Ans. (a) : Kingdom
↓
Phylum
↓
Class
↓
Order
↓
Family
↓
Genus
↓
Species

•Taxonomic categories showing hierarchical arrangement in descending order.

40. Assertion (A) : Numerical Taxonomy require mathematical methods and computer.
Reason (R) : All characters are given codes, numbers and with equal importance, and hundreds of character are to be evaluated.
The correct option among the following is :

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-II

@apna_pdf

Ans. (a) : Numerical taxonomy is the analysis of various types of taxonomic data by computerized or mathematical methods. It aims to create a taxonomy using numeric algorithms like cluster analysis rather than using Subjective evaluation of their properties.

Each character is given equal importance and at the same time hundreds of characters can be considered in Numerical taxonomy.

41. Taxon 'Tigris' represents _____ .

(a) Class (b) Species
(c) Family (d) Genus

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Tigris represent species

Kingdom	:	Anemalia
Phylum	:	Chordata
Class	:	Mammalia
Order	:	Carnivora
Family	:	Felidae
Subfamily	:	Pantherinae
Genus	:	Panthera
Species	:	tigris

42. Amongst all the kingdoms, the only taxon that exists in nature as a biologically cohesive unit is the _____

(a) Phylum (b) Species
(c) Genus (d) Kingdom

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Species is the lowest taxon in taxonomic hierarchy. Which helps in describing the organisms and their characteristics that can successfully interbreed and produce fertile offspring.

Species is only taxon that exist as biologically cohesive unit.

43. Assertion (A) :Species is an ecological unit.
Reason (R) : Species have similar structure and functional characteristics.
The correct option among the following is
Options:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Species is an ecological unit because individuals make up a population, make up a species and multiple species makes a community.

A species is group of organisms that can reproduce naturally with one another and create fertile offspring. Species have similar structure and functional characteristics.

44. Study the following table which shows different organisms with their taxonomic categories. Select the correct option for A,B, C and D?

Common name	Biological name	Genus	Family	Order	Class	Phylum / Division
Man	Homo sapiens	Homo	Hominidae	Primata	Mammalia	A
Housefly	Musca domestica	Musca	Muscidae	Diptera	B	Arthropoda
Mango	Mangifera indica	Mangifera	C	Sapindales	Dicotyledonae	Angiospermae
Wheat	Triticum aestivum	Triticum	Poaceae	Poales	D	Angiospermae

(a) A- Chordata, B- Insecta, C- Anacardiaceae, D- Monocotyledonae
(b) A-Animalia, B- Arachnida, C- Anacardiaceae, D- Monocotyledonae
(c) A- Chordata, B- Arachnida, C-Polygonaceae, D- Monocotyledonae
(d) A-Non-Chordata, B-Insecta, C- Anacardiaceae, D- Dicotyledonae

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : Man comes under phylum- Chordata.
- Housefly comes under class - Insecta.
- Mango comes under family of - Anacardiaceae.
- Wheat comes under class - Monocotyledonae.

45. Match the following lists

List -I	List - II
A. Genera plantarum	**I. Theophrastus**
B. Species plantarum	**II. Bentham and Hooker**
C. Historia plantarum	**III. Hutchinson**
D. Families of flowering plants	**IV. Linnaeus**
	V. Engler and Prantl

The correct match is

	A	B	C	D
(a)	II	IV	III	V
(b)	II	IV	I	III
(c)	II	I	III	IV
(d)	IV	II	V	III

TS EAMCET-29.09.2020 Shift-I

Ans. (b) :

List -I	List - II
A. Genera plantarum	–Bentham and Hooker
B. Species plantarum	–Linnaeus
C. Historia plantarum	–Theophrastus
D. Families of flowering plants	– Hutchinson

46. Identify and arrange the following taxonomic categories in ascending order.

(A) Hominidae **(B) Triticum**
(C) Spermatophyta **(D) Sapiens**
(E) Primata **(F) Insecta**

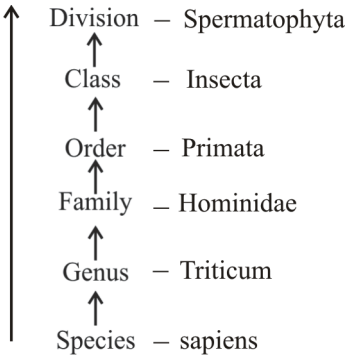
Options:

(a) D, A, B, F, E, C (b) D, B, E, A, F, C
(c) A, B, C, D, E, F (d) D, B, A, E, F, C

TS EAMCET-28.09.2020 Shift-I

@apna_pdf

Ans. (d) :

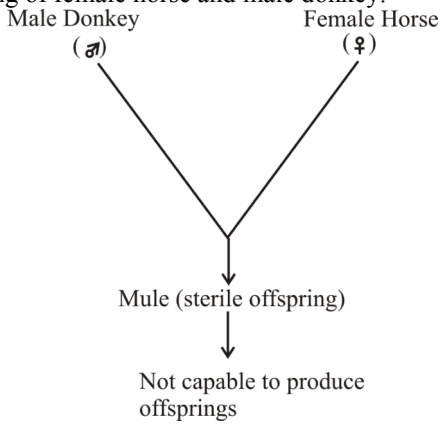


Taxonomic categories in ascending order.

47. Assertion (A) : Species is a breeding unit.
Reason (R) : Closely related species of a genus can interbreed, but they generally give rise to sterile offspring.
The correct option among the following is:
(a) Both A and R are true, R is correct explanation for A
(b) Both A and R are true, R is not correct explanation for A
(c) A is true, But R is false
(d) A is false, But R is true

TS EAMCET-29.09.2020 Shift-I

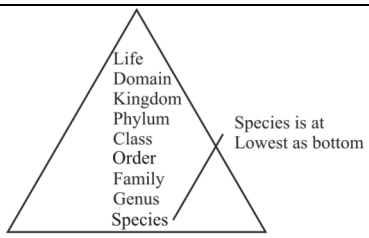
Ans. (b) : Species is a breeding unit, Species are reproductively isolated from individuals of other species.
In nature there are some example where closely related species of a genus can interbreed, but they generally give rise to sterile offsprings. This phenomenon is best example of interspecies hybridization. Mule is an offspring of female horse and male donkey.



48. In the hierarchy of classification, the lowest obligatory category in five kingdom classification is
(a) Order (b) Species
(c) Phylum (d) Class

TS EAMCET-29.09.2020 Shift-II

Ans. (b) : In the hierarchy of classification, the lowest obligatory category in five kingdom classification is species.
This hierarchy according to five kingdom system are as follows -



49. Assertion (A): Species is an evolutionary unit
Reason (R): Having similarity in structural and functional characteristics
The correct option among the following is
(a) Both A and R are true. R is correct explanation of A.
(b) Both A and R are true. R is not correct explanation of A.
(c) A is true but R is false
(d) A is false but R is true

TS EAMCET-29.09.2020 Shift-II

Ans. (a) : According to Simpson (in 1961) it is "an evolutionary species is a lineage" (an ancestral - descendant sequence of populations) evolving separately from others and with its own unitary evolutionary role and tendencies".
• Species having similarity in structure and functional characteristics hence species have similarity in morphology, size and also similar in function or physiology.

50. Highest unit of classification
(a) phylum (b) kingdom
(c) class (d) series

MHT CET 5.10.2020 Shift-I
CG PMT-2006

Ans. (b) : Highest unit of classification is kingdom . It has the largest number of organism with lowest number of similarities. Living organisms are classified into five kingdom - Monera, Protista, Fungi, Plantae and Animalia.

51. The Study of external features is called ____
(a) Morphology (b) Anatomy
(c) Taxonomy (d) Astronomy

AP EAMCET-24.09.2020 Shift-II

Ans. (a) : In biology the study of external feature of living organism is called morphology this can include the physical characteristic of an organism such as its shape , size colour, and other visible traits.

52. Match the following

	Set-I		Set-II
A	The black buck	i	*Grus leucogeranus*
B	Kashmiri stag	ii	*Panthera leo persica*
C	Pygmy hog	iii	*Antelope cervicapra*
D	Siberian Crane	iv	*Cervus elaphus hanglu*
		v	*Sus salvanius*

@apna_pdf

The correct match is

	(A)	(B)	(C)	(D)
(a)	i	ii	iv	iii
(b)	iii	iv	v	i
(c)	v	i	iv	ii
(d)	i	iii	iv	ii

TS EAMCET-09.05.2019 Shift-I

Ans.(b):

List - I	List-II
(A) The black buck	*Antilope cervicapra*
(B) Kashmiri stag	*Cervus elaphus hanglu*
(C) Pygmy hog	*Sus salvanius.*
(D) Siberian crane	*Grus leucogeranus*

53. Assertion (A): Classification is grouping into categories based on observed characters and the categories are referred as taxon.
Reason (R): Taxa are unbiased and indicative of categories at different levels in classification.
The correct answer is:
(a) Both (A) and (R) are true, (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.05.2019 Shift-I

Ans. (a) : Taxa is the scientific term for each unit or category of classification. It indicates at different levels. Group of living organisms indicates the taxon whether category indicates the status in the particular taxon.

54. Choose the correct set of taxonomic words belong to the given statements
(I) Taxonomic category showing individual organisms with fundamental similarities
(II) Taxonomic category with same hierarchical status
(i) Dicotyledonae (ii) domestica
(iii) indica (iv) Insecta
(v) Mangifera (vi) sapiens
(vii) Mammalia (viii) Monocotyledonae
(ix) vulgare
Options :
(a) ii, iii, vi, ix ; i, iv, vii, viii
(b) i, ii, iii, viii ; ii, iii, vi, ix
(c) i, ii, iii, iv ; v, vi, vii, viii
(d) iii, iv, v, vi ; vii, viii, ix, i

AP EAMCET-24.04.2019 Shift-I

Ans. (a) : (1) The taxonomical category showing individual organism with fundamental similarities include name of species of organism like- domestica, indica, sapiens, vulgare.
(2) Taxonomic category with same hierarchical status include taxa like - Insecta , Dicotyledonae, Mammalia and Monocotyledonae.

55. Statement (S) : Species is a breeding unit.
Reason (R) : A species is reproductively isolated from the individuals of the other species.
The correct answer is
(a) Both (S) and (R) are correct and (R) is the correct explanation to (S)
(b) Both (S) and (R) are correct but (R) is not correct explanation to (S)
(c) (S) is correct but (R) is not correct
(d) (S) is not correct but (R) is correct

TS EAMCET-08.05.2019 Shift-I

Ans. (a) : Species are groups of actually or potentially interbreeding population which are reproductively isolated from other such group. The biological species concept has been prevalent in the evolutionary literature for the last several decades and is emphasized in many college level biology courses.

56. The correct sequence of taxonomic categories is:
(a) class-phylum-order-family-genus-species
(b) phylum-order-class-genus-family-species
(c) division-class-family-genus-species-order
(d) phylum-class-order-family-genus-species

TS EAMCET-08.05.2019 Shift-II
TS EAMCET-02.05.2018 Shift-II,
AP EAMCET-2015
AFMC-2001

Ans. (d) : The correct sequence of taxonomic categories is the phylum-class-order-family-genus-species.
Here phylum is highest unit of classification and it has largest number of organism. Species is lowest unit of classification and it has least number of organisms but the species has the more common characters.

57. Identify the levels and hierarchy from the following in the classification of animal kingdom.
1. Family 2. Class
3. Phylum 4. Order
5. Genus 6. Species
(a) $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 6 \rightarrow 5$
(b) $4 \rightarrow 3 \rightarrow 2 \rightarrow 1 \rightarrow 6 \rightarrow 5$
(c) $3 \rightarrow 2 \rightarrow 4 \rightarrow 1 \rightarrow 5 \rightarrow 6$
(d) $1 \rightarrow 4 \rightarrow 3 \rightarrow 2 \rightarrow 6 \rightarrow 5$

TS EAMCET-02.05.2018 Shift-II

Ans. (c) : There are seven divisions in the system:-
1. Kingdom 2. Phylum or Division
3. Class 4. Order
5. Family 6. Genus
7. Species.
Kingdom is the highest category and species is the lowest category.

58. Assertion (A) : Species is the lowest taxonomic category in the hierarchical arrangement and shows distinguishing characters from one species from other closely related species based on several phenotypic characters. However, as we go higher from species to kingdom the number of common characters goes on decreasing.
Reason (R) : All plants come under the highest category called kingdom, plantae, which has two major classes dicotyledonae and monocotyledonae.
Which of the following is true?

@apna_pdf

(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) (A) is true, but (R) is false
(c) (A) and (R) are false
(d) Both (A) and (R) are true, but (R) is not the correct explanation of (A).

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : The lowest category consists of a single species. Each of the categories above species can have numerous subcategories.
• Within the plant kingdom, plants are divided into two main groups. The largest group contains the plants that produce seeds. These are flowering plants (angiosperms) and conifers, Ginkgo, and cycads (gymnosperms).
• In angiosperms seeds are coverd by seed coat but in gymnosperms seeds are not coverd by seed coat. Angiosperms are further divided into two classes (i)Dicotyledonae (ii) Monocotyledonae.
Hence, both (A) and (R) are true, but (R) is not the correct explanation of (A)

59. The correct sequence of taxonomic hierarchy is
(a) Genus → Family → Class → Order → Phylum → Kingdom → Species
(b) Species → Genus → Family → Order → Class → Phylum → Kingdom
(c) Species → Family → Genus → Kingdom → Order → Class → Phylum
(d) Species → Genus → Family → Class → Order → Phylum → Kingdom

Karnataka CET-2018

Ans. (b) : Hierarchy is the process in which organisms are arranged into successive level decreasing or increasing order. There are seven categories. So correct answer is
species → genus →family → order →
class → phylum → kingdom

60. Match the following

List-I	List-II
(p) Order	**(i) Nigrum**
(q) Species	**(ii) Polemoniales**
(r) Family	**(iii) Solanum**
(s) Class	**(iv) Solanaceae**
	(v) Dicotyledonae

The correct answer is
Options :

	(p)	(q)	(r)	(s)
(a)	(ii)	(i)	(iii)	(v)
(b)	(iii)	(v)	(iv)	(ii)
(c)	(ii)	(i)	(iv)	(v)
(d)	(i)	(iii)	(v)	(ii)

TS EAMCET-02.05.2018 Shift-I

Ans. (c) : Polemoniales comes under Order. Nigrum comes under Species (eg. *Solanum nigrum*) Solanaceae comes under Family (like potato). Dicotyledonae comes under Class.

61. Identify the 'order' from the following:
(a) Carnivora (b) Muscidae
(c) Insecta (d) Panthera

Karnataka CET-2017

Ans. (a) : Carnivora is an order of placental mammals that have specialized in primarily eating flesh" whose members are formally referred to as carnivores.
• Muscidae are family of flies found in the super family muscidea.
• Insecta is a class under the phylum Arthropoda.
• Panthera is a genus within family Felidae.

62. Classical Taxonomy is based on
(a) Morphological traits
(b) Habitat of organisms
(c) Similarities and dissimilarities of behavior
(d) Phylogeny

AIIMS-2017

Ans. (a) : Classical taxonomy is based on morphological traits. Classical taxonomy is concerned with the classification of species, in which species serving as the fundamental unit. An organism divided into Domains, Kingdom, Phylum, Class, Order, Family, Genus and Species in the classification system. Systematic is another name for classical taxonomy or old systematic.

63. Which one is smallest unit of classification?
(a) Class (b) Order
(c) Species (d) Family

VMMC-2011
JIPMER-1997

Ans. (c) : Smallest unit of classification is species. The classification of organism in a specific sequence of categories either in an ascending order (starting from species and reaching up to kingdom) is called a hierarchy of categories. The hierarchy includes seven main obligate phylum, class, order, family, genus and species. The smallest unit of this hierarchical categorization is species and largest unit is kingdom.

64. Branch of biology dealing with study of organism in outer space is
(a) Exobiology (b) Ethology
(c) Euphenics (d) Ethnology

DUMET-2007

Ans. (a) : The branch of biology dealing with the study of organisms in outer space is called Exobiology or astrobiology. This field of study focuses on understanding the origin, evolution, distribution and feature of life. Exobiologist explore the potential habituality of other planets.

65. Scientific study of diversity of organisms and their evolutionary relationships is
(a) Morphology (b) Anatomy
(c) Taxonomy (d) Systematics

J&K CET-2011

Ans. (d) : Scientific study of diversity of organisms and their evolutionary relationship is called as systematics.
• The branch of biology which deals with structure and forms of organism (plants or Animals) called morphology.
• The branch of science deals with classification of living organism called taxonomy.
• The branch of biology that deals with the structure and identification of organism's body and their different sections, called anatomy.

@apna_pdf

66. The term phylum was given by

(a) Haeckel (b) Linnaeus
(c) Cuvier (d) Theophrastus

MGIMS Wardha-2013
AIPMT-1992

Ans. (a) : The term phylum was given by Ernst Haeckel. The phylum is the taxonomic rank which is placed below kingdom and above the class. It is used to describe the classification of animal, division is the similar term used for plants.

67. Interbreeding population of animals is called :

(a) sub - species (b) species
(c) community (d) genus

MGIMS Wardha-2003

Ans. (b) : Interbreeding population of animal is called species. A species refer to a group of living organisms which are capable of interbreeding and producing fertile offsprings. They can be interbreed and reproduce.

68. Ambulacral grooves are absent in the living forms of the class

(a) Crinoidea (b) Ophiuroidea
(c) Asteroidea (d) Echinodermata

Punjab MET-1999

Ans. (b) : Ambulacral grooves are found in the arms of echinoderms lined by tube feet.
Ambulacral grooves are absent in Ophiuroidea (brittle stars) which are covered by ossicles.
Ambulacral are replaced by ossicles & Ambulacral grooves extend from the mouth to the end of each ray of arm of the animal.

69. Sequence of taxonomic categories is

(a) Division, class, family, tribe, order, genus, species
(b) Class, phylum, tribe, order, family, genus, species
(c) Division, class, order, family, tribe, genus, species
(d) Phylum, order, class, tribe, family, genus, species

VMMC-2013
AIPMT-1992

Ans. (c) : The correct arrangement of taxonomic categories in descending order from high, to lower in biological classification include following 7 obligatory categories. Kingdom → Phylum or Division → Class → Order → family → Tribe → Genus → species
• Tribe is a taxonomic category present between sub family and genus.

70. Phenetic classification is based, on

(a) sexual characteristics
(b) the ancestral lineage of existing organisms
(c) observable characteristics of existing organisms
(d) dendogram based on DNA characteristics

Manipal-2012

Ans. (c) : Phenetic classification is based on the observable characteristics of existing organisms.
Phenetic classification is simply understood as like they use many character to define the overall similarity of the special organism are group together based on the mutual similarity of their phenotype.
• It uses statistical method for evaluating similarities and differences finding out relationships, primitiveness and advancement of species with the help of all the known traits.

71. A group of related genera, with still less number of similarities as compared to the genus and species constitutes

(a) order (b) class
(c) family (d) division

DUMET-2010

Ans. (c) : A group of related genera with less no. of similarities are kept in a family taxonomic groups which comes between order & genus.
• Family is represented by a group of related genera that are more similar to each other than with the genera of other families.
Ex. A cat (Felis domestica) and a lion (Panthera leo) belongs to the "cat" family - Felidae.

72. The total number of species, that are known and described range between

(a) 0.5 - 1.0 million (b) 1.1 - 1.2 million
(c) 1.7 - 1.8 million (d) 2.5 - 3.0 million

DUMET-2010

Ans. (c) : The total number of species that are known and described range between 1.7-1.8 million. This refers to biodiversity or the number and type of organism present on earth.

73. Taxa differs from taxon due to this being

(a) a higher taxonomic category than taxon
(b) lower taxonomic category than taxon
(c) the plural of taxon
(d) the singular of taxon

DUMET-2010

Ans. (c) : Taxa differs from taxon (Singular) due to the plural of taxon.
A taxon is defined as a collection of one or more population of organism . Taxa are the hierarchical division of a species from kingdom to subspecies.

74. The number of species classified in Species Plantarum

(a) 5900 (b) 6000
(c) 4000 (d) 3800

DUMET-2008

Ans. (a) : Carl Linnaues introduced the Binomial system of Nomenclature in his book **"Systema Naturae"** published in 1758.
• All valid names for plants are the ones given by Linnaues in his book **"Species Plantarum"** published in 1753.
• It includes names & description of 5900 species of plants.

75. Which of the following belongs to the class Amphineura ?

(a) Chiton (b) Nautilus
(c) Dentalium (d) Pinctada

Uttarakhand PMT-2004

@apna_pdf

Ans. (a) : Nautilus:- The only cephalopod that has an outer shell is the Nautilus genus.
Dentalium:- Under the genus' Dentalium' the elephant tusk is described.
• It is a scaphopod a mollusc genus
Pinctada:- It is a genus of marine bivalve mollusc that are salt water clams
• They belong to the pteriidae tribe.
• **Chiton** (Coat of mail shell) are small to large marine mollusca in the class-Polyplacophora formerly known as Amphineura.

76. Which one is the correct hierarchical order in Taxonomy?
(a) Genus < species < class < order
(b) Genus < class < order < family
(c) Species < order <class < phylum
(d) Genus < class < division < order

J&K CET-2015, 2009

Ans. (c) : Taxonomic hierarchy
• First used by Linnaeus
• Arrangement of taxonomic categories descending order from higher to lower in biological classification

Kingdom
↓
Phylum
↓
Class
↓
Order
↓
Family
↓
Genus
↓
Species

77. Class is the category of taxonomy which includes related
(a) families (b) orders
(c) genus (d) species

J&K CET-2014

Ans. (b) : Class is the category includes related order. For example- - order primate comprising monkey, gorilla and gibbon is placed in class, Mammalia along with order Carnivora that includes animals like tiger, cat and dog.

78. The concept of "biological species" was proposed by
(a) Carolus Linnaeus (b) Darwin
(c) E. Mayr (d) Von Baer

AMU -2000

Ans. (c) : The concept of 'biological species' was proposed by 'Earnst Mayr'. It was groups of actually or potentially interbreeding natural populations which are reproductively isolated from other such groups.
• This theory explain that organism distinct at a biological level do not interbreed with each other when budding in the same region.

79. Which of the following taxonomist described classification of plant kingdom in"Families flowering plants"?
(a) Cronquist (b) Takhtajan
(c) Benson (d) Hutchinson

MGIMS Wardha-2004

Ans. (d) : John Hutchinson an English botanist, proposed phylogenetic classification in his famous book ' families of flowering plants ' in 1959.
In Hutchinson's classification
(i) Tree and shrubs are considered to be more primitive than monocot herbs
(ii) Dicots have been considered more primitive than monocots.
(iii) Polypetalous, actinomorphic and solitary flowers are considered more primitive than gamopetalous zygomorphic and inflorescence respectively.

80. Which of the following taxonomic ranks contains organisms most similar to one another?
(a) Class (b) Genus
(c) Family (d) Species

UP CPMT-2001

Ans. (d) : A group of individual organism with fundamental similarities as a species. As we go higher taxonomic categories to tower taxonomic categories the common characters are increases like kingdom to species. In kingdom common characters are less similar than species. i.e. species have more similar characters.

81. Statement: Sub species has a geographical area and geographically isolated from other sub species.
Reason: When members of a species are geographically isolated they give rise to a sub species.
(a) both statement and reason are correct and the reason is the correct explanation to the statement
(b) reason is the correct explanation to the statement but the statement is not correct
(c) both statement and reason are not correct
(d) only statement is correct and reason is wrong

AP EAMCET-2004

Ans. (a) : Sub -species is a category in taxonomy that ranks below the species which include geographically isolated group of individual not all species have sub-species because when members of a species are geographically isolated then they give rise to a sub - species.

82. Taxonomically, which of the following set is matched correctly?
(a) Cattle fish, Jelly fish, Silver fish
(b) Bat, Pigeon, Kite
(c) Lobsters, Spider, Shrimps
(d) Oyster, Otter, Octopus

CG PMT-2009

Ans. (c) : All of these organisms belongs to members of phylum arthropod. This phylum is characterised by having a segmented body plan and an outer cuticle mode of chitin.

@apna_pdf

83. Cladistics can be best defined as
(a) the relationship between sub-species and species
(b) relationship between two most forward races
(c) relationship between endangered and surviving species
(d) method of classification that attempt to interfere phylogenetic relationship

AMU-2006

Ans. (d) : Method of classification that attampt to interfere phylogenetic relationship is known as cladistics.
• It is also called phylogenetic system of classification that indicates the evolutionary or phylogenetic relationship of organism.
This classification was initiated by Engler & Prantl (1887-1899).
• In this system flowering plants are placed in ascending series related to complexity or floral morphology.

84. If a botanist has to nomenclate a similar species, he will use :
(a) isotype (b) mesotype
(c) neotype (d) syntype

JIPMER-2001

Ans. (a) : Isotype is the duplicate of holotype as another branches of the same tree.
For a similar species isotype is done of a plant as holotype which means (reference specimens)
• In this process a specimen is collected from the same plant at the same time and this duplicate specimen are often kept in several Institute. So if a botanist has to nomenclature a similar species he will use isotype.
• **Mesotype-** Specimen are not used for the study of similar species.
• **Neotype–** New nomenclature type when original type is missing.
• **Syntype–** Any specimens cited by author, when there is no holotype, was designated.

85. The word species was coined by
(a) Aristotle (b) Linnaeus
(c) John Ray (d) Engler

J&K CET-2015

Ans. (c) : The term species was coined by John Ray (1693). Species is basic unit of classification which include a group of organisms that can interbreed and produce fertile offspring's.

86. Which set of 'species' names belong to same genus?
(a) histolytica and coli
(b) gingivalis and protens
(c) protens and coli
(d) vivax and coli

JIPMER-1996
Haryana PMT-1999

Ans. (a) : Entamoeba histolytica (parasitic protozoans) and Entamoeba coli both belongs to same genus - Entamoeba which is a genus of parasitic protozoa.

87. A species is a collection of demies. The deme is a group of
(a) genes in different environment
(b) individuals in same environment
(c) chromosome in same organism
(d) population with a common gene pool

BHU PMT (Screening)-2011

Ans. (d) : Deme is a population of organisms within which the exchange of genes is completely random i.e. all mating combinations between individuals of opposite sexes have the same probability of occurrence.
• The deme usually is not a closed population but contribute individuals to neighboring populations & receives immigrants from them. The deme is an assemblage of closely related interbreeding individuals of a species that shores a continuous uninterrupted distribution.

88. Taxonomic hierarchy refers to
(a) stepwise arrangement of all categories for classification of plants and animal
(b) a group of senior taxonomists who decide the nomenclature of plants and animals
(c) a list of botanists or zoologists who have worked on taxonomy of a species or group
(d) classification of a species based on fossil record

Haryana PMT-2003
DUMET-2009,2011

Ans. (a) : Taxonomic hierarchy stepwise arrangement of all categories for classification of plants and animals.
In taxonomic hierarchy each category referred to as unit of classification infact, represents a rank and is commonly termed as taxon.

89. Principles and rules of classification are studied under :
(a) natural classification (b) systematics
(c) nomenclature (d) taxonomy

Haryana PMT-2003

Ans. (d) : The main objective of taxonomy are Identification, Nomenclature and Classification. Taxonomy is the branch of biology that involves the study of principle and rules of classification into groups based on similarities of structure, origin etc.

90. Which of the following taxonomical ranks contain organisms least similar to one another?
(a) Class (b) Genus
(c) Family (d) Species

CG PMT-2010
BCECE-2009
AP EAMCET-1997

Ans. (a) : The correct hierarchy of classification of various taxon is descending order in given by kingdom →Phylum→Class→Order→Family→ Genus →Species.
• Class taxonomic categories contains organism least similar to one another. It represents the organisms of related orders.
• Related order are kept in a class and related classes are kept in a phylum. The phylum, class and order are higher taxonomic categories identified on the basis of aggregate of character.

@apna_pdf

91. Which of the following have more characters in common?

(a) Order (b) Family
(c) Class (d) Phylum

CG PMT-2011

Ans. (b) : As we move from species to kingdom, the number of common characters decreases so, more characters are found in family as per options.
• According to hierarchy level species has the more common characters.
Whereas kingdom has the least common characters.

92. Taxonomy is the branch of science which deals with

(a) identification (b) nomenclature
(c) classification (d) All of these

CMC Ludhiana -2013

Ans. (d) : Based on characteristics, all living organisms can be classified into different taxa. This process of classification is taxonomy.
Hence, characterization, identification, classification nomenclature are the basics of taxonomy.

93. Polytypic species are those which

(a) do not interbreed
(b) are distributed in different geographical areas
(c) have two or more species
(d) belong to different time periods

CMC Ludhiana-2015

Ans. (c) : Species are those which have two or more sub-species are called polytypic species while the species having no sub-species are called monotypic species. Example is tiger- *Panthera tigris* which have several subspecies ,such as (i) Indian tiger - *Panthera tigris tigris* (ii) Chinese tiger - *Pathera tigris amoyensis* (iii) Siberian tiger- *Panthera tigris sondaica* etc.

94. What is true for individuals of same species

(a) Live in same niche
(b) Live in same habitat
(c) Interbreeding
(d) Live in different habitat

AIPMT-2002

Ans. (c) : Species is lowest taxonomic categories.
Niche- Defined as the functional or maximum activity performed of any organism or individual.
Habitat- It is defined as an area of specific organism or type of a location of organism.

95. Mark the odd one.

(a) Family (b) Class
(c) Taxon (d) Phylum

Uttarakhand PMT-2011

Ans. (c) : Taxon– It is suggested as a group of one or more population of organism in taxonomical form.
Phylum– It is placing similar class together with similar characters.
Family– It is placing similar genus together with similar characters.
Class– It is placing similar order together with similar characters.

96. Choose the wrong statement with reference to subspecies

(a) They show minor variations from parent population
(b) They do not interbreed with individuals of other subspecies
(c) They are new species in the making
(d) Geographically isolated population of a species

AP EAMCET-2014

Ans. (b) : Species is the fundamental unit of classification recognized by the International commission of Zoological Nomenclature.
Subspecies is a category in biological classification that ranks below a species and usually a fairly permanent geographically isolated race.
e.g. – The dog (Canis lupus familiaris) and the dingo (Canis lupus dingo) are both subspecies of the wolf (Canis lupus).

97. Phenetic classification of organisms is based on:-

(a) The ancestral lineage of existing organisms
(b) Dendogram based on DNA characteristics
(c) Sexual characteristics
(d) Observable characteristics of existing organisms

AIPMT-2004

Ans. (d) : In biology, phenetics term is originated from greek word phainein. In greek word phainein means appear.
• Phenetic classification is done on the basis of observable characteristics of an existing organism. Here observable character refers to morphology and other trait that can observe.

98. In Whittaker's system of classification, prokaryotes belong to the kingdom

(a) Monera (b) Protista
(c) Animalia (d) Fungi

JIPMER-2010

Ans. (a) : R.H Whittaker give five kingdom system of classification. Whittaker divided all living organisms into five categories namely - Monera, Protista , Fungi, Plantae and Animalia.
• **Monera** include prokaryotic organisms. eg. E. coli, Salmonella etc.
• **Protista** include all unicellular eukaryotic organisms. eg. Euglena, Paramecium etc.
• **Fungi** include eukaryotic, non-vascular , non-motile and heterotrophic organisms like - Mucor, Agaricus, Rhizopus etc.
• **Animalia** include all multicellular eukaryotic organisms. It include members of phylum from porifera to chordata.
• **Plantae** include all multicellular eukaryotic organisms who can synthesize their food from sunlight including all plants.

99. A species with several subspecies is called a

(a) polytypic species (b) polytopic species
(c) superspecies (d) monotypic species.

AMU-1995

@apna_pdf

Ans. (a) The species which have more than one subspecies called polytypic species.
• Those species which have only one subspecies called monotypic species.

100. In which kingdom would you classify the archaea and nitrogen-fixing organism, if the five-kingdom system of classification is used:
(a) Plantae (b) Fungi
(c) Protista (d) Monera

AIPMT-2003

Ans. (d): Five kingdom system was given by R.H. Whittaker in 1969. The names of kingdom are Monera, Protista, Fungi, Planate and Animalia. The kingdom Monera is divided into the Archaebacteria and the Eubacteria. The Archaebacteria group includes primitive prokaryotes and Eubacteria group includes the nitrogen -fixing bacterium. Both Archaea and nitrogen-fixing organisms are prokaryotic in nature.
Hence, they can be placed in the kingdom Monera.

101. In five kingdom system, the main basis of classification is: -
(a) Structure of nucleus
(b) Nutrition
(c) Structure of cell wall
(d) Asexual reproduction

AIPMT-2002

Ans. (b) : Five kingdom system proposed by R.H. Whittaker in 1969. Monera, protista, fungi, plantae and animalia. The main criteria for classification used by him include cell structure, body organisation, mode of nutrition, reproduction and phylogenetic relationships.

102. Species can be identified on the basis of
(a) interbreed
(b) species diversity
(c) reproductive isolation
(d) None of the above

JIPMER-2008

Ans. (c) : A species is a group of organisms that may interbreed and produce offspring that is also capable of reproducing the same kind. Species are the lowest rank of taxonomic hierarchy and it is considered as the basic unit of taxonomy. Species can be identified on the basis of reproductive isolation.

103. The taxon which includes related species is
(a) Class (b) Order
(c) Family (d) Genus

AIIMS-2010

Ans. (d) : Genus show additional characters in common in comparison to species of other genera. Genus includes a group of related species. In the other words, genera are aggregates of closely related species. Eg. : potato and brinjal are two different species but both belong to the genus Solanum.

104. Static concept of species was put forward by:
(a) De Candolle (b) Linnaeus
(c) Theophrastus (d) Darwin

AIPMT-1988

Ans. (b) : Static concept of species was put forward by Linnaeus. According to static concept of species there is no change in the species and they do not vary in size, shape, form etc.

105. Which of the following is not true for a species?
(a) Members of a species can interbreed
(b) Variations occurs among members of a species
(c) Each species is reproductively isolated from every other species
(d) Gene flow does not occur between the populations of a species

Uttarakhand PMT-2010

Ans. (d) : Gene flow does not occurs between the population of a species is wrong statement.
• Members of a species can interbreed to produce sexually capable offspring's
• Variation occurs among members of species is proved by law of genetics.
• Each species is reproductively isolated from every other species because individual of one species can interbreed to Individual of same species to produce fertile offspring's.

106. The biological concept of species was formulated by
(a) Mayr (b) Stebbins
(c) Heywood (d) Love

Punjab MET-2007

Ans. (a) : The biological concept of species was formulated by Mayr for group members of same species organism that can interbreed to produce fertile offspring .
• Mayr's biological concept of species is mainly based on reproductive isolation.

107. Identify the correct sequence of taxonomic hierarchial arrangement in ascending order of the following
(a) Spermatophyta, Sapindales, Dicotyledons, Anacardiaceae, Mangifera
(b) Mangifera, Dicotyledons, Anacardiaceae, Spermatophyta, Sapindales
(c) Mangifera, Anacardiaceae, Sapindales, Dicotyledons, Spermatophyta
(d) Dicotyledons, Anacardiaceae, Sapindales, Spermatophyta, Mangifera

AP EAMCET-2016

Ans. (c) : Mangifera, Anacardiaceae, Sapindales Dicotyledons, Spermatophyta. The correct sequence of taxonomic hierarchial arrangement in ascending order are as follows-

Genus→	Family→	Order→	Class→	Division
⇓	⇓	⇓	⇓	⇓
Mangifera	Anacardiaceae	Sapindales	Dicotyledons	Spermatophyta

108. Select the wrong statements :
A. Lower the taxon, more are the characteristics that the members within the taxon share.
B. Order is the assemblage of genera which exhibit a few similar characters.
C. Cat and dog are included in the same family Felidae
D. Binomial nomenclature was introduced by Carolus Linnaeus.

@apna_pdf

(a) A, B and C only (b) B ,C and D only
(c) A and D only (d) C and D only
(e) B and C only

Kerala PMT-2011

Ans. (e) : In taxonomy the order is assemblage of family which show similar characters while similar characters are less in number as compared to different genera included in family.
• Cat and dog are included in different family because Cat belong to family Felidae while Dog belong to family Canidae.
Hence, option (b) and (c) both are wrong statements.

109. Identify the correct sequence of taxa in Linnaeus hierarchy:
(a) Species, genus, family, order, class
(b) Class, family, species, genus, order
(c) Species, genus, phylum, family, class
(d) Phylum, class, family, species, order

Karnataka CET-2001

Ans. (a) : Taxonomy is the science of classifying organisms. Taxa are the range from kingdom to species. According to Linnaeus the sequence of taxa are as follow → species → Genus → family → Order → Class→ Phylum → Kingdom.
Hence, option (a) is correct.

110. A species defined as "the group of actually or potentially inter-breeding natural population producing fertile offspring and reproductive isolated from other groups" The above statement is given by
(a) Carolus Linnaeus (b) Mayr
(c) J.B. Lamarck (d) Charles Darwin

CG PMT-2005

Ans. (b) : Mayr's biological concept of species is mainly based on reproductive isolation.
According to Mayr the species is the group of actually or potentially inter-breeding natural population producing fertile offspring and reproductive isolated from other groups .

111. Which is highest in the hierarchy of taxonomic category?
(a) Genus (b) Family
(c) Order (d) Class

BCECE-2015

Ans. (d) : The hierarchial order for any organism are as follows - Class is highest in the hierarchy of taxonomic category for the given question.

Kingdom
↓
Phylum
↓
Class
↓
Order
↓
Family
↓
Genus
↓
Species

112. Which taxonomic term may be suggested for any rank in the classification?
(a) Class (b) Order
(c) Species (d) Taxon

Karnataka CET-2013

Ans. (d) : According to definition of taxon "It is as a collection of one or more population of organisms".
A particular level of hierarchy in the classification of living beings is known as Taxon.

113. Which of the following is the largest taxon among plants in terms of the number of species?
(a) Algae (b) Mosses
(c) Ferns (d) Fungi

AMU-2014

Ans. (d) : Among the above option fungi is the largest taxon among plants in terms of the number of species algae 5%, mosses 5%, fern 8% but fungi have 82%. Hence option 'd' is correct

114. A group of individuals, which are able to breed among themselves and produce their own kind, is known as
(a) genus (b) species
(c) family (d) order

J&K CET-2010

Ans. (b) : A group of individuals, which are able to breed among themselves and produce their own kind is known as species eg.- sapiens is species name of Human as- *Homo sapiens* , tigrina is species name of frog as *Rana tigrina*, domestica is species name of Housefly as *Musca domestica* etc.

115. Humans belong to the family
(a) Hominidae (b) Pongidae
(c) Hylobatidae (d) Ramapithecus

J&K CET-2010

Ans. (a) : Taxonomic status of Human are as follows-
Kingdom - Animalia
Phylum - Chordata
Class - Mammalia
Order - Primata
Family - Hominidae
Genus - Homo
Species - sapiens

116. The biological definition of a species depends on
(a) The geographical distribution of two groups of organisms
(b) Reproductive isolation of two groups of organisms
(c) Anatomical and development differences between the two groups of organisms
(d) Difference in the adaptation of two groups of organisms

BCECE-2012

Ans. (b) : According to concept of species it is a group of closely related organisms that are very similar to each other and usually capable of interbreeding and producing fertile offspring. Reproductive isolation refers to the inability of relative species to breed.

@apna_pdf

117. The framework system of classification in which various taxonomic categories are arranged in order of logical sequence is called

(a) Systematics (b) Classification
(c) Hierarchy (d) Taxon

J&K CET-2011

Ans. (c) : Hierarchy is the framework system of classification in which various taxonomic categories are arranged in order.

• Hierarchy was introduced by Linnaeus. The sequence of taxa in hierarchy are as follows-

Domain
↓
Kingdom
↓
Phylum /Divison
↓
Class
↓
Order
↓
Family
↓
Genus
↓
Species

118. Which one of the following shows, the hierarchical arrangement of taxonomic categories of plants in ascending order?

(a)	(b)	(c)	(d)	(e)
Kingdom	Kingdom	Kingdom	Kingdom	Kingdom
↑	↑	↑	↑	↑
Division	Division	Division	Division	Division
↑	↑	↑	↑	↑
Class	Order	Order	Class	Family
↑	↑	↑	↑	↑
Order	Class	Class	Order	Order
↑	↑	↑	↑	↑
Family	Family	Family	Family	Class
↑	↑	↑	↑	↑
Species	Genus	Genus	Genus	Genus
↑	↑	↑	↑	↑
Genus	Species	Species	Species	Species

Kerala PMT-2014

Ans. (d) : The hierarchical arrangement of taxonomic categories of plants in ascending order are as follows

Kingdom
↑
Division
↑
Class
↑
Order
↑
Family
↑
Genus
↑
Species

119. Match the following and choose the correct combination from the options given.

Column-I (Common Name)		Column –II (Taxonomic Category-Family)	
A.	**Man**	**1.**	**Poaceae**
B.	**Datura**	**2.**	**Anacardiaceae**
C.	**Mango**	**3.**	**Solanaceae**
D.	**Wheat**	**4.**	**Hominidae**

(a) a – 4, b –3, c – 2, d – 1
(b) a – 4, b –3, c – 1, d – 2
(c) a – 1, b –2, c – 3, d – 4
(d) a – 1, b –3, c – 2, d – 4
(e) a – 3, b –4, c – 1, d – 2

Kerala PMT-2013

Ans. (a) :

	(Common name)	(Taxonomic category - family)
a.	Man	Hominidae
b.	Datura	Solanaceae
c.	Mango	Anacardiaceae
d.	Wheat	Poaceae

120. Organisms who are able to freely interbreed producing fertile offsprings and having similar blue print for making these organisms are referred to as:

(a) species (b) tribe
(c) genus (d) sub-genus

JIPMER-2015

Ans. (a) : Species represent a group of organisms. The organisms of the species can reproduce independently among themselves, and can produce fertile offspring and have a similar genetic composition.

121. Which organization publishes the Red Data Book?

(a) GEF (b) IUCN
(c) UNEP (d) WWF

NEET (Karnataka)-2013

Ans. (b) : The International Union for Conservation of Nature and Natural Resource. Publishes the Red list of threatened species, also known as the IUCN Red list or Red data book, founded in 1964 is the world's most comprehensive inventory of the global conservation status of biological species.

• Red data book is the document established by IUCN for documenting the rare and endangered species of plant, animals, fungi and also a few local species that exist within a state or country.

122. The common characteristics between tomato and potato will be maximum at the level of their

(a) Genus (b) Family
(c) Order (d) Division

NEET (Karnataka)-2013

@apna_pdf

Ans. (b) : Potato (*Solanum tuberosum*) and tomato (*Lycopersicum esculentum*) both belong to family solanaceae.
The common characteristics between tomato and potato will be maximum at the level of their family.

123. Which arrangement is in correct ascending order
(a) Species < genus < order < family
(b) Genus < species < family < order
(c) Order < family < genus < species
(d) Species < genus < family < order

AIPMT-1999

Ans. (d) : Taxonomic hierarchy refers to the sequence of taxonomic categories in definite order from higher to lower or lower to higher.
Kingdom is the highest rank and species is the lowest rank.
Correct sequence in ascending order is species, genus, family, order, class, phylum or division kingdom.

124. Practical purpose of taxonomy or classification
(a) Facilitate the identification of unknown species
(b) Explain the origin of organisms
(c) To know the evolutionary history
(d) Identification of medicinal plants

AIPMT-1999

Ans. (a) : Taxonomy help to identify the unknown species. Taxonomy is based on the classification of living organism is to facilitate identification.
Taxonomy is the science of classification of organism and include identification and nomenclature based on the description of characteristics.

125. Which of the following less general in characters as compared to genus : -
(a) Species (b) Division
(c) Class (d) Family

BHU PMT (Screening)-2010
AIPMT-2001

Ans. (a) : There are seven obligate categories-kingdom, division, class, order, family, genus and species.
- When we go higher from species to kingdom, the number of common characteristics goes on decreasing.
- Species are the smallest group among all the seven levels of taxonomy with almost similar characters.

Example: Cat *: Felis catus* etc. 'Species' is less general in characters as compared to genus.

126. Which one of the following expanded forms of the following acronyms is correct ?
(a) IUCN = International Union for Conservation of Nature and Natural Resources
(b) IPCC = International Panel for Climate Change
(c) UNEP = United Nations Environmental Policy
(d) EPA = Environmental Pollution Agency

AIPMT (Screening)-2011

Ans. (a) : IUCN → International Union for Conservation of Nature and natural resources.
- It is international organization working in the field of nature conservation and sustainable use of natural resources. It is involved in data gathering and analysis, research field and education.
- IPCC ⇒ The Intergovernmental Panel on Climate Change.
- UNEP ⇒ United Nations Environmental Programme.
- EPA ⇒ Environmental Protection Agency.

127. Which one of the following animals is correctly matched with its particular named taxonomic category ?
(a) Housefly – Musca, an order
(b) Tiger – tigris, the species
(c) Cuttlefish – Mollusca, a class
(d) Humans – Primata, the family

AIPMT (Screening)-2011

Ans. (b) : According to the taxonomic hierarchy includes eight ranks from general classification to specific classification .
Which are; Domain, Kingdom, Phylum, Class, Order, Family, Genus and Species.
- The zoological name of the tiger is *Panthera tigris tigris* being of the species classified under the genus Panthera.
  Other options – Cuttlefish belongs to class cephalopoda & phylum mollusca.
- Human belong to order primates and family Hominidae.
- Housefly is *Musca domestica,* it belongs to diptera order and musca is genus.

128. Statement (S) : Species are groups of potentially inter breeding natural populations that are isolated from other such groups.
Reason (R) : Reproductive isolation brings about distinctive morphological characters.
(a) Both statement and reason are true and reason is a correct explanation to statement
(b) Only statement is true and reason is a correct explanation to statement
(c) Both statement and reason are not true,
(d) Both statement and reason are true but reason is not the correct explanation to the statement

AP EAMCET-2005

Ans. (d) : Species are groups of interbreeding natural populations that are isolated from other groups of organisms. They belong to the same genus. Reproductive isolation or sympatric isolation brings about distinctive morphological characters.

129. Which of the following is not true for a species?
(a) Members of a species can interbreed
(b) Variations occur among members of species
(c) Each species is reproductively isolated from every other species
(d) Gene flow does not occur between the populations of a species

JIPMER-2014, 2007

@apna_pdf

Ans. (d) : Gene flow is the movement of genetic material from one to another population. Gene flow can take place through migration between two population of same species and is mediated by reproduction and vertical transfer of gene from parent to offspring. There is gene transfer between a species population. Within plant species, gene flow may occurs when pollen is carried by bees or blown by wind from one flowering plant to another of same species.

130. Identify from the following, the only taxonomic category that has a real existence.

(a) Genus (b) Species
(c) Phylum (d) Kingdom

Karnataka CET-2006

Ans. (b) : The biological species concept is proposed by Ernst Mayr in which organisms that share common character and capable of interbreeding are called species. Term species was coined by John Ray. Species is the lowest taxon in hierarchy.

131. Assertion (A) :''The Biological Species'' concept helps us to ask how species are formed.
Reason (R) : The concept of biological species focuses our attention on the question of how reproductive isolation comes about.
The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are not true.
(c) Only (A) is true but (R) is not true
(d) Both (A) and (R) are correct and (R) is a not true explanation to (A)

AP EAMCET-2009

Ans. (a) : Species is a groups of actually or potentially inter breeding natural population which are reproductively isolated from other such group.

132. Assertion (A) : An ascending taxonomic sequence of *Gossypium herbaceum* indicates its placement in progressively higher groups.
Reason (R) : Ascending taxonomic hierarchy indicates that a taxon is treated as belonging to a number of taxa.
The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A).
(c) Only (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP EAMCET-2009

Ans. (a) : *Gossypium herbaceum* (Cotton) belongs to family Malvaceae.

In taxonomic hierarchy various taxanomic categories are arranged in a proper descending order. The ascending taxonomic hierarchy shows that a taxon belongs to a number of taxa and its placement in progressively higher group.

133. The concept of genus was proposed by.

(a) John Ray (b) Tournefort
(c) Hooker (d) Bessey

AMU-2003

Ans. (b) : The concept of genus was proposed by Tournefort. But the terms like monocot, dicots, family and species was coined by John Ray.

134. Biological concept of species is mainly based on

(a) reproductive isolation
(b) morphological features only
(c) methods of reproduction only
(d) morphology and methods of reproduction

Uttarakhand PMT-2008

Ans. (a) : The Biological concept of species is based on the idea that a species is a group of organisms that can interbreed and produce viable fertile offspring. Reproductive isolation is considered as the primary factor in defining species boundaries with other factors such as morphology, and behaviors being secondary.

135. The type specimen used by the author in the original publication is known as :

(a) Lectotype (b) Isotype
(c) Holotype (d) Syntype

BVP-2006

Ans. (c) : The type specimen used by the author in the original publication is known as the holotype. The holotype is the single physical specimen eg- (a plant, animal or fossil) that is used to define and describe a new species and serve as the reference point for that species.

D. Taxonomical AIDS

136. Which taxonomic hierarchy contains organisms belonging to the same class but not to the same family?

(a) Genus
(b) Order
(c) Family
(d) Population

AP EAPCET-11.05.2023, Shift-I

Ans. (b) : Order being a higher category. It is the assemblage of families which exhibit a few similar character. In order organism belonging to the same class but not the same family.

137. Identify the Taxonomists from the group of scientists mentioned below :
Hugodevries, Endlicher, Frankel Konrat, Haeckel, de Candolle, Hanning

(a) Endlicher and de Candolle
(b) Hanning and Haeckel
(c) Frankel Konrat and Endlicher
(d) Hugodevries and Hanning

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : From the above scientist group Endlicher and de Candolle are taxonomists.

- Stephan Endlicher Austrian botanist who formulated a major system of plant classification.
- Term taxonomy was coined by A P de Candolle who was a swiss botanist.

@apna_pdf

138. Which of the following are true about the taxonomical aid 'key'?

(A) Keys are based on the similarities and dissimilarities.

(B) Key is analytical in nature.

(C) Keys are based on the contrasting characters in pair called couplet.

(D) Same key can be used for all taxonomic categories.

(E) Each statement in the key is called Lead.

Choose the most appropriate answer from the options given below:

(a) (A), (B) and (C) only
(b) (B), (C) and (D) only
(c) (A), (B), (C) and (E) only
(d) (A), (C), (D) and (E) only

NEET (Re-Exam)-04.09.2022

Ans. (c) : Taxonomical aid keys are used for identifying plants and animals based on the similarities and dissimilarities. For identification purposes, separate taxonomic keys are required for each taxonomic category such as family, genus and species.

- Each statement in the key is called **lead**.
- The keys are based on the contrasting characters generally in a pair called **couplet**.

139. Read the following statements regarding biological museums

(i) Biological museums are generally set up in educational institutes such as schools and colleges

(ii) Museums have collections of preserved plant and animal specimens for study and reference

(iii) Specimens are preserved in the containers or jars in preservative solutions

(iv) Insects are preserved insect boxes after collecting, killing and paining

(v) Larger animals like birds and mammals are stuffed and preserved

(vi) Skeletons of mammals are not allowed to be kept in museums.

Which of the above statement is/are not correct?

(a) (ii) & (iii) only (b) (i) & (vi) only
(c) (v) only (d) (vi) only

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : For research and reference, museums have collections of preserved plant and animal species. The containers or jars contain preservation solutions that preserve the specimens. Insects are collected, killed and pinched before being kept in insect boxes. Larger creatures, such as birds and mammals are frequently preserved and stuffed. Animal skeleton collections are frequently found in museums.
Except statement (vi) all the given statements are correct regarding biological museums.

140. The taxonomical aid used for identification of organisms based both similarities and differences is

(a) Herbarium (b) Key
(c) Museum (d) Flora

AP EAMCET-25.09.2020 Shift-II
Kerala PMT-2012

Ans. (b) : Key is another taxonomical aid used for identification of plants and animals based on the similarities and dissimilarities.

•Keys are based on the contrasting character generally in a pair called couplet. Each statement in the key is called a lead. Keys are generally analytical in nature.

141. Assertion (A) : Herbariums are plant repositories which are used as reference specimens. Recently these are digitalized for global use.

Reason (R): Herbarium helps in the classification of plants and gives complete description about the taxonomy.

The correct answer is:

(a) Both (A) and (R) are true, (R) is the correct explanation of (A).
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A).
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Herbarium is a store house of collected plant specimens that are dried and pressed and finally preserved on sheets, known as herbarium sheet. They are arranged in according to a phylogenetic system of classification to give an idea about the evolution of families. Recently these are also digitalized for global access.

142. The contrasting characteristics generally in a pair used for identification of animals in Taxonomic Key are referred to as :

(a) Alternate (b) Lead
(c) Couplet (d) Doublet

NEET (Odisha)-2019

Ans. (c) : The contrasting characters in a key which are generally in a pair is called couplet. It represents the choice made between two opposite options, which results in acceptance of only one and rejection of the other. Each statement in the key is called a lead.

143. Lac is used in the manufacture of following products EXCEPT

(a) Toys (b) Polish
(c) Isinglass (d) Ink

MHT CET-2018

Ans. (c) : Lac and isinglass's are two different substance that obtained from different sources and used for different purposes. Lac is used in the manufacture of toy, polis, inks etc.

• The isinglass is product of fisheries i.e. used for centuries as a fining, or clearfying agent, in alcoholic beverages.

@apna_pdf

144. Match the items given in Column I with those in Column II and select the correct option given below:

	Column I		Column II
(A)	**Herbarium**	**(i)**	**It is a place having a collection of preserved plants and animals**
(B)	**Key**	**(ii)**	**A list that enumerates methodically all the species found in an area with brief description aiding identification**
(C)	**Museum**	**(iii)**	**Is a place where dried and pressed plant specimens mounted on sheets are kept**
(D)	**Catalogue**	**(iv)**	**A booklet containing a list of characters and their alternates which are helpful in identification of various taxa.**

	A	B	C	D
(a)	(i)	(iv)	(iii)	(ii)
(b)	(iii)	(ii)	(i)	(iv)
(c)	(iii)	(iv)	(i)	(ii)
(d)	(ii)	(iv)	(iii)	(i)

NEET-2018

Ans. (c) :

(A)	Herbarium	Is a place where dried and pressed plant specimens mounted on sheets are kept
(B)	Key	A booklet containing a list of characters and their alternates which are helpful in identification of various taxa.
(C)	Museum	It is a place having a collection of preserved plants and animals
(D)	Catalogue	A list that enumerates methodically all the species found in an area with brief description aiding identification

145. Assertion (A): Species is the lowest taxonomic category in the hierarchical arrangement and shows distinguishing characters from one species from other closely related species based on several phenotypic characters. However, as we go higher from species to kingdom the number of common characters goes on decreasing.
Reason (R): All plants come under the highest category called kingdom, plantae, which has two major classes dicotyledonae and monocotyledonae.
Which of the following is true?
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) (A) is true, but (R) is false
(c) (A) and (R) are false
(d) Both (A) and (R) are true, but (R) is not the correct explanation of (A)

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : In the assertion there are discussion of various aspect of species but Reason discuss about major category of plant. However, both assertion and reason are separately correct but they discuss about separate aspects. So, reason is not the correct explanation of Assertion.

146. Taxonomic key is one of the taxonomic tools in the identification and classification of plants and animals. It is used in the preparation of
(a) Monographs (b) Flora
(c) Both (a) and (b) (d) None of these

JIPMER-2017

Ans. (c) : The taxonomic keys are used in preparation of both monographs and flora.
Monograph have detailed information of one taxon that may be family, genus, order, class, kingdom, species, etc.- while flora represents the naturally occurring plants in a particular time or region.

147. Scientific names of plants are based on principles criteria agreed by and are given in
(a) IUCN (b) ICZN
(c) ICBN (d) ICPN

J&K CET-2014

Ans. (c) : The naming of plants are according to the rule of ICBN after its establishment. The ICBN only deals and control to the naming of plants but does not do any work on taxonomy. It has three departments. Namely, principles, rules and provisions for the governance of the code.
ICBN- International Code for Botanical Nomenclature.
IUCN- International Union for Conservation of Nature and Natural resources. It is an international organisation working in the field of nature Conservation and sustainable use of natural resources.
ICZN-International Code of Zoological Nomenclature.
ICPN– International Certificate in Pediatric Nutrition.

148. Who is regarded as the Father of Taxonomy?
(a) John Ray (b) Carolus Linnaeus
(c) AP de Candolle (d) Charles Darwin

WB JEE-2012
Rajasthan PMT-1995

Ans. (b) : Carolus Linnaeus- Father of taxonomy
• John Ray- Coined the term "species".
• AP de Candolle- coined the term "Taxonomy "
• Charles Darwin- Theory of Biological evolution by natural selection.

149. Herbarium sheets are arranged according to the system of classification and should have information about
(a) time and place of collection, English, local and botanical names, phylum, collectors name
(b) date and time of collection, English, local and botanical names, class, collectors name

@apna_pdf

(c) date and place of collection, English, local and botanical names, order, collectors name
(d) date and place of collection, English, local and botanical names, family, collectors name

J&K CET-2014

Ans. (d) : Herbarium sheets are arranged according to the system of classification and should have information about- Date and place of Collection, English, Local and botanical name, family, Collectors name.

150. Study the following statements regarding to the preparation of herbarium sheets. (I) Plants should be collected in flowering stage. (II) Every detail regarding the plant such as locality, ecological conditions vegetative and floral characters, etc should be noted. (III) Plants are evenly pressed by unfolding all the plants parts between blotting papers (or newspapers) with the help of plant presser. (IV) Blotting paper need not to be changed until plants get dried. (V) After drying, the plants specimen is carefully mounted/pasted on the herbarium sheets. (VI) The herbarium sheet is labelled on the lower right hand corner representing the number of plant specimen, date of collection, etc. Which of the above statement (s) is not correct?

(a) Only I (b) Only IV
(c) I and IV (d) III and IV

Manipal-2015

Ans. (b) : Herbarium is a store house of collected plant specimens that are dried, pressed and preserved on sheets. The herbarium sheets also carry a label founding information about date and place of Collection English, local and botanical names, family, Collectors name. Herbarium also serves as quick referral system in taxonomical studies.

151. Study of preservation of dead organism in liquid by chemical method is called:

(a) Dermatology (b) Urobiology
(c) Chondrobiology (d) Cryobiology

JIPMER-1995

Ans. (b) : Study of preservation of dead organism in liquid by chemical method is called - Urobiology.
Study of skin - Dermatology
The study of the effects of freezing and low temperature on living organism →Cryobiology
Study of Cartilage → Chondrobiology.

152. The Imperial Forest Research Institute (IFRI) established in 1906 changed its name to

(a) IARI (b) FRI
(c) CDRI (d) CSIR

CMC Ludhiana-2014

Ans. (b) : The Imperial Forest Research institute (IFRI) established in 1906 changed its name to FRI. It is now known as the forest research institute, and it is a leading forestry research institution in India. It is part of the Indian council of forestry research and education.
Forest Research Institute and taught the forest system known as scientific forestry.

153. What is the correct sequence of Man, taxonomically starting from super-family to sub-family ?

(a) Hominoidea, Hominidae, Homininae
(b) Homininae, Hominoidea, Hominidae
(c) Hominidae, Homininae, Hominoidea
(d) Hominoidea, Homininae, Hominidae

TS EAMCET-2015

Ans. (a) : The taxonomic position of man is as follow-
Order - Primates
Suborder - Antheropidea
Super family - Hominoidea
Family - Hominidae
Sub family - Homininae

- Hominoidea is a branch of old world tall-less simians which is native to Africa and Southeast Asia.
- Group members of Hominidae are known as great apes.
- Homininae is a subfamily of Hominidae which includes, gorillas, chimpanzees and humans.

154. Which one of the taxonomic aids can give comprehensive account of complete compiled information of any genus or family at a particular time ?

(a) Taxonomic Key (b) Flora
(c) Herbarium (d) Monograph
(e) Dictionary

Kerala PMT-2009

Ans. (d) : A monograph provides a detailed written study of the organism. It is a comprehensive taxonomic aid of a taxonomic group, generally a genus or a family, providing all taxonomic data relating to group.

- **Herbarium-** Herbarium is a store house of collected plant specimens that are dried, pressed and preserved an sheets. These sheets are arranged according to a universally accepted system of classification.
- **Key-** Key is another taxonomical aid used for identification of plants and animals based on the similarities and dissimilarities.

155. The label of a herbarium sheet does not carry information on

(a) date of collection (b) name of collector
(c) local names (d) height of the plant

NEET-2016 Phase-II

Ans. (d) : It is a collection of preserved plant specimens that are organized, labeled and stored in a way that makes them easier to find. You can consider it a library of dried plant which is utilized for both schooling and exploration. It does not carry information on plant height. When specimens are collected in the field, the herbarium and associated information in the library are used to identify the specimens, to determine how one species differs from another, or whether a specimen represents a species new to science.

156. Which one of the following is not a correct statements?

(a) Key is taxonomic aid for identification of specimens
(b) Herbarium houses dried, pressed and preserved plant specimens

@apna_pdf

(c) Botanical gardens have collection of living plants for reference
(d) A museum has collection of photographs of plants and animals

NEET-2013

Ans. (d) : Museums have collections of preserved plant and animal specimens for study and reference. Specimens are preserved in the containers or Jars in preservative solutions. Plant and animal specimens may also be preserved as dry specimens. A museum has not collection of photographs of plants and animals. Key consists of a contrasting character called couplet.

157. One of the most important function of botanical gardens is that–
(a) one can observe tropical plant there
(b) they allow ex situ conservation of germplasm
(c) they provide the natural habitat for wildlife
(d) they provide a beautiful area for recreation

Uttarakhand PMT-2010
JIPMER-2007

Ans. (b) : Botanical garden function as ex-situ conservation of germplasm of different plants. It is a technique of conservation of biological diversity outside natural habitats.

158. The pesticide that is used in the preparation of herbarium is
(a) 2, 4 dichlorophenoxy acetic acid
(b) NAA
(c) mercuric chloride
(d) carbon disulphide

J&K CET-2010

Ans. (c) : The herbarium is the place where collection of dried plants parts are arranged in a systemic manner and where information about the plant printed. Mercuric chloride is a antifungal pesticides, and they are used in herbarium, after pasting the herbarium sheets the specimen gets sprayed.

159. A major break through in the studies of cells came with the development of electron microscope. This is because
(a) the resolution power of the electron microscope is much higher than that of the light microscope
(b) the resolving power of the electron microscope is 200 – 350 nm as compared to 0.1 – 0.2 nm for the light microscope
(c) electron beam can pass through thick materials, whereas light microscopy requires thin sections
(d) the electron microscope is more powerful than the light microscope as it uses a beam of electrons which has wavelength much longer than that of photons

BCECE-2013

Ans. (a) : A beam of electrons with a wavelength substantially greater than that of photons is used in an electron microscope.
The electron microscope has a higher magnification power than a light microscope.

160. Which of the following statement(s) about taxonomical aids is/are true?
I. Keys are used to identify plants and animals based on similarities and dissimilarities
II. Flora contains the account of habitat and distribution of plants in a given area
III. Flora provide an index to the plant species found in a particular area
IV. Monographs provide information for identifying the species found in an area
(a) I and II only (b) I, II and III only
(c) I and IV only (d) I only
(e) IV only

Kerala PMT-2014

Ans. (b) : Monographs contain information on any one taxon. It can not be used for identification purpose.
A monograph is a systematic detailed study of a particular organism or its taxonomic group.
Hence, correct statements are I, II, and III only.

161. A student wishes to study the cell structure under a light microscope having 10X eyepiece and 45X objective. He should illuminate the object by which one of the following colours of light so as to get the best possible resolution?
(a) Yellow (b) Green
(c) Blue (d) Red

JIPMER-2007

Ans. (c) : Wavelength of light is inversely proportional to the resolution power of microscope.

$$E \propto F \propto \frac{1}{\lambda} \propto R.P$$

$$\underrightarrow{VIBGYOR}$$

Red light $\Rightarrow$ Wavelength maximum, Resolution Power minimum.
Violet light $\Rightarrow$ Wavelength minimum, Resolution Power maximum.

162. A collection of plants and seeds having diverse alleles of all the genes of a crop is called :
(a) Genome (b) Herbarium
(c) Germplasm (d) Gene library

AIPMT (Screening)-2011

Ans. (c) : The entire collection of plants/seed having all the diverse alleles for all the genes in a given crop is called germplasm collection.

- A herbarium is a museum of preserved plants for botanical research, mainly in identification and classification of plants. Ex- Royal Botanical Garden (England).
- Gene library is a large collection of DNA fragment cloned from given organism, tissue, organ and cell type.
- The genome is the entire set of DNA instructions found in a cell.

@apna_pdf

163. Match the following lists

List-I		List-II	
A.	**Pollen basket**	**1.**	**Butterfly**
B.	**Pseudotracheae**	**2.**	***Laccifer lacca***
C.	**Shellac**	**3.**	**Mosquito**
D.	**Dutton's membrane**	**4.**	**Musca**
E.	**Well developed galea**	**5.**	**Worker bee**

The correct set is

	A	B	C	D	E
(a)	5	4	2	3	1
(b)	4	5	3	2	1
(c)	1	5	3	4	2
(d)	3	2	4	5	1

AP EAMCET-2008

Ans. (a) : The tibia of hind legs of the worker bee carry a special apparatus called pollen basket or corbiculae.

- Housefly genus Musca have food channels on the surface of labella. These are called pseudotracheae.
- Shellac is bleached lac which is melted and moulded into rods, flakes or sheets. Lac are the products of *Laccifer lacca*.
- Dutton's membrane is a covering in the area between mosquito extended tongue and base of lamellae.
- Well developed galea is present in the butterfly.

164. Science, which deals with the study of ageing is knows as

(a) Teratology (b) Gerontology
(c) Limnology (d) Palaeontology

CG PMT-2009

Ans. (b) : Science which deals with the study of ageing is known as **Gerontology**. It is concerned with the physiological, psychological and social changes that occurs in individuals as the age increases and the impact of these changes on their overall health and well being.

Paleontology — The study of fossils.

Teratology — The study of abnormal fetal development.

Limnology — The study of inland aquatic ecosystems.

165. The study of relationship between size and shape is called

(a) allopatric (b) allelopathy
(c) allometry (d) allogamy

Uttarakhand PMT-2008

Ans. (c) : Allometry is the study of the relationship between the size of an organism or one of its parts and some other trait or charactersties such as metabolic rate, growth rate.

Allopatric — Occurring in different geographic areas or in isolation.

Allelopathy — The suppression of growth of one plant species by another due to the release of toxic substances.

Allogamy— Reproducing by cross fertilization.

166. Which national institute encourages the publication of flora of different regions of India?

(a) IARI (b) NBRI
(c) BSI (d) FRI

AP EAMCET-2001

Ans. (c) : B.S.I (Botanical Survey of India) is the national institute responsible for promoting the study conservation and sustainable utilization of India's flora. It was established in 1890 and operate under ministry of environment and Forest and Climate change, Government of India.

IARI — Indian Agriculture Research Institute. It is situated in New Delhi.

NBRI — National Botanical research institute. It is situated in Lucknow.

FRI — Forest Research Institute. It is situated in Dehradun, Uttrakhand.

167. Which one is a vital stain?

(a) methylene blue (b) janus green
(c) neutral red (d) All of these

Haryana PMT-2011

Ans. (d) : Vital stains is a technique in which stain are used on living cells without killing them.

Methylene blue, Janus green and neutral red are all examples of vital stain.

(i) Methylene blue- stain for nuclei of cells

(ii) Janus green stain living cells, particularly the mitochondria of cell.

(iii) Neutral red - It can be used for staining of nerve cell for microscopy and detection of viable cells in tissue culture.

168. Study the following lists.

List-I	List-II
(A) Training in landscaping	**1. BSI**
(B) Establishment of Mycological herbarium	**2. CIMAP**
(C) Research on paper pulp	**3. FRI**
(D) Introduction of Salvia into India	**4. IARI**
	5. NBRI

	A	B	C	D
(a)	3	1	4	5
(b)	5	4	1	3
(c)	5	3	1	4
(d)	5	4	3	2

AP EAMCET-2010, 2008

Ans. (d) :
1. BSI - Practice and Specification cover management and technical subject.
2. CIMAP - Introduction of Salvia into India.
3. FRI - Research on paper pulp.
4. IARI - Establishment of Mycological herbarium.
5. NBRI - Training in Landscaping.

169. Who invented electron microscope?

(a) Janssen (b) Edison
(c) Knoll and Ruska (d) Landsteiner

AIIMS-2010
DUMET-2002
Rajasthan PMT-2001

@apna_pdf

Ans. (c) : The first prototype of the electron microscope was invented by **Ernst Ruska** a physicist and the **Max Knoll (1932)**.

- It was efficient to magnify up to four hundred power magnification and was the first apparatus to demonstrate principles of electron microscopy practically.
- The magnification of an electron microscope is more than 10,000 greater than that of a light microscope.

170. The international unit used in biology to measure size of objects is

(a) μ m (micrometer) (b) nm (nanometer)
(c) Å (angstrom) (d) All are used

CMC Vellore-2012

Ans. (b) : The international unit used in biology to measure the size of objects is the metric system. The basic unit is the meter, other unit of length that are some time used in biology nanometers, picometers, angstrom - which are even smaller unit of measurement.

171. The crystal of lead zirconate is a key component of

(a) Sonography
(b) Electrocardiography
(c) Electroencephalography
(d) Magnetoencephalography

WB JEE-2007

Ans. (a) : The crystal of lead zerconate is key component in medical ultrasound imaging, which is a type of diagnostic imaging technique that uses high frequency sound waves to create image of internal organs and tissue in the body is called sonography.
Electrocardiography – The process of producing an electrocardiogram, a recording of the heart's electrical activity through repeated cardiac cycle.
Electroencephalography – It is a test of measures the magnetic fields your brain's electrical current produce.

172. What kind of microscopy uses acridine orange?

(a) Phase contrast
(b) Fluorescence
(c) Transmission microscope
(d) Scanning electron microscope

BCECE-2015

Ans. (b) : Acridine orange is a Fluorescence dye that can be used in various type of microscopy, including fluorescence microscope and confocal microscopy.

173. The following is generally used for creating density gradient during centrifugation:

(a) NaCl (b) KCl
(c) CsCl (d) $MgCl_2$

BCECE-2015

Ans. (c) : Cesium chloride (CsCl) is commonly used for creating density gradient during centrifugation. CsCl are often used in biochemistry and molecular biology to isolate and purify nucleic acid, such as DNA and RNA based on their buoyant density.

174. The biggest herbarium of India is situated in:

(a) Dehradun (b) Lucknow
(c) Delhi (d) Calcutta

Rajasthan PMT-1996, 1995

Ans. (d) : The biggest herbarium of India is situated in Calcutta and is known as Botanical Survey of India. (BSI). It is one of the oldest institution in the world that deals with the study of plants and thus classification.

E. Binomial Nomenclature

175. Binomial system of nomenclature was given by

(a) Linnaeus (b) Theophrastus
(c) Hooker (d) Bentham

Karnataka CET-2022
Tripura JEE-2021, 2017
AP EAMCET-05.10.2021 Shift-I
MHT CET 5.10.2020 Shift-I
VMMC-2012
UP CPMT-2012, 2008
AFMC-2010
CMC Vellore-2010
J&K CET-2010, 2000
AMU-2009, 2003
Rajasthan PMT-2008, 2003, 1998
Punjab MET-2008, 1999
BHU-PMT (Screening)-2008, 2006
MGIMS Wardha-2008
CG PMT-2008
DUMET-2004
Manipal-2002
AIIMS-2000

Ans. (a) : Binomial system of nomenclature was given by Carolus Linnaeus.
According to Binomial nomenclature system each organism has a name with two components (i) the Generic name (ii) the specific epithet. This system providing a name with two components is called Binomial nomenclature.

176. The usage of binomial names, for plant species, was accepted by all after the publication of the works by:

(a) Hooker (b) Linnaeus
(c) Bentham (d) Darwin

MGIMS Wardha-2010
CMC Vellore-2008
WB JEE-2006
AMU-2006
AP EAMCET-1997

Ans. (b) : A swedish naturalist Carolus Linnaeus for the first time introduced the hierarchy system both in plants and animals. He wrote a book, **Systema Naturae**, (1735) in 12 editions. He propagated "binomial nomenclature" for all species in 10^{th} edition of his book Published in 1758.
• Therefore the book - **" Systema Naturae"** is known as the dictionary of Classification and Linnaeus as father of binomial nomenclature and founder of Modern taxonomy.

177. ICBN stands for :

(a) Indian Code of Botanical Nomenclature
(b) Indian Congress of Biological Names
(c) International Code for Botanical Nomenclature
(d) International Congress of Biological Names

AMU-2014
AIPMT-2007
BVP-2004
DUMET-2003

@apna_pdf

Ans. (c) : The International Code for Botanical Nomenclature (ICBN) is a set of rules and recommendations dealing with the formal botanical names given to plant. The foundations of ICBN are given in book written by C. Linnaeus named **"Philosophia Botanica".**

178. Match the following plants with their Botanical names

Column-I		Column-II	
A.	Meadow Saffron	1.	Yucca gloriosa
B.	Red Dragon	2.	Smilax zeylanica
C.	Sarasaparilla	3.	Dracaena anguistifolia
D.	Spanish Dagger	4.	Colchicum autumnale

(a) A-2, B-3, C-4, D-1
(b) A-2, B-1, C-3, D-4
(c) A-4, B-3, C-2, D-1
(d) A-4, B-2, C-1, D-3

AP EAPCET-11.05.2023, Shift-II

Ans. (c) :
Meadow Saffron – *Colchicum autumnale*
Red Dragon – *Dracaena anguistifolia*
Sarasaparilla – *Smilax zeylanica*
Spanish Dagger – *Yucca gloriosa*

179. 'X' and 'Y' are the components of Binomial nomenclature. This naming system was proposed by 'Z':

(a) X-Specific epithet, Y-Generic name, Z-Carolus Linnaeus
(b) X-Generic name, Y-Specific epithet, Z-R.H. Whittaker
(c) X-Generic name, Y-Specific epithet, Z-Carolus Linnaeus
(d) X-Specific epithet, Y-Generic name, Z-R.H. Whittaker

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (c) : The system binomial nomenclature is given by Carolus Linnaeus. Every organism is given a scientific name that consists of two components. The first word belongs to generic name and second word is known as the specific epithet.
■ So, the correct answer is X- Generic name, Y – specific epithet, Z- Carolus Linnaeus.

180. Identify the wrong statement regarding ICBN

(a) Scientific names of plants should be printed in Italics
(b) The first word represents the genus and second word represents species
(c) When hand written, scientific names are separately underlined
(d) Genus names starts with small letter and species name starts with capital letter

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : ICBN stands for International Code of Botanical Nomenclature.
ICBN is the collection of rules of scientific nomenclature of plant and was first proposed by Sprague, Hitchcock, Green (1930) but was accepted in 1961.
According to ICBN, biological name consists of two word Genus names starts with capital letter and species names start with small letter.
• Hand written scientific name are separately underlined.

181. Assertion (A): Naja naja is a tautonym.
Reason (R) : Animals in which generic name and species name are the same.
The correct option among the following is

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-30.07.2022 Shift-II

Ans. (a) : The scientific name of species in which both parts of the genus and species name containing a similar spelling is known as tautonym.
• In tautonym both genus and species name have same spelling.
• Eg - Naja naja (for king cobra/nag)
• Gulo gulo (for wolverine)
• Alces alces (for moose)
• Vulpes vulpes (for red fox)

182. ICZN is ————

(a) International centre of Zoological Nomenclature
(b) International code of Zygote Nomenclature
(c) International code of Zoological Nomenclature
(d) International centre of Zygote Nomenclature

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : ICZN stands for International Code of Zoological nomenclature (ICZN).
It ensures that scientific name assigned to any animal has only one name and will be recognized by that name all over the world. The headquarters of ICZN is situated at Singapore.

183. The third name in trinomial nomenclature is_____

(a) Subgenus (b) Species
(c) Ecotype (d) Sub species

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : The third name in trinomial nomenclature is known as - sub species.
• In trinomial nomenclature name completed in three part -
First part - genus
Second part - species
Third part - subspecies
Eg- Scientific name of Human in trinomial nomenclature is - *Homo sapiens sapiens* in which Homo belongs to genus and first sapiens denotes species and second sapiens denotes subspecies .

@apna_pdf

184. In Binomial nomenclature, the name of the author _____.

(a) Is printed in the beginning of the biological name
(b) It is written in an abbreviated form
(c) Refers to that the genus was first described by him
(d) Printed in italics

AP EAMCET-25.09.2020 Shift-II

Ans. (b) : In Binomial nomenclature the name of the author is written in an abbreviated form at the end of the biological name. Eg. *Mangifera indica* Linn. It indicates that the species was first described by Linnaeus.

185. Match the following lists:

	List-I		List-II
A	Gaspard Bauhin	i	Crystallization of the enzyme urease
B	Sexual reproduction in plants	ii	Robert Hooke
C	J.B. Sumner	iii	Camerarius
D	Micrographia	iv	Introduced binomial nomenclature

The correct match is:

	(A)	(B)	(C)	(D)
(a)	iv	ii	iii	i
(b)	i	iii	iv	ii
(c)	iii	iv	ii	i
(d)	iv	iii	i	ii

TS EAMCET-09.05.2019 Shift-I

Ans. (d) :

	List - I	List - II
(A)	Gaspard Bauhin	Introduced binomial nomenclature
(B)	Sexual reproduction	Camerarius
(C)	J.B Sumner	Crystallization of the enzyme urease
(D)	Micrographia	Robert Hooke

186. Select the correctly written scientific name of Mango which was first described by Carolus Linnaeus

(a) Mangifera indica Linn.
(b) Mangifera indica
(c) Mangifera indica
(d) Mangifera indica Car. Linn.

NEET-2019

Ans. (a) : According to rules of binomial nomenclature, the name of an organism contain a generic and specific name.
So the correctly written scientific name of mango is *Mangifera indica* Linn.

187. Which of the following is against the rules of ICBN?

(a) Generic and specific names should be written starting with small letters.
(b) Hand written scientific names should be underlined.
(c) Every species should have a generic name and a specific epithet.
(d) Scientific names are in Latin and should be italized.

NEET (Odisha)-2019

Ans. (a) : ICBN wrote the important rules and guidelines for scientific names –

- All the scientific names of organisms are usually latin hence, they are written in italics
- The scientific name exist two parts of a name. 1) Generic name 2) specific epithet.
- When the names are handwritten, they are underlined or italized if typed. This is done to specify its Latin origin.
- The name of the genus starts with a capital letter and the name of the species starts with a small letter.

Ex- The scientific name of humans are presented as Homo sapiens. 'Homo' represents the genus name and 'sapiens' represents the species name.

188. Match the following lists :

List-I	List-II
(A) C.G.K. Ramanujam	(i) Historia plantarum
(B) Sutton and Boveri	(ii) palynology
(C) Theophrastus	(iii) sexual system of classification
(D) Carolus Von Linnaeus	(iv) sexual reproduction in plants
	(v) chromosome theory of inheritance

The correct answer is

	A	B	C	D
(a)	(i)	(ii)	(iii)	(iv)
(b)	(ii)	(v)	(i)	(iv)
(c)	(ii)	(v)	(iii)	(i)
(d)	(ii)	(v)	(i)	(iii)

TS EAMCET-02.05.2018 Shift-II

Ans. (d) :

	List – I	List - II
a.	C.G.K Ramanujan	Palynology
b.	Sutton and Boveri	Chromosome theory of inheritance
c.	Theophrastus	Historia plantarum
d.	Carolus Von Linnaeus	Sexual system of classification

189. Match the following species with their scientific name:

List -I		List-II	
(A)	The black buck	(i)	Ailurus ochraceus
(B)	Pygmy hog	(ii)	Antilope cervicapra
(C)	Kashmir stag	(iii)	Sus salvanius
(D)	Red Panda	(iv)	Cervus elaphus hanglu

@apna_pdf

The correct answer is

	(A)	(B)	(C)	(D)
(a)	(i)	(ii)	(iii)	(iv)
(b)	(ii)	(iii)	(iv)	(i)
(c)	(iii)	(i)	(ii)	(iv)
(d)	(iv)	(iii)	(ii)	(i)

TS EAMCET-03.05.2018 Shift-I

Ans. (b) :

	List - I	List - II
(A)	The black buck	Antilope cervicapra
(B)	Pygmy hog	Sus salvanius
(C)	Kashmir stag	Cervus elaphus hanglu
(D)	Red Panda	Ailurus ochraceus

190. Match the following :

List–I		List–II	
(A)	**Gaspard Bauhin**	**I.**	**Bacterial cell**
(B)	**Robert Hooke**	**II.**	**Bionomial nomenclature**
(C)	**Anton Van Leeuwenhoek**	**III.**	**Sexual reproduction in plants**
(D)	**Camerarius**	**IV.**	**Micrographia**

The correct answer is

Options:

	(A)	(B)	(C)	(D)
(a)	II	IV	I	III
(b)	II	IV	III	I
(c)	II	I	IV	III
(d)	III	I	IV	II

AP EAMCET-28.04.2017 Shift-II

Ans. (a) : Gaspard Bauhin introduced a scientific binomial system of classification to both anatomy and botany. In 1665 Robert Hook published his most famous book micrographia.

Anton von Leeuwenhoek is father of microbiology . He discovered both protists and bacteria. The discovery of sexual reproduction in plants is usually credited to Camerarius.

191. Match the following lists

List - I	List - II
(A) Diptera	**(I) *Homo sapiens***
(B) Poales	**(II) *Mangifera indica***
(C) Sapindales	**(III) *Musca domestica***
(D) Primata	**(IV) *Triticum aestium***

	A	B	C	D
(a)	III	I	IV	II
(b)	II	III	I	IV
(c)	III	IV	II	I
(d)	IV	II	III	I

TS EAMCET-12.05.2017
JIPMER-2013

Ans. (c) :

List-I		List-II
(A) Diptera	-	*Musca domestica*
(B) Poales	-	*Triticum aestium*
(C) Sapindales	-	*Mangifera indica*
(D) Primata	-	*Homo sapiens*

192. The binomial system of nomenclature now followed universally, was first proposed by

(a) Aristotle (b) Carolus Linnaeus
(c) G. Simpson (d) E. Mayr

Tripura JEE-2017
AMU-1995

Ans. (b) : Swedish botanist Carl Linnaeus is regarded as father of taxonomy. Linnaeus developed a ranked system known as Linnaean taxonomy for categorizing living organism and also give binomial nomenclature for naming organism.

193. Tautonym is

(a) unscientific explanation of a phenomenon
(b) common name used as scientific name
(c) non-latinised name
(d) same name for genus and species

CMC Ludhiana-2012
Haryana PMT-2003

Ans. (d) : Tautonym is a Scientific name in which the same word is used for both genus and species. For example: Bison is the scientific name of American Bison. Here both the Generic name and specific name is Bison. Naja-naja is the famous example of tautonyms.

194. Which of the following is the scientific or botanical name of Asafoetida (Hing)?

(a) *Curcuma longa* (b) *Curcuma amada*
(c) *Alpinia galanga* (d) None of these

MGIMS Wardha-2013

Ans. (d) : Botanical name of Asafoetida (Hing)- *Ferula asafoetida* Linn.
(a) *Curcuma longa*- turmeric (Haldi)
(b) *Curcuma amada* - Ginger
(c) *Alpinia galanga*- Galangal (Thai ginger)

195. Which of the following statements regarding universal rules of nomenclature is wrong?

(a) The first word denoting the genus starts with a capital letter
(b) The first word in a biological name represents the genus
(c) Biological names are generally in Greek and written in italics
(d) Both the words in a biological name, were hand-written, are separately underlined

MGIMS Wardha-2013

Ans. (c) : Universal rule of nomenclature are as follow-
(i) Biological names are generally in latin and written in italics. They are latinised or derived from Latin irrespective of their origin.
(ii) The first word in a biological name represents, the genus while the second word denotes the specific epithet.
(iii) Both the words in a biological name, were handwritten are separately underlined or printed in italics to indicate their Latin origin.
(iv) The first word denoting the genus start with Capital letter while the specific epithet start with a small letter. It can be illustrated with the example of *Mangifera indica* (mango).

@apna_pdf

196. The scientific name of Asian tiger mosquito
(a) *Aedes aegypti*
(b) *Aedes albopictus*
(c) *Aedes taeniorhynchus*
(d) *Aedes albolineatus*

WB JEE-2009

Ans. (b) : The Asian tiger mosquito *(Aedes albopictus)* is small black and white mosquito.
Aedes aegypti, the yellow fever mosquito is a mosquito that can spread dengue fever, chikungunya , zika fever, yellow fever viruses and other disease agents.

197. Scientific name of sunflower is
(a) *Hibiscus rosa sinensis*
(b) *Solanum nigrum*
(c) *Oryza sativa*
(d) *Helianthus annuus*

WB JEE-2009

Ans. (d) : Scientific or botanical name of Sunflower is - *Helianthus annuus*
Family → Compositae.
Hibiscus rosa sinensis- China rose
Family → Malvaceae
Solanum nigrum- Black berry nightshade
Family - Solanaceae

198. The zoological name of North Indian hare is
(a) *Oryctolagus cuniculus*
(b) *Lepus rufi caudatus*
(c) *Lepus nigricollis*
(d) *Sorex araneus*

UP CPMT-2004

Ans. (c) : The zoological name of North Indian hare is - *Lepus nigricollis*
(a) *Oryctolagus cuniculus*- European rabbit
(b) *Lepus rufi caudatus* is an incomplete scientific name.
(d) *Sorex araneus*- common shrew

199. Which is a social foresting species ?
(a) *Leucaena leucocephala*
(b) *Tectona grandis*
(c) *Mangifera indica*
(d) *Rosa indica*

Punjab MET-1999

Ans. (a) : *Leucaena leucocephala* (Sebabul) is a species that lives in social forests and serves a variety of purposes, such as producing green manure, biomass, food for people, and pulpwood for the paper industry.

200. Botanical name of Chili is:
(a) *Solanum melongena*
(b) *Lycopercicum esculentum*
(c) *Capsicum annuum*
(d) None of the above

Rajasthan PMT-1996

Ans. (c) : Botanical name of chili is - *Capsicum annuum*
Family - Solanaceae
Chillies belong to the flowering plants there are almost 27 species that have been identified under this genus each of the member are varied with respect to size, shape and colour.

201. The botanical name of cauliflower is
(a) Brassica oleracea var. capitata
(b) Brassica oleracea var. botrytis
(c) Brassica oleracea var. gongylodis
(d) Brassica oleracea

AMU -2000

Ans. (b) : The botanical name of cauliflower is Brassica oleracea var. botrytis and it belongs to the Family brassicaceae.

202. In zoological nomenclature the sub-species is represented by
(a) trinomen (b) binomen
(c) uninomen (d) none of these

AP EAMCET-2001
AMU-1999
JIPMER-1997

Ans. (a) : In zoological nomenclature the sub-species is represented by - trinomial nomenclature or trinomen.

203. Scientific name of king cobra is :
(a) *Naja naja* (b) *Bungarus caeruleus*
(c) *Naja hannah* (d) *Viper russelli*

J&K CET-2006

Ans. (c) : Scientific name of king cobra is - *Naja hannah* (*Ophiophagus hannah*) large venomous snake native to Asia.
- *Naja naja*-Indian cobra
- *Bungarus caeruleus* - common krait
- *Viper russelli*- viper

204. Zoological name of common Indian krait is
(a) *Bungarus caeruleus*
(b) *Ophiophagus hannah*
(c) *Viper russelli*
(d) *Naja naja*

AMU-2009
Punjab MET-2008

Ans. (a) : Zoological name of Common Indian Krait- *Bungarus caeruleus*
- *Ophiophagus hannah* (king cobra)
-*Naja naja* (Indian cobra)
- *Viper russelli* (viper).

205. The generic epithet for the species epithet 'Santalinus' is:
(a) Abrus (b) Pongamia
(c) Pterocarpus (d) Cassia

AP EAMCET-1997

Ans. (c) : The first word in the Scientific name is the generic name (represent the genus) and Second word is the specific epithet (represent species name)
Pterocarpus santalinus - Red Sandal wood.

206. Indian rose wood tree is a common name of
(a) Acacia (b) Shorea
(c) Dalbergia (d) Eucalyptus

Uttarakhand PMT-2008

Ans. (c) : Indian rose wood is common name of - *Dalbergia latifolia* (Sisso). Eucalyptus is tallest angiosperms (over 100 meters).

@apna_pdf

207. One of the recently introduced new crop of oil seed in the deserts of India is Jojoba . Select the correct botanical name of this plant

(a) *Simmondsia chinensis*
(b) *Lencaena leucophlala*
(c) *Dendroclamus*
(d) *Dendrobium javanica*

AMU-1996

Ans. (a) : *Simmondsia chinensis* - Jojoba commonly called goat nut, deer nut, pig nut, wild hazel, quinine nut, coffeeberry and gray box. Jojoba is grown commercially to produce jojoba oil, a liquid wax ester extracted from its seed.

208. Ragi is :

(a) *Eleusine coracana*
(b) *Hordeum vulgare*
(c) *Pennisetum typhodies*
(d) *Triticum aestivum*

BCECE-2003

Ans. (a) : Ragi (*Eleusine coracana*) is an important millet grown extensively in various region of India and Africa. Ragi is reach source of iron and other essential nutrients.

209. Botanical name of 'chana' is

(a) Cicer arietinum (b) Phaseolus aureus
(c) Lablab purpureus (d) Dolichos

JIPMER-2010

Ans. (a) : Botanical name of chana is *Cicer arietinum.*

- Chana also known as chickpea gram and Bengal gram.
- Chana is annual legume belong to the family Fabaceae.

It is classified as -
Kingdom - Planate
Division - Magnoliophyta
Class - Magnoliopsida
Order - Fabales
Family - Fabaceae
Genus - Cicer
Species - arietinum.

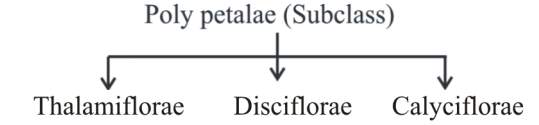
210. Thalamiflorae, Calyciflorae and Disciflorae are series of

(a) Polypetalae (b) Gamopetalae
(c) Monochlamydae (d) Monocots

Uttarakhand PMT-2011

Ans. (a) : Polypetalae , is a subclass in which the flowers contain non-essential whorls calyx and corolla.

- It is categorizes into three series namely - Thalamiflorae, Disciflorae and Calyciflorae.



211. The botanical name of soyabean is

(a) Cajanus cajan (b) Glycine max
(c) Glycyrrhiza glabra (d) Abrus precatorius
(e) Dolichos lablab

Kerala PMT-2008

Ans. (b) : The botanical name of soyabean is Glycine max. In India it is largely cultivated in Madhya Pradesh. Soyabean have rich source of protein.
Kingdom - Plantae
Order - Fabales
Family - Fabaceae
Subfamily - Faboideae
Genus - Glycine
Species – max

Name	Botanical Name
(i) Soyabean	*Glycine max.*
(ii) Pigeon pea	*Cajanus cajan*
(iii) Rosary pea	*Abrus precatorius*
(iv) Licorice	*Glycyrrhiza glabra*
(v) Hyacinth bean	*Dolichos lablab.*

212. Systema Naturae was written by

(a) Linnaeus (b) Aristotle
(c) Hippocrates (d) Darwin

JIPMER-2008

Ans. (a) : Systema Naturae was written by Carl Linnaeus, Linnaeus is also known as father of taxonomy. A book of binomial nomenclature introduced by a Swedish botanist, zoologist and physician Carolus Linnaeus.

213. Who credited with the introduction of binomial system of nomenclature of plants?

(a) Linnaeus
(b) John Ray
(c) Bentham and Hooker
(d) Aristotle

BVP-2002

Ans. (a) : The system of binomial nomenclature was established by Carolus Linnaeus in 1750 (According to some - 1751)

- Linnaeus published his work in the book **"Species Plantarum"** in 1753.
- It is a system of classification and naming a species given it a unique scientific name to avoid confusion
- Binominal nomenclature consist of two names in which first one indicate genus names while latter contains species names. For example - *Rana tigrina* is a binominal nomenclature for frog in which *Rana* indicates genus name while *tigrina* indicate species name.

214. Botanical name of arhu is :

(a) Prunus amygdalus (b) Prunus armeniaca
(c) Prunus persica (d) Prunus avium

Uttarakhand PMT-2006

Ans. (c) : The botanical name of arhu is *Prunus persica,* commonly known as peach.

- Peach (arhu) originated in China.
- It contain appreciable amount of vitamin A, C and niacin. Vitamin C content of the fruit rises as maturity progresses.

@apna_pdf

215. Biosystematics aims at: -

(a) The classification of organisms based on broad morphological characters

(b) Delimiting various taxa of organism and establishing their relationships

(c) The classification of organisms based on their evolutionary history and establishing their phylogeny on the totality of various parameters from all fields of studies

(d) Identification and arrangement of organisms on the basis of cytological characteristics

AIPMT-2003

Ans. (c): Biosystematics is the study of identification, nomenclature, classification and relationships amongst living beings.

The study of genetic development of plant and animal population is the basis of biosystematic which is the classification of species. As a results, it takes into account the evolutionary history of these creatures and develops their phylogeny using a variety of different factors from all different scientific domains.

216. Which one of the following organisms is scientifically correctly named, correctly printed according to the International Rules of Nomenclature and correctly described

(a) Felis tigris - The Indian Tiger, well protected in Gir forests

(b) E.coli-Full name Entamoeba coli, a commonly occurring bacterium in human intestine

(c) Musca domestica - The common house lizard, a reptile

(d) Plasmodium falciparum - A protozoan pathogen causing the most serious type of malaria

AIPMT (Mains)-2012

Ans. (d) : *Plasmodium falciparum* - A protozoan pathogen causing the most serious type of malaria According to binomial nomenclature the scientific name consist of genus and species

- Both genus and species are either italicized or are underlined separately.
- In genus first letter is capital whereas species name is always written in lower case letters. *Musca domestica* is European housefly, it belongs to phylum arthropoda. E.coli is having full name Escherichia coli.
- *Felis tigris* is the scientific name of Indian tiger. The first letter of species Tigris is not written in capital letter.

217. Which of the following is the correct scientific name of wheat derived by binominal nomenclature?

(a) Triticum vulgare (b) Triticum aestivum

(c) Oryza sativa (d) Zea mays

AIIMS-2016

Ans. (b) : The Scientific name of wheat plant is *Triticum aestivum*.

- *Zea mays* → Corn (Maize)
- *Oryza sativa* → Rice
- *Triticum vulgare* → Synonym of wheat
- *Triticum aestivum* is scientific name of common wheat or bread wheat, and *Triticum vulgare* is the wheat used for germ oil which is rich in vitamin E.

218. Match the following columns and select the correct option

Column I		Column II	
(A)	Panthera tigris	(i)	Mango
(B)	Mangifera indica	(ii)	Common Indian frog
(C)	Musca domestica	(iii)	Cockroach
(D)	Periplaneta americana	(iv)	Tiger
(E)	Rana tigrina	(v)	House fly

(a) A - (ii), B- (v), C - (i), D - (iii), E - (iv)

(b) A - (iv), B - (i), C - (v), D - (iii), E - (ii)

(c) A - (ii), B - (v), C - (iii), D - (i), E - (iv)

(d) A - (iv), B - (i), C - (v), D - (ii), E - (iii)

AIIMS-2010

Ans. (b) :

Scientific Name	Common Name
Panthera tigris	Tiger
Mangifera indica	Mango
Musca domestica	Housefly
Periplaneta americana	Cockroach
Rana tigrina	Common Indian frog

219. Linnaeus evolved a system of nomenclature called:

(a) mononomial (b) vernacular

(c) binomial (d) polynomial

AIPMT-1993, 1990

Ans. (c) : Linnaeus evolved a system of nomenclature called binomial nomenclature.

- This system of nomenclature was established in 1750 AD by Swedish scientist named as Carolus Linnaeus.

220. The term "New Systematics" was introduced by:

(a) Bentham and Hooker

(b) Linnaeus

(c) Julian Huxley

(d) A.P. de Candolle

AIPMT-1988

Ans. (c) : Julian Huxley first used the term "New systematics" in 1940. The cytological, genetic, anatomical, morphological and physiological aspects of an organism are all taken into account in this classification.

- This system (biosystematics) is the taxonomy based on the study of generic evolution of animal and plant.

221. When the specific epithet exactly repeats, generic name. It is called as

(a) Tautonym (b) Synonym

(c) Basionym (d) Homonym

Punjab MET-2007

@apna_pdf

Ans. (a) : Botanical name in which the specific name and generic name have same name or spelling called as tautonym.
Example -
Catla catla -(Gibelion catla)
Malus malus - (apple)
Axis axis (chital)
Dama dama (fallow deer)
Crocuta crocuta (spotted hyena)
Gazella gazella (chinkara).

222. Who gave the nomenclature according to which humans are called Homo sapiens?
(a) Darwin (b) Mendel
(c) Aristotle (d) Linnaeus

BCECE-2015

Ans. (d) : Linnaeus gave the nomenclature according to which humans are called *Homo sapiens*, in which Homo is genus, which includes early and modern humans and sapiens is specific name for humans

223. The binomial name in which names of genus and species are same is referred to as
(a) binomial nomenclature
(b) tautonym
(c) cladistics
(d) polytypic

MGIMS Wardha-2015

Ans. (b) : The binomial name in which name of genus and species are same is referred to as tautonym.
• There are many example of tautonym which are as following -
Axis axis (chital)
Bison bison (American bison)
Dama dama (fallow dear)

224. Binomial nomenclature means
(a) one name given by two taxonomists
(b) two names, the Latinized, other of a person
(c) two names, one scientific, other local
(d) two word names, the first indicates genus, and other species

AMU-2014

Ans. (d) : Binomial nomenclature is given by Linnaeus in which the scientific name of organism is completed into two part first one is generic name and second name is specific name.
Eg- *Rana tigrina, Homo sapiens*

225. Oryza sativa is the binomial name of the rice plant, the sativa stands for
(a) Specific name
(b) Specific epithet
(c) Species name
(d) Specific nomenclature

WB JEE-2008

Ans. (b) : *Oryza sativa* is the binomial name of the rice plant, the sativa stand for species epithet.

Oryza (↓ Generic name) sativa (↓ Species epithet)

• It is proper way of scientific name of any organism which completes into two part first one generic name and second one species epithet.

226. Nomenclature is governed by certain universal rules. Which one of the following is contrary to the rules of nomenclature
(a) When written by hand, the names are to be underlined
(b) Biological names can be written in any language
(c) The first word in a biological name represents the genus name, and the second is a specific epithet
(d) The names are written in Latin and are italicised

NEET-2016 Phase-I

Ans. (b) : Two word are used in binomial nomenclature to name an organism. Genus and species are represented by the first and second words, respectively.
Allows write the initial letter of the genus in capital letters, the first latter of the species in small letters. Since the names are mostly taken from Latin and Greak, they are always written in that languages.
They are underlined if they are written by hand.
Due to international nomenclature restrictions. These cannot be written in any other language.

227. The scientific name of Kashmiri stag is
(a) *Sus salvanius*
(b) *Grus leucogeranus*
(c) *Cervus elaphus hanglu*
(d) *Ailurus ochraceus*

AP EAMCET-2010

Ans. (c) : The Kashmir stag (***Cervus elaphus hanglu***) also **called Hangul,** is a subspecies of Central Asian red deer endemic to Kashmir, India. It is found in dense riverine forests in high valleys and northern Chamba district in Himachal Pradesh. It is commonly found in **Dachigam National Park**.
• The *Sus salvanius* (commonly known as the pygmy hog) is found only in the reserve forest belts of the **Manas Wildlife Sanctuary** and the Bornadi Wildlife Sanctuary in northwestern, Assam, India.
• The *Grus leucogeranus* also known as the Siberian white crane or the snow crane is a bird of the family Gruidae.
• The *Ailurus ochraceus* is a species of mammals in the family Red pandas they rely on running to move around.

228. Match the following lists.

	List I (Common Name)	List II (Scientific Name)
(A)	**Cat fish**	**(i)** ***Clarias batrachus***
(B)	**Milk fish**	**(ii)** ***Chanos chanos***
(C)	**White shrimp fossilis**	**(iii) Heteropneustces**
(D)	**Grey mullet**	**(iv)** ***Mugil cephalus***
		(v) ***Penaeus indicus***

The correct match is :

	A	B	C	D
(a)	1	3	5	4
(b)	2	4	5	1
(c)	1	2	5	4
(d)	2	4	5	1

AP EAMCET-2010

@apna_pdf

Ans. (c) **: List I** **List II**
(Common name)(Science Name)
Cat Fish - *Clarias batrachus*
Milk Fish - *Chanos chanos*
White shrimp - *Penaeus indicus*
Grey Mullet - *Mugil cephalus*

Clarias batrachus –is a native to southeastern Asia and has been introduced into many places for fish farming, **walking catfish** as it is commonly known is an opportunistic feeder and can go for month without food.
Chanos chanos – The **milkfish** is the sole living species of the world. It is found in the indo-west pacific from eastern and south-eastern Africa through India.
Mugil cephalus – The **flathead gray mullet** is an important food fish species in the mullet family mugilidae. It is found in coastal tropical and subtropical waters worldwide.
Penaeus indicus- The Indian prawn, is one of the major commercial prawn species of the world. It is found in the Indo-west pacific from eastern and south eastern Africa, through India, Malaysia and Indonesia to southern china and northern Australia.

229. Read the statements given below and identify the incorrect statement.
(a) Scientific names are used all over the world
(b) Scientific names are often descriptive and tell us some important character of an organism.
(c) Scientific names indicate relationship between species.
(d) Scientific names favour multiple naming for the same kind of an organism.

Karnataka CET-2012

Ans. (d) : Scientific name is unique to an organism. These names are used all over the world, to describe some important characters of organism. The scientific name is the taxonomic name given to the organism. The name is composed of the genus and the species. Hence, we can conclude that scientific names never favour multiple naming for the same kind of an organism. So, the option (d) is right answer.

230. Point out the correct method of showing scientific name of coconut palm derived by binomial nomenclature :
(a) Cocos nucifera (b) cocos Nucifera
(c) Cocos Nucifera (d) cocos nucifera

Karnataka CET-2012

Ans. (a) : The scientific name of coconut palm is *Cocos nucifera*, coconut palm belongs to the family Arecaceae It is cultivated extensively in tropical areas for its edible fruit, the coconut. The scientific name is used to identify the organisms and to avoid the confusion created by the local names.

231. Assertion (A) : The scientific name Malus malus is illegitimate.
Reason (R) : It is a tautonym
The correct answer is:
(a) Both (A) and (R) are true (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2005

Ans. (a) : According to binomial nomenclature each plant has been given a scientific name which consists of two parts. First part is genus and second part is species. The name is either underlined or written in italics. The scientific name Malus is illegitimate because it is just a tautonym and it does not follow the standard binomial nomenclature.
Malus malus is the scientific name of apple.

232. The scientific name of zebu is ……..
(a) *Bubalus bubalis* (b) *Gallus gallus*
(c) *Bos indicus* (d) *Bombyx mori*

Karnataka CET-2004

Ans. (c) : *Bos indicus*, sometime known as indicine cattle or humped cattle is a species of domestic cattle in south Asia.

Scientific Name	Common Name
Bubalus bubalis	Wild buffalo
Gallus gallus	Red junglefowl
Bos indicus	Zebu
Bombyx mori	Silk moth.

233. Which is not based on predictive generalisation or repeatable experimentation?
(a) Hypothesis (b) Theory
(c) Principle (d) Law

UP CPMT-2011

Ans. (a): Hypothesis is not based on predictive generalization or repeatable experimentation. Because A hypothesis is a supposition or proposed explanation that is made based on limited evidence as a starting point for furthest investigation.

234. Choose the correct combination of alphabets which matches the zoological names given under Column I with their common names given under Column II:

	Column I		Column II
A	***Labeo rohita***	E	**Jungle fowl**
B	***Gallus gallus***	F	**Carp**
C	***Bos indicus***	G	**Tussar silkmoth**
D	***Antheraea mylitta***	H	**Cattle**

(a) A = F, B = G, C = E, D = H
(b) A = G, B = E, C = H, D = F
(c) A = F, B = E, C = H, D = G
(d) A = F, B = E, C = G, D = H

Karnataka CET-2002

Ans. (c) :

	Column I	Column II
A	*Labeo rohita*	Carp
B	*Gallus gallus*	Jungle fowl
C	*Bos indicus*	Cattle
D	*Antheraea mylitta*	Tussar silkmoth

235. In biosystematics, the basis of classification is
(a) major morphological characters
(b) cytological characters
(c) evolutionary history considering various parameters from different fields of studies
(d) phenotypic relationships between species

MGIMS Wardha-2015

Ans. (c) : The classification of organism based on their evolutionary history and establishing their phylogeny on totality of various parameters from different fields of studies. This classification is referred to as Biosystematics.

@apna_pdf

02 BIOLOGICAL CLASSIFICATION

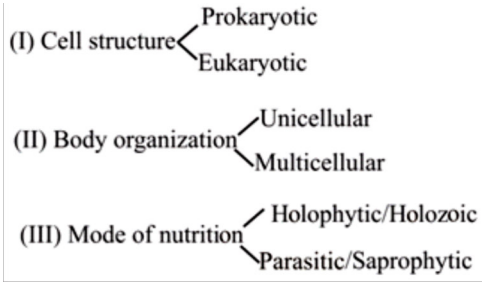
A. Categorization of Organisms and Kingdom System

1. The five-kingdom classification was suggested by

(a) Engler and prantl (b) Eichler
(c) Bentham and Hooker (d) Whittaker.

UPCPMT-2011, 2010
J&K CET-2010 / AFMC-2009
AIPMT-2002 / BVP-2001 / AIIMS-1994

Ans. (d) : The five kingdom classification was proposed by R.H Whittaker based on there characters.



2. In Whittaker's system of classification. prokaryotes belong to the kingdom of

(a) Monera (b) Protista
(c) Animalia (d) Fungi

J &K CET-2009, 2008
JIPMER-2008
MGIM Wardha-2008
BHU PMT (Screening)-2007

Ans. (a) : R. H. Whittaker divided living organisms into five kingdoms. The kingdom Monera is comprised of unicellular prokaryotic organisms. These are prokaryotic organisms which, lacks the nucleus, mitochondria and chloroplast, do not have well-developed cell organelles.

3. Choose the correct answer from the given statements below

(a) Cellular organization of the body is not required for metabolism
(b) Non living orgaism also shows reproduction
(c) Reproduction is synonymous with the growth in Amoeba
(d) Response of environment on living organism is called Irritability

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : Some common synonyms of reproduction are copy, duplicate, facsimile and replica.
In unicellular organisms like bacteria, Unicellular algae and amoeba, reproduction is synonymous with growth i.c. increase one number of cells.

4. Bacteria that have specialized cell wall and plasma membrane structures to live and withstand the extreme environmental conditions

(a) Eubacteria (b) Cyanobacteria
(c) Archaebacteria (d) Mycoplasma

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : Archaebacteria differ from other bacteria in having a different cell wall structure and this feature is responsible for their survival in extreme conditions. Archaebacteria are known as ancient bacteria.

5. Match List - I with List - II:

List-I		List-II	
A.	*Chlamydomonas*	i.	Conidia
B.	*Penicillium*	ii.	Zoospores
C.	Hydra	iii.	Gemmules
D.	Sponge	iv.	Buds

Choose the correct answer from the options given below:

(a) (A) - (i), (B) - (iv), (C)-(iii), (D)-(ii)
(b) (A) - (ii), (B) - (i), (C)-(iv), (D)-(iii)
(c) (A) - (iii), (B)-(ii), (C)-(i), (D)-(iv)
(d) (A) - (iv), (B) - (iii), (C) - (ii), (D) - (i)

NEET (Re-Exam)-04.09.2022

Ans. (b) :

Chlamydomonas	- Zoospores
Penicillium	- Conidia
Hydra	- Buds
Sponge	- Gemmules

6. Which of the following organism is multicellular?

(a) Bacillus (b) Amoeba
(c) Yeast (d) Spirogyra

TS EAMCET-31.07.2022 Shift-I

Ans. (a) : Bacillus subtillis - Bacillus subtilis also known as the hay bacillus or grass bacillus is a Gram positive catalase positive bacterium found in soil and the gastrointestinal tract of ruminants humans and marine sponges Bacillus subtilis is rod shaped and can form protective endospore.

7. The number of cohorts in calyciflorae and heteromerae of Bentham and Hooker classification respectively are:

(a) 5 and 3 (b) 3 and 5
(c) 3 and 3 (d) 3 and 4

TS EAMCET-30.07.2022 Shift-I

Ans. (a) : Calyciflorae in Bentham and Hooker system of classification the dicotyledons have subclass, series and coharts. The series (iii) (Calyciflorae) of subclass I (Polypetalae) have 5 cohorts. The last cohant is umbellales.

8. Statement 1 : Artificial system of classifications were incomplete and fragmentary.
Statement 2 : Artificial system of classifications always show inter relationships among the group of plants.

@apna_pdf

(a) Statement 1 and statement 2 are true.
(b) Statement 1 is false, statements 2 is true.
(c) Both statements are false.
(d) Statement 1 is true and statement 2 is false.

AP EAMCET-12.07.2022 Shift-II

Ans. (d) : Artificial system of classification which is mainly based on the morphological characters, non evolutionary features. Theophrastus a Greek botanist and father of botany classified the plants into four habit herbs, undershrubs, shrubs and trees. He was the first to propose artificial system of classification.

9. Two animals belong to the same Kingdom but different classes. They may belong to the same_____

(a) Species (b) Phylum
(c) Division (d) Order

AP EAPCET-07.09.2021 Shift-I

Ans. (b) : Several similar phyla are included in the kingdom, therefore, if two animals belong to the same phylum and they must also be in the same kingdom, but different classes.

10. Biosystematics aims at_____.

(a) The classification of organisms based on broad morphological characters
(b) Delimiting various taxa of organisms and establishing their relationships
(c) The classification of organisms based on their evolutionary history and establishing their phylogency on the totality of various parameters from all fields of studies
(d) Identification and arrangement of organisms on the basis of their cytological characteristics.

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : Biosystematics deals with the classification, identification and arrangement of organisms based on their biological characteristics. It aims at the understanding the evolutionary relationship between the different organism.

11. Engler and Prantl published a phylogenetic system in the monograph

(a) Die Naturlichen Pflanzen Familien
(b) Historia Plantarum
(c) Species Plantarum
(d) Genera Plantarum
(e) Origin of Species

AP EAMCET-2021, Shift-I
CMC Vellore-2008

Ans. (a) : German botanist Adolf Engler is renowned for his contributions to plant taxonomy and phytogeography, including Die Naturlichen Pflanzen Familien (the natural plants), which Karl von Prantl and he co-edited in 23 volume between 1887 and 1915. However, the Engler system of plant classification is widely used by many herbaria.

12. If the student wants to study the development of zygote, internal structure and function of various pairs to assign the organism to a particular phylum, the student takes the help of following branches?

(a) Development Biology, Anatomy, Physiology and Taxonomy
(b) Embryology, External Morphology, Physiology and Taxonomy
(c) Embryology, Anatomy, Osteology and Physiology
(d) Embryology, Histology, Physiology and Taxonomy

AP EAMCET-03.09.2021 Shift-I

Ans. (a) : Developmental biology : Includes production of gametes fertilization, development of embryo, etc.
• **Anatomy :** Anatomy is the study of the physical structure and parts of organism.
• **Physiology :** Physiology is the study of human and animals junction.
• **Taxonomy :** Includes, naming, describing and classifying organisms and includes all plants, animals and micro-organisms.

13. Assertion (A) : Using mathematic methods and computers, differences and similarities between taxa can be studied and is called as numerical taxonomy.
Reason (R) : Primitive and advanced characters are recognized as evolution which may be progressive or retrogressive.
The correct option among the following is
Options:

(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-28.09.2020 Shift-I

Ans. (b) : Numerical taxonomy was defined by Robert R. Sokal and Peter Sneath. It is a method of classifying organisms with the help of numerical methods. The phonetic similarity is the basis of this classification.

14. Match the following lists:

	List-I	List-II
(A)	Cell walls with silica, symmetrical rejuvenatory spores	(I) Actinomycetes
(B)	Holozoic nutrition, definite growth pattern, locomotion	(II) Chrysophyta
(C)	Zoospores, fusion of two gametes, endogenous spores, sporangia	(III) Phycomycetes
(D)	Branched filamentous, radical colonies, cell wall with mycolic acid	(IV) Animalia

The correct match is

	A	B	C	D
(a)	I	IV	II	III
(b)	II	IV	III	I
(c)	II	III	I	IV
(d)	IV	I	II	III

TS EAMCET-29.09.2020 Shift-I

@apna_pdf

Ans. (b) :

List - I	List II
(A) Cell walls with silica, symmetrical rejuvenatory spores	(II) Chrysophyta
(B) Holozoic nutrition definite Growth pattern, locomotion	(IV) Animalia
(C) Zoospores fusion of two gametes, endogenous spores	(III) Phycomycetes
(D) Branched filamentous, radical colonies , cell wall with mycolic acid.	(I) Actinomycetes

15. Multicellular heterotrophs are placed in how many kingdoms by R.H. Whittaker ?

(a) 4 (b) 3
(c) 1 (d) 2

MHT CET-06.10.2020 Shift-I

Ans. (d) :

- Multicellular heterotrophs are included in the kingdom of fungi and animalia.
- These organisms have well develop nucleus and membrane bound organelles.

16. Assertion (A):Carolus Von Linnaeus popularized the binomial system of nomenclature and proposed sexual system of classification.
Reason (R): Sexual reproduction in plants was discovered by Camerarius.
The correct option among the following is

(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true.

TS EAMCET-29.09.2020 Shift-II

Ans. (b) : (A) is true, (R) is true and (R) is the correct explanation of (A)
The discovery of sex in plants is usually credited to Camerarius (1964) and Koelreuter (1761) is generally believed to have made the first systematic study of plant hybrids.

17. The study of different kinds of organisms, their diversities and relationship among them is studies in:

(a) Biodiversity (b) Plant taxonomy
(c) Systematics (d) α-Taxonomy

TS EAMCET-29.09.2020 Shift-II

Ans. (c) : Systematics is the study of organism identification, classification and nomenclature. It is concerned with the evolution of organism relationship, classification of organism into various kingdoms have been done by systematic.

18. Who proposed the sexual system of classification?

(a) N. Grew
(b) Marcello Malpighi
(c) Carolus Van Linnaeus
(d) Robert Hooke

AP EAMCET-24.09.2020 Shift-II
UPCPMT-2012

Ans. (c) : The sexual system of classification is based on the androecium structure. It was given by Linnaeus, he divided the plants into 24 groups depending on the number, union and length of stamens.

19. Who suggested the third kingdom Protista?

(a) R.H. Whittaker (b) Carl Linnaeus
(c) Haeckel (d) Carl Woese

MHT CET-08.10.2020 Shift-I

Ans. (c) : Linnaeus - Proposed two kingdoms. Plantae and Animalia.

- **Hackel** gaves third kingdom system for all micro organism unicellular organism called it Protista.
- **R.H whittaker-** proposed five kingdom theory

(i) Monera, (ii) Protista, (iii) Fungi (iv) Plantae (iv) Animalia

- **Carl woese:** - Proposed six kingdom theory.

20. Which of the following statements is correct regarding Mangifera indica, Solanum tuberosum (potato) and Panthera leo (lion)?

(a) indica, tuberosum and leo, represent the genera.
(b) Mangifera, Solanum and Panthera are specific epithets
(c) Mango belongs to Solanacea, Potato belongs to Family Anacardiaceae and Lion belongs to Canidae
(d) Mango belongs to Anacardiaceae, Potato belongs to Solanacea and Lion belongs to family Felidae

AP EAMCET-25.09.2020 Shift-I

Ans. (d) : Mangifera indica, commonly known as mango is a species of flowering plant in the family Anacardiaceae.

- Solanum tuberosum - belong to family Solanaceae family. The lion (Panthera leo) is a large cat of the genus Panthera native to Africa and India. It belong to family Felidae.
- It has muscular Broad-chested body is short rounded head round ears and a hairy is tuft at the end of its tail.

21. Study the following statements.

(I) Circular naked DNA is the genetic material
(II) Membrane bound cell organelles are present.
(III)Cell membrane infoldings called mesosomes present.
(IV) Nuclear membrane absent.

Arrange the given organisms based on their above respective characters and give the ratio.

(A) Bacillus **(B) Nostoc**
(C) Noctiluca **(D) Chlorella**
(E) Rhodospirillum **(F) Trichodesmium**
(G) Amoeba **(H) Euglena**

Options:

(a) 4:3:4:4 (b) 4:4:3:4
(c) 2:2:2:1 (d) 2:2:1:2

AP EAMCET-24.04.2019 Shift-II

@apna_pdf

Ans. (d) : The circular naked DNA is the genetic material of prokaryotes like Nostoc, Anabaena

- Membrane bounded cell organelles are present in both prokaryotes and eukaryates , single cell membrane bounded organelles, vacuole, lysosome, Golgi apparatus, Endoplasmic reticulum.
- Nuclear membrane absent in Kingdom Monera because they lack well defined nucleus and other membrane bounded cell organelles, mitochondria, golgi apparatus and chloroplast.

22. Assertion (A) : The six kingdom classification proposed by Carl Woese included Bacteria, Archaebacteria, Protista, Fungi, Plantae and Animalia.
Reason (R) : Carl Woese divided six kingdoms into 2 domains using 16s rRNA.
The correct answer is
(a) Both (A) and (R) are true, (R) is the correct explanation of (A).
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A).
(c) (A) is true but (R) is false.
(d) (A) is false but (R) is true.

TS EAMCET-08.05.2019 Shift-I

Ans. (c) : Six kingdom classification was proposed by Carl Woese. These six kingdoms are
Kingdom - Archaebacteria
Kingdom - Eubacteria
Kingdom - Protista
Kingdom - Fungi
Kingdom - Plantae
Kingdom - Animalia

23. Which one of the following pairs was excluded from Whittaker's five kingdom classification?
(a) Viruses and lichens (b) Algae and euglena
(c) Lichens and algae (d) Euglena and viruses

KVPY SB and SX-2019

Ans. (a) : Viruses and lichens was excluded from Whittaker's five kingdom classification.
Whittaker has used five criteria for delimiting the different kingdoms.

- Complexity of cell structure - prokaryotic or eukaryotic.
- Mode of nutrition which is divergent in multicellular kingdoms photoautotrophy in plantae, absorptive heterotrophy in fungi and ingestive heterotrophy in animalia.
- Ecological life style like producers (plantae) decomposers (fungi) and consumers (animalia)
- Phylogenetic relationship.
- Monera all prokaryotic unicellular.
- Protista all Eukaryotic unicellular.

24. Find odd one out.
(a) Stamen (b) Stigma
(c) Style (d) Ovary

JIPMER-2019

Ans. (a) : odd option is (a)

- Stamen- The stamen is the pollen producing reproductive organ of a flower which is male part of the flower.
- Collectively stamens form the androecium.

25. Which among the following is not a prokaryote?
(a) Saccharomyces (b) Mycobacterium
(c) Oscillatoria (d) Nostoc

NEET-2018

Ans. (a) : Saccharomyces is a fungus i.e. yeast. Yeast belong to Eukaryotes. Yeast are single cell called **microorganism** classified as member of the fungus kingdom. The first yeast originated hundreds of millions of years ago. Almost 1500 species are currently recognized.

- They are estimated 1% of all described fungus species.
- Nostoc and Oscillatoria are Cyanobacteria while mycobacterium is true bacteria.

26. Natural system of classification of plant kingdom was proposed by
(a) Lam and Tuwill
(b) Benthum and Hooker
(c) Eichler and Engler
(d) Engler and Prantl

Tripura JEE-2018
VMMC-2013

Ans. (b) : Natural system of classification based on the all external visible character. This classification was first proposed by **A. L. de Jessieu** and **A.P. de Candole** later on supported by Bentham and Hooker.

- George Bentham and Joseph Doltan Hooker are the british scientist who were working in the Royal Botanical Garden, Kew, England.
- They wrote the book **Genera Plantarum**. Bentham and Hooker describe 200 family in the book.

27. New Systematics introduced by Sir Julian Huxley is also called as
(a) Phonetics
(b) Cladistics
(c) Biosystematics
(d) Numerical Taxonomy
(e) Chemotaxonomy

Kerala PMT-2008

Ans. (c) : The concept of new systematics or biosystematics was given by J. Huxley (1940). It deals with subspecies and populations to explain population systematics.

- Biosystematics considers besides morphology, other aspects also like ecology, biochemistry, physiology, cytology and genetics.

28. Match the following column I with column II.

Column I		Column II	
A.	**Cytology**	**1.**	**Study of fossils**
B.	**Entomology**	**2.**	**Study of cells**
C.	**Palaeontology**	**3.**	**Study of birds**
D.	**Ornithology**	**4.**	**Study of insects**

@apna_pdf

(a) A-2 B-3 C-4 D-1 (b) A-2 B-4 C-1 D-3
(c) A-1 B-2 C-4 D-3 (d) A-3 B-2 C-1 D-4

WB JEE-2015

Ans. (b) :
(A) Cytology - (2) Study of cells
(B) Entomology - (4) Study of Insects
(C) Palaeontology - (1) Study of fossils
(D) Ornithology - (3) Study of birds

29. Study the following lists

	List-I		List-II
(A)	**Cellulase**	**(I)**	**Cell wall of bacteria**
(B)	**Chitinase**	**(II)**	**Cell wall of plant cells**
(C)	**Lysozyme**	**(III)**	**Proteins**
(D)	**Protease**	**(IV)**	**Cell wall of fungal cells**
		(V)	**RNA**

The correct match is

	(A)	(B)	(C)	(D)
(a)	(II)	(IV)	(I)	(III)
(b)	(II)	(I)	(IV)	(III)
(c)	(V)	(I)	(III)	(II)
(d)	(V)	(IV)	(I)	(II)

TS EAMCET-2015

Ans. (a) :

	List-I		List-II
(A)	Cellulase	(II)	Cell wall of plant cells.
(B)	Chitinase	(IV)	Cell wall of fungal cells
(C)	Lysozyme	(I)	Cell wall of Bacteria
(D)	Protease	(III)	Proteins

30. Which one of the following is not a eukaryotic organism?
(a) Euglena (b) anabaena
(c) Spirogyra (d) Agaricus

Assam CEE-2014

Ans. (b) : They are organism whose cells have a nucleus enclosed within membranes, unlike prokaryotes which have no membrane-bound organelles are called eukaryotes.
Anabaena - It is nitrogen fixing blue green algae. They are both in solitary and colonial forms.

31. 'Genera Plantarum' was written by
(a) Hutchinson
(b) Bessey
(c) Bentham and Hooker
(d) Linnaeus.

AIIMS-1994

Ans. (d) : Linnaeus gave artificial classification and after that in 1862 Bentham and Hooker also wrote new Genera planterum.
• Genera plantarum was written by Carolus Linnaeus in 1753. But they gave biggest and natural classification of spermatophyta.

32. The Phylogenetic System of classification was put forth by
(a) Carolus Linnaeus
(b) George Bentham and Joseph Dalton Hooker
(c) Aristotle
(d) Theophrastus
(e) Adolf Engler and Karl Prantl

VMMC-2013
Kerala PMT-2009

Ans. (e) : The phylogenic classification of the plant kingdom was proposed by Adolf Engler (1844 – 1930) and his associate Karl prantl (1849 – 1893), in their book Die Natrulichen Pflanzen Familien. This classification was also adopted by the John Hutchinsion in two volumes of his book "The families of flowering plant phylogenetic classification is based on common evolutionary descent".

33. Consider the following statements with respect to characteristic features of the Kingdom.
A. In Animalia the mode of nutrition is autotrophic
B. In Monera the nuclear membrane is present
C. In Protista the cell type is prokaryotic
D. In Plantae the cell wall is present
Of the above statements
(a) A alone is correct
(b) B alone is correct
(c) C alone is correct
(d) D alone is correct
(e) A, B and C are correct

Kerala PMT-2012

Ans. (d) :
(d) In Plantae, the cell wall is present.
(a) In Animalia, the mode of nutrition is Holozoic or Heterotrophic, Saprophytic.
(b) In Monera, the nuclear membrane is absent.
(c) In Protista, the cell type is unicellular Eukaryotic. .

34. Pick up the wrong statement
(a) Nuclear membrane is present in Monera
(b) Cell wall is absent in Animalia
(c) Protista have photosynthetic and heterotrophic mode of nutrition
(d) Some fungi are edible

AIPMT (Re-Exam)-2015

Ans. (a) : The member of kingdom – **Monera are prokaryote they lack nuclear membrane.**
- Absence of nuclear envelope around nucleus and absence of membrane bound cell organelle is characteristics of prokaryote.
- The taxon monera was first proposed as a phylum by Ernst Haeckel in 1866. Subsequently, the phylum was elevated to the rank of kingdom in 1925 by **Edouard Hatton.**

35. Five kingdom system of classification suggested by R.H. Whittaker is not based on:
(a) Presence or absence of a well defined nucleus
(b) Mode of reproduction
(c) Mode of nutrition
(d) Complexity of body organisation

AIPMT-2014

@apna_pdf

Ans. (a) : The key principle for analysis by R.H. Whittaker include.
(1) **Complexity of cell structure** (eukaryotic or prokaryotic)
(2) **Body organization** (unicellular or multicellular)
(3) Thallus organization.
(4) **Mode of nutrition** (autotrophs or heterotrophs)
(5) Reproduction (sexual or asexual)
(6) Phylogenetic relationships
Based on these criteria, he classified organisms into five kingdoms-Monera, Protista, Fungi, Plantae and Animalia. Presence or absence of a well defined nucleus is not basis of whittaker's classification.

36. Arrange the following in the ascending order to Linnaean hierarchy.
(a) Kingdom - order - species - genus - class - family - phylum.
(b) Kingdom - family - genus - species - class - phylum - order.
(c) Kingdom - phylum - class - order - family - genus - species.
(d) Species - genus - family - order - class - phylum - kingdom.

Karnataka CET-2011

Ans. (d) : Various groups used in classification are called Taxa. The arrangement of Taxa is called hierarchy a species represent the smallest taxon although subgroup such as races are also used. Species → Genus → Family → Order → Class → Phylum → Kingdom.

37. An important criterion for modern day classification is:
(a) resemblances in morphology
(b) anatomical and physiological traits
(c) breeding habits
(d) presence or absence of notochord

AIPMT-1991

Ans. (b) : An important criterion for modern day classification is anatomical and physiological traits.
Modern day classification is a new systematic or bio systematics which includes all the characteristic of organisms gathered from the study of different sections like physiology, ecology, anatomy, cytology.
• The modern classification that is domain, kingdom, phylum, class, order, family, genus and species.

38. Systema Naturae was written by
(a) Linnaeus (b) Aristotle
(c) Hippocrates (d) Darwin

JIPMER-2008
DUMET-2008

Ans. (a) : Systema Nature was written by **Carl Linnaeus,** who is also known as father of taxonomy. A book of binomial nomenclature introduced by a Swedish botanist, zoologist and physician **Carolus Linnaeus** as the basis for Linnaean taxonomy.

39. Phylogenetic system of classification includes
(a) Evolutionary trends only
(b) Genetic trends only
(c) Evolutionary trend as well as morphology
(d) Behavrioural trends in environment

AIIMS-1995, 2014

Ans. (a) : There are many advantages to study the organism in point of view of evolution as you will know something very important feature of the organism. (that was developed first in that organism) and evolutionary history too.
• All the organisms belonging to the ancestral stock are taken in to consideration and their relations are established leading to the conclusion that they are evolutionary point of view related or not.

40. In five kingdom system of classification of RH Whittaker, how many kingdoms contain eukaryotes ?
(a) Four kingdoms (b) One kingdom
(c) Two kingdoms (d) Three kingdoms

Punjab MET-2008

Ans. (a) : Five kingdom classification was proposed by **R.H. Whittaker** in **1969**. Five kingdom system of classification of **R.H. Whittaker** distributed eukaryotes among four kingdoms Protista, Fungi, Plantae, and Animalia. Four kingdom are eukaryotes and Monera come under prokaryotes.

41. Match the following and choose the correct combination from the options given :

	Column-I (Kingdom)		Column-II (Class)
(A)	**Plantae**	**(1)**	**Archaebacteria**
(B)	**Fungi**	**(2)**	**Euglenoids**
(C)	**Protista**	**(3)**	**Phycomycetes**
(D)	**Monera**	**(4)**	**Algae**

(a) A–4, B–3, C–2, D–1
(b) A–1, B–2, C–3, D–4
(c) A–3, B–4, C–2, D–1
(d) A–4, B–2, C–3, D–1
(e) A–2, B–3, C–4, D–1

Kerala PMT-2011

Ans. (a) :

Column- I	**Column II**
(A) Plantae	(4) Algae
(B) Fungi	(3) Phycomycetes
(C) Protista	(2) Euglenoid
(D) Monera	(1) Archaebacteria

So the correct ans A -4, B - 3, C- 2, D- 1

42. Which is not true about prokaryotes?
(a) DNA is complexed with histones
(b) Well developed nucleus absent
(c) Mesosome present
(d) Mitochondria absent

DUMET-2006

Ans. (a) : The prokaryotic cells are unicellular organisms, which lack a true nucleus with well defined nuclear membrane and other organelles. The DNA in prokaryotes are naked meaning that it has no histones associated with it, and it is not formed into chromosomes.

43. Engulfing of food either in solid or liquid is called:
(a) sparozoic nutrition
(b) holozoic nutrition

@apna_pdf

(c) parasitic nutrition
(d) saprophytic nutrition

J&K CET-2005

Ans. (b) : Holozoic nutrition is a type of nutrition where the food is taken in either solid or liquid form and is digested inside the body.

44. Study the following lists

List-I		List-II	
(A)	**Takhtajan**	**(I)**	**Five kingdom Classification**
(B)	**Linnaeus**	**(II)**	**Phylogenetic Classification**
(C)	**Warming**	**(III)**	**Artificial Classification**
(D)	**Carl Woese**	**(IV)**	**Classification of Communities based on relation of water**
		(V)	**Six kingdom Classification**

The correct match is

	A	B	C	D
(a)	(II)	(III)	(IV)	(V)
(b)	(IV)	(I)	(V)	(III)
(c)	(V)	(II)	(I)	(IV)
(d)	(V)	(IV)	(II)	(III)

TS EAMCET-15.05.2016

Ans. (a) :

List-I		List-II	
(A)	Takhtajan	(II)	Phylogenetic Classification
(B)	Linnaeus	(III)	Artificial Classification
(C)	Warming	(IV)	Classification of Communities based on relation of water
(D)	Carl Woese	(V)	Six kingdom

45. The book Genera Plantarum was written by
(a) Bessey
(b) Hutchinson
(c) Engler and Pranti
(d) Bentham and Hooker

BVP-2008

Ans. (d) : The book Genera Plantarum was written by – Carolus Linnaeus in 1753 and after 1862.
- The book new Genera Plantarum was written by - Bentham and Hooker.
- The book Family of flowering plant writing by Hutchinson.

46. A virus differs from a bacterium as it contains
(a) A cell wall
(b) Cytosol
(c) DNA as genetic material
(d) DNA or RNA as genetic material with no ribosomes

J&K CET-2011

Ans. (d) : A virus is made up of either DNA or RNA surrounded by a protective coat called a capsid, made of protein. It does not contain ribosomes or other cell organelles, and it does not have a cell wall nor cytoplasm.

47. The Kingdoms-Monera, Protista, Fungi, Plantae and Animalia are distinguished on the basis of :
(a) type of nutrition (b) type of cell
(c) type of reproduction (d) all of these

Haryana PMT-2000

Ans. (d) : The kingdam, Monera, Protista fungi plantae and animalio are classified on the basis of cell structure, body organization and mode of nutrition and type of reproduction.

48. As per Whittaker's classification, an organism possessing eukaryotic cell stucture, multicellular organisation, with a cell wall and nuclear membrane showing heterotrophic nutrition can be placed under the kingdom:
(a) Monera (b) Protista
(c) Plantae (d) Fungi
(e) Animalia

Kerala PMT-2014

Ans. (d) : Fungi are multicellular or single celled. They are eukaryotic as they have a well-defined nucleus with a nuclear membrane. They lack chlorophyll, hence, their mode of nutrition is heterotrophic. The cell wall is made up of chitin.

49. In the five kingdom system of classification, which single kingdom out of the following can include blue-green algae, nitrogen-fixing bacteria and methangenic archaebacteria?
(a) Monera (b) Fungi
(c) Plantae (d) Protista

Punjab MET-2010

Ans. (a) : Monera :- Monera is a biological kingdom that is made up of prokaryotes. As such, it is composed of single celled organism that lack of nucleus, e.g. blue green algae, nitrogen, fixing bacteria and methogenic archaebacteria are present in this kingdom.
Nitrogen fixing bacteria is two types-
(1) Free living- Cyanobacteria, Anabaena, Nostoc, Beijerinckia
(2) Symbiotic- e.g. Rhizobium, Frankia, Azospirillum.

50. Phylogenetic system of classification is based on:
(a) Floral characters
(b) Evolutionary relationships
(c) Morphological features
(d) Chemical constituents

AIPMT-2009

Ans.(b): Phylogenetic classification system is based on evolutionary relationships between the various organism are acceptable. This assumes that organisms belonging to the same taxa have a common ancestor. We now use information from many other sources too to help resolve difficulties in classification. These become more important when there is no supporting fossil evidence.

@apna_pdf

51. Statement (S) : Linnaeus system of animal classification is essentially an artificial system, yet it has become a natural system.
Reason (R) : Similarities forming the basis of Linnaeus system are indicative of genetic relationship.
(a) Both (S) and (R) are true, and (R) is the correct explanation to (S)
(b) Both (S) and (R) are true, but (R) cannot explain (S)
(c) Only (S) is true and (R) is not true
(d) (S) is not correct and (R) cannot explain (S)
AP EAMCET-2006

Ans. (c) : Carlous Linnaeus divided the entire living world into two Kingdoms, namely, Animalia and Plantae. The artificial system of classification is based on locomotion type and the absence of chlorophyll. The Linnaeus system does not show genetic relationship or phylogeny.

52. Assertion : Phylogenetic systems of classification are considered as post Darwinian.
Reason : They are proposed after the publication of the book 'Origin of Species'.
The correct one is
(a) Both Assertion and Reason are true and Reason is the correct explanation of Assertion
(b) Both Assertion and Reason are true but Reason is not the correct explanation of Assertion
(c) Assertion is true but Reason is false
(d) Assertion is false but Reason is true
AP EAMCET-2010

Ans. (a) : The phylogentic system of classification was proposed by Engler and Prantl.
- Phylogenetic Classification is based on the evolutionary descent of the group of organisms, the relationship illustrated via a phylogram phylogenetic tree or a cladogram **e.g. Engler and Prantl system, Takhtajan classification**.

53. Number of criteria used in classifying organisms in five kingdom classification is
(a) 5 (b) 4
(c) 3 (d) 2
AP EAMCET-2011

Ans. (a) : R.H Whittaker (1969) proposed an elaborate five kingdom classification - Monera, Protista, Fungi, Plantae and Animalia. The main criteria of the five kindom classification were cell structure, body organisation, mode of nutrition, reproduction and phylogenetic relationships.

54. Which of the following cannot determine phylogenetic relationship?
(a) Physiology (b) Morphology
(c) Biogeography (d) Embryology
AP EAMCET-2011

Ans. (b) : The phylogenetic relationship is the linkage between the two or more species. Some organisms appear to be closely related in many respects and it may seem to be distantly related in other respects. So, morphologically it cannot determine phylogenetic relationship.

55. In classification of Carolus Linnaeus, which was/were not included?
(a) Family and phylum (b) Animalia
(c) Plantae (d) All of the above
UP CPMT-2014

Ans. (a): In Linnaeus time a two kingdom system of classification, with Plantae and Animalia kingdoms was developed that included all plants and animals respectively hence, in classification of Linnaeus phylum and family were not included.

56. Prokaryotic genetic system has
(a) DNA and Histone
(b) DNA and no Histone
(c) No DNA and Histone
(d) No DNA and no Histone
UPCPMT-2002

Ans. (b) : The genetic system of prokaryotic cell have nucleoid, made of naked (without histone protein) and folded DNA which lies freely in the cytoplasm or in contact with a membranous structure called mesosome.

57. Plant cell is differ from animal cell because of :
(a) the presence of cell wall and absence of chlorophyll in plant cell
(b) the presence of cell wall and chlorophyll in plant cell
(c) the absence of cell wall and presence of chloroplast in animal cell
(d) the absence of cell wall and presence of chlorophyll in plant cell
MGIMS Wardha-2003

Ans. (b) : Plants have cell wall and chlorophyll which are responsible for photosynthesis in presence of light. In plants, the cell wall surrounds the cell membrane. This gives the plant cell its unique rectangular shape but in animal cell have a simply cell membrane without cell wall. Animal cell have lack of chlorophyll.

58. Phylogenetic classification is one which is based on:
(a) habits of plants
(b) utilitarian system
(c) over all similarities
(d) common evolutionary descent
J&K CET-2014
AFMC-2000

Ans. (d) : Phylogenetic classification system is based on evolutionary relationships between the various organism are acceptable.
This classification assumes that organisms belonging to same taxa have common ancestor.

59. Evolutionary history of an organisms is known as
(a) Phylogeny (b) Ancestry
(c) Palaeontology (d) Ontogeny
Manipal-2012

Ans. (a) : Phylogenetics classification is based on evolutionary history of an organisms. This classification was proposed by Adolf Engler and Karl Prantl and supported by Hutchinson, Takhtajan and Cronquist.
- Engler and Prantl are german botanist, they published a book of 200 volume from 1800-1899. The name of the book is Die Naturlichen Pflanzen Familien.
They divided the plant into 280 family.

@apna_pdf

60. Which one is a prokaryote?
(a) Spirogyra (b) Agaricus
(c) Bacteriophage (d) Streptococcus
Manipal-2011

Ans. (d) : Prokaryotic cells are single celled microorganism known to be earliest on earth. The prokaryotic cell belongs to kingdom Monera.
•Prokaryotic cell does not have a nuclear membrane however the genetic material is present in a region is cytoplasm known as nucleoid prokaryotes includes mainly bacteria.
The Streptococcus are Gram positive and spherical or oval shape bacteria that form short or long chain.

61. The method of classification, called cladistics, is based on :
(a) natural system (b) mutation theory
(c) artificial system (d) evolutionary history
Manipal-2004

Ans. (d) : Cladistics refers to taxonomy by which the organisms are ranked and classified, according to the "recency of common descent". The categorical status of the animal according to this theory depends upon the position of branching points on the phylogenetic tree.
Clade term is used by Julian Huxley in 1958 and Coin and Harrison introduced the term cladistics in 1960.

62. The basic unit of classification of plants and animals is :
(a) genus (b) species
(c) order (d) family
Uttarakhand-2005
BHU PMT-2001

Ans. (b) : The species, the fundamental unit of taxonomic hierarchy. Davis called Building bricks in biological classification.
• In biological, phenomenon biosystematics concept is the older one. It is the lowest category of hierarchy which is consistently used and recognized by all the botanists.

63. Two kingdoms constantly figured in all biological classifications are
(a) Plantae and Animalia
(b) Monera and Animalia
(c) Protista and Animalia
(d) Protista and plantae
J&K CET-2008

Ans. (a) : In past all the organisms were split into two groups plants and animals, mainly on the basis of presence or absence of cell wall. This was also done by Linnaeus (father of Taxonomy). He founded two kingdoms Plantae and Animalia.

64. Phylogenetic system of classification was supported by:
(a) George Bentham (b) John Hutchinson
(c) Carolus Linnaeus (d) Father Santapau
Manipal-2000
JIPMER-1998

Ans. (b) : John Hutchinson was a British botanist associated with Royal Botanical Garden, Kew, (England).
• He developed and proposed his system based on Bentham and Hooker and also on Bessey, His phylogenetic system first appeared as "Families of flowering plants" in two volumes.
• The first volume contains dicotyledons and second volume contains monocotyledons. He made several revisions in different years and finally revision of "The families of flowering plants".

65. Classification of organisms based on evolutionary as well as genetic relationships is called
(a) Biosystematics (b) Phenetics
(c) Numerical taxonomy (d) Cladistics
DUMET-2010

Ans. (d) : Phyletic or Evolutionary or Phylogenetic character are used primarily in phylogenetic classification. The term phylogentic is used in many ways.
Ernst Haeckel (1886) used the term in evolutionary history of groups. Recently a particular approach to classification (cladism) have used phylogentic to refer to reconstructing only the branching sequence of phylogeny this approach is called cladistic with phylogenetics retained in its original and broader usage.

66. Scala naturae was written by
(a) Linnaeus (b) Darwin
(c) Aristotle (d) Whittaker
DUMET-2008

Ans. (c) : Aristotle developed the idea of ***Scala Naturae.*** to organize all things in the natural world, living and non-living things.
• Aristotle is known as father of biology. Aristotle's writings on biology, the first in the history of science are scattered acrossed several books forming about a quarter of his writings that has survived. The main biology texts were the history of animals, generation of animals, movement of animals.

67. Which of the following classification is based on some morphological characters?
(a) Artificial (b) Natural
(c) Phylogenetic (d) Both (b) and (c)
BHU PMT (Screening)-2010
DUMET-2008

Ans. (a) : Carolus Linnaeus was a great Swedish botanist and said to be the father of taxonomy. He outlined on artificial system of classification in Species Plantarum in 1753 where he listed and described 7300 species and arranged in 24 classes mostly on the basis of number, union, length and distribution of stamens.
• The classes were further subdivided on the basis of carpel characteristics into orders. Hence the system of classification is also known as sexual system of classification.

68. Which of the following have equal placement in the five kingdom classification on the basis of nutrition?
(a) Monera and Protista
(b) Protista and plantae
(c) Fungi and Animalia
(d) Plantae and Animalia
AMU-2011

@apna_pdf

Ans. (c) : Fungi is spore producing multicellular or multinucleate eukaryotic organisms. Basically unicellular yeast are also include amongst fungi because prokaryotes differ from all their sexual reproduction is similar to that of some fungi.

- Heterotrophic with absorptive type nutrition.
- It is either saprophytic or parasitic.
- Food reserve in glycogen and fat.
- Members of this kingdom are known as metazoa or multicellular animals.
- Organism multicellular eukaryotes.
- Body form is regular.
- Response to stimuli quick.
- Plastid and photosynthetic pigments are absent.

69. Which of the following is a prokaryote?

(a) Chlorella (b) Chlamydomonas
(c) Protomyces (d) Oscillatoria

AMU-2011

Ans. (d) : Oscillatoria is fresh water blue green algae (bacteria).

- Bacteria are placed under kingdom monera and they are prokaryotes.
- Oscillatoria plant body is called thallus.
- The unbranched filamentous structure of Oscillatoria is called trichomes.

70. On the basis of body organization, animals are grouped as

(a) Metazoa and Eumetazoa
(b) Protozoa and Parazoa
(c) Parazoa and Metazoa
(d) Protozoa and Metazoa

CG PMT-2007

Ans. (d) : Protozoa is unicellular where as Metazoa are multicellular. Protozoa are animal like protista and are believed to be primitive type of animal metazoa are divided into invertebrate and vertebrate.

- Both protozoans and metazoans are eukaryotic organism and the cells lack a cell wall.

71. Binomial nomenclature indicates:

(a) genus and species (b) genus and family
(c) species and veriety (d) phylum and genus

Uttarakhand-2005

Ans. (a) : Binomial nomenclature was introduced by Carolus Linnaeus, the first term indicates the genus and second term indicates the species of the organism.

- Multiples local names make it extremely difficult to identify an organism globally and keep a track of the number of species thus it creates a lot of cunfusion.
- Every organism would have one scientific name which would be used by every one to identify an organism. This process of standarized naming is called as binomial nomenclature.
- In binomial nomenclature generic name and species name are used.

72. Hutchinson system of classification is:

(a) Natural (b) Artificial
(c) Phylogenetic (d) Binomial

Uttarakhand-2005

Ans. (c) : Phylogenetic classification is based on the study of evolutionary relationship of organisms. Evolutionary characters are also considered.

- This classification is expressed in the form of phylogenetic trees.
- This classification was proposed by Engler and Prantl.

73. The division of the plant kingdom into prokaryotic and eukaryotic is based on the character is of:

(a) nucleus (b) chromosomes only
(c) cell organelles (d) all of these

Haryana PMT-1999

Ans. (d) : Prokaryotes are one of the most ancient group of living organisms on earth.

- Prokaryotic is comparatively simpler and smaller than eukaryotic.
- Eukaryote contains true nucleus it means nuclear membrane is present.
- Double membrane bound cell organelles is absent in prokaryotic cells.

74. In five-kingdom classification, Euglena is placed in

(a) Monera (b) Protista
(c) Fungi (d) Animalia

Rajasthan PMT-2011

Ans. (b) : Euglena belongs to Kingdom Protista.

- Euglena shows mixotrophic nutrition.
- Euglena is autotroph due to presence of chloroplast.
- There is a presence of a flexible outer membrane known as pellicle.
- In Protista, all organisms are unicellular eukaryotic.

75. In five kingdom classification of Whittaker, eukaryotes were assigned to

(a) 3 of 5 kingdoms (b) 2 of 5 kingdoms
(c) 4 of 5 kingdoms (d) All the 5 kingdoms

HP CET-2012
AMU-2009
Uttarakhand PMT-2004

Ans. (c) : 5 kingdoms classification was proposed by R.H. Whittaker in 1969.
(i) Monera (ii) Protista (iii) Fungi (iv) Plantae
(v) Animalia

- In Monera, unicellular prokaryotic organisms are placed.
- In Protista, unicellular Eukaryotic organisms are placed.
- Only Monera kingdom, organisms are unicellular prokaryotic while other four kingdom are eukaryotic.

76. In the classification of Whittaker the kingdom Monera include :

(a) bacteria, cyanobacteria, and fungus
(b) bacteria and cyanobacteria
(c) fungus and algae
(d) lichens and bacteria

Rajasthan PMT-2000

@apna_pdf

Ans. (b) : In Kingdom Monera, unicellular prokaryotic organism are placed.
- Bacteria and cyanobacteria are unicellular prokaryotic organism.
- Bacteria are small single celled organisms.
- Cyanobacteria are also known as cyanophyta.
- Cyanobacteria are gram-negative prokaryotic perform oxygenic photosynthetic and also fix atmosphere.

77. The kingdoms-Monera, Protista, Fungi, Plantae and Animalia are distinguished on the basis of:
(a) type of nutrition (b) type of cell
(c) type of reproduction (d) all of these

VMMC-2002

Ans. (d) : An American taxonomist R. H. Whittaker in 1969 divided the living world into five kingdoms such that Monera, Protista, Fungi, Plantae and Animalia on the basis of complexity of cell structure, mode of nutrition, complexity of body organization, life cycle and source of nutrition.

B. Monera

78. Extra circular, double stranded, self-replicating DNA present in a bacteria is known as_____
(a) Cosmid (b) Nucleoid
(c) Phagemid (d) Plasmid

AP EAPCET-11.07.2022 Shift-I
Rajasthan PMT-2007, 2003
BVP-2005
JCECE-2004
AIIMS-1998

Ans. (d) : Plasmid are genetic element of DNA molecule in the form of extra chromosomal material discovered by Lederberg in 1952, smaller than nucleoid.

79. Plasmids are found in
(a) virus (b) bacteria
(c) fungi (d) viroid

MHT CET-2010
Rajasthan PMT-2009, 2005, 1996
Punjab MET-2009
CMC Vellore-2009
UP CPMT-2009, 2002
Manipal-2002
Karnataka CET-2001

Ans. (b) : Plasmid is a small circular, extra chromosomal genetic material found in bacteria and some other microorganism.
- Plasmid are physically separated from chromosomal DNA and can replicate independently.

80. _____is a bacterium commonly found in the animal and human intestines
(a) Escherichia coli (b) Bacillus anthracis
(c) Vibrio cholera (d) Corny bacterium

AP EAMCET-11.07.2022 Shift-II
Punjab MET-2011
DUMET-2011

Ans. (a) : Escherichia coli is a bacterium commonly found in the animal and human intestine. It is a symbiotic bacteria of intestine, but excess of E. coli can damage the lining of the small intestine. This can lead to stomach cramps, vomiting, diarrhoea etc.

81. Which of the following is autotrophic:
(a) Virus (b) Mycoplasma
(c) Nostoc (d) All of these

HP CET-2011 / VMMC-2005
AMU-2004 / BVP-2003

Ans. (c) : Nostoc– Genus of blue green algae with cells arranged in bead like chains that are grouped together in a gelatinous mass, ranging from microscopic to walnut sized masses of *Nostoc* may be found on soil and floating in quiet water .

82. Choose the correct pair form the following
(A) E.coli - Retains copy of genetic material
(B) Streptococcus pneumonia - F^+ and F^- cells
(C) Transduction - Capture of naked DNA
(a) B, C (b) B
(c) A (d) A, C

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : E.coli is a gram negative bacteria and faculative, Anaerobic, rod shaped, coliform bacterium of the genus comonly found in lower instine of worm blooded organism and retain copy of genetic material.
- Transduction is process by which A virus transfer genetic material from one bacterium to another bacterium.

83. Identify the denitrifying bacterium
(a) Nitrosomonas (b) Nitrobacter
(c) Nitrococcus (d) Pseudomonas

TS EAMCET 10.05.2023 Shift-I

Ans. (d) : *Pseudomonas aeruginosa* is the species of denitrifying bacteria.
- Denitrifying bacteria are microorganisms that convert nitrates in the soil into free atmospheric nitrogen.
- Pseudomonas bacteria belongs to family Pseudomonadaceae which are Gream-negative bacteria.

84. Assertion (A) : Acetobacter is a pleomorphic bacteria
Reason (R) : Acetobacter changes shape depending on environment and nutrient availability
The correct option among the following is
(a) (A) and (R) are true (R) is the correct explanation for (A)
(b) (A) and (R) are true, but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET 10.05.2023 Shift-I

Ans. (a) : Pleomorphic bacteria are the bacteria that keep on changing their shape depending upon the type of environment and nutrients available. Ex. Acetobacter *Acetobacter aceti* is a gram-negative, obligate, aerobic, rod-shaped bacterium that can oxidize vinegar to carbon dioxide and water.

@apna_pdf

85. Assertion (A) : Beggiotoa changes its shape.
Reason : (R) : Some bacteria change their shapes depending upon he type of environment
(a) Both A and R are correct and R is the correct explanation of A
(b) Both A and R are correct but R is not the correct explanation of A.
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Beggiatoa species are filamentous bacteria belonging to the gamily Beggiatoaceae that contains. several largest bacteria known today. It is sulphide-oxidizing bacteria.
Some bacteria change their shapes depending upon the type of environment are known as pleomorphic bacteria. Ex:- *Acebacter, Mycoplasma pneumonia*.
Thus, Assertion (A) is incorrect but reason (R) is correct**.**

86. Identify the organism based on their cell wall characteristics such as pseudomurein, mycolic acid, stiff cellulosic plates, chitin.
(a) Archeabacteria, Dinoflagellates, Fungi, Actinomyces
(b) Dinoflagellagtes,Actinomyces, Archaebacteria, Fungi
(c) Actinomyces Dinoflagellates, Archaebacteria, Fungi
(d) Archaebacteria, Actinomyces, Dinoflagellates, Fungi

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Archaebacteria- The cell wall of this bacteria are made up of the polysaccharide psedomurein. Pseudopeptidoglycan (PPG) is a major component of cell wall in Archaea.
Actinomycetes- Actinomycetes are related to both bacteria and fungi but are now recognized as prokaryotic organism close to the bacteria.
Mycolic acid are unique long chain fatty acids found in the cell wall of mycobacteria**.**
Dinoglagellates- The cell wall of dinoflagellates has stiff cellulose plates on the outer surface.
Fungi- The cell wall of fungi are composed of chitin & polysaccharides**.**

87. Wriggling movements of sporozoites are caused by
(a) Microtubules (b) Convoluted tubules
(c) Pseudopodia (d) Flagella

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : An uninucleate, spindle or sickle-shaped organism called sporozoite that are capable of wriggling movement. Each of them has a covering composed of elastic pellicle containing longitudinal contractile microtubules.
Spindle fibres are made up of microtubules. Microtubules are important for vesicular trafficking, morphogenesis. cellular mechanics polarity and motility of sporozoites.

88. Amphitrichous bacteria contains flagella like this
(a) Two flagella at each end
(b) Many flagella at each end
(c) Single flagella at each end
(d) Three flagella at three sides

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : In Bacteria ,on basis of the arrangement of flagella , it is of four types.
(i) Monotrichous
(ii) Amphitrichous
(iii) Lophotrichous
(iv) Peritrichous.
Amphitrichous bacteria having a single flagella at each end.

89. DNA of $\phi \times 174$ bacteriophage has
(a) 48502 Nucleotides
(b) 5386 Nucleotides
(c) 5386 Nitrogen base pairs
(d) 48502 Nitrogen base pairs

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : Bacteriaophage $\phi\times$ 174 is a single e-stranded DNA virus that infects Escherichia coli; and the first DNA based genome to be sequenced. In this bacteriophage, DNA is composed of 5386 nitrogen base pairs.

90. Which of the following bacteria get carbon from CO_2 but derive energy from oxidation of inorganic substances during bacterial nutrition?
(a) Bacillus and Xanthomonas
(b) Rhodospirillum and Rhodopseudomonas
(c) Chromatium and Chlorobium
(d) Nitrobacter and Beggiatoa

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : Nitrobacter and Beggiatoa are chemolithotrophic bacteria.
Chemolithoautotrophs is an autotrophic microorganism that obtains energy by oxidizing inorganic compound**.**
These organism obtain their energy from the oxidation of the inorganic compounds.

91. The early bacteria synthesized chlorophyll from
(a) Iron porphyrin
(b) Magnesium porphyrin
(c) Sulphur porphyrin
(d) Carbon porphyrin

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : Early bacteria synthesized chlorophyll from magnesium porphyrin. This is a crucial process for plants and other photosynthetic organisms to produce their own food.
Chlorophyll is a pigment responsible for capturing light energy during photosynthesis**.**
In its structure, a central magnesium atom is surrounded by a porphyrin ring which allow chlorophyll to absorb light and convert it into energy.

@apna_pdf

92. The structures of the parent that disappear during binary fission of Euglena and develop a fresh in daughter euglenae

(a) Flagella and kinetosome
(b) Nucleus and basal granule
(c) Chromotophores and cytoplasm
(d) Stigma paraflagellar body and contractile vacuole

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : During binary fission of Euglena, the structures of the parents that disappears and develop a fresh in daughter Euglena is stigma, paraflagellar body and contractile vacuole.
During this fission, the nucleus divides into two daughter nuclei by mitosis followed by kinetosomes and the chromatophores.

93. Assertion (A) : Mary Mallon was nicknamed as 'Typhoid Mary'.
Reason (R) : Mary Mallon spread typhoid for several years through the food she prepared.

(a) Both A and R correct explanation of A
(b) Both A and R are correct but R is not correct explanation of A.
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct.

AP EAPCET-22.05.2023, Shift-II

Ans. (a) : Mary Mallon was a cook and carrier of a typhoid disease which she spread for several years through the food she prepared.
Typhoid is a disease which are caused by *Salmonella typhi* bacteria and also known as enteric fever.
Thus, Both Assertion (A) and Reason (R) are correct explanation of Assertion (A)

94. The correct match among the following

	Bacteria	Disease
I	Clostridium	Botulism
II	Diplococcus	Pneumonia
III	Treponema	Gonorrhoea
IV	Neisseria	Tetanus

(a) I & II (b) I & III
(c) II & IV (d) III & IV

AP EAPCET-22.05.2023, Shift-II

Ans. (a) : Botulism is a rare but deadly form of food poisoning. It is caused by a bacteria (clostridium botulinum) that is found all over, even in soil and water. Botulism is a rare but serious illness caused by a toxin that attacks the body's nerves and causes difficulty in breathing, muscle paralysis and even death.
Deplococcus, is the most common cause of bacterial pneumonia.
Hence, only I and II are correctly matched.

95. Structure of bacteriophages is complicated because they show

I. Polyhedral symmetry
II. Helical symmetry
III. Bilateral symmetry
IV. Radial symmetry

(a) III, IV (b) I, III
(c) II, III (d) I, II

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Structure of Bacteriophages is complicated because they show polyhedral and helical symmetry.
In helical structure nucleic acid surrounded by a hollow protein cylinder or capsid and possessing a helical structure.
In polyhedral structure nucleic acid is surrounded by a polyhedral capsid, usually in the form of an icosahedron.
Most of the phages have tailed phage morphology.

96. Two enzymes responsible for restricting the growth of bacteriophage were isolated from

(a) Salmonella (b) Agro bacterium
(c) Escherichia Coli (d) Archea bacteria

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : The two enzymes responsible for restricting the growth of bacteriophage were isolated from E.coli. Restriction enzyme is a protein isolated from bacteria that cleaves DNA sequences at sequence - specific sites, producing DNA fragments with a known sequence at each end. The use of restriction enzymes is critical to certain laboratory procedure including recombinant DNA technology and genetic engineering.

97. Which of the following is a correct statement?

(a) Mycoplasma have DNA, ribosome and cell wall.
(b) Cyanobacteria are a group of autotrophic organisms classified under Kingdom Monera.
(c) Bacteria are exclusively heterotrophic organisms.
(d) Slime moulds are saprophytic organisms classified under Kingdom Monera.

NEET-2022

Ans. (b) : Cyanobacteria or blue-green algae are the one of most successful autotrophic organisms. Cyanobacteria are the most self contained photosynthetic organisms. Cyanobacteria may be unicellular, colonial or filamentous. Ex-Oscillatoria.

98. Plasmid is

(a) extragenetic material in mycoplasma
(b) circular DNA in bacteria
(c) extra DNA in bacteria
(d) fragment of DNA inserted in bacteria for forming copies

AP EAMCET-12.07.2022 Shift-II
Punjab MET-2009

Ans. (d) : A plasmid is a small circular DNA molecule found in bacteria and some other microscopic organism. The insertion of a DNA fragments into a bacterial plasmid with the enzymes DNA ligase. The plasmid is cut open with a restriction nuclease in this case one that produces cohesive ends and is mixed with DNA fragment to be cloned.

99. Which of the following show the presence of chromatophores?

(a) Photosynthetic autotrophic eubacteria
(b) Heterotrophic bacteria
(c) Chemosynthetic autotrophic bacteria
(d) Branched filamentous bacteria

TS EAMCET-30.07.2022 Shift-I

@apna_pdf

Ans. (a) : Chromatophores are pigment containing vesicles that are found in cytoplasm. They are present in prokaryotes such as photosynthetic autotrophic eubacteria.

100. Antibiotics are produced by _____

(a) Virus (b) Bacteria
(c) Protozoans (d) Cyanobacteria

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : Antibiotics are chemicals that inhibit or kill the growth of bacteria and are used to treat bacterial infection. They are produced by bacteria and fungi.

101. Which of the following statements is not true about bacterial cell?

(a) Possess genetic material not bounded by nuclear membrane.
(b) Small circular DNA molecules are present in the cytoplasm.
(c) Pili and fimbriae are extracellular structures for motility.
(d) The cell envelop is composed of glycocalyx, cell wall and plasma membrane.

TS EAMCET-30.07.2022 Shift-II

Ans. (c) : Pili and Fimbriae– Pilli are hair like, cell wall of bacteria smaller that filagella are involved in the conjugation of bacterial cells, promoting the initial joining of mating pairs, short pili are known as fimbriae means for attachment on the substratum of the bacterial cell.

102. Choose the incorrect statement regarding Archaebacteria

(a) They are halophiles and thermoacidophiles
(b) The cell wall contains peptidoglycan
(c) The cell membrane contains branched chain lipids
(d) They are responsible for the production of Methane from the dung of animals

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : Archaebacteria:– It is unicellular, prokaryotic organism. The cell wall consist of complex proteins and non cellulosic polysaccharide but peptidoglycan is absent in cell wall. The cell membrane made up of branched chain of lipid due to the presence of lipid chains, they are resistant to high temperature, salinity, radiation and change in pH.

103. Archaebacteria differ from eubacteria in:

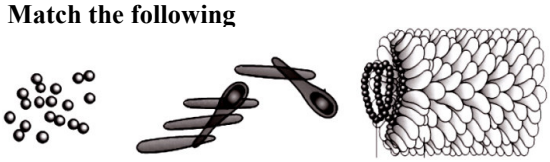
(a) Cell membrane
(b) Mode of nutrition
(c) Cell shape
(d) Mode of reproduction

AP EAMCET -03.09.2021, Shift-I
AIPMT-2014

Ans. (a) : The archaebacteria are the 'primitive' bacteria that include extremophiles like methanogens, halophiles and thermophiles. They represent some of the most ancient of life forms that persist today. They have both eubacterial and eukaryotic characters besides the features unique to them. Their mode of reproduction, nutrition and cell shape and size resembles a typical eubacteria. Their cell walls are made of a variety of polymers, but do not contain peptidoglycan unlike eubacteria.

• Archaebacteria differs from eubacteria only in the cell membrane. The membrane lipids present in archaebacteria are ether-linked, whereas, the eubacteria contain ester-linked membrane lipids.

104. Match the following

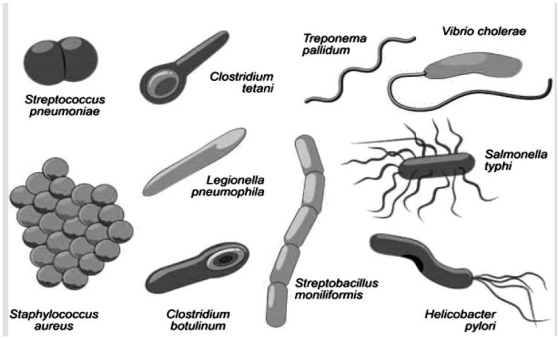


(a) A–Tobacco mosaic virus, B– Coccus, C–Bacillus
(b) A–Coccus, B–Bacillus, C–Tobacco mosaic virus
(c) A–Bacillus, B–Coccus, C–Tobacco mosaic virus
(d) A–Coccus, B–Tobacco mosaic virus, C–Bacillus

AP EAMCET-03.09.2021 Shift-I
AIIMS-25.05.2019 Shift-I

Ans. (b) : Bacteria are of various shapes and sizes. The four basic shapes of bacteria are bacillus (rod-like), Coccus (Spherical), Vibrio (Comma-shaped) and spirillum (Spiral).

• TMV is made up of a piece of nucleic acid (RNA) and is surrounding a protein coat. The complete virus is a submicroscopic, rigid, rod-shaped particle.



105. The use of friendly bacteria for therapeutic use is a concept of _____

(a) Antibiotic (b) Probiotics
(c) Beverages (d) Enzymes

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : The use of friendly bacteria for therapeutic use is a concept of Probiotics. They fight off the bad bacteria and restore the balance within your body, making you feel better.

106. Bacteria possess following appendages EXCEPT _____.

(a) flagella (b) fimbriae
(c) cilia (d) pili

MHT CET 5.10.2020 Shift-I

Ans. (c) : Bacteria have different appendages like flagella, fimbriae and pili and they are used for motility and attachment. A flagellum is a whip-like structure that allow a cell to move most Gram - negative bacteria. Fimbriae have hair-like projections external to the cells that allow bacteria to stick to the cells they infect.
Cilia are not found in bacteria.

@apna_pdf

107. Smallest bacterial genome is seen in _____.
(a) *Methanococcus jannaschii*
(b) *Mycobacterium genitalium*
(c) *Heamophilus influenzae*
(d) *Saccharomyces cerevisiae*

MHT CET 5.10.2020 Shift-I

Ans. (b) : *Mycobacterium genitalium* has the smallest genome of organism that can be grown in pure culture.
- It has a minimum metabolism and little genomic redundancy. Its genome is expected to be a close approximation to the minimum set of genes needed to sustain bacterial life.

108. The sites of nitrogen fixation in blue green algae are _____.
(a) vegetative cells (b) apical cells
(c) heterocysts (d) basal cells

MHT CET 5.10.2020 Shift-I

Ans. (c) : A heterocyst is a nitrogen - fixing cyanobacterial cell that has undergone differentiation.
- Under anaerobic conditions, the heterocysts serve as nitrogen fixation sites. They arise as a result of a deficiency of fixed nitrogen.
- Heterocysts are found in many species of filamentous blue-green algae. They are cells of slightly larger size and with a more thickened wall than the vegetative cells.

109. Match the following lists:

List – I		List - II
A. Leeuwenhoek	**I.**	**Link to infections disease**
B. Louis Pasteur	**II.**	**Description of bacteria**
C. Koch	**III.**	**Coined the term bacteria**
D. Ehrenberg	**IV.**	**Chemical factories**

The correct match is

	A	B	C	D
(a)	II	III	I	IV
(b)	I	II	III	IV
(c)	III	IV	I	II
(d)	II	IV	I	III

TS EAMCET-29.09.2020 Shift-I

Ans. (d) :

List-I	**List-II**
A. Leeuwenhoek	II. Description of bacteria
B. Louis Pasteur	IV. Chemical factories
C. Koch	I. Link to infections disease
D. Ehrenberg	III. Coined the term bacteria

110. Based on the following characters identify the organisms respectively
– Cell wall with pseudomurein
– Cell wall with mucopeptide
– Marine bioluminescence
– Cell wall made of protein rich pellicle and found in stagnant water
(a) Methanogens, Bacillus, Noctiluca, Euglena
(b) Bacillus, Methanogens, Noctiluca, Euglena
(c) Noctiluca, Euglena, Methanogens, Bacillus
(d) Euglena, Noctiluca, Bacillus, Methanogens

TS EAMCET-28.09.2020 Shift-II

Ans. (a) : The cell wall with pseudomurein is present methanogens
- The cell wall with mucopeptide is found in Bacillus.
- Noctiluca is marine bioluminescences protozoa.
- The cell wall of Euglena made up of protein rich pellicle and found in stagnant water.

111. 250 grams of which microbes, among the following, can produce 25 tons of protein?
(a) Methanobacterium (b) Spirulina
(c) Brevibacterium (d) Methylophilus

AP EAMCET-24.09.2020 Shift-II

Ans. (d) : It has been observed that about 250 gm of Methylophilus produces 25 tones of proteins per day because of its high rate of biomass production and growth.

112. Escherichia coli is extensively used in biological research because it is _____
(a) Easily cultured
(b) Easily available
(c) Easy to handle
(d) Easily multiplied in host

AP EAMCET-24.09.2020 Shift-II
AIPMT-1993

Ans. (a) : E. coli is extensively used in biological research because it is easily cultured on minimal medium and has fast rate of multiplication and short generation time.

113. The structure present in cyanobacteria (BGA) helping is N_2 fixation is
(a) haplosperm (b) holostrum
(c) holotrema (d) heterocyst

Punjab MET-2008
TS EAMCET-29.09.2020 Shift-II

Ans. (d) : The structure present in Cyanobacteria(BGA) helping in N_2-fixation is called **heterocyst.**
- The trichome of *Nostoc* are characterized by the presence of heterocysts which are intercalary. The intercalary heterocyst has two polar nodules and the terminal ones have only one polar nodule.

114. Which of the following statements about inclusion bodies in incorrect?
(a) These are involved in ingestion of food particles
(b) They lie free in the cytoplasm
(c) These represent reserve material in cytoplasm
(d) They are not bound by any membrane

NEET-2020 Phase-I

Ans. (a) : Inclusion bodies are particles that are freely found in the cytoplasm of the cell.
- They are formed via multiplication of virus or bacteria in the host cell and can also be used for diagnosis of the respective viral or bacterial disease.
- They help in storage of cellular metabolic products and are not membrane bound.
- Inclusion bodies don't play a role in ingestion of food particles.

@apna_pdf

115. Inclusion bodies of blue-green, purple and green photosynthetic bacteria are

(a) Microtubules (b) Contractile vacuoles
(c) Gas vacuoles (d) Centrioles

NEET-2020 Phase-II

Ans. (c) : Blue green algae, purple and green photosynthetic bacteria have gas vacuole as inclusion bodies.

- Inclusion bodies are reserved materials found in prokaryotic cells and are stored in cytoplasm.
- They are gas vacuoles and cyanophycean granules.

116. Which of the following is incorrect about Cyanobacteria?

(a) They have chlorophyll A similar to green plants
(b) They are photoautotrophs
(c) They lack heterocysts
(d) They often form blooms in polluted water bodies

NEET-2020 Phase-II

Ans. (c) : Cyanobacteria have heterocysts that fixes atmospheric nitrogen to NO_2, NO_3^+.

- Heterocysts or heterocytes are specialized nitrogen - fixing cells formed during nitrogen starving by some filamentous cyanobacteria, such as Nostoc, *Anabaena.*
- They fix nitrogen from dinitrogen (N_2) in the air using the enzyme nitrogenase.

117. The main difference in Gram (+)ve and Gram (–)ve bacteria resides in their:

(a) cell wall (b) cell membrane
(c) cytoplasm (d) flagella

WB JEE-2011
AP EAMCET-24.09.2020 Shift-II
AIPMT-1990

Ans. (a): Gram positive bacteria have cell walls composed of thick layers of peptidoglycan and Gram negative bacteria have cell wall composed of a thin layer of peptidoglycan.
Thus, the main difference in Gram (+ve) and Gram (–ve) bacteria resides in their cell wall.

118. Match the following lists:

	List -I		List-II
A	**Photoautotroph**	**I**	**Nitrosomonas**
B	**Chemoautotroph**	**II**	**Rhodospirillum**
C	**Photoheterotroph**	**III**	**Salmonella**
D	**Chemoheterotroph**	**IV**	**Chlorobium.**

The correct match is :

	A	B	C	D
(a)	IV	I	II	III
(b)	II	IV	III	I
(c)	II	I	IV	III
(d)	IV	III	II	I

TS EAMCET-08.05.2019 Shift-II

Ans. (a) :

	List -I		List-II
A	Photoautotroph	IV	Chlorobium
B	Chemoautotroph	I	Nitrosomonas
C	Photoheterotroph	II	Rhodospirillum
D	Chemoheterotroph	III	Salmonella

119. Identify combination of incorrect statements related to cyanobacteria

I. Cyanobacteria are referred to as blue-green algae
II. They perform oxygenic photosynthesis in chloroplasts
III. The red- colour of red-sea is due to the presence of a cyanobacterial species Trichodesmium erythraeum.
IV. All the cyanobacterial species can fix atmospheric N_2 in specialised cells called heterocysts.

(a) I, II (b) II, III
(c) II, IV (d) I, IV

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Cyanobacteria are referred to as blue green algae. They do not perform oxygenic photosynthesis in chloroplast. The red colour of red sea is due to the presence of a Cyanobacterial species *Trichodesmium erythraeum*.

- All the Cyanobacterium species cannot fix atmospheric N_2 in specialized cell called hetrocysts.

120. Microbes like Spirulina can be good alternate to the conventional sources of proteins for human nutrition, because …

(a) they give more biomass in less time
(b) they are produced using synthetic fertilizers
(c) their proteins are different from plant proteins
(d) they have high fibers content

Karnataka CET-2019

Ans. (a) : Microbes like Spirulina can be grown easily on materials like waste water, molasses, animal manure and sewage, to produce large quantity and can serve as food rich in protein minerals and nutrition because of a high rate of biomass in less time.

121. The following are true about culture media for microbes

(a) Lowenstein-Jensen medium is used to isolate mycobacteria
(b) Thioglycolate broth allows only anaerobes to grow
(c) MacConkey agar prevents the growth of Gram negative bacteria
(d) Sabouraud's culture is useful for culturing bacterial infection

SRM JEEE-2019

Ans. (a) : Jensen Medium better known as L.J medium, is a selective egg-based medium specifically used for the culture and isolation of Mycobacterium species, including Mycobacterium tuberculosis, form chemical specimens.

- In culture media for microbes, Lowenstein-Jensen medium is used to isolate mycobacterium.

122. Examples of photoautotrophic bacteria which capture light energy and transform it into chemical energy to obtain carbon from atmospheric carbon dioxide are

i. Anabaena **ii. Nitrosomonas**
iii. Chlorobium **iv. Xanthomonas**

@apna_pdf

The correct combination is:

(a) i, ii (b) i, iii
(c) ii, iii (d) iii, iv

TS EAMCET-09.05.2019 Shift-I

Ans. (b) : Anabaena has unseriate, straight, curved or coiled trichomes that may be constricted at the cell wall, the blue green to yellow – green colored cells may be spherical ellipsoidal, cylindrical.

- Chlorobium vesicles are protein – bound organelles that enclose photosynthetic pigments in the cytosol of photosynthetic green bacteria.

123. Match the following.

List-I	List-II	List-III
(A) Photoauto-trophs	i. Oxidation of inorganic substances	I. Bacillus
(B) Photohe-terotrophs	ii. Organic detritus	II. Beggiotoa
(C) Chemoauto-trophs	iii. Organic CO_2	III. Chromatium
(D) Saprophytes	iv. Atmospheric CO_2	IV. Rhodos-pirillum

The correct answer is

Options:

	A	B	C	D
(a)	iv, III	iii, IV	i, II	ii, I
(b)	iv, III	i, II	iii,IV	ii, I
(c)	iv, I	i, IV	iii, II	ii,III
(d)	iv, IV	iii, I	ii, III	i, II

AP EAMCET-24.04.2019 Shift-II

Ans. (a) : Photoautotrophs are organism that use energy and inorganic carbon to produce organic materials.

Photoheterotrophs- They are organism that use light for energy but can not use carbon dioxide as their sole carbon source.

Saprophytes- Decomposed or decaying material is converted into simple organic materials called the saprophytes.

Chemoautotrophs- They are organism that obtains their energy from a chemical reaction.

124. Match the following lists :

v	List-I		List-II
A.	Photoautotroph	I.	Xanthomonas
B.	Photoheterotroph	II.	Rhodopseudomonas
C.	Saprophyte	III.	Bacillus
D.	Parasite	IV.	Chlorobium

The correct match is

	A	B	C	D
(a)	IV	I	II	III
(b)	IV	II	III	I
(c)	I	III	IV	II
(d)	II	IV	III	I

TS EAMCET-08.05.2019 Shift-I

Ans. (b) :

	List-I		List-II
A.	Photoautotroph	IV.	Chlorobium
B.	Photoheterotroph	II.	Rhodopseudomonas
C.	Saprophyte	III.	Bacillus
D.	Parasite	I.	Xanthomonas

125. Single chromosome with circular DNA as genetic material occurs in____

(a) E. Coli (b) Chlamydomonas
(c) AIDS virus (d) Yeast

MHT CET-2019

Ans. (a) : Single chromosome with circular DNA as genetic material occurs in E. coli. E. coli is a gram negative bacteria. It is rod shaped coliform bacteria of genus Escherichia that is commonly found in intestine of warm blooded organism.

126. Choose the mismatch bacteria in the given list

(a) *Xanthomonas oryzae*
(b) *Xanthomonos oxanopodis pv citri*
(c) *Agrobacterium tumefacience*
(d) *Bdellovibrio bacteriovorus*

AP EAMCET-24.04.2019 Shift-I

Ans. (d) : Bdellovibrio is a Gram-negative, obligate aerobic bacteria. They can prey upon other Gram negative bacteria and feed on the biopolymers eg. proteins and nucleic acids, of their hosts. They have two lifestyles a host- dependent, highly mobile phase, the attack phase in which they form bdelloplasts form.

127. Which of the following nucleic acids is present in an organism having 70 S ribosomes only?

(a) Double stranded circular DNA with histone proteins
(b) Single stranded DNA with protein coat
(c) Double stranded circular naked DNA
(d) Double stranded DNA enclosed in nuclear membrane

NEET (Odisha)-2019

Ans. (c) : 70S ribosome are present in prokaryotic species like bacteria, which also lack a nucleus and have double-stranded, circular naked DNA in their cytoplasm that is not protected by the nuclear membranes.

128. Match the organisms in column I with habitats in column II.

Column-I	Column-II
(A) Halophiles	(i) Hot springs
(B) Thermoacidophiles	(ii) Aquatic environment
(C) Methanogens	(iii) Guts of ruminants
(D) Cyanobacteria	(iv) Salty areas

Select the correct answer from the options given below :

(a) (A)-(ii), (B)-(iv), (C)-(iii), (D)-(i)
(b) (A)-(iv), (B)-(i), (C)-(iii), (D)-(ii)
(c) (A)-(i), (B)-(ii), (C)-(iii), (D)-(iv)
(d) (A)-(iii), (B)-(iv), (C)-(ii), (D)-(i)

NEET (Odisha)-2019

Ans. (b) : Halophiles can be found in salty environments with high salt concentrations.

- **Thermoacidophiles** are a type of extremophilic microbe that can endure both high temperature and acidic environment.
- **Methanogens** are micro-organisms that generate methane as a metabolic by product in hypoxic conditions. It is found in guts of ruminants.

@apna_pdf

• **Cyanobacteria** are a group of photosynthetic bacteria, some of which are nitrogen fixing, that live in a wide variety of moist soils and water either freely or in a symbiotic relationship with plants or lichen forming fungi. They can also be found in aquatic environments.

129. Which of the following statements about methanogens is not correct ?

(a) They produce methane gas
(b) They can be used to produce biogas
(c) They are found in the rumen of cattle and their excreta
(d) They grow aerobically and breakdown cellulose-rich food

NEET (Odisha)-2019

Ans. (d) : Methanogens are the microorganisms that produce methane as a by product of its metabolic activities. They are anaerobic organisms which grow on cellulosic material which produce methane, carbon dioxide and hydrogen.

• Methanogens can be used to digest organic matter and thus, produce **biogas**. It is found in the rumen of cattle helps in digestion of cellulose and its breakdown into glucose, thus providing a source of energy for the cattle.

130. Identify the diagram of heterocyst.

(a)
(b)
(c)
(d)

JIPMER-2019

Ans. (a) : Blue green algae or cyanobacteria acquire the specialized cells known as heterocysts. Heterocysts is the site of N_2 fixation. It contains an enzyme nitrogenase, which help in nitrogen fixation. This diagram shows the hetrocysts of Nostoc bacteria.

131. Which statement is correct

(a) Mycoplasma is smallest and wall less living organism
(b) Influenza and herpes caused by virus having DNA and RNA
(c) Nostoc and Anabaena are important decomposer
(d) Methanogen are methane producing bacteria in wheat crop

AIIMS-26.05.2019 Shift-II

Ans. (a) : Mycoplasma are the smallest among the known aerobic prokaryotes. They were first discovered by Pasteur in 1843, during his work on the possible causal agent of pleuropneumonia of cattle. Therefore, they were called pleuro-pneumonia-like organism (PPLO).

• As they do not have cell wall they do not get affected by antibiotics and causes severe disease to the plants and animals. They can even survive without oxygen and respire anaerobically.

132. Study the following statements

(A) Archaea and Eukarya are more closely related to each other than bacteria
(B) R.H. Whittaker placed unicellular eukaryotic organisms in the kingdom Monera
(C) Carl Woes replaced Kingdom Monera with two kingdoms Bacteria and Archaea
(D) 24S subunit of ribosomal RNA is used in the identification of Microbes

In the above, incorrect statements are

(a) A, C (b) A, D
(c) B, C (d) B, D

AP EAMCET-25.04.2018 Shift-I

Ans. (d) : R.H Whittaker placed unicellular eukaryotic organism in the Kingdom Protista not placed in Monera.

• The subunit of ribosomal RNA is used in the identification of microbes 16 S rRNA.

133. Study the following statements

(i) Branched chain of proteins are present in membranes of Archaebacteria
(ii) Histones are absent in Noctiluca chromosomes
(iii) Asexual spores of diatoms are Auxospores
(iv) In Nostoc chromatin is present in centroplasm

Choose the correct answer

Options:

(a) i, ii, iii, iv (b) i, iv
(c) i, iii (d) ii, iv

AP EAMCET-25.04.2018 Shift-II

Ans. (d): Without histones the unbind DNA chromosomes would be very long. Nucleoid is occupied by an extremely involuted double stranded and nucleolus are absent in nucleoid.

• The single-celled Nostoc does not have a nucleus or other internal membrane systems and the cytoplasm is comprised of seventy to eighty-five percent water.

134. Bacterial flagella is made up of

(a) Microtubules (b) tubulin
(c) Flagellin (d) Spinin

SRM JEEE-2018

Ans. (c) : Bacterial flagella is made up of a protein referred to as **Flagellin**. It is found in the flagellar structure of many bacteria.

• Microtubule is highly dynamic polymers that are part of the cytoskeleton which provides structure and shape to the eukaryotic cells.
• Tubulin is found in centrosomes and spindle pole bodies.

135. Match the following

List-I		List-II	
A.	**Spirillum**	**(i)**	**comma shaped**
B.	**Vibrio**	**(ii)**	**helical**
C.	**Pleomorphic**	**(iii)**	**spherical**
D.	**Cocci**	**(iv)**	**elongated rods**
		(v)	**keep on changing their shape**

@apna_pdf

The correct answer is

	A	B	C	D
(a)	(ii)	(i)	(v)	(iii)
(b)	(ii)	(v)	(i)	(iii)
(c)	(i)	(iv)	(iii)	(ii)
(d)	(iii)	(i)	(v)	(iv)

TS EAMCET-02.05.2018 Shift-II

Ans. (a) :

List-I		List II
(A) Spirillum	-	(ii) Helical
(B) Vibrio	-	(i) Comma shaped
(C) Pleomorphic	-	(v) Keep on changing their shape
(D) Cocci	-	(iii) Spherical

136. Which of the following is the non-pathogenic bacteria of colon?

(a) Escherichia coli
(b) Balantidium coli
(c) Entamoeba histolytica
(d) Enterbius vermicularis

HP CET-2018

Ans. (a) : Escherichia coli is a Gram-negative facultatively anaerobic, rod-shaped, coliform bacterium of genus Escherichia that is commonly found in the lower intestine of warm-blooded organisms, which is non pathogenic bacteria of colon.

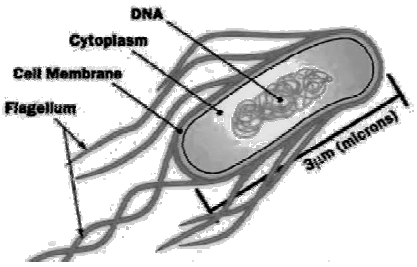
137. Which is incorrect about E.coli.

(a) It is diploid
(b) It is found in human intestine
(c) Transformation, Transduction, Conjugation can show
(d) Can be used in Recombinant DNA technology

AIIMS-27.05.2018 Shift-II

Ans. (a) : *Escherichia coli* is a gram-negative, facultatively anaerobic, rod-shaped, coliform bacterium of the genus Escherichia which is commonly found in the lower intestine of warm-blooded organisms. It is able to survive with or without oxygen and thus is a "facultative anaerobic".

- In bacteria there is only one copy of the chromosome, bacterial cells are considered haploid, for example, E. coli.



The E. coli bacterium

138. From which bacterium the REN-Sal-I is isolated?

(a) *Escherichia coli*
(b) *Streptococcus aureus*
(c) *Haemophilus influenzae*
(d) *Streptomyces albus*

Karnataka CET-2017

Ans. (d) : The restriction endonucleases Sal-I is isolated from the bacteria *Streptomyces albus.*
This is the first enzyme extracted from bacteria.

139. Restriction endonucleases are isolated from some bacteria. Their role in bacteria is:

(a) defence against virus
(b) synthesis of proteins
(c) act as genetic material
(d) help in reproduction

Karnataka CET-2017

Ans. (a) : Restriction endonucleases are naturally present in the bacteria where they provide protection against invading viral DNA. Hind II was first restriction endonuclease to be isolated and characterized. Today more than 900 restriction enzymes have been isolated from over 230 strain of bacteria.

140. Which of the following options show the characters of mycoplasma?

(a) Smallest living cell without cell wall survive with oxygen.
(b) Smallest living cell with cell wall survive with oxygen.
(c) Smallest living cell without cell wall survive without oxygen.
(d) Smallest living cell with cell wall survive without oxygen.

Karnataka CET-2017

Ans. (c) : Dienes and Edsall(1937) detected first Mycoplasma isolated from humans in a Bartholin's gland abscess. It is unicellular smallest prokaryotic organism, which is capable for independent growth, reproduction and metabolism, also called PPLO (pleuropneumonia like-organism) cell wall absent exhibit polymorphism called "Joker of the plant kingdom" cell membrane made up of lipoproteins, mesosomes are absent.

141. Read the following statement regarding bacteria.

I. Bacteria exchange their genetic matter through conjugation which involves cell to cell contact.
II. Transduction in 'Salmonella is reported by Tatum and Lederberg in 1952.
III. Citrus canker disease is caused by bacteria Xanthomonas citri.
IV. Hans Christian gram's staining method is based on cell wall composition of bacteria.

Choose the correct option with true statements

(a) I and III (b) I, III and IV
(c) I, II and III (d) II and IV

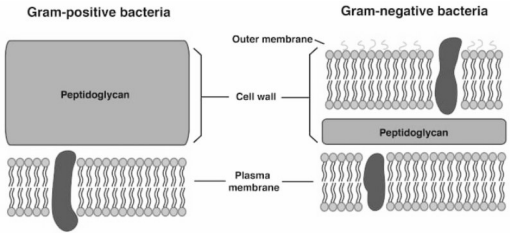
AIIMS-2017

Ans. (b) : Conjugation is the process of transfer of genetic material, that is associated with cell to cell connection, it was first reported in E. coli by Tatum and Lederberg in 1946.

- **Transduction** is a process of transfer of DNA by bacteriophage virus in bacteria. It was first reported in the Salmonella by Zinder and Lederberg in 1952.

@apna_pdf

• **Gram Staining** is based on the composition or size of bacterial cell wall as Gram positive bacteria has thick cell wall compare to Gram negative bacteria.



142. *Treponema pallidum* is a ____bacterium.
(a) Streptococcus (b) Streptobacillus
(c) Spirochaete (d) Oligochaete

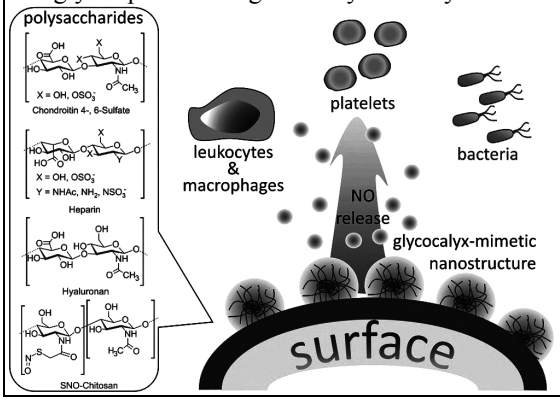
MHT CET-2017

Ans. (c) : *Treponema pallidum* formally known as *Spirochaete pallida*, is a spirochaete bacterium with various sub-species that cause the diseases syphilis, bejel, and yaws. *Treponema pallidum* is a Gram-negative bacteria which is a motile spirochaete bacterium.

143. Which of the following components provides sticky character to the bacterial cell?
(a) Cell wall (b) Nuclear membrane
(c) Plasma membrane (d) Glycocalyx

NEET-2017

Ans. (d) : The glycocalyx is a dense, gel-like meshwork that surrounds the cell constituting a physical barrier for any object to enter the cell. Glycocalyx is the outermost layer of the cell envelope in bacteria. It is a glycoprotein and glycolipid covering and may be slimy and sticky.



144. Which of the following are found in extreme saline conditions?
(a) Archaebacteria (b) Eubacteria
(c) Cyanobacteria (d) Mycobacteria

NEET-2017

Ans. (a) : Archaebacteria are found in extremely harsh environments. **Halophytes** are found in extreme saline conditions. The difference in their cell wall structure makes them survive in extreme conditions.

- There are three type of Archaebacteria. These are methanogens, halophiles, and thermoacidophiles.
- **Halophiles** (Salt loving) are the extremophile organisms that can survive in extreme saline conditions.

145. All monerans
(a) Contain DNA and RNA
(b) Demonstrate a long circular strand of DNA, not formed enclosed in a nuclear membrane
(c) Are bacteria
(d) All of the above

JIPMER-2017

Ans. (d) : The prokaryote with circular DNA is called Monera (lack a nuclear membrane). RNA is also a component of Monera. The Monera kingdom includes every kind of bacterium.

146. Teichoic acids are typically found in
(a) Outer membranes of gram positive bacteria
(b) Cell walls of gram positive bacteria
(c) Cell walls of gram negative bacteria
(d) outer membranes of gram negative bacteria

SRM JEEE -2017
UPCPMT-2011, 2009
J & K CET-2008

Ans. (b) : Teichoic acids are found within the cell wall of most Gram-positive bacteria such as species in the genera *Staphylococcus, Streptococcus, Bacillus, Clostridium, Corynebacterium and Listeria* and appear to extend to the surface of the peptidoglycan layer.

147. Microbes that inhibit the growth of other microorganisms termed as
(a) Synergism (b) Mutualism
(c) Parasitism (d) Antagonism

SRM JEEE -2017

Ans. (d) : It refers to the inhibition of one microorganism. It is also called the first line of defense.
• Microbes that inhibit the growth of other microorganisms termed as antagonism.

148. Most widely used bioweapon is
(a) Bacillus subtilis (b) Pseudomonas putida
(c) Bacillus anthracis (d) None of the above

BCECE-2010

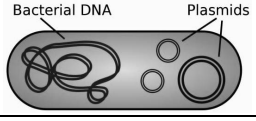
Ans. (c) : Spores of the bacteria Bacillus anthracis are essentially unbreakable and continue to function even when subjected to high temperature and ultraviolet radiation.

149. In bacteria, plasmid is : -
(a) Extra chromosomal material
(b) Main DNA
(c) Non functional DNA
(d) Repetative gene

AIPMT-2002

Ans. (a) : The bacteria have a extra-chromosomal material known as **plasmid**.

- The plasmid used in genetic engineering. It is a small, circular, double-stranded DNA molecule that is distinct from a cell's chromosomal DNA.
- It is the most commonly used bacterial cloning vector.
- It is naturally existing in bacterial cell and also occur in some eukaryotes.



@apna_pdf

150. Choose the correct sequence of stages of growth curve for Bacteria

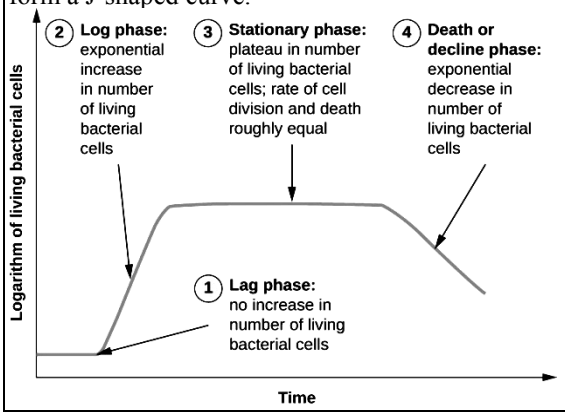
(a) Lag, Log, stationary, Decline phase
(b) Lag, Log, Stationary phase
(c) Stationary, Lag, Log, Decline phase
(d) Decline, Lag, Log phase

AIPMT-2002

Ans. (a) : When microbes are grown in a closed system or batch culture, the resulting growth curve has usually four phase-

1. Lag phase 2. Log phase
3. Stationary phase 4. Death phase

- Time-dependent size of a growing bacterial cell population is commonly represented in log-scale against time, in which case, the lag and the exponential phase form a J-shaped curve.



151. The semilog of per minute growing bacteria is ploted against time. What will the shape of graph

(a) Sigmoid
(b) Hyperbolic
(c) Ascending straight line
(d) Descending straight line

AIPMT-2002

Ans. (c) : The ascending straight line is the representation of the growth of bacteria per minute. It is basically the graphical representation of the increase in growth.

152. 'Comma' shaped bacteria are known as:

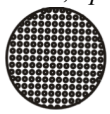
(a) coccus (b) spiral
(c) lophotrichus (d) vibrio

AFMC-2001

Ans. (d) : Comma shaped bacteria are called as Vibrio. It causes various systemic diseases such as cholera. Eg. *Vibrio cholera, Vibrio vulnificus* etc.

Coma shaped

- **Coccus or cocci–** It is spherical in shape smallest bacteria eg- *Diplodocus pneumonae*.
- **Spiral bacteria–** It is coiled in shaped eg- *Spirillum minus, Spirillum valutane*.



Spiral bacteria

Spiral Bacteria

Lophotrichus– The tuft of flagella at the end is called Lophotrichus, eg- *Salmonella, Spirillum valutan.*

Tuft

Lophatricus. B Lophatricous

153. What is the type of nutrition in purple and green sulphur bacteria ?

(a) Photoautotrophic (b) Chemoautotropic
(c) Photoheterotrophic (d) Chemoheterotrophic

TS EAMCET-2015

Ans. (a) : The nutrition found in purple and green sulphur bacteria is known as the **photoautotrophic type** of nutrition, the organism captures the photons from the sunlight and produces organic compound such as carbohydrates etc. and derives energy from them to survived.

- **Chemoheterotrophic–** Use the chemical energy for the synthesis of own food by breathing the inorganic and organic compound.

154. Bacterium responsible for retting of jute and flex is

(a) Lactobacillus (b) Clostridium
(c) Bacillus (d) Agro bacterium

UP CPMT-2013

Ans. (b) : The micro organism acclimated for the retting of jute is the butyric acid bacteria of Clostridium genera. Retting of jute is the extraction of fibers from the bast plant.

155. Which one of the following is not characteristic of gram-positive bacteria?

(a) Cell wall is smooth
(b) Mesosomes are distinctively prominent
(c) Basal body of flagellum contains 2 rings
(d) Outer membrane is present
(e) Murein content of cell wall is 70 - 80%

Kerala PMT-2008

Ans. (d) : On the basis of peptidoglycan in Gram positive bacteria is thick 70-80% in Gram negative bacteria peptidoglycan single layer thin 10-20%.

- In Gram negative bacteria out side of the peptidoglycan, other layer is present called liposaccharide due to which Gram negative bacteria are mostly pathogenic and liposaccharide layer absent in Gram positive bacteria but in Gram positive bacteria, teichoic acid is present and absent in Gram negative bacteria.
- Thickening of cell wall in Gram + ve bacteria 20-80 nm but in Gram – ve bacteria 8-12 nm.
- Gram positive bacteria non pathogenic and asceptable to antibiotics but Gram negative bacteria are resistance to antibiotics
- Mesosomes are prominent in gram positive but less prominent in gram negative bacteria.
- In Gram + ve bacteria blue voilet colour retains after the washing with alcohol, but in Gram –ve bacteria colour is washed.

@apna_pdf

156. Bacteria with flagella all over its body, is called
(a) monotrichous (b) amphitrichous
(c) lophotrichous (d) peritrichous.
AIIMS-1994

Ans. (d) : Peritrichous :- When flagella are present all over the surface of bacteria is called **peritrichous** eg- *E. coli, Salmonella, Proteus vulgaris.*

Peritricus

157. Single filament of Nostoc without mucilage sheath is called as
(a) colony (b) mycelium
(c) trichome (d) hyphae
BHU PMT (Mains)-2010

Ans. (c) : The single filament of Nostoc without mucilage sheath is known as trichome.
Mycelium– The network of hyphae is known as mycelium.
Hyphae– Filaments are fine tubular highly branched is called hyphae.
Colony– A group of bacteria , fungi and other organism in solid, agar plate is known as colony.

158. Cyanobacteria are:
(a) Mosses which attack bacteria
(b) Bacteria which attack Cyanophyccae
(c) Autotrophic organism with phycocyanin
(d) None of these
BVP-2004

Ans. (c) : Cyanobacteria commonly known as **blue green algae.** Cyanobacteria are autotrophic and synthesized their food from photosynthesis. These are oxygenic organism which evolved O_2 in photosynthesis and oxidizing atmosphere. Main pigment phycobilins are of two types Phycocyanin and Phycoerythrin along with chlorophyll a.

159. Which of first photosynthetic organism?
(a) Green algae (b) Red algae
(c) Cyanobacteria (d) None of these
BVP-2004

Ans. (c) : Cyanobacteria– These are oxygenic organism which evolved O_2 in presence of photosynthesis and oxidizing atmosphere, which consist of C. phycocyanin

160. An auxotroph is:
(a) a plant that responds by vending towards sun
(b) an organism that depends on another organism for meeting its nutritional requirements
(c) a mutant which has lost its ability to synthesize one or more essential compounds
(d) a plant that is able to synthesize its own carbohydrate
BVP-2005

Ans. (c) : Auxotroph:– It is a mutant which has lost its ability to synthesize and are more essential compound. Auxotrophy, to increase is the inability of an organism to synthesized a particular organic compound required it's growth.

161. Heterothallism was discovered in :
(a) Mucor (b) Aspergillus
(c) Agaricus (d) Albugo
BVP-2002

Ans. (a) : Heterothallism, was discovered by Blakeslee (1904) in *Mucor mucedo*. Heterothallism is a condition similar to dioecious plants in which two complementary individuals are required for sexual reproduction but are morphologically different.

162. Bacterial toxins when excreted into the surrounding medium are known as :
(a) toxins (b) endotoxins
(c) exotoxins (d) both [b]and [c]
Uttarakhand PMT-2006

Ans. (c) : Exotoxins:– Exotoxins are usually heat labile proteins secreted by certain species of bacteria which diffuse into the surrounding medium. An exotoxin can cause to damage to the host by destroying cells or by disrupting normal cellular metabolism. Pathogenic bacteria that produce exotoxin mainly include *Clostiridium tetani, Clostridium botulinum, Vibrio cholera.*

163. Sexual reproduction is absent in:
(a) Volvox (b) Spirogyra
(c) Nostoc (d) Ulothrix
BVP-2001

Ans. (c) : Sexual reproduction absent in Nostoc. It reproduces vegetatively by the fragmentation hormogonia, akinetes and heterocyst.
• By fragmentation- Filament broken into segment called the fragment. Each fragment after the growth forms new plant.
• Akinetes are formed during the unfavorable condition.

164. Choose the wrong statements regarding bacterial cell
A. Glycocalyx is the outer most envelope in bacteria.
B. The glycocalyx could be a loose sheath called capsule
C. The glycocalyx may be thick and tough called slime layer
D. A special structure formed by the plasma membrane is called mesosome
E. Small bristle like fibres sprouting out of the cell are called fimbriae
(a) A and C are wrong (b) A and B are wrong
(c) B and C are wrong (d) A and D are wrong
(e) C and D are wrong
Kerala PMT-2012

Ans. (c) : Glycocalyx:– It is outer most covering layer of bacteria. It is thick and tough layer called the **capsule.** Such bacteria are called capsulated bacteria. Mostly pathogenic, made up polypeptide and polysaccharide consist of mucilage which retains the water and protect the cell dehydration also help stick on the substances. If glycocalyx is slippery and loose called the slime layer consisting of polysaccharide.

165. Beggiatoa is a
(a) Chemoheterotroph (b) Chemoautotroph
(c) Photoautotroph (d) Photoheterotroph
AP EAMCET-2014

@apna_pdf

Ans. (b) : Beggiatoa is a species of filamentous colourless proteobacteria. It is present in sulphur rich environment. This is a chemoautotroph that is a symbiotic sulfur-oxidizing bacteria.

166. Identify the pair of wrong statements in the following

(i) Intine of pollen grain is made up of sporopollenin

(ii) Pollen grains are well preserved as fossils because of the presence of sporopollenin.

(iii) Enzymes each degrade the organic material of the exine of pollen grain.

(iv) Sporopollenin can withstand high temperatures, strong acids and alkali

(a) (iii) and (iv) (b) (ii) and (iii)

(c) (i) and (iii) (d) (i) and (ii)

AP EAMCET-2014

Ans. (c) : Sporopollenin is a chemically inert biological polymer. It is a major component of the tough outer walls of plant spores and pollen grains. It is preserved in soil and sediments. Sporopollenin is one of the most resistant organic compound. It protects, pollen grains from external factors such as temp., acid due to the presence of sporopollenin. Pollen grain are preserved as fossils by sporopollenin.

167. The structure present in cyanobacteria (BGA) helping in nitrogen-fixation is

(a) haplosperm (b) holostrum

(c) holotrema (d) heterocyst

JCECE-2010

Ans. (d) : Cyanobacteria or blue green algae having the potential to fix atmospheric nitrogen. It is possible due to the presence of heterocyst. They have evolved multiple specialized cell types, including nitrogen fixing heterocysts.

168. Which of the following are true archaebacteria? (1) Extreme halophytes
(2) Extreme thermophiles
(3) Methanogens
(4) Presence of peptidoglycan cell wall

(a) 1, 2 and 3 are correct

(b) 1 and 2 are correct

(c) 1, 2 and 4 are correct

(d) 1 and 3 are correct

BHU PMT (Mains)-2006,2008

Ans. (a) : It is unicellular. Prokaryotic organism, the cell wall consist of complex proteins and complex non cellulosic polysaccharide but peptidoglycan is absent in cell wall.

- The cell membrane made up of branched chain of lipid, due to the presence of lipid chains, they are resistant to high temperature, salinity, radiation and change of pH is tolerance of unfavorable condition methanogenes.

169. Plasmid found in bacteria and used as vectors in molecular biology/biotechnology work. These genetic element of bacteria are

(a) Chromosomal (b) extra-chromosomal

(c) mitochondrial (d) none of these

AMU-1995

Ans. (b) : Plasmids are genetic element of DNA molecule in the form of extra-chromosomal segment discovered by-Lederberg in 1952. It is smaller than nucleoid.

170. Prokaryotes have

(a) large nuclei (b) single large nucleus

(c) large and small nuclei (d) no defined nucleus.

AMU-1995

Ans. (d) : Prokaryotes are organism whose cell lack a nucleus and other organelles like membrane bounded organelles as Mitochondria, Golgi body, Endoplasmic reticulum. It is unicellular organism which has incipient nucleus and 70 S type of Ribosomes.

171. When there is bunch of flagella on one side, the bacteria are known as

(a) lophotrichous (b) amphitrichous

(c) peritrichous (d) none of these

AMU-1995

Ans. (a) : When a group of flagella is present at an end only is called **lophotrichous** Eg- *Spirillum volutans.*

Lophatricous

172. Assertion (A) : Bacteria have three basic shapes, i.e. round, rod, spiral.
Reason (R) : Cocci and bacilli may form clusters or chain of a definite length,

(A) If both the (A) and the (R) are true and the (R) is a correct explanation of the (A).

(B) If both the (A) and the (R) are true but the (R) is not a correct explanation of the (A).

(C) If the (A) is true but (R) is false.

(D) If both the (A) and the (R) are false.

(E) If (A) is false but (R) is true

(a) A (b) B

(c) C (d) D

(e) E

AIIMS-2000

Ans. (b) : Bacteria have four basic shapes
(1) Rounded or coccus- eg *Micrococcus agilis*
(2) Rod shaped or bacillus- eg *Lactobacillus, E. Coli.*
(3) Commo shaped or vibria - *Vibrio cholerae*
(4) Spiral shaped or spirillum- *Spirillum volutans.*

173. Methanogens belong to

(a) eubacteria (b) archaebacteria

(c) dinoflagellates (d) slime moulds

NEET-2016 Phase-II

Ans. (b) : The archaebacteria that produce methane as a metabolic by product are called **Methanogens** e.g. Methane producing genera are *Methanobacterium, Methanococcus, Methanospirillum* etc.

- Archaebacteria are a group of most primitive prokaryotes which are believed to have evolved immediately after the evolution of first life.
- They are autotrophs and derive their energy from oxidation of chemical energy sources such as ammonia and methane etc.

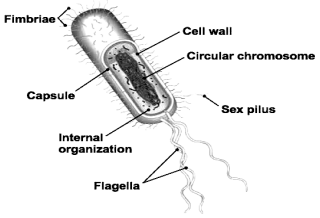
@apna_pdf

174. The structures that help some bacteria to attach to rocks and/or host tissues are :

(a) Holdfast (b) Rhizoids
(c) Fimbriae (d) Mesosomes

AIPMT (Re-Exam)-2015

Ans. (c) : Fimbriae and pili are thin, protein tubes originated from the cytoplasmic membrane of many bacteria. It help to stick the bacteria to the surface.
Fimbriae help to adhere to animal cells and some inanimate objects.
• The main difference between fimbriae and pili is that fimbriae are responsible for the attachment of the cell to its substrate whereas pili are responsible for the attachment and horizontal gene transfer during bacterial conjugation.

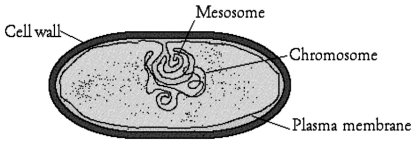


175. Which structures perform the function of mitochondria in bacteria?

(a) Nucleoid (b) Ribosomes
(c) Cell wall (d) Mesosomes

AIPMT-2014

Ans. (d) : Mesosomes are found in the membranes of bacterial cells. These are organelles formed by plasma membrane infoldings. It increases the surface area of the plasma membrane to carry out various enzymatic activities and also helps in secretion process as well as in bacterial respiration.



176. Pigment-containing membranous extensions in some cyanobacteria are:

(a) Chromatophores (b) Heterocysts
(c) Basal bodies (d) Pneumatophores

NEET-2013

Ans. (a) : Cyanobacteria have chromatophores a unique compartment in their cytoplasm. Amphibians, Fish, Reptiles, and Cephalopods all have chromatophore, which are pigment containing and light reflecting cells.

177. Besides paddy fields, cyanobacteria are also found inside vegetative part of:

(a) Psilotum (b) Pinus
(c) Cycas (d) Equisetum

NEET-2013

Ans. (c) : Cycas are considered ancient plants. They are palm-like trees. The trunk of the plant is columnar and aerial in nature. The roots show negative geotropism. So, these are called **coralloid roots** that have nitrogen-fixing bacteria. Also, these roots are photosynthetic due to the presence of photosynthetic bacteria. This property is due to the presence of cyanobacteria.

178. Barophilic prokaryotes –

(a) Grow slowly in highly alkaline frozen lakes at high altitudes
(b) Grow and multiply in very deep marine sediments
(c) Readily grow and divide in sea water enriched in any soluble salt of barium
(d) Occur in water containing high concentrations of barium hydroxide

AIPMT-2005

Ans. (b) : Barophilic prokaryotes, also known as barophile, is a type of organism which can grow and exists at high pressure zone. e.g. deep sea bacteria and archaebacteria. They can grow and multiply is very deep sea sediments.

179. How many organisms in the list given below are autotrophs
Lactobacillus, Nostoc, Chara, Nitrosomonas, Nitrobacter, Streptomyces, Saccharomyces, Trypanosoma, Porphyra, Wolfia

(a) Six (b) Three
(c) Four (d) Five

AIPMT (Mains)-2012

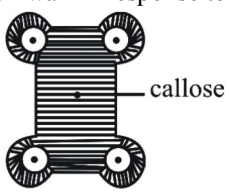
Ans. (a) : An autotrophs is an organism that can make its food from light, water, carbon dioxide or other substances. Form the list autotrophs include a total of six as **Chara, Nostoc, Porphyra, Wolfia, Nitrosomonas, Nitrobacter,** Of these **Chara, Nostoc, Porphyra, Wolfia** is photoautotrophs while **Nitrosomonas, Nitrobacter** are chemoautotrophs.

180. In Angiosperm all the four microspores of tetrad are covered by a layer which is formed by : -

(a) Pectocellulose (b) Callose
(c) Cellulose (d) Sporopollenin

AIPMT-2002

Ans. (b) : The callose plays an important role in different stages of development of plants. It is a plant polysaccharide which is produced to act as a temporary cell wall in response to stimuli such as stress or damage.



Microspore tetrad
(means 4 microspore)

181. Transduction in bacteria is mediated by:

(a) plasmid vectors (b) phage vectors
(c) cosmids (d) F-factors

AIPMT-1994

Ans. (b) : Transduction is the process by which a virus transfers genetic material from one bacterium to another.
• Bacteriophage mediate horizontal gene transfer through a mechanism known as transduction, therefore, transduction in bacteria is mediated by phage vector.

@apna_pdf

182. Genophore/bacterial genome or nucleoid is made of:
(a) histones and non-histones
(b) RNA and histones
(c) a single double stranded DNA
(d) a single stranded DNA

AIPMT-1993

Ans. (c) : Genophores refers to the corresponding chromosome in prokaryotes, viruses, and semi-autonomous organelles that function as inherited material. It is made up of nucleic acid, DNA or RNA but has no histone proteins.
Thus, the genophores/ bacterial genome or nucleoid is made of a single double stranded DNA.

183. Bacteria lack alternation of generation because there is:
(a) neither syngamy nor reduction division
(b) distinct chromosomes are absent
(c) no conjugation
(d) no exchange of genetic material

AIPMT-1992, 1991

Ans. (a) : Syngamy and meiotic division take place during sexual reproduction, but since bacteria do not create gametes, therefore, no syngamy or reduction division occur in bacteria. So, they do not have alternation of generation.

184. Which one belongs to Monera?
(a) Amoeba (b) Escherichia
(c) Gelidium (d) Spirogyra

AIPMT-1990

Ans. (b) : *Escherichia coli* is the bacteria belongs to the kingdom of Monera. *Escherichia coli* is a unicellular, prokaryotic bacteria.

185. Organisms, which fix atmospheric nitrogen in the soil, fall under the category of:
(a) bacteria (b) green algae
(c) soil fungi (d) mosses

AIPMT-1994

Ans. (a) : Microscopic single- celled organisms lacking a distinct nucleus are known as bacteria.
• Organisms which fix atmospheric nitrogen in the soil are come under bacteria because they are only prokaryotic organism who have certain enzymes.

186. A large number of organic compounds can be decomposed by:
(a) Azotobacter (b) Chemolithotrophs
(c) Mycoplasma (d) Pseudomonas.

AIPMT-1995

Ans. (b) : Chemolithotrophs:– A cell's acquisition of energy from the oxidation of inorganic compounds, also known as electron donors. It can drive the energy required for growth from the oxidation of inorganic components.
Thus, a large number of organic compounds can be decomposed by chemolithotrophs.

187. What are the sex organs provided in some bacteria?
(a) Sex pili (b) Plasmid
(c) Circular DNA (d) Gametes

AIPMT-1996

Ans. (a) Sex pili are tiny, non flagellar hair- like structure that are present on Gram negative bacteria and a few Gram positive bacteria have on their walls. During conjugation, they serve as sex organs and create the conjugation tube.
Therefore, the sex organs provided in some bacteria are sex pili.

188. Azotobacter and *Bacillus polymyxa* are the examples of:
(a) pathogenic bacteria
(b) decomposers
(c) symbiotic N_2 fixer
(d) non-symbiotic N_2 fixer

AIPMT-1996

Ans. (d) : Azotobacter and *Bacillus polymyxa* are the examples of non-symbiotic N_2 fixers.
• Azotobacter is aerobic because it can strictly live only in the presence of oxygen.
• *Bacillus polymyxa*, is a gram-positive bacterium capable of fixing nitrogen.
• *Rhizobium* is an example for symbiotic nitrogen fixer.

189. The hereditary material present in the bacterium E.coli is:
(a) single-stranded DNA
(b) double-stranded DNA
(c) DNA
(d) RNA

AIPMT-1997

Ans. (b) : The hereditary material present in the bacterium E. coli is double-stranded DNA. The DNA is not linked with any histone proteins so it is referred to as naked DNA.

190. Assign the following substances to the cell wall, flagella, 's' layer and pili of bacteria in correct sequence
i. Glycoprotein ii. Fimbrin/Pilin
iii. Teichoic acid iv. Flagellin
The correct sequence is
(a) iii, i, iv, ii (b) iii, iv, i, ii
(c) ii, iv, iii, i (d) iii, iv, ii, i

AP EAMCET-2008

Ans. (b) : The cell wall component of a Gram-positive bacteria is teichoic acids which is linked to N-acetylmuramic acid or terminal D-alanine in the cross-linkage between N-acetylmuramic acid units of the peptidoglycan layer.
• The bacterial flagellum is made up of the protein flagellin. The S-layer is also known as surface layer which is a part of the cell envelop of bacterial. It is composed of glycoproteins whereas pilli is a hair-like appendage which is composed of pilin protein also known as fimbrin.

191. In bacteria respiration occurs in
(a) cytoplasmic membrane
(b) mitochondria
(c) nuclear membrane
(d) endoplasmic reticulum

JIPMER-2005

@apna_pdf

Ans. (a) : In bacteria respiration occurs in cytoplasmic membrane. Cytoplasmic membrane has folded invagination's called mesosomes. It increases the surface area required for cellular respiration. They are the site of respiration as they contain respiratory enzymes.

192. Water bloom is generally caused by

(a) green algae (b) blue green algae
(c) bacteria (d) Hydrilla

JIPMER-2008
BHU PMT (Screening)-2007
BVP-2004

Ans. (b) : Water bloom is caused by rapid increase in the population of algae which leads to the changes in the colour of water body. Blue-green algae, also called cyanobacteria, any of a large, heterogenous group of prokaryotic, principally photosynthetic organisms. Cyanobacteria range in size from 0.5 to 60 micrometers, which represents the largest prokaryotic organism.

193. Genes are packaged into a bacterial chromosome by

(a) Acidic protein (b) Actin
(c) Histones (d) Basic protein

AIPMT-1997

Ans. (d) : Bacterial chromosome are present in a nucleoid, a distinct cytoplasmic structure, in which double-stranded DNA. Genes are packed into a bacterial chromosome by basic protein.

• The bacterial chromosome is having circular DNA containing the entire genome within it.

194. Photosynthetic bacteria have

(a) pigment system I
(b) pigment system II
(c) Both (a) and (b)
(d) some other kind of pigments, B_{890}

AIIMS-2011

Ans. (c) : Cyanobacteria contain two type of photosystem namely, type I, also known as Fe-S type and type II also known as quinone type and carry out oxygen-evolving photosynthesis. The other four group of photosynthetic bacteria contain only one type of photosystem which perform non-oxygen evolving photosynthesis.

195. Photosynthetic bacteria do not contain

(a) Quantasome (b) PS-I and PS-II
(c) PS - II (d) PS- I

AIIMS-2001

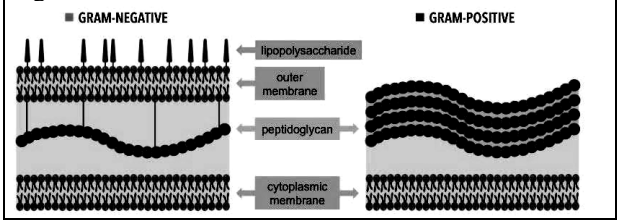
Ans. (c) : Since, there are only two photosystems, PS-I and PS-II, photosynthetic bacteria can only carry out cyclic photophosphorylation because they have only PS-I, which uses H_2S as an electron donor rather than water and results is no oxygen produced.

196. Some Gram-ve bacteria have peptidoglycan and an extra layer of

(a) Lipo-polysaccharide (b) Lipo-protein
(c) Protein (d) Both (a) and (c)

AIIMS-2001

Ans. (a) : The Gram-negative bacteria are surrounded by a thin peptidoglycan cell wall, which is covered surrounded by an outer membrane containing lipopoly saccharide, where as Gram -positive bacteria lack an outer membrane but are surrounded by many layers of peptidoglycan and is thicker than is found in the gram - negative.



197. The site of respiration in bacteria is:

(a) Ribosome (b) Microsome
(c) Episome (d) Mesosome

AIPMT-1997

Ans. (d) : The mesosomes are membrane bound organelles that are produced by the plasma membrane and they lie close to the cell membrane. They are also referred to as the chondrin. They are known to play a role in the respiration bacterial cell. In bacteria, the process of respiration is performed in mesosomes.

198. Bacteria with single flagella at one end is called :

(a) monotrichous (b) lophotrichous
(c) amphitrichous (d) peritrichous

Punjab MET-2006

Ans. (a) : Monotrichous bacteria:– When a single flagella is present at one end bacteria is called monotrichous. eg *Pseudomans, Vibrio cholerea.*

199. Which of the following is a prokaryote?

(a) Nostoc (b) Protozoa
(c) Prosopis (d) Chlorella

J&K CET-2000

Ans. (a) : Nostoc:– It is prokaryote unicellular, autotrophic organism. Cell wall made up of nucleopeptide and cell membrane made of lipoprotein.

200. Maximum number of antibiotics are obtained from:

(a) fungi (b) bacteria
(c) virus (d) plants

AFMC-2003

Ans. (b) : The maximum number of antibiotics are obtained form bacteria which are following-

Bacteria		Antibiotics
Bacillus subtilis	-	Subtilisin
Bacillus brevis	-	Gramicidin
Streptomyces venezuelae	-	Chloramphenicol
Streptomyces griseus	-	Streptomycin
Streptomyces fradae	-	Neomycin
Streptomyces rimosus	-	Terramycin

201. Substances secreted by bacteria are:

(a) proteins (b) toxins
(c) inter ferons (d) antibiotics

AFMC-2003

Ans. (b) : Some pathogenic bacteria destroy the cells of the host, but most cause disease because they produce poisonous substances that damage the host metabolism.

• These substances are called toxins. Bacterial toxins may be divided into two classes - (i) endotoxins, are

@apna_pdf

liposaccharides in the cell wall of gram negative bacteria they produce fever and damage to circulatory system, (ii) Exotoxins are much less common than endotoxins they are proteins and are secreted from the bacterium into the surrounding medium. They may be carried by the host body in the blood in the bacteria causing diphtheria, tetanus, cholera etc produce exotoxins.

202. Splenic fever occurs in cattles, goats, camel and sheep etc, and is caused by
(a) *Corynebacterium pyogenes*
(b) *Cowpox virus*
(c) *Klebsiella pneumoniae*
(d) *Bacillus anthracis*

BCECE-2015

Ans. (d) : Splenic fever occurs in cattles, goats, camel and sheep etc and its caused by *Bacillus anthracis*. It is a Gram-positive and rod-shaped bacterium that is occasionally pathogenic to humans.

203. Incubation period of Treponema pallidum is about
(a) 2 to 14 days (b) 7 to 21 days
(c) 1 to 2 weeks (d) 3 to 4 weeks

MHT CET-2016

Ans. (d) : The bacterium *Treponema pallidum* causes syphilis. Syphilis is a type of sexually transmitted disease. The Incubation period of *Treponema pallidum* is about 3 to 4 weeks.

204. Which of the following is a BGA ?
(a) Anabaena (b) Rhizobium
(c) Clostridium (d) Azotobacter

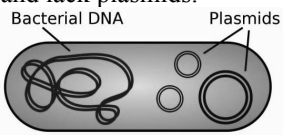
MHT CET-2010

Ans. (a) : Anabena is a blue green algae reside in pond river lake etc. *Anabaena azollae* is found in pockets on the leaves of Azolla and helps in converting N_2 to NH_4 by nitrogen fixation. It increases the productivity of rice paddies.

205. Extra chromosomal circular DNA is found in
(a) Virus (b) Bacteria
(c) Protozoa (d) Algae

MHT CET-2008

Ans. (b) : Circular DNA is found as extrachromosomal plasmid DNA in bacteria . This confers antibiotic resistance to the cell. Plant and animals are eukaryotes and lack plasmids.



206. The structure formed by bacterial genome is called:
(a) nucleoside (b) nucleoside
(c) nucleoid (d) nucleus

Rajasthan PMT-1997
JIPMER-1996

Ans. (c) : The structure formed by bacterial genome is called nucleoid, or genophore or incipient nucleus. In the central part, true nucleus is absent, nuclear membrane absent and histone protein absent called nucleoid. Nucleoid consists of naked single as circular DNA true chromosome absent.

207. A plasmid is made up of.
(a) f-RNA (b) m-RNA
(c) r-RNA (d) DNA

JIPMER-2002

Ans. (d) : A small circular DNA molecule found in bacteria and same other microscopic organism are called **plasmids**. Plasmids are physically separated from chromosomal DNA and replicate independently.

208. An organisms having cytoplasm, DNA and RNA but no cell wall is
(a) cyanobacterium (b) mycoplasma
(c) bacterium (d) virus

CG PMT-2005

Ans. (b) : Mycoplasma is the unicellular, smallest prokaryotes organism. Cell wall is absent and having cytoplasm, DNA, RNA, and cell membrane. Cell membrane made up of lipoproteins. Mesosomes are absent in mycoplasma.

209. How many basal body rings are present in gram positive cells?
(a) 3 (b) 2
(c) 4 (d) 5

BCECE-2015

Ans. (b) : Basal body is also known as basal granule. The basal body is embedded outside the cytoplasm under the plasma. Gram- positive organism have two basal body rings, one in peptidoglycan layer and one is in the plasma membrane.

210. Which one of the following is also called halophiles?
(a) Eubacteria (b) Actinomycetes
(c) Archaebacteria (d) Cyanobacteria

WB JEE-2007

Ans. (c) : Salt lovers archebacteria or halophiles, these are also known as anaerobic bacteria, which occurs in extreme saline or salty conditions (upto 35% of salt or NaCl in culture medium) a purple pigmented membrane containing bacterio rhodopsin is developed in sunlight, these bacteria utilizes light energy for metabolic activities.

211. Which one of the following is not a bacteria ?
(a) Pseudomonas (b) Clostridium
(c) Actinomycetes (d) Azotobacter

MGIMS Wardha-2015

Ans. (c) : Actinomycetes, these are filamentous bacteria (like moulds or fungi). These are generally present as decomposers in soil. They reproduce sexually by means of conidia produced at tip of filaments. These secretes antibiotics, such as *Streptomyctes secretes* streptomycin, neomycin etc.

212. Organisms found in extreme temperature are:
(a) cyanobacteria (b) archaebacteria
(c) fungi (d) eubacteria

DUMET-2002

Ans. (b) : Archaebacteria are the primitive group of organism, unicellular and prokaryotic organism the cell wall consist of complex proteins and complex non cellulosic polysaccharides. But peptidoglycan absent the cell membrane is made up of branched chain of lipid, due to branched lipid chain they are resistant to high temperature, salinity, radiation, change of pH.

@apna_pdf

213. In ruminants cellulose digestion takes place by:
(a) bacteria (b) protozoans
(c) virus (d) both (a) and (b)

DUMET-2002

Ans. (d) : In Ruminants, cellulose digestion takes place by bacteria and protozoa. Cellular digestion in ruminants like cattle occurs in the rumen of foregut that harbors bacteria that bring about breakdown of cellulose through fermentation.

214. Bacteria do not have :
(a) ribosome
(b) protein synthesizing apparatus
(c) mitochondria
(d) cell wall

BVP-2008
DUMET-2005

Ans. (c) : Bacteria are prokaryotic and unicellular organism. They do not have a membrane, bounded nucleus and other organelles like mitochondria, golgi bodies, endoplasmic reticulum and chloroplast. They have mesosome 70S type of ribosome and, RNA. The cell wall of bacteria is made up of peptidoglycan or mucopeptide or murein.

215. Spirochaetes is are
(a) a class of insects (b) a class of viruses
(c) bacteria (d) fungi

DUMET-2011

Ans. (c) : A spirochaete or spirochete is a member of phylum Spirochaetota which contains distinctive form of Gram-negative bacteria most of which have long, helically coiled cells. Spirochaetes are chemoheterotrophic in nature.

216. How many linear DNA fragments will be produced when a circular plasmid is digested with a restriction enzyme having 3 sites?
(a) 4 (b) 5
(c) 3 (d) 2

KVPY SB & SX-2014

Ans. (a) : When the plasmid contain 3 recognition sequences for a given restriction endonuclease, 4 linear DNA fragment are produced because circular DNA produces N-recognition sequences for the same restriction endonuclease whereas linear DNA produces (N + 1) fragments.

217. A bacterial colony is produced from
(a) a single bacterium by its repetitive division
(b) multiple bacterium without replication.
(c) clumping of two to three bacteria
(d) a single bacterium without cell division

KVPY SB & SX-2014

Ans. (a) : A single bacterium divides to become a visible collection called a colony, which denotes how bacteria can be grow on a nutritional medium. Clone refers to each cell in a bacterial colony.

218. Monera possess:
(a) Membrane bound nucleoproteins lying free in the cytoplasm.
(b) Gene containing nucleoproteins condensed together in compact masses.
(c) Nucleoproteins in direct contact with the rest of the cell substance.
(d) Only free nucleic acid aggregates.

MP PMT-2013

Ans. (c) : Monera possess nucleoproteins in direct contact with the rest of the cell substances. It is prokaryotic unicellular organism. They contain 70S ribosomes naked DNA and is not bounded by a nuclear membrane. It lacks organelles, like mitochondria, lysosome, golgi bodies endoplasmic reticulum and centromere.

219. Which of the following are not eukaryotes?
(a) Monera (b) Protista
(c) Animals (d) Plants

AMU-2014

Ans. (a) : Monera:– It is unicellular prokaryotes. It is composed of single celled organism that lack a nucleus.
Protista- It is unicellular eukaryotes.
Animal and Plants– Multicellular and eukaryotic.

220. In purple and green bacteria, oxygen is not evolved during photosynthesis because hydrogen donor is
(a) H_2O (b) H_2S
(c) NH_3 (d) CH_4

AMU-2014

Ans. (b) : In purple and green bacteria oxygen is not evolved during photosynthesis because H_2S serves as a hydrogen donor in purple and green sulphur bacteria.

221. The plasma membrane of mycoplasma is rich in
(a) cellulose (b) cholesterol
(c) myosin (d) glycogen

Punjab MET-2011

Ans. (b) : Mycoplasma belongs to the genus bacteria that has a plasma membrane that is rich in cholestrol and includes a significant quantity of fatty acids but lacks a cell wall around its cell membrane.

222. The characteristic of blue-green algae is :
(a) DNA without histone
(b) nuclear membrane absent
(c) 70s ribosomes
(d) all of the above

Rajasthan PMT-2002
JCECE-2003

Ans. (d) : Blue green algae or Cynobacteria is a unicellular, prokaryotic organism. It does not have well defined nucleus. The DNA is not present inside the nucleus (means the DNA is naked) rather it is present into each cytoplasm (not enclosed by the nuclear membrane) DNA has no histone protein. It consists of 70 S ribosome.

223. Gram negative bacteria are resistant due to presence of
(a) teichoic acid (b) lipopolysaccharides
(c) chitin (d) cellulose

UP CPMT-2012

Ans. (b) : In gram negative bacteria out side of the peptidoglycan other layer is lipopolysaccharide due to which Gram negative bacteria are resistant to antibiotic.
• Teichoic acid present in Gram-positive bacteria.

@apna_pdf

224. Match the following and choose the correct combination from the options given below:

Column A	Column B
(A) Eubacteria	(I) Trichoderma
(B) Dinoflagellates	(II) Albugo
(C) Phycomycetes	(III) Gonyaulax
(D) Deuteromycetes	(IV) Anabaena

	A	B	C	D
(a)	(I)	(II)	(III)	(VI)
(b)	(II)	(III)	(IV)	(I)
(c)	(IV)	(III)	(II)	(I)
(d)	(IV)	(III)	(I)	(II)

AP EAMCET-2015

Ans. (c) :	
(A) Eubacteria	(IV) Anabaena
(B) Dinoflagellates	(III) Gonyaulax
(C) Phycomycetes	(II) Albugo
(D) Deuteromycetes	(I) Trichoderma

225. The organism which completely lack a cell wall and can live without oxygen are

(a) Archaebacteria (b) Thermoacidophiles
(c) Mycoplasmas (d) Methanogens

Karnataka CET-2015

Ans. (c) : Mycoplamsma, it is unicellular smallest prokaryotic cell. Cell wall absent and cell membrane made up of lipoprotiens. Cell organelles are absent like mitochondria, golgibodies, endoplasmic reticulum, lysosome and mesosomes.

226. Linkage group in E. coli is/are

(a) 4 (b) 2
(c) 1 (d) 5

DUMET-2007

Ans. (c) : E. coli contains single chromosome so, the number of linkage group in E. coli is 1.

227. The structure of E. coil chromosomal DNA is

(a) Double – stranded, right handed and circular
(b) Single – stranded, right handed and circular
(c) Double – stranded, left handed and linear
(d) Double – stranded, left handed and circular

WB JEE-2014

Ans. (a) : The structure of E. coli chromosomal DNA is double stranded, right-handed and circular. A double stranded DNA molecule is made up of two strands of DNA, running in opposite or in antiparallel direction.

228. Which of the following processes was discovered by Lederberg and Tatum (1946)?

(a) Transduction (b) Transformation
(c) Asexual reproduction (d) Conjugation

WB JEE-2014

Ans. (d) : Conjugation - Discovered by Lederberg and Tatum 1946 in E. coli bacterium

- Transduction- Discover by Zinder and Lederberg (1952) in *Salmonella typhi* bacterium.
- Transformation- Discovered by Griffith (1928) in Diplococcus pneumonia and detailed work out by MacLeod and McCarty.

229. The component of bacteria that retains the crystal violet stain during Gram staining is

(a) O - antigen
(b) Lipopolysaccharide
(c) Peptidoglycan
(d) Cytoplasmic membrane

WB JEE-2014

Ans. (c) : The component of bacteria that retains the crystal violet stain during Gram staining is petidoglycan, thick in Gram positive bacteria 70-80% but in Gram negative bacteria thin 10 -20% single layer.
- In Gram positive bacteria blue violet colour retained after washing with blue violet colour returned after washing with alcohol, but in Gram negative bacteria colour is washed.

230. Which of the following bacteria is observed as chain - like formation?

(a) *Escherichia coli*
(b) *Bacillus subtilis*
(c) *Streptococcus pyogenes*
(d) *Micrococcus flavus*

WB JEE-2014

Ans. (c) : *Streptococcus pyogenes* is a species of Gram positive aerotolerant bacteria in the Genus Streptococcus. These are extracellular and made up of non-motile and non - sporing cocci that tend to link in chains.

231. Chromosomes in a bacterial cell can be 1-3 in number and

(a) are always circular
(b) are always linear
(c) can be either circular or linear, but never both within the same cell
(d) can be circular as well as linear within the same cell

BVP-2008

Ans. (a) : Single double stranded circular DNA molecule can be found in the majority of bacterial cells.
- They are capable of possessing multiple chromosomes, which was initially seen in the Gram negative bacterium *Rhodobacter*.

232. Bacteria are considered plant because they:

(a) Are green in colour
(b) Have rigid cell wall
(c) Have chlorophyll
(d) Have stomata

JIPMER-2010
BHU PMT (Mains)-2008
BHU PMT (Screening)-2005

Ans. (b) : Bacteria are considered plant because they have rigid cell wall and they were classified as plants in the traditional classification system. This is due to the presence of cellulose-based cell walls in them. Bacteria like plants can produce their own food through the photosynthesis process but not all bacteria can do, and they also have a cell wall like plant cells.

233. The mode of asexual reproduction in bacteria are

(1) formation of gametes
(2) endospore formation
(3) conjugation
(4) zoospores formation

@apna_pdf

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (c) : Asexual reproduction in bacteria following types-
By Endospore- It forms during unfavorable condition, it is single form resistant against antibiotics high temperature, chemicals and radiation.
(ii) By Zoospore - Motile spores are formed in rhizobium bacteria but rare in other bacteria .
(iii) By Conidia- In filamentous bacteria sexual reproduction occurs by conidia as Streptomyces.

234. The bacterium (*Clostridium botulinum*) that causes botulism is
(a) a facultative anaerobe
(b) an obligate anaerobe
(c) a facultative aerobe
(d) an obligate aerobe

BCECE-2013
BHU PMT (Mains)-2010
AIPMT-2006

Ans. (b) : The bacterium *Clostridium botulinum* is the rod-shaped Gram positive bacteria, which causes the disease botulism. *Clostridium botulinum* is an obligate anaerobic bacteria. They always live in absence of O_2 in presence of O_2 they can not live.

235. Which of the following is not characteristic of gram positive bacteria?
(a) Cell wall is smooth
(b) Mesosomes are distinctive prominent
(c) Basal body of flagellum contains two rings
(d) Murein content of cell wall is 70-80%

BCECE-2012

Ans. (b) : Gram positive bacteria have basal body of flagellum contains two ring. It lack outer membrane layer which is found in Gram negative bacteria.
Gram - positive bacteria are bacteria that give a positive result in the gram stain test. Most Gram- positive bacteria have a relatively thick continuous cell wall which is composed largely of peptidoglycan (also known as mucopeptide or murein)

236. The bacterial genome contains
(a) DNA and histone
(b) DNA or histone
(c) DNA without histone
(d) Neither DNA nor histone

CG PMT-2004

Ans. (c) : The bacterial genome consist of a single circular double stranded DNA molecule without histone proteins.

237. The smallest free-living organism is
(a) virus (b) mycoplasma
(c) cyanobacteria (d) bacteria

CG PMT-2004

Ans. (b) : The smallest free living organism is mycoplasma. It is unicellular smallest prokaryotic organism ranges from 0.1μ to 00.3μ, which is capable for independent growth reproduction and metabolism also called **PPLO** (pleura pneumonia like organism). Cell wall absent exhibit polymorphism called "Joker of plant kingdom".

238. The sexuality in bacteria was established by
(a) Lederberg and Tatum
(b) H J Muller
(c) Hargobind Khorana
(d) Ochoa and Kornberg

CG PMT-2004

Ans. (a) : The sexuality in bacteria was discovered by Lederberg and Tatum (1946). E. coli bacterium in this process gene transfer from one cell to other cell by physical contact called the conjugation.

239. Cell wall is extremely well preserved in fossil specimen in
(a) diatoms (b) dinoflagellates
(c) slimemoulds (d) None of these

BVP-2011

Ans. (a) : Diatoms may be either unicellular or colonial the diatoms are important components of marine and fresh water habitats. The cells are normally protected by a wall called a frustules, made up of silica and surrounded by mucilage.

240. Some bacteria are not easily killed by antibiotics or heat treatment because of their
(a) Capsule
(b) Chitinous cell wall
(c) Mucopeptides in cell wall
(d) Mesosomes

CMC Vellore-2011

Ans. (a) : Some bacteria are not easily killed by antibiotics and heat treatment because their capsule and mucopeptide cell wall is present. The gram positive bacteria produce endospores during the unfavorable condition. Endospore are tough and resistant structure which remains undamaged during stressful condition.

241. Which one of the following is denitrifying bacteria?
(a) Nitrosomonas (b) Pseudomonas
(c) Azotobacter (d) Nostoc

J&K CET-2011

Ans. (b) : The process of conversion of nitrate into nitrogen is known as denitrification. Denitrification is carried out by the denitrifying bacteria such as Pseudomonas.

242. Plague (black death) is caused by.
(a) bacteria (b) virus
(c) protozoan (d) fungi

Haryana PMT-2000

Ans. (a) : Plague is an infectious disease that affect animals and humans. It is caused by the bacterium *Yersinia pestis*. This bacterium is found in rodents and their fleas occurs in many areas of the world including the United States. *Yersinia pestis* is easily destroyed by sunlight and drying.

243. The Gram (-) bacteria detect and respond to the chemicals in their surroundings by
(a) Muramic acid
(b) Lipopolysaccharide

@apna_pdf

(c) Volutin granules
(d) Porin

WB JEE-2008

Ans. (d) : The Gram-negative bacteria detect and respond to the chemicals in their surroundings by porin.
• They are involved in the exchange of nutrients over the outer membrane of Gram-negative bacteria but are also involved in pathogenesis.

244. Which of these components is/are not present in Gram-negative bacteria?
(a) Teichoic acid
(b) Pseudomurein
(c) Lipopolysaccharide
(d) Mycolic acid

WB JEE-2015

Ans. (a) : Teichoic acid present in gram positive bacteria and join perpendicular to the NAG and NAM.
• Teichoic acid bind the peptidoglycan layers, it is absent in Gram negative bacteria.

245. Which one of the following cocci appears like graphs under microscope?
(a) Streptococci (b) Diplococci
(c) Staphylococci (d) Pneumococcal

WB JEE-2015

Ans. (c) : Staphylococci are grape-like (irregular) clusters of cocci. It is found as a part of the normal skin flora on the nasal passage and skin and also upper respiratory tracts of birds and mammals.

246. I. Unicellular, colonial, filamentous, marine or terrestrial forms
II. The colonies are surrounded by a gelatinous sheath
III. Some can fix atmospheric nitrogen in specialized cells called heterocysts
IV. They often form blooms in water bodies
These above characters are seen in
(a) Archaebacteria (b) Cyanobacteria
(c) Chrysophytes (d) Dinoflagellates
(e) Slime moulds

Kerala PMT-2013

Ans. (b) : **Cyanobacteria :-** It is unicellular, colonial, filamentous, marine or terrestrial forms.
• The colonies are surrounded by a gelatinous sheath called **Palmelloid colony**.
• Some can fix atmospheric nitrogen in specialized cells called **Heterocysts.**
• They after form blooms are seen is *Oscillatoria, Nostoc* etc.

247. Smallest bacteria is:
(a) Spirillum (b) Bacillus
(c) Dialister (d) None of these

VMMC-2007
Rajasthan PMT-2005
UPCPMT-2002

Ans. (c) : The non-fermentative, anaerobic, Gram negative bacillus is *Dialister pneumosintes*. It was formally called *Pneumosintes bacteroides* among the organism given, it is the smallest bacterium.

248. Photosynthetic bacteria have pigments in
(a) chromoplasts (b) leucoplasts
(c) chloroplasts (d) chromatophore

Punjab MET-2010

Ans. (d) : Photosynthetic bacteria convert the water and CO_2 into the O_2 and the sugar with the help of sunlight.
• These bacteria possess the chromotophores. The pigment containing cell is present in the chromatophore.

249. Which one of the following statements is wrong
(a) Phycomycetes are also called algal -fungi
(b) Cyanobacteria are also called blue- green algae
(c) Golden algae are also called desmids
(d) Eubacteria are also called false bacteria

NEET-2016 Phase-I

Ans. (d) : Eubacteria are also called false bacteria is wrong statement. Bacteria have two domains, namely eubacteria are also called **true bacteria and archaea**
• They have rigid cells walls and flagella.
• Eubacteria are prokaryotic microorganisms consisting of a single cell lacking a nucleus and containing DNA is a single circular chromosome.

250. Which of the following is not a feature of the plasmids
(a) Single- stranded
(b) Independent replication
(c) Circular structure
(d) Transferable

NEET-2016 Phase-I

Ans. (a) : Generally **plasmids are extra chromosomal genetic material** which is present in bacteria. They are capable of independent replication. They are **circular double stranded DNA** molecule and contains some specialized genes like antibiotic resistance genes. They are transferable.
Thus, single stranded is not a features of plasmids.

251. Some hyperthermophilic organisms that grow in highly acidic (pH - 2) habitats belong to the two groups –
(a) Eubacteria and archaea
(b) Cyanobacteria and diatoms
(c) Protists and mosses
(d) Liverworts and yeasts

AIPMT (Screening)-2010

Ans. (a) : Eubacteria like BGA and Thermoacidophiles (Archaebacteria) grow in highly acidic (pH - 2) habitats.
• Archaebaceteria are called ancient bacteria where as eubacteria are called true bacteria. Unlike eubacteria, archaebacteria can survive in extreme conditions.

252. Membrane-bound organelles are absent in:
(a) Saccharomyces
(b) Streptococcus
(c) Chalamydomonas
(d) Plasmodium

AIPMT (Screening)-2010

Ans. (b) : Streptococcus belongs to kingdom Monera, it is a unicellular prokaryotic organism. They do not have membrane-bound organelles.

@apna_pdf

253. Select the correct combination of the statements (a-d) regarding the characteristics of certain organisms.

(1) Methanogens are archaebacteria which produce methane in marshy areas
(2) Nostoc is a filamentous blue-green alga which fixes atmospheric nitrogen
(3) Chemosynthetic autotrophic bacteria synthesize cellulose form glucose
(4) Mycoplasma lack a cell wall and can survive wihout oxygen.

The correct statements are

(a) (1), (2), (4) (b) (2), (3)
(c) (1), (2), (3) (d) (2), (3), (4)

AIPMT (Mains)-2010

Ans. (a) : Methanogens :- Microorganisms that create methane as a byproduct of their metabolism, these bacteria can be found in the stomach of ruminant animal. Nostoc is a filamentous blue-green alga which fixes atmospheric nitrogen..

• Nostoc plays a important role in nitrogen fixation with the help of special type of cell called **heterocyst**.

• The mycoplasma are organism that completely lack a cell wall. They are the smallest living cell known and can survive without oxygen many mycoplasma are pathogenic in animal and plants.

254. Which type of DNA is found in bacteria?

(a) Helical DNA
(b) Membrane bound DNA
(c) Straight DNA
(d) Circular free DNA

JIPMER-2004

Ans. (d) : Circular free DNA is found in bacteria. A plasmid is a small circular DNA molecule found in bacteria and some other microscopic organisms. Plasmids are physically seperate from chromosomal DNA and replicate independently.

255. Select incorrect pair

(a) Porifera – Choanocytes
(b) Coelenterata – Nematocysts
(c) Annelida – Segmentation
(d) Monera – Eukaryote

JIPMER-2012
VMMC-2009

Ans. (d) : Kingdom Monera includes all prokaryotic organism. Bacteria are the sole membrane of kingdom Monera. They are the most abundant micro organisms . Bacteria occur almost everywhere.

256. Thermococcus, Methanococcus and Methanobacterium are groups of

(a) bacteria containing a cytoskeleton and all membrane bound organelles
(b) archaebacteria with peptidoglycan in their cell wall
(c) archaebacteria that consists of protein homologous to eukaryotic core histones
(d) most advanced type of bacteria

CMC Vellore-2015
JIPMER-2015
AIIMS-2008

Ans. (c) : Thermococcus, Methanococcus and Methanobacterium are examples of Archaebacteria, which lack the histone protein found in eukaryotes.

• Histones are of the same type and eukaryotic are similar to the archaeal ancestor of the histone family. Thermococcus, Methanococcus and Methanobacterium, whose histones are shorter than eukaryotic histones and assembled into tetramers.

257. The part of the bacterial chromosome sharing homology with genome fragment transferred from the recipients to cell during merozygote formation is known as

(a) eugenic (b) exogenate
(c) endogenate (d) dysgenic

JIPMER-2015

Ans. (c) : Bacterial chromosome which is similar or homologous to the received copy is called endogenous. The remaining part of the bacterial chromosome which is not similar is called exogenate. When the exchange of genetic material is carried out as part of the bacterial cells recombination process, the merozygote formation occurs. At this stage, the cell contains two copies of the same part of the bacterial chromosome.

258. Gas gangrene is caused by:

(a) Clostridium botulinum
(b) Xanthomonas campestris
(c) Pseudomonas
(d) Clostridium perfringens

JIPMER-2015

Ans. (d) : Gas gangrene is usually caused by a bacteria called Clostridium perfringens. Bacteria collect in an injury or surgical wound that does not have a blood supply. Bacterial infection produces toxins that release gas and cause tissue death.

259. Study the following lists :

List–I		List–II
(A)	**Epulopiscium**	**1. Vector fishelsoni**
(B)	**Bacillus thuringiensis**	**2. Acanthurus**
(C)	**Treponema pallidum**	**3. Bacitracin**
(D)	**Agrobacterium tumefaciens**	**4. Bioinsecticide**
		5. Syphilis

The correct match is

	A	B	C	D
(a)	2	4	5	1
(b)	3	1	2	4
(c)	5	2	1	3
(d)	4	2	5	3

AP EAMCET-2007

Ans. (a) :

A	B	C	D
2	4	5	1

List–I	List–II
(A) Epulopiscium	2. Acanthurus
(B) Bacillus thuringiensis	4. Bioinsecticide
(C) Treponema pallidum	5. Syphilis
(D) Agrobacterium tumefaciens	1. Vector fishelsoni

@apna_pdf

260. The most abundant prokaryotes helpful to humans in making curd from milk and in production of antibiotics are ones categorised as:
(a) Chemosynthetic autotrophs
(b) Heterotrophic bacteria
(c) Cyanobacteria
(d) Archaebacteria

AIPMT (Screening)-2012

Ans. (b) : Heterotrophic bacteria derive energy from organic compound. They help in nutrient recycling. They compose of dead and decaying plants and animals remnants and help in biodegradation.
- Heterotrophic bacteria are used for making curd, antibiotics, nitrogen fixation etc.

Some of the example of heterotrophic bacteria are Agrobacterium, Xanthomonas, Pseudomonas, Salmonella, Escherichia, Rhizobium etc.

261. The Cyanobacteria are also referred to as:
(a) Slime moulds (b) Blue green algae
(c) Protists (d) Golden algae

AIPMT (Screening)-2012

Ans. (b) : The cyanobacteria are unicellular, colonial of filamentus freshwater / marine or terrestrial algae. The Cyanobacteria (also referred to as blue green algae) have chlorophyll a similar to green plants and are photosynthetic autotrophs. The colonies are generally surrounding by gelatinous sheath. They often from blooms in polluted water bodies. Some of these organism can fix atmospheric nitrogen in specialised cells called **heterocysts.**

262. Which one of the following does not differ in E.coli and Chlamydomonas?
(a) Cell wall
(b) Cell membrane
(c) Ribosomes
(d) Chromosomal Organization

AIPMT (Screening)-2012

Ans. (b) : E. coli (bacteria) is a prokaryote while Chlamydomonas (algae) is a eukaryote. It is the cell membrane which has similar organization in both the group.
- Cell wall organization also differs as bacterial cell wall is rich in muramic acid while algae cell wall is rich in cellulosic.

263. Maximum nutritional diversity is found in the group:
(a) Monera (b) Plantae
(c) Fungi (d) Animalia

AIPMT (Screening)-2012

Ans. (a) : Maximum nutritional diversity is found in the group Monera.
- Monera is comprised of two group of Archaebacteria and Eubacteria.
  Monera is a biological kingdom that is made up of prokaryotes, as such, it is composed of single celled organism that lack a nucleous.
- The taxon Monera was first proposed as a phylum by Ernst Haeckel in 1866.
- Classification with the taxon Monera was the five-kingdom system classification system established by Robert Whittaker in 1969.

264. Why is a capsule advantageous to a bacterium?
(a) It allows the bacterium to attach to the surface
(b) It protects the bacterium from desiccation
(c) It provides means of locomotion
(d) It allows bacterium to "hide" from host's immune system

NEET (Karnataka)-2013

Ans. (d) : Capsule advantageous to a bacterium because it allows bacterium to hide from host immune system. S-strain bacteria or virulent bacteria are capsulated made of polysaccharides and amino acids. It is tough and thick mucilage covering providing protection to bacteria against host immune system.

265. The term 'Glycocalyx' is used for
(a) A layer surrounding the cell wall of bacteria
(b) A layer present between cell wall and membrane of bacteria
(c) Cell wall of bacteria
(d) Bacterial cell glyco-engineered to possess N-glycosylated proteins

NEET (Karnataka)-2013

Ans. (a) : Glycocalyx is a carbohydrate protein layer that is covered on many of the eukaryotic and prokaryotic cells.
- It is a sticky gelatinous material that is present outside the cell wall of bacteria, to form an additional surface layer. It is gel-like meshwork that surrounds the cell, constituting a physical barrier for any object to enter the cell. When this layer is firmly attached to the surface of the cell, it is called a capsule.

266. Modern farmer's can increase the yield of paddy upto 50% by the use of :
(a) Cyanobacteria
(b) Rhizobium
(c) Cyanobacteria in Azolla pinnata
(d) Farm yard manure

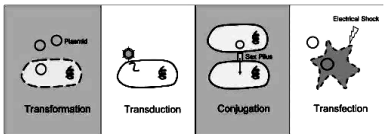
AIPMT-1998

Ans. (c) : The leaves of this species contain the ***Anabaena***, ***Azolla***, which is a symbiont that fixes nitrogen from the atmosphere, that the former can use this to give it is the ability to grow in habitats that are low in nitrogen.
- Farmers keeps their plant in paddy because it generate valuable nitrogen via its symbiotic Cyanobacteria

267. Transduction in bacteria carried out by :
(a) Bacteriophage (b) B.G.A.
(c) Mycoplasma (d) Rickettssiae

AIPMT-1998

Ans. (a) :



Transduction is a mode of genetic transfer from one bacteria to another through a virus.
- There is no direct contact between the bacterial cells.
- In this process, bactoriophages, which infect bacteria, use host cells to multiplicate and while assembling they sometimes pack the bacterial DNA with them.

@apna_pdf

268. Which of the following survives a temperature of 104 ºC to 106ºC

(a) Marine Archaebacteria
(b) Hot water spring thermophiles
(c) Seeds of angiosperms
(d) Eubacteria

AIPMT-1998

Ans. (b) : Thermophiles - Thermophiles are microorganisms that grow at high temperature of 55ºC or more.

• Some micro organisms grow in very high temperature (80ºC–113ºC) are called hyperthermophiles.

269. Bacteria are essential in carbon cycle as :

(a) Decomposer (b) Synthesizer
(c) Consumer (d) Primary producer

AIPMT-1998

Ans. (a) : Bacteria are mostly decomposers in the carbon cycles. Bacteria sustain life by their ability to decompose plant and animal bodies, replenishing the limited amount of carbon dioxide needed for photosynthesis. As a result, they act as carbon decomposer in the carbon cycle.

• The decomposers are bacteria, fungi and insects.

270. According to five kingdom system, blue-green algae belongs to

(a) Metaphyta (b) Monera
(c) Protista (d) Algae

J&K CET-2011
AIPMT-1998

Ans. (b) : Blue green algae belongs to kingdom Monera. The Monerans are unicellular, prokaryotes which lack well defined nucleus and other membrane bound organelles.

• Blue green algae, also called **Cyanobacteria**, are heterogeneous prokaryotic organism.
• They are considered the first organism to release oxygen.
• They are believed to be organisms to convert reducing atmosphere to oxidizing atmosphere, as they have chlorophyll, cyanobacteria believed to be developed by endosymbiosis.

271. Non–symbiotic nitrogen fixing bacteria :

(a) Rhizobium (b) Azospirilium
(c) Azotobacter (d) Nitrosomonas

AIPMT-1998

Ans. (c) : Azotobacter is a heterotrophic and aerobic bacteria which converts nitrogen gas into ammonia, form by the process of nitrogen fixation.

• They do not reside inside the root nodules of the plant rather they exist freely in the soil. It is a diazotrophs.
• Rhizobium is a genus of bacteria associated with the formation of root nodules on plant. These bacteria live in symbiosis with legumes, they take in nitrogen form the atmosphere and pass it on to the plants.
• Nitrosomonas is a gram-negative bacteria which oxidized NH_3 into Nitrite.

272. DNA of *E.Coli* :

(a) ds circular (b) ss circular
(c) ds Linear (d) ss Linear

AIPMT-1998

Ans. (a) : E. coli bacteria are comes under prokaryotes. The DNA of E.coli is double-stranded and circular. The nucleic acid is usually double stranded DNA (ds DNA).

• It is an important species in the field of biotechnology and microbiology, where it has served as the host organism for the majority of work with recombinant DNA.

273. Which one produce gas by decomposing the gobar (Dung) in gobar gas

(a) Fungus (b) Virus
(c) Methanogenic bacteria (d) Algae

AIPMT-1999

Ans. (c) : Gobar gas is a term used for the biogas in India. Biogas is produced by the breakdown of the organic matter in the closed container in the absence of the O_2.

Biogas is an alternate source of energy produced by anaerobic breakdown or digestion of biomass such as animal excreta and kitchen waste with the help of methanogenic bacteria.

• Biogas is made up methane (50-70%), CO_2 (30-40%) with traces of nitrogen, hydrogen sulphide and hydrogen.

274. Azolla is used in the cultivation of

(a) Maize (b) Sorghum
(c) Wheat (d) Rice

AIPMT-1999

Ans. (d) : Azolla is a nature's gift for rice cultivation and has tremendous other agricultural use.

• Azolla substaintially increase the amount of nitrogen fertilizer available to growing rice and it has been used for thousands of year as a green nitrogen fertilizer to increase rice production.

275. Anabaena is associated with Azolla

(a) Stem (b) Leaves
(c) Roots (d) Flowers

AIPMT-1999

Ans. (b) : Azolla is a free-floating water fern and has agronomic importance due to its ability to fix nitrogen.

• Azolla is also called the mosquito fern.
• Anabeana forms a symbiotic relationship where its leaves in the ovoid cavities of the dorsal leaves in the term and is connected to the external surrounding through pores.

276. Plant pathogenic bacteria are mostly

(a) Gram + Non spore forming
(b) Gram – Non spore forming
(c) Gram positive spore forming
(d) Gram negative spore forming

AIPMT-1999

Ans. (b) : Several species of bacteria are pathogenic and cause disease but plant pathogenic bacteria are mostly gram -ve non spore forming.

• The gram stain characterises bacteria based on the structural characterstics of their cell walls.

@apna_pdf

- While bacteria are known to form endospores, these are rarely plant pathogenic.
- The conidiophores and sporangiospores are reproductive spore formed only in Streptomycetes, some of which are plant pathogens.

277. Koch's Postulates not applicable to

(a) Mycobacterium leprae (b) Tuberculosis
(c) Pneumonia (d) Cholera

AIPMT-1999

Ans. (a) : Koch's postulates not applicable to *Mycobacterium leprae*.

- *Mycobacterium leprae* can not be cultured in vitro, Hence, Koch's postulates are not applicable because its incubation period is 2–5 yr.
- Cholera is caused by *Vibrio cholerae*.
- Diptheria is caused by *Corynebacterium diphtheriae*.

278. In Lederberg's replica plating experiment what shall be used to obtain streptomycin resistant strain : -

(a) Minimal medium and streptomycin
(b) Complete medium and streptomycin
(c) Only minimal medium
(d) Only complete medium

AIPMT-2001

Ans. (b) : If streptomycin resistant mutant are to be obtained, material should be allowed to grow on medium lacking streptomycin so that both mutant and wild types may grow.

- The plate now containing only mutants for streptomycin resistance will grow.
- These colonies are imprinted on petriplates to form the master pattern and other plates having streptomycin can then be pressed on velveteen to get an impression.

279. What is true for cyano bacteria : -

(a) Oxygenic with nitrogenase
(b) Oxygenic without nitrogenase
(c) Non oxygenic with nitrogenase
(d) Non oxygenic without nitrogenase

AIPMT-2001

Ans. (a) : Cyanobacteria, also known as blue green algae (BGA) are photosynthetic prokaryotes. According to Bergey's classification, they are oxygenic photoautotroph. Certain filamentous Cyanobacteria can also act as nitrogen fixers. Nitrogen fixation in cyanobacteria is carried out by nitrogen -fixing cells called **heterocysts,** which have a thick cell wall and presence of oxygen scavenging proteins.

280. Plant Decomposers are : -

(a) Monera and fungi
(b) Fungi and plants
(c) Protista and Animalia
(d) Animalia and Monera

AIPMT-2001

Ans. (a) : Bacteria (Monera) and Fungi can be considered as plant decomposers.

- The bacteria and fungi are heterotrophic organisms which cannot produce their own food and depend on the other organism for the source of food. The fungi and the bacteria feed on the dead and decaying matter and are known as saprophytes and also called decomposers.
- Decomposer refers to an organism that breaks down dead organic material into its constituent elements also referred to as **detritivores**.

281. What is true for Archaebacteria : -

(a) All Halophiles
(b) All photosynthetic
(c) All fossils
(d) Oldest living beings

AIPMT-2001

Ans. (d) : Archaebacteria are the most ancient and halogenous group of bacteria and are called living fossils.

- These were the first organism which evolved on the earth. These organisms have evolved to survive in the extreme conditions like the halophiles, thermophiles, acidophiles.

282. Difference in gram positive and gram negative bacteria is due to –

(a) Cell wall (b) Cell membrane
(c) Ribosome (d) Cytoplasm

AIPMT-2001

Ans. (a) : Gram stain, is a method of staining used to classify bacterial species into two large group: gram-positive bacteria and gram-negative bacteria. The name comes from the Hans Christian Gram, in 1884. Those bacteria which retain the stain are known as Gram positive and those which do not retain the stain are called Gram negative.

- The cell wall in bacteria contains peptidoglycan, a polymer of N-acetyl glucosamine, N- acetyl muramic acid and amino acids.
- Gram –positive cell walls contain a thick layer of peptidoglycan that encircles the cell.
- Gram- negative cell walls contain a thin layer of peptidoglycan between the cytoplasmic membrane and the outer membrane.

283. What is true for plasmid : -

(a) Plasmids are widely used in gene transfer
(b) These are found in virus
(c) Plasmid contain gene for vital activities
(d) These are main part of chromosome

AIPMT-2001

Ans. (a) : Plasmids have the ability to replicate independently which makes it an excellent cloning vector in the recombinant DNA technology for manipulating and transferring genes. They are widely used in genetic engineering for gene transfer.

284. An organism used as a Biofertilizer for raising soyabean crop is :

(a) Nostoc (b) Azotobacter
(c) Azospirillum (d) Rhizobium

AIPMT (Screening)-2011

Ans. (d) : Rhizobium is a bacteria that live inside the root nodules of the leguminous plant. Rhizobium is used as a biofertilizer for raising crop (soyabeans and pea). *Rhizobium japonium* forms a symbiotic association with the plant.

@apna_pdf

285. Which of the following is mainly produced by the activity of anaerobic bacteria on sewage ?

(a) Marsh gas (b) Laughing gas
(c) Propane (d) Mustard gas

AIPMT (Screening)-2011

Ans. (a) : The activity of anaerobic bacteria on sewage produces biogas, commonly called **gobar gas or marsh gas.** Marsh gas produced by physical treatment or primary treatment organic matter (Cow dunk, plant leaves etc) decomposed by activity of anaerobic bacteria in sewage treatment processes produced a rich amount of marsh gas

286. Which one of the following helps in absorption of phosphorus from soil by plants ?

(a) Anabaena (b) Glomus
(c) Rhizobium (d) Fankia

AIPMT (Screening)-2011

Ans. (b) : *Glomus* is a mycorrhizal fungus and participates in symbiotic relationships with plant root and benefit the plant in uptake of phosphorus from soil, production of growth hormones, increase of proteins , lipids, and sugars.

287. The function of leghaemoglobin in the root nodules of legumes is :

(a) expression of ni*f* gene
(b) inhibition of nitrogenase activity
(c) oxygen removal
(d) nodule differentiation

AIPMT (Screening)-2011

Ans. (c) : Leghaemoglobin is an oxygen scavenger. It protects the nitrogen fixing enzyme nitrogenase.

• The nitrogenase enzyme is responsible for converting atmospheric nitrogen into ammonia.

• Leghaemoglobin can't inhibit nitrogenase activity.

288. Nitrifying bacteria :

(a) reduce nitrates to free nitrogen
(b) oxidize ammonia to nitrates
(c) convert free nitrogen to compounds
(d) convert proteins into ammonia

AIPMT (Screening)-2011

Ans. (b) : In the process of bacteria nitrification, ammonia is converted into nitrate with the presence of bacteria in the soil, nitrate are formed by the oxidation of ammonia with the help of Nitrosomonas bacteria species.

• The process of bacteria nitrification involves the following reaction.

$$2NH_3 + 3O_2 \rightarrow 2NO_2^- + 2H^+ + 2H_2O$$

$$2NO_2^- + O_2 \rightarrow 2NO_3^-$$

289. In eubacteria, a cellular component that resembles eukaryotic cell is :

(a) Cell wall (b) Plasma membrane
(c) Nucleus (d) Ribosomes

AIPMT (Screening)-2011

Ans. (b) : In eubacteria, a cellular component that resembles eukaryotic cell is plasma membrane. It is made up of phospholipid, protein and some amount of polysaccharides.

290. Organisms called Methanogens are most abundant in a

(a) Hot spring (b) Sulphur rock
(c) Cattle yard (d) Polluted stream

AIPMT (Screening)-2011

Ans. (c) : Methanogens are mostly found in cattle yard and marshy area. Methanogen belongs to Archaebacteria group. They are capable of producing methane gas or bio gas.

• Methanogens are coccoid (spherical shaped) or bacilli (rod shaped). They are mostly anaerobic organism. The reduction reaction of CO_2 into CH_4 in the presence of hydrogen.

$$CO_2 + 4H_2 \rightarrow CH_4 + 2H_2O$$

291. Assertion : Plasmids are single-stranded extra chromosomal DNA.

Reason : Plasmids are possessed by eukaryotic cells.

(a) Both assertion and Reason are true and reason is the correct explanation of Assertion
(b) Both Assertion and reason are true but Reason is not the correct explanation of Assertion
(c) Assertion is true but Reason is false
(d) Both Assertion and Reason are false.

AP EAMCET-2011
AIIMS-1997

Ans. (d) : Plasmids are small circular, double - stranded, self-replicating, additional or extra chromosomal DNA which are commonly found in bacteria (prokaryote).

292. PPLO are smallest cell in the living world. The extend form of PPLO is

(a) Pseudo Pneumonia Length Orge
(b) Pseudo Plank Leg Organelle
(c) Pneumonia Plank like Organism
(d) Pleuro Pneumonia Like Organism

JIPMER-2016
AMU-1999

Ans. (d) : Pleuro Pneumonia Like Organisms is the full form of PPLO in biology. Mycoplasma is another name for the PPLO which is the tiniest cell or creatures, measuring between 0.1 and 0.3 mm in diameter.

293. In the light of recent classification of living organisms into three domains of life (bacteria, archaea and eukarya), which one of the following statements is true about archaea?

(a) Archaea completely differ from both prokaryotes and eukaryotes
(b) Archaea completely differ from prokaryotes
(c) Archaea resemble eukarya in all respects
(d) Archaea have some novel features that are absent in other prokaryotes and eukaryotes

AIPMT-2008

Ans. (d) : Archea belong to the domain Archaea and are single celled, prokaryotic organisms that do not have membrane bound organelles and are distinct from both bacteria and eukaryotes. One unique character of Archaea is their ability to thrive in extreme environmental conditions that would kill other life forms.

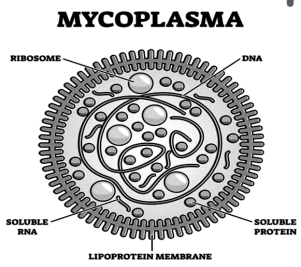
@apna_pdf

• The group contains methanogens that can produce methane gas. The DNA of these organisms is generally present in a relaxed state or as positively coiled. The cell wall of these organisms does not contain lipids, peptidoglycan etc.

294. Which one of the following statements about mycoplasma is wrong?
(a) They cause diseases in plants
(b) They are also called PPLO
(c) They are pleomorphic
(d) They are sensitive to penicillin

AIPMT-2007
CG PMT-2005

Ans. (d) : Mycoplsma is the free living and the simplest of the prokaryotes. They were found in the pleural fluid of the animals who were suffering from pleuropneumonia and they are called PPLO which stands for pleuropneumonia like organism.



295. The wall of bacteria consists of
(a) N- acetyl glucosamine
(b) N- acetyl muramic acid
(c) both (a) and(b)
(d) cellulose

UP CPMT-2005
DUMET-2005

Ans. (c): The bacterial cell wall consists of peptidoglycan, is a polymer of N- acetyl glucosamine and muramic acid. Cellulose is a polymer of glucose.

296. How many genes are present in E. coli?
(a) 200 (b) 230
(c) 231 (d) None of these

UP CPMT-2005

Ans. (d): The E. coli chromosome is currently represented by 4,401 genes encoding 116 RNAs and 4285 protein modules.

297. A bacterial cell wall is mainly composed of
(a) Mucopolysaccharides
(b) Sialomuco protein
(c) Peptidoglycan (murein)
(d) Glycogen and muramic acid

UP CPMT-2014
VMMC-2003 / AIIMS-1999

Ans. (c): A bacterial cell is composed of mainly peptidoglycan (murein). It also contain lipid, protein and polysaccharide. The peptidoglycan contain, N-acetylglucosamine (NAG) and N-acetyl muramic acid (NAM).

• In addition to these constituent L - alanine and D-alamine, D-glutamic acid and diaminopimelic acids are also found.

298. Which cell is most minute and smallest free-living organism?
(a) Mollicutes (b) Bacterium cell
(c) Prions (d) Viroids

UP CPMT-2014

Ans. (a): Mycoplasma or mollicutes is smallest and minute free-living organisms. They were discovered by Nocard and Roux (1898).
They are cell wall devoid, pleomorphic. Gram negative Monera member with smallest cell size (0.1–0.15μm). These are popularly known as Pleuro pneumonia Like Organism (PPLO).

299. Circular free floating molecule of DNA duplex, autonomous, found in bacterial cytoplasm are extensively used as vector in genetic engineering
(a) Cosmids (b) Phages
(c) Plasmids (d) Bacterial DNA

UP CPMT-2014
BVP-2006

Ans. (c): Plasmids are circular, free floating molecule of DNA duplex (extra-chromosomal DNA) autonomous, found in bacterial cytoplasm as (extra-chromosomal DNA).
These are extensively used as vector in field of genetic engineering to insert the desirable gene into organism.

300. Bacteria differ from plants in that they do not have
(a) DNA (b) RNA
(c) cell wall (d) a well define nucleus

UP CPMT-2011

Ans. (d): Bacteria are prokaryote unicellular organisms. They lack membrane bounded cell organelles and a well-defined nucleus. Plants are eukaryotes multicellular organisms. They are eukaryote. They have organelles and well defined nucleus.
Both plant and bacteria have cell wall and DNA and RNA but the cell wall of plant cell made up of cellulose and bacteria cell wall is made up of murein.
• In plant cell wall, DNA found in multiple chromosomes while in bacterial cell wall DNA is in a single circular ring.

301. Identify a micro-organism that can produces biomass of protein.
(a) Monoscus purpureus
(b) Aspergillus niger
(c) Methylophilus methylotrophus
(d) Trichoderma polysporum

Karnataka CET-2016

Ans. (c) : The methylotrophic bacterium *Methylophilus methylotrophus* hydrolyses urea to ammonia using a cytoplasmic urease. During growth in continuous culture under various nutrient limitations urease was induced by urea and short- chain amides and repressed by excess ammonia.

302. Match the types of bacteria listed in column I with their activity given in column II. Choose the correct combination of alphabets of the two columns.

@apna_pdf

Column-I (Types of bacteria)		Column-II (Activity)	
A	Streptomyces	p	Food poisoning
B	Rhizobium	q	Source of Antibiotics
C	Nitrosomonas	r	Nitrogen fixation
D	Acetobacter	s	Nitrification
		t	Vinegar synthesis

(a) A = s; B = t; C = p; D = r
(b) A = t; B = p; C = r; D = s
(c) A = q; B = r; C = p; D = t
(d) A = q; B = r; C = s; D = t

Karnataka CET-2004

Ans. (d) :

Column-I (Types of bacteria)		Column-II (Activity)
A. Streptomyces	–	q. Source of Antibiotics
B. Rhizobium	–	r. Nitrogen fixation
C. Nitrosomonas	–	s. Nitrification
D. Acetobacter	–	t. Vinegar synthesis

303. Identify the plasmid……

(a) Eco RI (b) pBR 322
(c) AIU I (d) Hind III

Karnataka CET-2004

Ans. (b) : pBR 322, in order to link the alien DNA the vector needs to have very few recognition site of the commonly used restriction enzymes.

304. Which of the following statements is right?

(a) Diatoms produce basidiospores.
(b) Heterocysts are found in Nostoc.
(c) Fronds are found in Bryophytes.
(d) Multiciliate sperm are found in Angiosperm

Karnataka CET-2004

Ans. (b) : Nostoc species are filamentous cyanobacteria. These organisms have the ability to fix atmospheric N_2 with the help of enzyme present in heterocyst. Basidiospores are produced by basidiomycetes. Fronds are found in pteridophytes. Cilia are absent in sperm of angiosperms.

305. Match the following lists

List I	List II
(A) Syphilis	(i) Acetobacter
(B) Pathogen of cattle	(ii) Agrobacterium
(C) Crown Gall of Apples	(iii) Corynebacterium
(D) Diphtheria	(iv) Mycobacterium
	(v) Treponema

The correct match is

	A	B	C	D
(a)	(iii)	(i)	(iv)	(ii)
(b)	(v)	(iv)	(ii)	(iii)
(c)	(v)	(iii)	(ii)	(i)
(d)	(ii)	(iv)	(v)	(iii)

AP EAMCET-2013

Ans. (b):

List-I		List-II
Syphilis	–	Treponema
Pathogen of cattle	–	Mycobacterium
Crown gall of apples	–	Agrobacterium
Diptheria	–	Corynebacterium

306. Study the following list

List I	List II
(A) *Pasteurella pestis*	1. Angular leaf spot of cotton
(B) *Treponema pallidium*	2. Amphotericin
(C) *Mycobacterium bovis*	3.Actinomycosis of cattle
(D) *Streptomyces nodosus*	4. Syphilis
	5. Plague

The correct match is

	A	B	C	D
(a)	4	1	2	3
(b)	2	3	4	5
(c)	5	4	3	2
(d)	3	2	1	4

AP EAMCET-2009

Ans. (c) :

(A)	*Pasteurella pestis*	-	Plague
(B)	*Treponema pallidium*	-	Syphilis
(C)	*Mycobacterium bovis*	-	Actinomycosis of cattle
(D)	*Streptomyces nodosus*	-	Amphotericin

307. Match the column I with column II and select the correct option.

Column I	Column II
(A) Bacillus thuringiensis	(1) Production of chitinases
(B) *Rhizobium meliloti*	(2) Scavenging of oil spills
(C) *Escherichia coli*	(3) Incorporation of 'nif' genes
(D)*Pseudomonas putida*	(4) Production of Bt-toxin
(E) Trichoderma	(5) Production of human insulin

	A	B	C	D	E
(a)	2	4	4	5	3
(b)	2	4	5	1	3
(c)	4	3	5	2	1
(d)	5	4	3	1	2

AP EAMCET-2011

Ans. (c) : *Bacillus thuringiensis* is a gram-positive bacteria that produces crystal proteins toxin specific to the target insect, but it is not toxic to humans and non-target organism.

- ***Rhizobium meliloti*** – It contains Nif genes, that encodes enzymes involved in the fixation of atmospheric nitrogen into ammonium compound.
- ***Escherichia coli*** – Gene for production of human insulin can be transferred to *Escherichia coli* by recombinant DNA technique.

@apna_pdf

- ***Pseudomonas putida*** – Genetically engineered bacteria which is used for scavenging of oil spills by digesting hydrocarbons of crude oil.
- **Trichoderma** – Chitinase production by *Trichoderma harzianum* grown on a chitin-rich mushroom by product formulated medium.

308. Which one of the following pairs is not correctly matched :-
(a) **Serratia**–Drug addiction
(b) **Spirulina** – Single cell protein
(c) **Rhizobium** – Biofertilizer
(d) **Streptomyces** – Antibiotic

AIPMT-2004

Ans. (a) :
- Serratia is a genus of gram negative, facultatively anaerobic, rod-shaped bacteria of the family **Yersiniaceae.**

309. Which one of the following bacteria has found extensive use in genetic engineering work in plants?
(a) Bacillus coagulens
(b) Agrobacterium tumefaciens
(c) Clostridium septicum
(d) Xanthomonas citri

MGIMS Wardha-2010

Ans. (b) : *Agrobacterium tumifaciens* is a soil bacterium that is transferred to the plants through the wounded region and causes gall tumors in plants. This bacterium contains a plasmid Ti plasmid or tumor inducing plasmid.
- It is popular in genetic engineering because this bacterium is associated with the roots of the all cereal and pulse crops.

310. In which kingdom, would you classify the archaea and nitrogen-fixing organisms. If the five-kingdom system of classification is used?
(a) Protista (b) Monera
(c) Plantae (d) Fungi

MGIMS Wardha-2010
CGPMT-2007

Ans. (b) : Archaea and nitrogen fixing bacteria or organisms are prokaryotic in nature. Hence, they can be placed in the kingdom monera.
- Monera includes eubacteria and archaea. They include non-nucleated unicellular organisms. They are prokaryotics. They have a cell wall. They have no membrane bound organelles and true nucleus.

311. Chromosomes in bacterial cell can be 1 to 3 in
(a) number and can be either circular or Linear, but never both within the same cell
(b) can be circular as well as linear within the same cell
(c) are always circular
(d) are always linear

MGIMS Wardha-2010
Uttarakhand PMT-2007

Ans. (c) : Bacterial chromosome is called nucleiod. It is an irregularly shaped and contains genetic material.
Bacterial cell usually have one circular chromosome of a few metabase in size.
- They often have plasmids whose size range from a few to one hundred or kilobases.
- Bacteria possess a single circular chromosome comprised of double stranded DNA molecule.

312. Bacterial endotoxin is
(a) a toxic protein that stays inside the bacterial cell
(b) a toxic protein that is excreted into the medium
(c) lipopolysaccharide located on the surface of the bacteria
(d) None of the above

JIPMER-2013

Ans. (c) : Bacteria secretes toxins which is divided into two category :- (i) Endotoxin (ii) Exotoxin.
- Endotoxins are membrane compounds of gram-negative bacteria which elicit an inflammatory response in host.
- Exotoxins are secretes proteins which act locally and at distance of bacterial colonization site.

313. Colourless, unicellular, cell wall bound, spherical or rod-shaped micro-organism and lacking organised nucleus is called
(a) mycoplasma (b) virus
(c) bacteria (d) cyanobacteria

UP CPMT-2004

Ans. (c) : Colourless, unicellular, cell wall bound, spherical or rod-shaped micro-organism and lacking organised nucleus is characteristic feature of bacteria. Bacteria are found almost everywhere on earth and it play vital role to the maintain ecosystem.

314. Tuberculosis is caused by
(a) Mycobacterium sp. (b) Aspergillus sp.
(c) Clostridium sp. (d) Vibrio sp.

WB JEE-2010

Ans. (a) : Tuberculosis is a bacterial disease caused by bacteria Mycobacterium tuberculosis.
- Bacteria usually attack the lungs but T.B. bacteria can attack any part of the body such as kidney, brain etc.
- It is spread from one person to the other through the air, people who have active Tuberculosis in their lungs.

315. Bacteriophages kill
(a) fungi (b) parasites
(c) bacteria (d) viruses

WB JEE-2010

Ans. (c) : Bacteriophages are viruses that kill bacteria. Bacteriophages are composed of protiens that encapsulate a DNA or RNA genome and may have structure that are either simple or elaborate.
- Bacteriophages are so small they do not even have a single cell, but are instead just a piece of DNA surrounded by a protein coat. When they attack a bacterium, bacteriophages can multiply very quickly until the bacterium bursts and releases lots of new phages.

@apna_pdf

316. Bacteria with single flagella at one end is called:
(a) monotrichous (b) lophotrichous
(c) amphitrichous (d) peritrichous
Rajasthan PMT-2004

Ans. (a) : Bacteria with single flagella at one end is called monotrichous.
• Bacterial flagella are a coiled thread like structure sharp bent consisting of a rotary motor of its base and are composed of the flagellin protein.

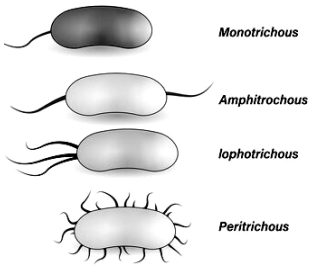


Fig:- Types of bacteria

317. Bacteria causing disease of citrus is:
(a) citrus leaf spot
(b) stunt disease
(c) citrus canker
(d) citrus greening leaf disease
Rajasthan PMT-2004

Ans. (c) : Citrus canker is a bacterial disease caused by the bacterium *Xanthomonas citri.*
- It affects the leaves, twigs and fruit of citrus plants, causing the leaves to drop and unripe fruit fall to the ground.
- Citrus canker is most severe in hot, wet areas.

318. O_2 does not evolved in photosynthesis of:
(a) BGA (b) green algae
(c) bacteria (d) autotrophic plant
Rajasthan PMT-2004

Ans. (c) : Plants produce organic food by the help of photosynthesis. Like plants, some bacteria are capable of synthesising their organic food in presence of light, which is known as **bacterial photosynthesis.** This process is anoxygenic thats why they do not produce O_2.

319. When the procedure of bacterial staining is carried out, the Gram negative bacteria stains :
(a) red (b) green
(c) purple (d) black
AFMC-2000

Ans. (a) : When the procedure of bacterial staining is carried out, the Gram negative bacteria stains red. Stains and dyes are used to highlight the microscopic level to study it at higher magnification for histopathological studies and diagnostic purposes. However, staining is not just limited to biological specimens. It can also be used to study the structure of crystalline polymers.
• Gram's staining procedure is used to identify becteria based on their cell wall composition.

320. The cell wall material present only in bacteria and blue-green algae is
(a) pectin (b) cellulose
(c) chitin (d) muramic acids
AMU-2015

Ans. (d) : Muramic acid is an amino sugar acid. It occurs naturally as N-acetyl muramic acid in peptidoglycan, whose primary function is a structural component of many typical cell walls.
• Muramic acid, is a component of the muramyl peptide found only in the cell wall of bacteria and blue green algae.

321. Which is the hereditary material in bacteria?
(a) Nucleic acid
(b) Nucleic acid cytoplasm
(c) Nucleic acid and histone
(d) None of the above
BCECE-2005

Ans. (a) : The DNA of most bacteria is contained in a single circular molecule called the **bacterial choromosome.** The chromosome along with several protiens and RNA molecules, forms an irregularly shaped structure called the **nucleiod.** This sites in the cytoplasm of the bacterial cell.
The genetic material is free irregular, thin fibril double - stranded circular DNA.

322. Mesosomes are found in:
(a) Yeast (b) Acetabularia
(c) Bacteria (d) Chara
BHU PMT-2002

Ans. (c) : Mesosomes are organelles formed by plasma membrane infoldings and found in the membrane of bacteria.
- Mesosome play a role in the formation of cell walls.
- They are involved in the replication of DNA in prokaryotic.
- Increase plasma membrane surface area and enzymatic content.
- Mesosomes are analogous to cristae in the mitochondria in eukaryotic cells.

323. Type of genetic material present in bacteria is:
(a) DNA
(b) DNA with histones
(c) RNA with histones
(d) RNA without histones
Punjab MET-2003
BHU PMT-2002

Ans. (a) : The genetic material of bacteria and plasmids is DNA. Bacterial viruses (bacteriophages) have DNA or RNA as genetic material.
- The bacterial chromosome is one long-single molecule of double - stranded helical supercoiled DNA.
- Bacterial DNA contains Uracil instead of Thymine.
- Prokaryotic cells typically have only a single circular chromosome.

324. In bacteria respiration occurs in:
(a) cytoplasmic membrane
(b) mitochondria
(c) nuclear membrane
(d) endoplasmic reticulum
BHU PMT-2003

Ans. (a) : The cytoplasm or protoplasm of bacterial cells is where the functions for cell growth, metabolism, respiration and replication are carried out because bacteria is a prokaryotic cell.
• Some bacteria exhibit a unique mode of respiration called anaerobic respiration.

@apna_pdf

325. In bacterial cell enzymes for aerobic respiration are found in:
(a) Ribosome (b) Mesosome
(c) Mitochondria (d) None of these
Punjab MET-2003
Rajasthan PMT-1996

Ans. (b) : Generally mesosomes are found in association with nuclear area or near the site of cell division they are absent in eukaryotes.
- Mesosomes are the invaginated structures formed by the localized in folding of the plasma membrane. The invaginated structures comprise of vesicles, tubules of Lamellar Whorls.
- Mesosomes are supposed to take part in respiration but they are not analogous to mitochondria.

326. Blue-green algae are
(a) prokaryotic (b) eukaryotic
(c) monocots (d) dicots
UP CPMT-2010

Ans. (a) : Blue green algae are prokaryotes.
- Blue green algae and some bacteria are photosynthetic autotrophic. Their photosynthetic thylakoids lie freely in the cytoplasm.
- Prokaryotic cells lack in mitochondria, endoplasmic reticulum etc.

327. Which of the following have flagella on both ends of the bacterial cell?
(a) Monotrichous (b) Amphitrichous
(c) Lophotrichous (d) Peritrichous
UP CPMT-2010, 2001

Ans. (b) : The bacteria cells having one or more flagella at the opposite side of their cell body are **amphitrichous**.
• Amphitrichous bacteria contain a single flagellum on each of their two opposite end since only one flagellum is active at once. The bacterium can quickly change its direction by switching the flagellum in use.

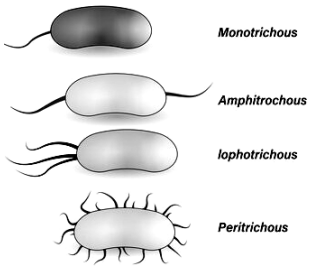

Fig :- Types of bacteria

328. Pigment present in cyanobacteria is
(a) r - phycocyanin (b) r-phycoerythrin
(c) c-phycocyanin (d) anthocyanin
BHU PMT (Screening)-2007
UP CPMT-2003

Ans. (c) : Pigment present in Cyanobacteria is c-phycocyanin. A Cyanobacteria is an ancient group of photosyntetic prokaryotes that are thought to be the first organism to carry out oxygenic photosynthesis.
• C-phycocyanin is used to capture light energy for photosynthesis.
• Cyanobacteria contain pigments like **phycoerythrin** and **phycocyanin** which are responsible for their blue-green color and only due to appearance these bacteria are called **blue-green algae** although they are not algae at all.
• Cyanobacteria are the prokaryotic organisms found in lake. Oceans capable of using sun light as their energy.

329. The wall of bacteria is consists of
(a) N-acetyl glucosamine
(b) N-acetyl muramic acid
(c) both (a) and (b)
(d) cellulose
UP CPMT-2003

Ans. (c) : Bacteria cell wall is made up of peptidoglycan, has N-acetyl glucosamine and N-acetyl muramic acid with small peptide chain, which is a component of the bacterial cell wall.

330. Bacteria do not have
(a) ribosome
(b) protein synthesizing apparatus
(c) mitochondria
(d) cell wall
Uttarakhand PMT-2007
UP CPMT-2003

Ans. (c) : Bacteria do not have mitochondria, because mitochondria is a membrane bound organelles and present in eukaryotic cell. In Bacteria, prokaryotic cell are present. In prokaryotic cell, no any membrane bound organelles are found.

331. In which of the following oxygen does not evolve during photosynthesis?
(a) Photosynthetic red algae
(b) Photosynthetic green algae
(c) Photosynthetic blue-green algae
(d) Photosynthetic bacteria
UP CPMT-2003

Ans. (d) : Photosynthetic bacteria does not evolve oxygen during photosynthesis. Photosynthetic bacteria directly utilize energy from solar radiation and electron from inorganic or organic compound. The photolysis of H_2O does not takes place in photosynthetic bacteria so oxygen is not involved.

332. Cyanobacteria is an
(a) algae having blue-green pigment
(b) algae having red pigment
(c) algae having brown pigment
(d) algae having yellow-brown pigment
UP CPMT-2003

Ans. (a) : Cyanobacteria is an algae having blue-green pigment. Cyanobacteria is also called blue green algae.
Cyanobacteria is a microscopic organism found naturally in all types of water.
These organism use sunlight to make their own food.

333. The peptidoglycans of bacteria consist of
(a) sugars, D-amino acids and L-amino acids
(b) sugars and only D-amino acids
(c) sugars and only L-amino acids
(d) sugars and glycine
KVPY SB and SX-2015

@apna_pdf

Ans. (a) : Bacteria cell wall contains sugar (NAG), D-amino acid and L-amino acid.

- Peptidoglycan is a polymer that is made up of sugars and amino acids. Diaminopimelic acid and muramic acid are present in the wall of bacteria and cyanobacteria.
- The sugar component is made up of alternating N- a cetyl glucosamine acid (NAG) and N - acetyl muramic acid (NAM).
- Muramic acid is then attached to the amino-acid chain of L-alanine, D-glutamic acid.

334. Which is a wrong statement?

(a) Plasmids of cyanobacteria have been used in biotechnology
(b) DNA of cyanobacteria is circular and double-stranded
(c) Cyanobacteria possess single linkage group
(d) Like bacteria, they also exhibit genetic recombination

Manipal-2011

Ans. (a) : Plasmids are usually circular molecules of DNA, although occasionally plasmid that are linear or made of RNA exist.

- Plasmid can duplicate independent of the genome.
- Plasmids are useful in cloning short segment of DNA.
- Plasmid can be used to replicate proteins.

335. Which of the following organisms completely lack cell wall, they are the smallest living cells known and can survive without oxygen?

(a) Mycoplasma (b) Euglenoids
(c) Slime moulds (d) All of these

AFMC -2009
MGIMS Wardha-2009

Ans. (a) : Mycoplasma are the smallest and simplest self-replicating bacteria.

- Mycoplasma cell contains the minimum set of organelles essential for growth and replication a plasma-membrane ribosomes and a genome consisting of a double stranded circular DNA molecule.
- Mycoplasma can survive without oxygen.

336. Which of the following statement is correct?

(a) All bacteria are heterotrophic
(b) Bacteria are either heterotrophic or chemoautotrophic
(c) Bacteria can also be photoautotrophic
(d) Bacteria are either photoautotrophic or chemoautotrophic

DUMET-2010

Ans. (c) : A photosynthetic organism that utilizes energy from light to synthesize organic molecule such as a green plant or a Cyanobacterium.

- Photoautotrophs are organisms that carry out photosynthesis, using energy from sunlight, carbon dioxide and water are converted into organic materials to be used in cellular functions such as biosynthesis and respiration.

337. Which one of the following does not belong to kingdom-Monera?

(a) Mycoplasma (b) Archaebacteria
(c) Slime mould (d) Eubacteria

DUMET-2008

Ans. (c) : Slime mould organisms that exist as slimy masses and are commonly found on decaying plant matter.

- Slime mould are saprophytic and lack chlorophyll.
- They are classified among the Protista as two distinct phyla. Dictyosteliomycota (the cellular slime mould) and Myxomycota (the plasmodial slime mould).

338. Which of the following is symbiotic bacteria?

(a) Rhizobium (b) Azotobactor
(c) Clostridium (d) Streptomyces

JCECE-2005

Ans. (a) : Rhizobium is a genus of Gram - negative soil bacteria that fix - nitrogen.

- It forms an endosymbiotic nitrogen fixing associated with roots of legumes.
- They take nitrogen from the atmosphere and pass it, on to plant allowing it to grow in soil low in nitrogen.

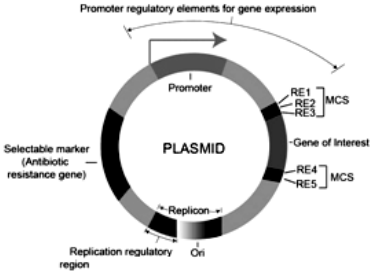
339. The autonomously independent self replicating extra nuclear DNA imparting certain factors to some bacterium is called

(a) plastid (b) plasmid
(c) phagemid (d) cosmid

J&K CET-2009

Ans. (b) : Plasmid is a small, circular double stranded DNA molecule that is distinct from a cells chormosomal DNA.

- Plasmid naturally exist in bacteria.
- Genes carried in plasmids provide bacteria with genetic advantages, such as antibiotic resistance.
- Plasmids are physically separate from chromosomal DNA and replicate independently.



340. The term bacteria was coined by

(a) Leeuwenhoek (b) Louis Pasteur
(c) Robert Koch (d) Ehrenberg

J&K CET-2009

Ans. (d) : The Genus bacterium was a taxon described in 1828 by Christian Gottfried Ehrenberg.

- The type of species was later changed from bacterium triloculare to bacterium coli, now Escherichia coli as it was lost.
- In 1676 Antonie Van Leeuwenhoek first observed bacteria through a microscope called then animalcules.

341. The genetic material of bacteria is present as:

(a) spherosome (b) genophore
(c) lomasomes (d) mesosome

JIPMER-2002, 1997

Ans. (b) : The genetic material of bacteria is present as genophore. It refers to chromosome equivalent in prokaryotes, virus and semi- autonomous organelles that serves as heredity material it consist of nucleic acid. DNA or RNA but lack histone protein.

@apna_pdf

• Many eukaryotes (such as plants and animals) carry genophores in organelles such as mitochondria and chloroplast. These organelles are very similar to true prokaryotes.

342. The site of photosynthesis in blue-green algae is
(a) Chromatophores (b) Mitochondria
(c) Chloroplast (d) Root hair

BCECE-2014
Uttarakhand PMT-2009
BHU PMT (Screening)-2009

Ans. (a) : Cynobacteria or blue-green algae are prokaryotes and hence lack membrane bound organelles such as chloroplast. They possess chromatophores insted of chloroplast as the site of photosynthesis.
• Chromatophore are pigment - containing vesicles that are found in cell cytoplasm and play vital role in photosynthesis.

343. Of the following statements which are not relevant to Archaebacteria?
(A) They live in some of the most harsh habitats
(B) They are present in the gut of several ruminant animals
(C) They are characterized by the presence of a rigid cellulosic cell wall
(D) They include mycoplasma
(E) They are also referred to as blue-green algae
(a) A, B and C (b) A, C and E
(c) C, D and E (d) A, C and D
(e) B, C and E

Kerala PMT-2015

Ans. (c) : Archaebacteria live in some of the harsh habitats. They have cell wall which is made up of polysaccharides and protein, without peptidoglycan. They are also present in the gut of several ruminant animal.

344. Which of the following characters belongs to the Kingdom Monera?
(a) Eukaryotic
(b) Heterotrophic
(c) Multicellular
(d) Presence of cell walls made of cellulose
(e) Presence of nuclear membrane

Kerala PMT-2015

Ans. (b) : Heterotrophic organisms are those organism which can not prepare their own food through the process of photosynthesis and they depend on autotrophs for nutrition directly or indirectly.
• All animals and non-photosynthetic plants are classified as heterotrophs since they are unable to prepare food.

345. Maximum number of bases in plasmid discovered so far is
(a) 50 kilobase (b) 500 kilobase
(c) 5,000 kilobase (d) 5 kilobase

BHU PMT (Screening)-2010

Ans. (b) : Plasmids have a wide range of length from roughly one thousands DNA base pairs to hundreds of thousands of bases pairs.
• Plasmids are known to vary from 5 to 500 kilo base in size although plasmid as small as 2 kilo base to as large as more than 1 mb in size has been reported.

346. What is true for archaebacteria?
(a) All are halophilic
(b) All are photosynthetic
(c) All are fossils
(d) These are oldest living beings

BHU PMT (Screening)-2010

Ans. (d) : The oldest living organisms on earth are known as Archaebacteria. They belong to the kingdom Monera and are classified as bacteria because they resemble bacteria when observed under a microscope.
• Archaebacteria have the capability to produce methane.

347. The red color of red sea is due to which of the following blue-green algae?
(a) Chlamydomonas nivalis
(b) Anabaena
(c) Microcystis
(d) Trichodesmium

JIPMER-2003

Ans. (d) : Trichodesmium is a diazotroph that is fixes atmospheric nitrogen into ammonia a nutrient used by other organisms.
• Trichodesmium is thought to fix nitrogen on such a scale that it accounts for almost half of the nitrogen fixation in marine systems globally.
• Trichodesmium are Cyanobacteria also known as blue-green algae.
• It is widely accepted that the red sea is caused by Trichodesmium.

348. Blue-green algae is found in :
(a) Cycas (b) Pinus
(c) Scales of Marchantia (d) Riccia

JIPMER-2003

Ans. (a) : Nostoc and Anabaena are blue green algae. These are commonly found in the coralloid root of Cycas but other Nostocales can also be found. They have the necessory characteristics to infect the roots and to develop and maintain a symbiotic relationship with the Cycas.
• Coralloid root systems form near the surface of the soil where they are not hidden from light.

349. In prokaryotes, chromatophores are
(a) specialized granules responsible for coloration of cells
(b) structures responsible for organizing the shape of the organism
(c) incusion bodies lying free inside the cells for carrying out various metabolic activities
(d) internal membrane systems that may become extensive and complex in photosynthetic bacteria

Rajasthan PMT-2010

Ans. (d) : Chromatophores are pigment-containing vesicles that are found in the cell cytoplasm.They are present in prokaryotes such as Cyanobacteria and Rhodospirillum.
• Chromatophore is found in some photosynthetic bacteria. These are the pigment - containing phycobilin that are necessary for photosynthesis take place

@apna_pdf

350. Nuclear membrane is absent in

(a) Monera (b) Protista
(c) Fungi (d) Plantae

AMU-2010

Ans. (a) : The nuclear membrane is a double layer that encloses the cells nucleus, where chromosome reside.

Nuclear membrane are absent in kingdom Monera, because here all organism are unicellular prokaryotes.

- Nuclear membrane separate the chromosome from the cells cytoplasm and other contents.
- It provide the structural framework of the nucleus.
- The nuclear membrane acting as barrier that prevent the free passage of molecules between the nucleus and the cytoplasm.

351. One of the following is not the characteristic feature of Cyanobacteria

(a) They are multi cellular
(b) They form colonies
(c) They form blooms in polluted water bodies
(d) They can fix atmospheric nitrogen

AMU-2010

Ans. (a) : Cyanobacteria also known as **Cyanophyta** are a group of Gram negative bacteria that obtain energy via photosynthesis. They are unicellular organism.

- Cyanobacteria are a special category of bacteria that can perform photosynthesis.
- They have chlorophyll and carry out oxygen producing photosynthesis as much as plant and eukaryotic algae.

352. Select the most successful group of organism on the surface of our globe

(a) Gram positive heterotrophs
(b) Gram negative photosynthetic cyanobacteria
(c) Chemoautotrophic bacteria
(d) Photoautotrophic bacteria

AMU -2000

Ans. (b) : Cyanobacteria are a group of bacteria that are able to do photosynthesis.

- A family of photosynthetic bacteria known as Cyanobacteria are widely dispersed in both aquatic and terrestrial. Hence, the most successful group of organism on the surface of our globe is Gram negative photosynthetic Cyanobacteria.

353. The characteristic cells wall material peptidoglycan has another covering of lipopolysaccharides. This specialized condition is found in

(a) Eubacteria Gram positive
(b) Eubacteria Gram negative
(c) All eukaryotes
(d) Both (a) and (b)

AMU -2000

Ans. (b) : Eubacteria is a genus of Gram-positive bacteria in the family Eubacteriaceae.

These bacteria are characterised by rigid cell wall.

- They may be either be motile or non-motile.
- Gram- negative bacteria are surrounded by a thin peptidoglycan cell wall which itself is surrounded by an outer membrane containing lipopolysaccharide.

354. Gram negative heterotrophic bacteria that can biodegrade a variety of natural as well as man-made organic compounds, such as petroleum products, include

(a) cyanobacteria (b) clostridia
(c) archaebateria (d) none of these

AMU-1999

Ans. (d) : Bacteria with the ability to degrade hydrocarbon are named as hydrocarbon degrading bacteria.

- Biodegradation of hydrocarbons can occur under aerobic and anaerobic conditions.
- Waste materials can be broken down into simple, non-toxic substances by microorganism.

355. The rumen of cattle is the site of fermentation of cellulose fibres through the action of

(a) archaebacteria (b) cyanobacteria
(c) mycoplasmas (d) spirochaetes

AMU-1999

Ans. (a) : Archaebacteria is a group of kingdom monera which is found in extreme habitats such as hot springs, marshy areas.

- Archaea is a domain of single celled organisms these microorganisms lack cell nuclei.
- Archaebacteria have the capability to produce methane i.e. are methanogens.

356. The nature of photosynthesis in blue-green algae is

(a) Oxygenic (b) Anoxygenic
(c) Anaerobic (d) None of these.

AMU-1998

Ans. (a) : The oxygenic photosynthesis performing organisms are called Cyanobacteria. The blue-green algae were the first oxygenic photoautotrophs on the planet earth. It is found in eukaryotes.

357. Heterocysts are found in:

(a) Aspergillus (b) Nostoc
(c) Cystopus (d) Ulothrix

HP CET-2013
VMMC-2002

Ans. (b) : A heterocyst is a differentiated cyanobacterial cell that carries out nitrogen fixation.

- It is the site for nitrogen fixation under aerobic conditions.
- Heterocysts are found in many species of filamentous blue-green algae. They are cells of slightly larger size and with a more thickned wall than the vegetative cells.
- Example-Nostoc, Anabaena etc.

358. Which of the following is free living aerobic, non- photosynthetic nitrogen fixing bacterium?

(a) Rhizobium (b) Azotobacter
(c) Nostoc (d) Azospirillium

HP CET-2013

Ans. (b) : Azotobacter are free living aerobic and non photosynthetic nitrogen fixing bacteria. It retains the capability of fixing atmospheric nitrogen i.e. fixation of atmospheric nitrogen into ammonia.

@apna_pdf

359. A pigment in cartenoid is found in bacteria and fungi, it is:

(a) fuxocanthin (b) lycopene
(c) capsanthin (d) xanthophyll

VMMC-2006

Ans. (c) : Capsanthin is a natural red dye of the xanthophylls class of carotenoids. It is also found in some species of lily. It is a carotenoid compound with antioxidant properties that help protect cells from oxidative damage.

360. The site of respiration in bacteria is:

(a) microsome (b) mesosomes
(c) episome (d) ribosome

VMMC-2006

Ans. (b) : Mesosomes is a convoluted membranous structure formed in prokaryotic cell by the invagination of the plasma-membrane.

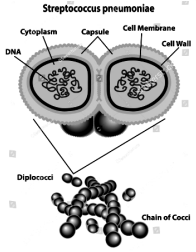
- It helps in the synthesis of the cell membrane, replication of DNA, and protein synthesis.
- It also involved in septum formation during cell division.
- It perform the function of mitochondria in bacteria.

361. The cells of the bacterium Streptococcus remain arranged in the form of:

(a) irregular cluster (b) chain
(c) plate (d) cube

VMMC-2006

Ans. (b) : Streptococci are Gram-positive, non-motile non-spore forming, catalase-negative bacteria that occur in pairs or chains. Most Streptococci are facultative anaerobes and some are obligate anaerobes. The cells of the bacterium Streptococcus remain arranged in the chain form of different length.



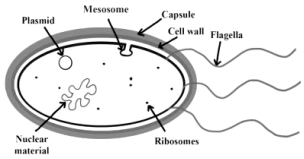
362. Infolding of plasma membrane in gram (+ve) bacterial cell is called :

(a) mesosome (b) reticulum
(c) lamellae (d) cristae

Rajasthan PMT-1998

Ans. (a) : Mesosomes is a convoluted membranous structure formed in prokaryotic cell by the invagination of the plasma-membrane.

- It helps in the synthesis of the cell membrane, replication of DNA and protein synthesis.
- It also involved in septum formation during cell division.
- It perform the function of mitochondria in bacteria.



Mesosome

363. Witches broom disease is caused by:

(a) Fungus (b) Mycoplasma
(c) Bacteria (d) Mineral

JCECE-2005
Manipal-2000
Rajasthan PMT-1998

Ans. (b) : Witch-broom disease is a type of disease caused by stress or Mycoplasma. In this, there's a dense mass of shoots from one point, this results in a structure resembling a broom.

364. Which kingdom incorporates photoautotrophs, chemoautotrophs and heterotrophs ?

(a) Monera (b) Protista
(c) Plantae (d) Both (b) and (c)

BCECE-2009
CG PMT-2007
AMU-1999

Ans. (a) : The kingdom Monera incorporates photoautotrophs, chemoautotrophs and heterotrophs. Some organisms belonging to kingdom Monera have an autotrophic mode of nutrition which means that they can prepare their own food while others are heterotrophic which depends on others for food.

- Mode of nutrition of all organisms belonging to kingdom Monera is autotrophic.
- Chemoautotroph do not require light and pigment for their nutrition. These bacteria oxidize certain inorganic substances with the help of atmospheric O_2.

365. Blue-green alga are included in:

(a) protista (b) fungi
(c) prokaryotes (d) bryophytes

Uttarakhand-2005

Ans. (c) : Prokaryotes are organisms whose cells lack a nucleus and other organelles.

- Most of the bacteria are single celled small organisms that have a relatively simple structure.
- Prokaryotes include the domains Eubacteria and Archaea. Thus example of prokaryotes include bacteria, archaea, and cyanobacteria.

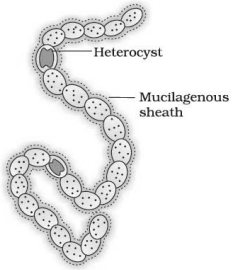
366. Heterocysts are found in

(a) Cyanophyceae (b) Chlorophyceae
(c) Pheophyceae (d) Rhodophyceae

Haryana PMT-2007
J & K CET-2000

Ans. (a) : Heterocyst are found in many species of filamentous blue-green algae. They are cells of slightly larger size and with more thickened wall than the vegetative cells.

- It is a transparent thick - walled cell seen in blue-green algae filaments at an intermediate position.



@apna_pdf

367. The outer face of outer membrane of Gram-negative bacteria having
(a) mycoic acid (b) teichoic acid
(c) lipopolysaccharides (d) peptidoglycan
VMMC-2014

Ans. (c) : Gram-negative bacteria are surrounded by a thin peptidoglycan cell wall which itself is surrounded by an outer membrane containing lipopolysaccharide.
• It forms an impermeable barrier for various antimicrobial protiens of the immune system.

368. Which of the following does not evolve oxygen?
(a) Autotrophic plants
(b) Green algae
(c) Blue-green algae
(d) Photosynthetic bacteria
JIPMER-2001

Ans. (d) : Some bacteria are photosynthetic which convert energy from sunlight into another form of energy they can use to grow.
• Photosynthetic bacteria contain different photosynthetic pigments.
• None of the anoxygenic phototrophic bacteria have the ability to use water as an electron donor and thus perform photosynthesis using sulfide hydrogen or organic substance. Therefore photosynthesis by these bacteria does not involve oxygen.

369. Organism without any specific shape are
(a) mycoplasm (b) bacteria
(c) viruses (d) cyanobacteria
Manipal-2013

Ans. (a) : Organism without any specific shape are mycoplasma. Mycoplasmas are a group of pleomorphic micro-organisms characterized by lack of cell wall and ability to form colonies on agar agar resembling tiny fried eggs.
• Mycoplasma is a genus of bacteria that like the other membrane of the class mollicutes.

370. Botanical name of 'gram' is
(a) *Cicer arietinum* (b) *Phaseolus aurens*
(c) *Lablab purpureus* (d) Dolichos
BHU PMT (Mains)-2008

Ans. (a) : *Cicer arietinum* is the botanical name of the gram belongs to family Fabaceae.
• Its different types are variously known as gram or Bengal gram, chana etc.

371. The shape of the cocci bacteria is
(a) rod (b) spherical
(c) comma (d) spiral
AMU-2012

Ans. (b) : A coccus is any bacteria or archaeon that has a spherical, ovoid, or generally round shape staphylococcus bacteria form clusters of cells that resemble grapes. They seem spherical (cocci) when observed under the microscope and create grape -like groups.

372. Black rot of crucifers is caused by a
(a) fungus (b) bacterium
(c) virus (d) None of these
AMU-2012

Ans. (b) : Black rot is caused by a bacteria *Xanthomonas campestris* that can infect most crucifer crops at any growth stage.
• This bacteria can infect any plant in the Brassica family.

373. All are true about bacterial endospores except
(a) sporulation in bacteria is a method of reproduction
(b) spores of all the medically important bacteria are killed by autoclaving at 121°C for 15 minutes
(c) spores can be stained by modified Ziehl-Neelsen technique
(d) bacterial spores help them to survive under favourable conditions
BHU PMT (Screening)-2011

Ans. (a) : The cells of the bacteria, plant or fungi which are created when an organism encounter harsh conditions are called spores. These spores have a thick cell wall which helps them to with stand harsh conditions. They preserve the organisms genetic material and resume multiplying once favourable conditions are available.
The formation of these spores is known as sporulation.

374. E. coli lives in human intestine and cause
(a) urinary tract infection in infants only
(b) diarrhoea only adults
(c) meningitis
(d) None of the above
BHU PMT (Screening)-2011

Ans. (d) : *Escherichia coli* is a gram-negative, facultative anaerobic, rod- shaped coliform bacterium of the genus Escherichia that is commonly found in the intestine of warm blooded organisms.
• They live naturally in intestinal tract and helps in digestion of food.

375. Many bacteria are now resistant to penicillin because
(a) penicillin cause gene mutations
(b) previously resistant forms survived and reproduced better than non-resistant forms
(c) hospital environment inhibits competition among bacteria
(d) penicillin triggers the synthesis of resistant proteins
BHU PMT (Screening)-2011

Ans. (b) : Penicillins are used to treat infections caused by bacteria. They work by killing the bacteria or preventing their growth. So bacteria with resistant gene from penicillin transferred character to offspring.
• Some bacteria have developed resistance to antibiotics that were once commonly used to treat them.

376. A bacterium is capable of withstanding extreme heat, dryness and toxic chemical. This indicates that it is probably able to form
(a) a thick peptidoglycan wall
(b) endospores
(c) endotoxins
(d) endogenous buds
Manipal-2009

@apna_pdf

Ans. (b) : Bacterial endospores are simplified form of bacteria consisting of the DNA genome, Bacillus and the Clostridium are the main two genera of bacteria that form endospores.

• The endospore are formed in response to unfavourable growth conditions in the bacterial environment most commonly induced by the limitaion of nutrients.

377. An example for symbiotic bacteria

(a) *Erwinia amylovora*
(b) *Rhizobium leguminosarum*
(c) *Xanthomonas campestris*
(d) *Agrobacterium tumefaciens*

DUMET-2009

Ans. (b) : *Rhizobium leguminosarum* is the bacteria that live in symbiotic association with the root nodules of the leguminous plants.

- Fixation of nitrogen cannot be done independently.
- Nitrogen fixation helps in increasing soil productivity and soil fertility.
- Rhizobium infects the roots of leguminous plants. They are usually found in the soil and produce nodules after infecting the roots of the leguminous plants.

378. Which of the following bacteria is found in colon of human?

(a) E. coli (b) M. tuberculosis
(c) C. botulinum (d) Azotobacter

VMMC-2010

Ans. (a) : *Escherichia coli* is a Gram-negative rod shape bacteria.

- It is commonly found in the lower intestine of warm blooded organism.
- It is peritrichous bacteria i.e. flagella are present in the whole body.
- E. coli has several practical uses besides its use as a vector for genetic experiments and processes.

379. Leprosy is due to:

(a) TMV (b) Monocystis
(c) Salmonella (d) Mycobacterium

Haryana PMT-2003

Ans. (d) : Leprosy is a disease that causes severe scarring skin sores and causes more damage in the limb.

- It mainly affects the peripheral nerves, skin, respiratory tracts and eyes.
- Leprosy is actually not that infectious but it spreads when a healthy person comes in regular and close contact with nasal mucosa droplets of leprosy patients.

380. Where does meiosis occur in blue green algae/bacteria?

(a) Zygote (b) Zygospore
(c) Akinete (d) None of these

CG PMT-2011

Ans. (d) : Meiosis doesn't occur in blue-green algae and bacteria as they are prokaryotes, their reproduction is via asexual processes and these processes are binary fission or mitosis.

381. Cyanobacteria differs from other groups of bacteria in their

(a) DNA (b) Cell wall
(c) Nutrition (d) Reproduction

CG PMT-2010

Ans. (c) : Cyanobacteria known as blue-green algae. They are photosynthetic, microscopic organisms that are technically bacteria.

- Cyanobacteria possess chlorophyll- a while most bacteria do not contain chlorophyll.
- Bacteria are mainly heterotrophs while the Cyanobacteria are autotrophs.
- Both bacteria and cyanobacteria are prokaryotes.
- Cyanobacteria are Gram-negative bacteria.

382. Instead of chromosome which of the following has only DNA

(a) Anabaena and E. coli
(b) Volvox
(c) Chlamydomonas
(d) Plasmodiophora and Cystopus

CMC Vellore-2014

Ans. (a) : The prokaryotes, which have only DNA are Anabaena and E.coli. in these organisms, chromosomes are not formed as histone is absent.

383. Which type of ribosomes are found in Nostoc cells?

(a) 50 S (b) 60 S
(c) 70 S (d) 80 S

CMC Vellore-2014

Ans. (c) : Prokaryotes contains 70S ribosomes while eukaryotes have 80S ribosomes. The cytoplasmic ribosomes of prokaryotes (blue-green algae, bacteria and PPLO) are 70S.

• Nostoc is a prokaryotic organism, 70S ribosome are mainly found.

384. Bacterial chlorophyll absorbs mainly:

(a) infra red light (b) visible light
(c) UV rays (d) X-rays

VMMC-2003

Ans. (a) : Chlorophyll is the primary pigment involved in absorbing sunlight to capture energy for photosynthesis. Bacterial chlorophyll absorbs mainly infra red light. There are many different types of pigments in nature but chlorophyll is unique in its ability to enable plants to absorb energy to build tissues.

385. Bacteria in cold climate can live for:

(a) few years (b) 1,000 years
(c) 2, 000 years (d) many thousand year

AFMC-2001

Ans. (d) : Bacteria can survive thousands of years in cold climate. These microbes are called psychrophiles which means cold loving. They survive in extremely cold environments with the help of cold shock proteins.

386. The disease caused by mycoplasma is :

(a) Papaya bunchy top
(b) Brinjal little leaf
(c) Witches broom of potato
(d) all of the above

Rajasthan PMT-2000

Ans. (d) : The bunchy top of the papaya is caused by Phytoplasma. They are the bacterial parasites that are similar to mycoplasma.

@apna_pdf

- The little leaf disease is caused by the Phytoplasma in the brinjal plant.
- Witches broom disease is a type of disease caused by stress or mycoplasma.

387. The inner most membrane of gram (-) negative bacteria is consist of :

(a) mucopeptide (b) lipoprotein
(c) phospholipid (d) lipopolysaccharides

Rajasthan PMT-2000

Ans. (b) : The inner most membrane of gram negative bacteria is plasma membrane which consist of lipoprotein while outer cell wall which consist of mucopeptide. Cytoplasm of all bacteria cells are surrounded by an inner membrane composed of phospholipids which is enclosed by the cell wall a macromolecular network of peptidoglycan that is single layered.

- The outer membrane of Gram-negative bacteria contains lipo-polysaccharides, proteins and phospholipids.

388. Which one of the following is detrimental to soil fertility?

(a) Saprophytic bacteria (b) Nitrosomes
(c) Nitrobacter (d) Pseudomonas

KVPY SA-2015

Ans. (d) : The denitrifying bacteria are microorganisms whose actions results in the conversion of nitrates in soil to free atmospheric nitrogen, thus depleting soil fertility and reducing agricultural productivity. Hence, Pseudomonas are denitrifying bacteria.

389. Product of photosynthesis in blue-green algae is

(a) glycogen like (b) glucoside
(c) globulin (d) glycerol phosphate

AMU-2002

Ans. (a) : Cyanobacteria is autotrophic eubacteria and make their food with the help of oxygen present in water.

- The cell structure in cyanobacteria is typically prokaryotic.
- Photosynthetic pigment of cyanobacteria is chlorophyll A and β-carotene and reserve food material is cyanophycean starch like glycogen.

390. Aerobic bacteria found in hot sulphur springs are termed as

(a) halophiles (b) thermoacidophiles
(c) chemolithotrophic (d) None of the above

AMU-2001

Ans. (b) : The microorganisms that have developed mechanism to successfully persist in hot, acidic environments are known as thermoacidophiles.

- Thermoacidophiles like Thermoplasma and Thermoproteus are the archaebacteria which have the two fold ability to tolerate a high temperature as well and acidic environment.
- They are habitually found in acidic sulphur springs where the temperature may exceed 80°C and pH be as low as 2.
- They are chemosynthetic as they obtain energy by synthesizing food from oxidizing sulphur to sulphuric acid.

391. The bacteria oxidising a number of inorganic compounds to obtain energy for the assimilation of CO_2 are called

(a) photoautotrophic bacteria
(b) chemoautotrophic bacteria
(c) heterotrophic bacteria
(d) None of the above

UP CPMT-2011 / AMU-2001

Ans. (b) : Chemoautotrophs are organisms that obtain energy by oxidation of inorganic compounds in their environment.

- Chemoautotrophs are able to thrive in very harsh environments such as deep sea vents, due to their lack of dependence on outside sources of carbon other than carbon dioxide.

392. Which of the following statements is not true for Nostoc ?

(a) It is prokaryotic (b) It is autotrophic
(c) It is filamentous (d) It is macroscopic

Karnataka CET-2012

Ans. (d) : Nostoc is a genus of blue-green algae or cyanobacteria. They are prokaryotic and perform photosynthesis. Nostoc are filamentous and unbranched. They have chlorophyll pigments. These pigments allows the organism to prepare its own food. They are autotrophic. Nostoc are the microscopic blue-green algae. Thus, the correct answer is option (d) because it is a microscopic not a macroscopic.

393. Xanthomonas citri possesses:

(a) tuft of flagella (b) bipolar flagella
(c) single polar flagellum (d) no flagella

AP EAMCET-2002

Ans. (c) : Xanthomonas citri is a gram-negative bacterium, further classified as rod-shaped protobacteria. It is motile by means of a single polar flagellum. It mainly affects the citrus plans. It causes citri pathogenesis and citrus canker disease in citrus species like lime.

394. Murein is not found in the cell wall of …….

(a) Cyanobactria (b) Diatoms
(c) Nostoc (d) Eubacteria

Karnataka CET-2004

Ans. (b) : Murein (peptidoglycan) found in cell wall of cyanobacteria & eubacteria. Nostoc is a genus of cyanobacteria. Diatoms are photosynthetic protist, wall of diatoms rich in silica and other minerals. Hence murein is not found in the cell wall of diatoms.

C. Protista

395. Contractile vacuole in protozoan Amoeba is meant for

(a) respiration (b) excretion
(c) locomotion (d) osmoregulation

UP CPMT-2012,2011,2008
Rajasthan PMT-2011, 2008, 2007, 2004, 2000, 2002, 1998
JCECE-2010 / Punjab MET-2008 / AIPMT-2002, 1991
CG PMT-2008/ Karnataka CET-2005
Manipal-2001/ AIIMS-1996

@apna_pdf

Ans. (d) : The process of osmoregulation which is the maintenance of water and salt balance is done with the help of contractile vacuole. It can be observed in unicellular organism such as Paramecium and Amoeba.

• Contractile vacuole protect a cell from absorb to much water and excreting excess water.

396. Passive food ingestion in Amoeba is known as :

(a) import (b) invagination
(c) circumfluence (d) circumvallation

BVP-2012, 2007 / CGPMT-2010
Manipal-2008 / Uttarakhand PMT-2008
MGIMS Wardha-2006

Ans. (a) : Passive food ingestion in Amoeba is known as **import,** which is basically endocytosis (taking in of food on contact)**.**

397. A bite of tse- tse fly may pass to humans

(a) Leishmania donovani
(b) Trypanosoma gambiense
(c) Entamoeba histolytica
(d) Plasmodium vivax.

AFMC-2003
Rajasthan PMT-2003
Karnataka CET-2000
AIPMT-1991, 1989

Ans. (b) : *Trypanosoma gambiense* is a parasitic zooflagellate spread by the tse-tse fly (*Glossina palpalis*) that cause the most deadly disease in humans known as **sleeping sickness or trypanosomiasis**. The disease is common in the humid and sub-humid regions of the African continent.

398. The infective stage of malarial parasite, Plasmodium that enters human body is

(a) merozoite (b) sporozoite
(c) trophozoite (d) minuta form

WBJEE-2011
DU MET-2008, 2005, 2001
Punjab MET-2003 / JIPMER-1996
AIPMT-1990

Ans. (b) : Sporozoites represent the infectious stage, which enters the human blood stream with saliva and undergoes schizogony. Sporozoites are small, spindle-shaped unicellular organisms that are present in the salivary glands of mosquitoes.

399. Amoeba differs from Entamoeba in having

(a) contractile vacuole (b) pseudopodia
(c) ectoplasm (d) cytostome

JIPMER-2010 /AMU-2009, 2002
Punjab MET-2008 / UPCPMT-2006

Ans. (a) : The maintenance of water balance within the body i.e. osmoregulation is done by contractile vacuoles. These are found in the cytoplasm of organisms living in hypotonic water. Amoeba is a good example of such type of organism.

400. Mild tertian malaria is caused by

(a) Plasmodium vivax
(b) Plasmodium ovale
(c) Plasmodium falciparum
(d) Plasmodium malaria

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : Mild tertian malaria is caused by *plasmodium ovale* is a species of parasitic protozoa. It is a parasite that infect humans and characterises by fever which occurs every third day.

401. The following is comparable to a professional dinner guest

(a) Competitive organism (b) Commensal
(c) Parasite (d) Predator

AP EAPCET-22.05.2023, Shift-I

Ans. (c) : Parasite is comparable to a professional dinner guest. Parasite is an organism that lives on the surface or inside another organism and feeds on it. The organism that is benefitted is called the parasite. Taperworms and fleas are example of parasites.

402. Free living microorganism that feed on organic detritus and an example

(a) Parasites, Salmonella
(b) Saprophytes, Bacillus
(c) Parasites , Rhodospirillum
(d) Saprophytes, Xanthomonas

AP EAPCET-22.05.2023, Shift-I

Ans. (b) : Saprophyes are the living organisms that live and feed on dead and decaying organisms. They break down the complex organic matter into simpler substances that are taken up by the plants for various metabolic activities. They also feed on nonliving organic matter known as detritus. Although they feed on the dead, decaying or decomposed matter. Saprophyter however, are living organisms. Example of it is 'Bacillus'.

403. Identify the Protozoan with anematic flagellum

(a) Chilomonas & Cryptomonas
(b) Euglena & Astasia
(c) Peranema & Monas
(d) Chlamidononas & Politoma

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : Protozoan with anematic flagellum are chilomonas and cryptomonas.

When flagellum is simple without mastigonomes and the distal end of the flagellum ends as a terminal 'naked' axial filament it is called anematic flagellum.

404. Protozoan in which cilia are confined only to juvenile stages are

(a) Paramecium (b) Vorticella
(c) Acineta (d) Euglena

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : *Acineta locustris* is a freshwater suctorian protozoan in which cilia are confined only to juvenile stages.

405. The diploid stage in the life cycle of Plasmodium vivax is

(a) Sporozoite (b) Cryptozoite
(c) Metacryptozoite (d) Ookinete

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : The ookinete is one of the most important stages of plasmodium development in the mosquito.

The zygotes in turn become motile and elongated (ookinetes) which invade the midgut wall of the mosquito where they develops into oocystes.

@apna_pdf

406. Which of the following is not correct in relation to sporogony of Plasmodium?

(a) Formation of sporozoites in the oocysts is called sporogony
(b) Sickle shaped sporozoites are formed
(c) Oocyst with sporozoites is called sporocyst
(d) The nucleus of the oocyst first under goes mitotic division

AP EAPCET-12.07.2022 Shift-I

Ans. (d) : Plasmodium sporogony is an extra cellular phase of asexual replication, asexual reproduction take place inside the Anopheles mosquito in case of malaria
• In this stage, the oocyte of the parasite undergoes multiple mitotic division to give rise to infective sporozoites.

407. Which of the following statements are correct in relation to host and parasites?

i) The host in which parasites undergoes asexual reproduction is secondary host
ii) Female Culex mosquito is the primary host for wuchereria
iii) In primary host parasite undergoes sexual reproduction
iv) Man is the primary host for plasmodium
v) The host that loves the infective stages of a parasite in its body when the main host is not available is called Reservoir host

(a) Only (ii), (iii) and (iv) are correct, (i) and (v) are wrong
(b) Only (i), (iii) and (v) are correct, (ii) and (iv) are wrong
(c) Only (i) and (v) are correct but (ii), (iii) and (iv) are wrong
(d) Only (ii) and (iv) are correct, remaining are wrong

AP EAPCET-12.07.2022 Shift-I

Ans. (b) :
(i) Female mosquito culex is secondary host of wuchereria not primary-host.
(ii) Man is secondary host of Plasmodium primary-host female anopheles.

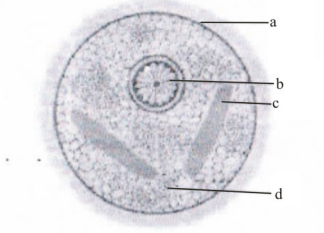
408. Undulipodia are

(a) Flagella and cilia of protozoans
(b) Cilia and pseudopodia of protozoans
(c) Flagella and pseudopodia of protozoans
(d) Pseudopodia and myonemes

AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Unduplipodia are basically synonymous to flagella and cilia. They are also called 9+2 organelle, is a motile filamentous extracellular projection of eukaryotic cells.

409. In the given diagram of the cystic stage of Entamoeba identify parts labeled as a, b, c, d and select the option?



(a) a → cyst wall, b → Nucleus, c → Glycogen granule , d → Chromatoid bar
(b) a → Nucleus, b → Cyst wall, c → Glycogen granule, d → Chromatoid bar
(c) a → cyst wall, b → Nucleus, c → Chromatoid bar, d → Glycogen granule
(d) a → cyst wall, b → Nucleus, c → Glycogen granule, d → Chromatoid bar

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : There are three stages in the life cycle of Entamoeba, trophozoite, pre-cystic and the cystic stage. The cystic stage is a rounded form with protective cyst wall and it has four nuclei.

410. In parasitic castration_____

(a) Gonads of the host degenerate
(b) Size of the Gonads of the host increases
(c) No change in the Gonads of the host
(d) Gonads of the parasite degenerate

AP EAPCET-11.07.2022 Shift-I

Ans. (a) : The parasitic castration is the degeneration of gonads of the host making it sterile. For example- *Sacculina* causes the degenerative of ovaries in the crab *Carcinus maenas*.

411. Multicellular animals that exhibit cellular level organisation are

(a) Protozoans (b) Metazoans
(c) Eumetazoans (d) Parazoans

TS EAMCET-30.07.2022 Shift-II

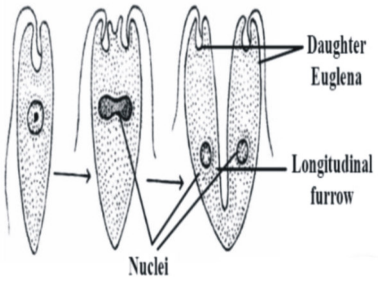
Ans. (d) : Parazoans exhibits cellular level organization.
• The Parazoans are animals whose body consists of loosely aggregated cells. They have a cellular level of organization in which cells are not organized into tissues.

412. Which of the following divide during binary fission of Euglena?

(a) Nucleus, flagellum and stigma
(b) Nucleus, kinetosomes and contractile vacuole
(c) Nucleus, stigma and chromatophores
(d) Nucleus, kinetosomes and chromatophores

AP EAPCET-12.07.2022 Shift-I

Ans. (d) : The division of binary fission of Euglena occurs in nucleus, kinetosomes and chromatophores.
• Euglena reproduces through asexual reproduction by the process of binary fission.
• Binary fission is a process of mitosis and two repeated sets of daughter cells are formed.
• Euglena reproduce asexually by longitudinal binary fission.



Binary Fission in Euglena

@apna_pdf

413. Which of the following stages of Plasmodium are commonly found both in human being and mosquito, in its life cycle ?
(a) Sporozoites and gametes
(b) Gametocytes and gametes
(c) Gametocytes and sporozoites
(d) Sporozoites only

TS EAMCET-30.07.2022 Shift-II

Ans. (c) : Gametocyte and sporozoites stages of plasmodium are commonly found both in human being and mosquito in its life cycle. Sporozoite stage are infectious stage for human beings, entered when mosquito bites. While gametocyte transmit from mammalian host to the mosquito.

414. Digenetic cytozoic parasite is
(a) Plasmodium (b) Wuchereria
(c) Entamoeba (d) Nosema

TS EAMCET-30.07.2022 Shift-II

Ans. (a) : Plasmodium is a digenetic cytozoic parasite. It is a causative agent of malaria. It requires two hosts to complete life cycle - an invertebrate female anopheles mosquito as its primary host and a vertebrate (man) as its secondary or intermediate host.

415. Organism "A" lives as a parasite in the body of an organism "B", "C" is another organism lives as a parasite in the body of "A" then C is
(a) Ectoparasite (b) Digenetic parasite
(c) Hyperparasite (d) Commensal

TS EAMCET-31.07.2022 Shift-I

Ans. (c) : Hyperparasite: A parasite that lives in or on another parasite. The most common examples are insects that lay their eggs inside or near parasitoid larvae.
- The Ectoparasite that live on external surface of the host organism. Example– Tick on dog, human hair, cuscuta.
- Digenetic parasite complete life cycle in two host. eg. liver fluke- (F-hepatica)
- Commensal one species benefitted and other is neither benefitted nor harmed.

416. Transformation of merozoites of Plasmodium into gametocytes takes place when the erythrocytes are in
(a) Liver (b) Kidney
(c) Bone marrow (d) Lymph

TS EAMCET-31.07.2022 Shift-I

Ans. (c) : Transformation of merozoites of Plasmodium in to gametocyte takes place when erythrocyte are in bone marrow.
- The merozoites involve in the erythrocyte (red blood cell) to form trophozoites, schizonts and gametocytes shows symptoms of malaria.
- The liver stage of parasite during which parasite goes to producing infection of liver.
- The malaria parasite develop in lymph node and infect blood cells.

417. Assertion (A): Entamoeba histolytica is an obligate anaerobe.
Reason(R): Mitochondria are absent in it.
The correct option among the following is
Options:
(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-30.07.2022 Shift-I

Ans. (a) : *Entamoeba histolytica* is an anaerobic parasite that is found in the colon.
- Mitochondria is absent in the endoplasm of *Entamoeba histolytica* which indicates the obligate anaerobic nature of Entamoeba.

418. Actinophrys has
(a) Lobopodia (b) Filopodia
(c) Reticulopodia (d) Heliopodia

TS EAMCET-09.08.2021 Shift-II

Ans. (d) : Actinophrys have many axopodia, called as helipodia, that radiate out from the body. These axopodia consists of a central, rigid rod which is coated in thin layer of ectoplasm and is rooted in the endoplasm to terminate there. These are used for mobility of cell fusion and division and for prey capture.

419. Statement I: The binary fission of Euglena is called homothetogenic fission because the daughter euglenae are like mirror images.
Statement II: Binary fission in Paramecium is known as perkinetal fission because it occurs at right angles to the kinetics.
(a) Both statement I and statement II are true
(b) Both statement I and statement II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

TS EAMCET-09.08.2021 Shift-II

Ans. (d) : The Euglena (Flagellates) exhibit a longitudinal, symmetrogenic fission. The Paramecium (Ciliates), on the other hand, basically divide in a point-by-point correspondence of parts, often seen as essentially transverse or perkinetal.

420. In which body part of female Anopheles mosquito, gametes of parasite plasmodium fertilise and develop?
(a) Salivary gland (b) Rectum
(c) RBC (d) Gut

GUJCET-2021

Ans. (d) : Plasmodium is a protozoan pathogens. It causes malaria in human pathogen and transmitted through bite of female Anopheles.
- Life cycle of Plasmodium in mosquito start when gametocyte develop into mature gamete within the gut of mosquito.

421. Match the following to effects of parasites on host ?

Parasite	Effect on host	Host effected
A) Sacculina	i) Hypertrophy	p) Sheep
B) Larva of Fasciola	ii) Hyperplasia	q) Snail
C) Plasmodium	iii) Parasitic castration	r) Carcinus
D) *Fasciola hepatica*	iv) Gigantism	s) Man

@apna_pdf

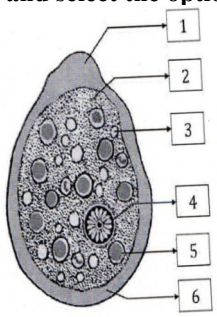
(a) (A–iii–r),(B–ii–p),(C–i–s),(D–iv–q)
(b) (A–iv–r),(B–ii–p),(C–i–s),(D–iii-q)
(c) (A–iii–r),–(B–iv–q),(C–i–s),(D–ii–p)
(d) (A–iii–r),(B–ii–p),(C–iv–s),(D–i–q)

AP EAMCET-06.09.2021 Shift-I

Ans. (c):

Parasite	Effect on host	Host effected
a) Sacculina	iii) Parasitic castration	r) Carcinus
b) Larva of Fasciola	iv) Gigantism	q) Snail
c) Plasmodium	i) Hypertrophy	s) Man
d) Fasciola hepatica	ii) Hyperplasia	p) Sheep

422. In the given diagram of the Trophozoite stage of entamoeba. Identify parts labelled as 1,2,3,4,5,6, and select the option ?



(a) 1– Pseudopodium, 2–Endoplasm, 3–Ribosome, 4– Cartwheel shaped nucleus,5–Food vacuole with RBC, 6– Ectoplasm
(b) 1– Pseudopodium 2–Ribosome, 3–Endoplasm, 4– Food vacuole with RBC, 5–Cartwheel shaped nucleus, 6– Ectoplasm
(c) 1– Pseudopodium, 2– Endoplasm, 3–Ribosome, 4– Food vacuole with RBC, 5–Cartwheel shaped nucleus, 6– Ectoplasm
(d) 1– Pseudopodium, 2– Ectoplasm, 3–Ribosome, 4– Cartwheel shaped nucleus, 5–Food vacuole with RBC, 6– Endoplasm

AP EAMCET-06.09.2021 Shift-I

Ans. (a): The protozoan *Entamoeba histolytica* causes Amoebiasis. The trophozoite stage is the infective stage of Entamoeba and also the activated feeding stage in the life cycle.

423. Choose the correct statements related of binary fission of Paramecium?

(i) During favorable conditions Paramecium stops feeding after attaining its maximum growth
(ii) At first the micronucleus divides by amitosis and the macronucleus divides into two daughter nuclei by mitosis
(iii) The proter receives the anterior contractile vacuole, cytopharynx and cytostome from its parent individuals
(iv) Before karyokinesis a transverse constriction appears in the middle of the body

(a) Except (iv) all are correct
(b) Except (ii) all are correct
(c) Except (ii) and (iv) all are correct
(d) Only (i) is correct

AP EAMCET-06.09.2021 Shift-I

Ans. (c): During favorable condition, Paramecium stops feeding after attaining its maximum growth and multiplies three times a day. The proter receives the anterior contractile vacuole, cytopharynx and cytosome from its parent individual.

424. In which of the animals dimorphic nucleus is found?

(a) Paramecium caudatum
(b) Amoeba proteus
(c) Plasmodium vivax
(d) Trypanosoma gambiense

AP EAMCET-06.09.2021 Shift-I
AIPMT-2002

Ans. (a): The *Paramecium caudatum* shows diamorphic nucleus. There are two type of nuclei, macronucleus, it is large, bean-shaped, polypoid, vegetative nucleus whereas micronucleus, it is small, rounded, diploid, reproductive nucleus.

425. The daughter paramecia formed immediately after binary fission are

(a) Mirror images (b) Proter and opisthe
(c) Genetically different (d) Identical

TS EAMCET-10.08.2021 Shift-I

Ans. (b) : After binary fission daughter Paramecia are formed. Anterior one daughter Paramecia called **proter** and the posterior Paramecia are called **opisthe.**

426. All protozoans are / have ————

(a) Pseudopodia
(b) Contractile vacuole
(c) Holozoic nutrition
(d) Eukaryotic organization

AP EAMCET-03.09.2021 Shift-I

Ans. (d) : The Protists are unicellular eukaryotes and the protozoans are classified under Protista. These protozoans belong to Protista group of R.H. Whittaker's five kingdom classification.

427. Match the following related to parasites ?

Parasite		Disease Caused	
i.	*Trypanosoma gambiense*	A.	Delli boils/oriental sores/Tashkent ulcers
ii.	*Wuchereria bancrofti*	B.	Malaria
iii.	*Leishmania donovani*	C.	African sleeping sickness
iv.	Plasmodium sps.	D.	Elephantiasis
v.	*Leishmania tropica*	E.	Kala azar/Dum dum fever/Visceral Leishmaniasis

Options:

(a) (i-C), (ii-D), (iii-A), (iv-B) ,(v-E)
(b) (i-D), (ii-C), (iii-A), (iv-B) , (v-E)
(c) (i-C), (ii-D), (iii-E), (iv-B) , (v-A)
(d) (i-D), (ii-B), (iii-A), (iv-C) , (v-E)

AP EAMCET-03.09.2021 Shift-II

@apna_pdf

Ans. (c) :

	Organism		Disease
(i)	*Trypanosoma gambiense*	:	African sleeping sickness
(ii)	*Wuchereria bancrofti*	:	Elephantiasis commonly affect lymphatic vessel of lower limb
(iii)	*Leishmania donovani*	:	Kala azar/dum-dum fever
(iv)	Plasmodium sps.	:	Malaria
(v)	*Leishmania tropica*	:	Delli boils/oriental sores/ Tashkent Ulcer.

428. Assertion (A): Symmetrogenic binary fission takes place in paramecium
Reason (R): The cytopharynx of the parent is retained by the proter
(a) Both A and R are correct and R is the correct explanation of A
(b) Both A and R are correct and R is not the correct explanation of A
(c) Both A and R are wrong
(d) A is wrong but R is correct

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : Symmetrogenic binary fission take place in amoeba.
• Binary fission is a mode of asexual reproduction, the cell broken down in two daughter cell.
• Binary fission take place in favourable condition.

429. Match the following related to evolution of Pseudopodia?

List-I	List-II	List-III
i. Locopodia	A. Net–like	p. Actinophrys
ii.Filopodia	B. Sun ray–like	q. Elphidium
iii.Reticulopodia	C. Blunt finger like	r. Euglypha
iv. Axopodia	D. Fibre–like	s. Entameoba

(a) (i–C–r), (ii–A–s), (iii–D–q), (iv–B–p)
(b) (i–C–s), (ii–A–r), (iii–D–q), (iv–B–p)
(c) (i–C–s), (ii–D–r), (iii–A–q), (iv–B–p)
(d) (i–C–s), (ii–D–q), (iii–D–r), (iv–B–p)

AP EAPCET-07.09.2021 Shift-I

Ans. (c) :

List-I	List-II	List-III
(i) Locopodia	Blunt finger-like	(s) *Entamoeba*
(ii) Filopodia	Fiber-like	(r) *Euglypha*
(iii) Reticulopodia	Net-like	(q) *Elphidium*
(iv) Axopodia	Sun ray-like	(p) *Actinophrys*

430. The interval between the first entry of plasmodium into the blood of man in the form of sporozoites and its second entry in the form of cryptozoites is called-
(a) Incubation period (b) Latent period
(c) Prepatent period (d) Window period

AP EAPCET-07.09.2021 Shift-I
TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Prepatent period: - The interval between the first entry of Plasmodium into blood of man in the form of sporozoites and its second entry in the form of cryptozoites is called **prepatent period.**

431. Match the following regarding the life cycle of plasmodium vivax. The correct combinations are _____

	Stage	Cycle	Product
i.	Sporozoite	Pre erythrocytic cycle	Cryoptozoites
ii	Cryptozoite	Exoerythrocytic cycle	Metacryptozoites
iii	Merozoite	Erythrocytic cycle	Merozoites
iv	Gametocyte	Gametogony	Gametes

Options:
(a) (i) & (ii) only (b) (ii) & (iii) only
(c) (i), (ii) & (iii) only (d) (i), (ii), (iii) & (iv)

AP EAMCET-05.10.2021 Shift-I

Ans. (d) : Life cycle of p-vivax

	Stage	Cycle	Product
i.	Sporozoite	Pre-erythrocytic cycle	Cryptozoites
ii	Cryptozoite	Exo-erythrocytic cycle	Meta-cryptozoites
iii	Merozoite	Erythrocytic cycle	Merozoites
iv	Gametocyte	Gametogony	Gametes

432. Which among the following is 'Photosynthetic Protozoa'?
(a) Euglena (b) Paramecium
(c) Plasmodium (d) Trypanosoma

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : Euglena is photosynthetic protozoa. It is a genus of single-cell flagellate eukaryotic protozoan.
• Euglena is photosynthetic in the presence of sunlight, when deprived of sunlight they behave like heterotrophs by predating on other tiny organisms.

433. Multiple fission in Amoeba is called
(a) Schizogony (b) Gametogony
(c) Sporogony (d) Sporulation

TS EAMCET-09.08.2021 Shift-I
BCECE-2004

Ans. (d) : Multiple fission in Amoeba is called **sporulation.** Amoeba reproduces by multiple fission during unfavourable conditions. It secretes three-layered protective cyst and the nucleus divides repeatedly to form several daughter nuclei. Each daughter nucleus with a small amount of cytoplasm forms a daughter Amoeba.

434. Arrange the following statement regarding Amoebiasis infection:
(1) The trophozoites multiply by binary fission and produce cysts and both stages are passed in the faeces
(2) Trophozoites migrate to the large intestine
(3) Excystation occurs in the small intestine and trophozoites are released

@apna_pdf

(4) Infection by *Entamoeba histolytica* occurs by ingestion of mature cysts in fecally contaminated food, water, or hands

(a) 1 – 3 – 2 – 4 (b) 4 – 3 – 2 –1
(c) 4 – 2 – 3 –1 (d) 2 – 3 – 4 –1

AP EAMCET-24.09.2020 Shift-I

Ans. (b) : Cysts are found in formed stool whereas trophozoites are found mainly in diarrheal stool. The infection with *Entamoeba histolytica* occurs via ingestion of mature cysts from focally contaminated food, water, etc. the exposure to infectious cysts and trophozoites in fecal matter can occur due to sexual contact also.

• The excystation occurs in small intestine and then the trophozoites migrate to large intestine, where they multiply by binary fission and produce cysts.

435. The vigour and vitality lost due to repeated binary fissions in ciliates is restored by

(a) Conjugation (b) Syngamy
(c) Multiple fission (d) Sporogony

TS EAMCET-29.09.2020 Shift-I

Ans. (a) : The vigour and vitality lost due to repeated binary fission in ciliates is restored by conjugation. The process which involve temporary union between two bacteria bearing ciliates on their outer surface belonging to two different mating types is known as **conjugation.**

436. Pseudopodia is mainly seen in _____

(a) Flat Worm (b) Euglena
(c) Amoeba (d) Paramecium

AP EAMCET-25.09.2020 Shift-II

Ans. (c) : A temporary arm-like projection of a eukaryotic cell membrane that is emerged in the direction of movement is pseudopodium.

• It primarly consist of actin filaments and may also contain microtubules and intermediate filaments. Pseudopods are used for motility and ingestion.They are often found in Amoeba.

437. Match the following

Type of Parasite	Example
A) Cytozoic	I) Ascaris
B) Histozoic	II) Pediculus
C) Coelozoic	III) Plasmodium
D) Ectoparasite	IV) Cancer
	V) Wuchereria

The correct match is

	A	B	C	D
(a)	II	I	V	III
(b)	III	IV	I	II
(c)	III	V	I	II
(d)	IV	II	III	I

TS EAMCET-28.09.2020 Shift-II

Ans. (c) :

Type of Parasite		Example
(A) Cytozoic	-	(III) Plasmodium
(B) Histozoic	-	(V) Wuchereria
(C) Coelozoic	-	(I) Ascaris
(D) Ectoparasite	-	(II) Pediculus

438. Match the following :

Protozoan	Type of flagellum
A) Astasia	I) Pantonematic
B) Polytoma	II) Stichonematic
C) Chilomonas	III) Acronematic
D) Monas	IV) Anematic
	V) Pantachronematic

The correct match is

	A	B	C	D
(a)	II	III	V	I
(b)	V	III	I	II
(c)	II	III	IV	I
(d)	II	IV	III	I

TS EAMCET-28.09.2020 Shift-II

Ans. (c) :

Prozotoan's		Type of flagella
(A) Astasia	-	(II) Stichonematic
(B) Polytoma	-	(III) Acronematic
(C) Chilomonas	-	(IV) Anematic
(D) Monas	-	(I) Pantonematic

439. The following are the different stage in the cycle of Golgi of Plasmodium. Arrange them in correct sequence.

(I) Amoeboid state
(II) Trophozoite
(III) Erythrocytic merozoite
(IV) Schizont
(V) Signet ring stage

(a) III, IV, I, V, II (b) I, II, III, IV, V
(c) V, IV, III, I, II (d) II, V, I, IV, III

TS EAMCET-29.09.2020 Shift-II

Ans. (d) : Plasmodium is unicellular Protozoa. It causes malaria and form different stages.

• Sporozoites - Trophozoites - Signet - Ring Stage - Amoeboid Stage - Schizont - Erythrocytic Merozoite in blood- stream

440. Study the following and pick up the incorrect combinations

S. no	Parasite	Infective stage to man	Mode of infection
I	Plasmodium vivax	Sporozoite	Biting of male culex mosquito
II	Entamoeba histolytica	Tetranucleate cyst	Contamination of food and water
III	Ascaris lumbricoides	Miracidium	Contamination of food and water
IV	Wuchereria bancrofti	Third stage microfilaria	Biting of female Culex mosquito

(a) I, II (b) III, IV
(c) II, III (d) I, III

TS EAMCET-29.09.2020 Shift-II

Ans. (d) :

Parasite	Infective stage of man	Mode of infection
P.vivax	Sporozoite	Biting of female Anopheles
Entamoeba histolytica	Tetranucleate cycst	Contamination of food and water
Ascaris lumbricoides	Miracidium	Infect egg, contain second stage larva
Wuchereria bancrofti	Third stage microfilaria	Biting of female Culex mosquito

@apna_pdf

441. Statement I: During binary fission in Paramecium, the daughter individual formed from the posterior part of the parent is called proter.
Statement II: Sporogony in Plasmodium is a type of multiple fission.
The correct option among the following is
(a) Both statements I and II are correct
(b) Both statements I and II are wrong
(c) Statement I is false and II is correct
(d) Statement I is correct and II is false

TS EAMCET-29.09.2020 Shift-II

Ans. (c) : During binary fission one paramecium cell divide into two cell macrouncleus and micronucleus genetically of spring of daughter cell . Micronucleus mitosis division and micronucleus amitotic.
• Sporogony in plasmodium is type of multiple fission.

442. Identify the typical angiosperm embryo sac from the following.
(a) 7 nucleate, 8 celled (b) 8 nucleate, 7 celled
(c) 8 nucleate, 8 celled (d) 8 nucleate, 6 celled

TS EAMCET-29.09.2020 Shift-II
Karnataka CET-2013

Ans. (b) : In angiosperm, the ovule contains embryo sac (female gametophyte) which develops from megaspore.
• The nucleus of megaspore divides mitotically and gives rise to 2-nucleate embryo sac.
• The embryo are seven cells; one central cell, two synergids, one egg cell and three antipodal cell.
• Six of the eight nuclei enclose by cell walls.
• Angiosperm embryo sac - 8 nucleated 7- celled.

443. Mastigophora is also known as_____
(a) Flagellata
(b) Ciliata
(c) Rhizopoda
(d) None of these options are correct

AP EAMCET-24.09.2020 Shift-II

Ans. (a) : Mastigophora also known as **flagellate,** any group of protozoa mostly uninucleate organism one to many flagella for locomotion.
• Ciliata commonly known as cilliophora.
eg- Paramecium.
• Rhizopoda, are group of Protozoa and amoeboid organism placed in kingdom Protista. e.g.- Amoeba.

444. Protozoan are usually _____
(a) Multicellular
(b) Unicellular
(c) Tissue grade
(d) None of these options are correct

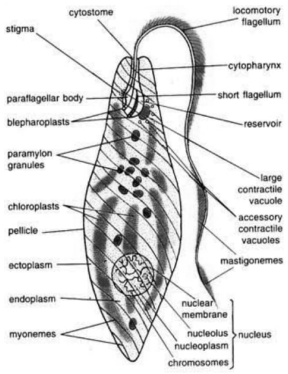
AP EAMCET-25.09.2020 Shift-I

Ans. (b) : Protozoa are unicellular eukaryotic heterotrophic organism.
• They are mostly either free living or parasites.
• Protozoa lack a cell wall.
• Protozoa that cause disease in animal and human.

445. Euglenoids are characterized by _____
(a) Flagellated, Pellicle, Eyespot
(b) Flagellated, Pellicle, Marine
(c) Pellicle, Eyespot, filamentous
(d) Fresh water, Pellicle, Eyespot

AP EAMCET-25.09.2020 Shift-I

Ans. (a) : Euglenoid are unicellular microorganism that belong to protista and algae.
• They are found in fresh water.
• They have both plant and animal-like features, that makes them difficult to classify and hence they are also known as connecting link between plants and animals.



Euglena

446. Match the column I and II

Column I	Column II
(i) Chrysophyte	**(A) Gonyaulax**
(ii) Dinoflagellate	**(B) Euglena**
(iii) Euglenoids	**(C) Diatom**
(iv) Slime moulds	**(D) Plasmodium**

(a) i – A, ii – C, iii – B, iv – D
(b) i – A, ii – D, iii – B, iv – C
(c) i – C, ii – B, iii – D, iv – A
(d) i – C, ii – A, iii – B, iv – D

AIIMS-25.05.2019 Shift-II

Ans. (d) :

(i) Chrysophyte	(C) Diatom
(ii) Dinoflagellate	(A) Gonyaulax
(iii) Euglenoids	(B) Euglena
(iv) Slime moulds	(D) Plasmodium

• Chrysophytes includes diatoms and golden algae (desmids). They are found in fresh water as well as in marine environments.
• Dinoflagellates are a group of unicellular protists. It is show character of both plants and animals. It is mostly marine. Some are photosynthetic autotrophs and some are heterotrops.
• Gonyaulax is a genus of dinoflagellates and commonly caused red tides.
• Euglenoids are unicellular microorganisms belongs to kingdom protista. Euglenoids shows features of both plant and animal.
• It is an unusual example of a unicellular animal with chlorophyll.
• Plasmodium Slime moulds are saprophytes that lack chlorophyll. During favorable condition slime moulds aggregates called plasmodium that can spread & wide, Spore formed by plasmodium during unfavourable condition.
The spores have true cell walls & are resistant to adverse conditions.

@apna_pdf

447. The following are events in life cycle of plasmodium in female Anopheles

(A) Syngamy
(B) formation of gametes
(C) Oocyst formation
(D) Sporocyst formation
(E) Ookinete
(F) Zygote

Arrange them in correct sequence.

Options:

(a) D, C, E, F, A, B (b) B, A, F, C, E, D
(c) B, A, F, E, C, D (d) B, F, A, E, C, D

AP EAMCET-24.04.2019 Shift-II

Ans. (c) : Plasmodium parasite have complex life cycle.
Formation of Gametes (Gametocyte)– Male and female gametocyte inside the gut.
Synogamy– Fusion of two cells.
Zygote– Gametes development inside mosquitos stomach.
Ookinete– Elongated zygote involved in midgut wall of mosquito.
Oocyst Formation– After ookinete, it develop into oocysts.
Sporocyst Formation– Oocyst develop into sporocyst.

448. Match the following

List-I	List-II
(A) Isogamy	**(i) Trichonympha**
(B) Anisogamy	**(ii) Euglena**
(C) Hologamy	**(iii) Plasmodium**
(D) Conjugation	**(iv) Monocytes**
	(v) Paramecium

The correct answer is

Options:

	A	B	C	D
(a)	IV	III	V	I
(b)	IV	III	I	V
(c)	IV	II	III	V
(d)	III	IV	I	V

AP EAMCET-24.04.2019 Shift-II

Ans. (b) : Isogamy- Fusion of similar gametes.
Anisogamy - Fusion of male and female gamete of different morphology.
Hologamy - Fertilization occurs in lower organism (unicellular) gamete.
Examples

Isogamy	–	Monocystis
Anisogamy	–	Plasmodium
Hologamy	–	Trichonympha
Conjugation	–	Paramecium

449. The process of 'exflagellation' occurs in which one of the following stages of the life cycle of plasmodium ?

(a) Sporogony
(b) Erythrocytic schizogony
(c) Hepatic schizogony
(d) Gametogony

TS EAMCET-08.05.2019 Shift-I

Ans. (d) : In this life cycle of Plasmodium malaria parasite, exflagellation occurs in microgametocytes occur in the stomach of Anopheles mosquito.

- **Sporogony -** Plasmodium sporogony has extracellular phase of asexual replication.
- **Erythrocytic schizogony** parasites undergo asexual multiplication in erythrocytis, merozoites infect red blood cell.

Hepatic schizogony, multinucleate form of parasite which develop in hepatic cells.

450. Which is CORRECT sequence in the developmental stages of plasmodium?

(a) Sporozoites → Merozoites → Trophozoites → Schizonts
(b) Merozoites → Sporozoites → Trophozoites → Schizonts
(c) Trophozoites → Merozoites → Sporozoites → Schizonts
(d) Schizonts → Merozoites → Sporozoites → Trophozites

MHT CET-2019

Ans. (a) : Plasmodium is unicellular protozoa. It causes malaria parasite. The sequence of development stage of Plasmodium -

- Sporozoites → Merozoites → Trophozoites → Schizonts stage.
- P. Sporozoites malaria parasite enter in human body by blood into liver.
- Merozoites infect red blood cell.
- The ring stage trophozoites mature in schizonts.

451. Identify the enzyme secreted by trophozoites of *Entamoeba hystolytica* to dissolve the mucosal lining of the intestine of man.

(a) Hyaluronidase (b) Histolysin
(c) Acrosin (b) Renin

TS EAMCET-09.05.2019 Shift-I

Ans. (b) : Histolysin enzyme is secreted by trophozoites of *Entamoeba histolytica* to dissolve the mucosal lining of the intestine of man. The trophozoites live in the lumen of the large intestine, where it multiply and differentiates in to cyst.

452. Infective stages of malarial parasite is found in –

(a) Salivary glands of mosquito
(b) Intestine of mosquito
(c) Heamolymph of mosquito
(d) Stomach wall of mosquito

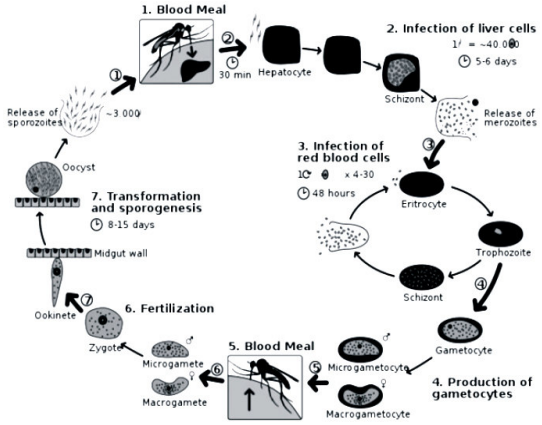
AIIMS-27.05.2018 Shift-II

Ans. (a) : Plasmodium belongs to phylum protozoa, which causes malaria disease.
Plasmodium is digenetic parasite (complete their life-cycle in two host), they requires two different hosts a vertebrate intermediate host, such as a human, and an insect definitive host, also known as the **vector** i.e., female **Anopheles mosquito**.
When the mosquito bites humans it ingests blood cells containing gametocytes. The mosquito digests the blood cells, releasing the male and female gametes, which fuse together and burrow into the mosquito's gut wall, where they mature inside oocysts. After 8-15 days the

@apna_pdf

oocysts burst and sporozoites are released into the body cavity of the mosquito. From there, they travel to the salivary glands. When the mosquito bites these infective sporozoites enters the blood of the humans.

Sporozoites are the infective stages of the malaria parasite, found in **salivary glands** of the mosquito.



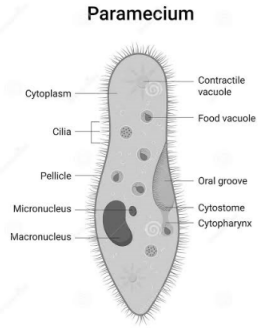
453. ------- is an example of ciliated Protozoa.

(a) Amoeba (b) Plasmodium
(c) Monocystis (d) Paramecium

Tripura JEE-2018

Ans. (d) : Paramecium is a genus of eukaryotic unicellular ciliates.

- The co-ordinated movement of thousands of cilia propels Paramecium. It can rotate around its axis and move in the reverse direction on encountering an obstacle.



454. The following are types of parasites

(I) Intracellular
(II) Coelozoic
(III) Intercellular
(IV) Hyperparasite

Which of the above are correct regarding *Nosema notabilis*?

Options:

(a) I, II (b) I, IV
(c) II, III (d) III, IV

AP EAMCET-25.04.2018 Shift-II

Ans. (b) : *Nosema notabilis* is a hyperparasite of *Spherospora polymorpha*. Intra cellular and hyperparasistism is the character of this organism. A hyperparasite is an organism, which parasitizes on another parasite whereas intracellular parasite as are microparasites that are capable of growing and reproducing inside the cells of a host.

455. Match the following

List–I **Animal**		**List–II** **No. of flagellae**
(A) Giardia		(I) Many
(B) Trypanosoma		(II) 3 pairs
(C) Trichomonas		(III) 4 pairs
(D) Trichonympha		(IV) Four
		(V) Single

Options:

	(A)	**(B)**	**(C)**	**(D)**
(a)	III	IV	V	I
(b)	III	V	II	IV
(c)	III	V	IV	I
(d)	III	II	IV	I

AP EAMCET-25.04.2018 Shift-II

Ans. (c) :

Animal		**No. of flagellae**
Giardia	—	4 Pairs
Trypanosoma	—	Single
Trichomonas	—	Four
Trichonympha	—	Many

456. Match the following :

List-I	**List-II**
(A) Ectoparasite	**(i) Ascaris**
(B) Hyperparasite	**(ii) Entamoeba**
(C) Coelozoic parasite	**(iii) Leishmania**
(D) Histozoic parasite	**(iv) Nosema**
	(v) Head lice

The correct answer is

	A	**B**	**C**	**D**
(a)	(iii)	(iv)	(v)	(i)
(b)	(v)	(iv)	(i)	(ii)
(c)	(ii)	(iv)	(iii)	(i)
(d)	(v)	(iv)	(ii)	(iii)

TS EAMCET-02.05.2018 Shift-II

Ans (b):

	List–I	**List–II**
a.	Ectoparasite	Head lice
b.	Hyperparasite	Nosema
c.	Coelozoic parasite	Ascaris
d.	Histozoic parasite	Entamoeba

457. Most unusual protist phyla is

(a) coflagellates (b) dinoflagellates
(c) choanoflagellates (d) paraflagellates

HP CET-2018

Ans. (b) : Dinoflagellates is most unusual Protist phyla. It is unicellular Protista comprising two flagella.

- These are mostly marine planktons but found in freshwater also.
- They have characteristic of both plants and animals.

458. Ciliates differ from all other protozoans in

(a) using flagella for locomotion
(b) having a contractile vacuole for removing excess water
(c) having two types of nuclei
(d) using pseudopodia for capturing prey

NEET-2018

@apna_pdf

Ans. (c) : The ciliates differ from all other protozoans in having two types of nuclei, larger nuclei is called **macronucleus** and smaller nuclei is known as **micronucleus.** This type of nucleus is called a **dimorphic nucleus**.

459. Statement (S): Mechanical vector merely transfers the infective stage of a parasite.
Reason (R): In this vector a part of development of parasite takes place before it gets transferred to another host.
Which of the following is true?
(a) Both (S) and (R) are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-I

Ans. (c) : Mechanical vector are those organisms that transfers the infective stage of a parasite without themselves getting affected. The parasite development doesn't occur in such type of vector. Example: Housefly.

460. Match the following

	List-I		List-II
(p)	**Cytozoic parasite**	**(i)**	**Lives within the cavities of host body.**
(q)	**Coelozoic parasite**	**(ii)**	**Lives between the cells of the tissue and organs of the host.**
(r)	**Histozoic parasite**	**(iii)**	**Lives within the host cells.**
(s)	**Hyper parasite**	**(iv)**	**A parasite lives in/on the body of another parasite.**

The correct answer is

	(p)	(q)	(r)	(s)
(a)	(iv)	(ii)	(i)	(iii)
(b)	(iii)	(i)	(ii)	(iv)
(c)	(i)	(iii)	(ii)	(iv)
(d)	(iii)	(iv)	(ii)	(i)

TS EAMCET-02.05.2018 Shift-I

Ans. (b)
Cytozoic parasite - Live within the host cells. Eg. *P. vivax*
Coelozoic parasite - Lives with in the cavity of host body. Eg. *Ascaris*
Histozoic parasite - Lives between the cell of the tissue and organ of the host. Eg. *Wuchereria bancrofti*.
Hyper parasite - A parasite live in/on the body of another parasite. Eg. *Nosema* .

461. Match the following

List-I Organism	List-II Number of Flagella
(p) Trypanosoma	**(i) Many**
(q) Euglena	**(ii) 2**
(r) Giardia	**(iii) 1**
(s) Trichonympha	**(iv) 8**

The correct answer is

	(p)	(q)	(r)	(s)
(a)	(iii)	(ii)	(iv)	(i)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(ii)	(i)	(iii)	(iv)
(d)	(iv)	(i)	(ii)	(iii)

TS EAMCET-02.05.2018 Shift-I

Ans. (a) :

Organism	-	Number of flagella
Trypanosoma	-	1 flagella
Euglena	-	2 flagella
Giardia	-	8 flagella
Trichonympha	-	Many

462. Assertion (A): Euglenoids have a flexible body.
Reason (R): They have a protein rich layer called pellicle, which makes their body flexible.
Which of the following is true?
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is true
(d) (A) is false but (R) is true

TS EAMCET-02.05.2018 Shift-I

Ans. (a) : Euglena is unicellular organism. Their body is covered by a protein rich layer called pellicle, which make their body flexible. Euglenoids change their shape because they have no rigid cell wall. The pellicle is composed of fibrous elastic protein, the small amount of lipid, carbohydrates and maintains a definite shape. It is flexible enough to permit temporary change in the body shape.

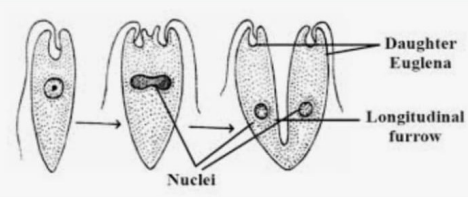
463. Statement (S) : Transverse binary fission seen in Paramecium is also considered as homothetogenic fission
Reason (R) : The plane of fission is at obtuse angle to the longitudinal axis of the body
Which of the following is true?
(a) Both (S) and (R) are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-03.05.2018 Shift-I

@apna_pdf

Ans. (c) Transvers binary fission seen in paramecium is also considered homothetogenic fission.

• Longitudinal binary fission, the plane of fission is at obtuse angle to the longitudinal axis of body (eg. Euglenoid)



464. Match the following

	List - I		List – II
(A)	**Longitudinal binary fission**	**(I)**	**Paramecium**
(B)	**Transverse binary fission**	**(II)**	**Amoeba**
(C)	**Sporogony**	**(III)**	**Pleurobrachia**
(D)	**Sporulation**	**(IV)**	**Plasmodium**
		(V)	**Euglena**

The correct answer is

	A	B	C	D
(a)	V	I	IV	II
(b)	V	III	IV	II
(c)	I	II	V	IV
(d)	V	IV	I	II

AP EAMCET-25.04.2018 Shift-I

Ans. (a) :

Longitudinal binary fission	- Euglena
Transverse binary fission	- Paramecium
Sporogony	- Plasmodium
Sporulation	- Amoeba

465. Study the following stages of life history of Plasmodium in mosquito and arrange them in correct sequence

(A) Sporoblast **(B) Oocyst**
(C) Sporozoite **(D) Ookinete**

The correct answer is:

Options:

(a) B-D-A-C (b) C-B-D-A
(c) D-B-A-C (d) A-C-D-B

AP EAMCET-28.04.2017 Shift-II

Ans. (c) : Life cycle of Plasmodium parasite that includes three stages. Gametocytes, sporozoites and merozoites

Gametocyte:- Gametocyte are transmitted through Anopheles mosquito . The male and female gametocyte mate inside the gut of mosquito these parasites are called **sporozoite.**

Sporozoites: - Sporozoites infected mosquito feed on human which is transmitted through the saliva into blood stream.

Merozoites : - The merozoites exist from the liver, enters the blood stream and again attack the red blood cells.

466. Match the following columns.

Column I	Column II
A. Pinocytosis	**1. Euglena gracilis**
B. Holozoic	**2. Paramecium**
C. Parasitic	**3. Amoeba proteus**
D. Mixotrophic	**4. Monocystis**

Codes

	A	B	C	D
(a)	3	2	4	1
(b)	2	3	4	1
(c)	4	3	1	2
(d)	1	4	2	3

JIPMER-2017

Ans. (a) :

Pinocytosis	- Amoeba proteus
Holozoic	- Paramecium
Parasitic	- Monocystis
Mixotrophic	- Euglena gracilis

467. Choose the following characteristics found in Noctiluca:

(A) Bioluminiscence
(B) Prokaryote
(C) Proteinaceous cell wall
(D) Cell wall with cellulose plates
(E) Chromosome without histones
(F) Eukaryote
(G) Longitudinal binary fission

Options :

(a) A, B, D, E, G (b) A, C, E, F
(c) D, E, F, G (d) A, D, E, F

AP EAMCET-28.04.2017 Shift-I

Ans. (d) : *Noctiluca* is a roughly spherical marine dinoflagellate which is strongly phosphorescent.

• *Noctiluca* produce bioluminescence and cell wall with cellulose plate, chromosome without stone, and they are eukaryotes.

468. Amoeba is immortal because:

(a) It is multicellular
(b) It is microscopic
(c) It reproduces by sexual method only
(d) Parental body is distributed among the offsprings during binary fission

Karnataka CET-2017

Ans. (d) : Amoeba is immortal because parental body is distributed among the offspring during binary fission.

• Binary fission is a method of asexual reproduction in which a parent cell divide into two halves and each daughter cell develop into an adult.

469. In erythrocytic cycle of Plasmodium vivax, the following stages are observed.

(I) Rosette stage
(II) Trophozoites
(III) Amoeboid stage
(IV) Signet ring stage
(V) Liberation of erythrocytic merozoites
(VI) Shuffner's dots in RBC
Arrange them in correct sequence

@apna_pdf

Options:

(a) II, IV, VI, III, I, V (b) II, IV, III, VI, I, V
(c) V, I, VI, III, IV, II (d) II, IV, III, VI, V, I

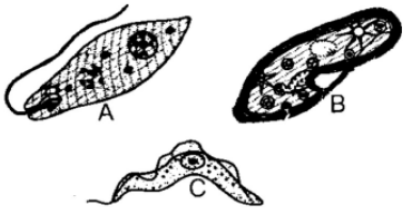
AP EAMCET-28.04.2017 Shift-I

Ans. (b) : *Plasmodium vivax* is parasite of protozoa. It causes malaria by female Anopheles mosquito to human.

The current sequence of following stage–

Trophozoites → Signet ring stage → Amoeboid stage → Shuffner's dots in RBC → Rosette stage → Liberation of erythrocytic merozoites.

470. Refer to the following figures.



Column I	Column II	Column III
A.	1. Paramecium	I. kinetoplast
B.	2. Euglena	II. Trichocysts
C.	3. Trypanosoma	III. Astaxanthin

(a) A-3-II, B-1-III, C-2-I
(b) A-1-II, B-3-I, C-2-I
(c) A-2-III, B-1-II, C-3-I
(d) A-3-I, B-2-II, C-1-III

AIIMS-2017

Ans. (c) :
(a) Euglena – Astaxanthin
(b) Paramecium – Trichocysts
(c) Trypanosoma – Kinetoplast

- **Astaxanthin** is an antioxidant. It is obtained from some algae and yeast etc.

It is used as many purposes Alzheimer's disease, Athletic performance, aging skin.

- **Trichocyst -** Many minute rod like structures found near the surface of ciliates and dinoflagellates used as locomotion, prey capture and defense.
- **Kinetoplast -** A mass of mitochondrial DNA lying close to the nucleus in some flagellate protozoa.

471. Auxospores are produced in

(a) diatoms (b) green algae
(c) brown algae (d) red algae

VMMC-2015

Ans. (a) : Auxospores are formed in diatoms and hormocysts are formed in Cyanobacteria.

- Both Cyanobacteria and diatoms play a part in nutrient cycling. Both organism are major source of oxygen on earth.
- The auxospore is usually a zygote and hence it is almost always diploid. It is not naked but possess a special organic wall.
- Diatoms have cell wall which are silica rich and they reproduce by asexual reproduction through spore formation like auxospores.

472. Life history of Plasmodium is:

(a) digenetic (b) monogenetic
(c) dizygotic (d) none of these

Haryana PMT-1999

Ans. (a) : Life history of Plasmodium is digenetic. Plasmodium belongs to phylum Apicomplexa. It is a single cell parasite which multiplies in the RBC of human and mosquito intestine.

- Mosquitoes, mainly of the genus Anopheles are the invertebrate hosts. Plasmodium vertebrate hosts include reptiles birds, rodents and primates.

473. Protists obtain their food as ?

(a) Photosynthesizers only
(b) chemosynthesizers
(c) heterotrophs only
(d) Both (a) and (c)

AIIMS-2011

Ans. (d) : The mode of nutrition in protists are holozoic, means in presence of sun light food material is synthesizes by photosynthesis. But when the light is absent they get their food material from dead and decaying organism.

- Protists are a vast group of species. They are microscopic and unicellular.
- Protists cell have a nucleus and organelles. Most protists can be found in damp and saturated environments.

474. Protista differs from monera in having

(a) Cell wall
(b) Autotrophic nutrition
(c) Flagella
(d) Nuclear membrane

AIIMS-2010

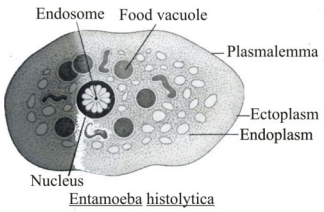
Ans. (d) : The protists are much advanced than bacteria. Monerans do not possess a true nucleus, whereas protista has its own nuclei bound with the nuclear membrane. The organism belonging to protists live in water, moist places, etc.

475. Intermediate host is absent in the infection of ?

(a) Plasmodium (b) Trypanosoma
(c) Entamoeba (d) Filarial worm

AIIMS-2009

Ans. (c) : Intermediate host is absent in the infection of *Entamoeba histolytica* because it lives in the large intestine of humans (single host). It causes amoebiasis or amoebic dysentery. Thus, intermediate host is absent in Entamoeba.



Entamoeba histolytica

476. Sexual stage (gametocytes) of Plasmodium occurs in

(a) Salivary glands of mosquito
(b) Human RBC

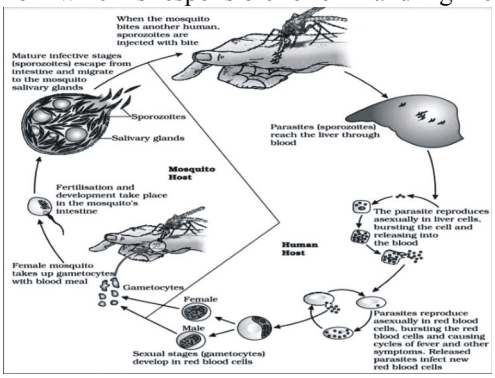
@apna_pdf

(c) Intestine of mosquito
(d) Human liver

AIIMS-2013

Ans. (b) : The complex life cycle of Plasmodium parasite that includes three stages namely Gametocytes, Sporozoites and Merozoites.

• The male gametocytes called **microgametocytes** and female gametocytes called **macrogametocytes** are transmitted through the Anopheles mosquito. The parasite when enters into the human body, then they firstly multiply in liver cells and then attack the red blood cells resulting in their rupture. The rupture of RBCs is associated with release of toxic substance hemozoin which is responsible for chill and high fever.

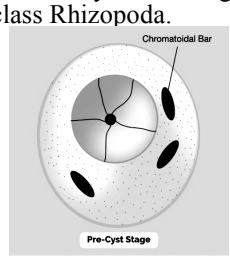


477. In Entamoeba histolytica, the presence of chromatid bodies is characteristic of
(a) Precystic stage
(b) Mature quadrinucleate stage
(c) Trophozoite stages
(d) Mature binucleate stage.

AIIMS-2002

Ans. (a) : In Entamoeba histolytica, the presence of chromatid bodies is the characteristic of precystic stage. It is an oval, non-motile form without a cyst wall. It contains reserve food glycogen and chromatid bodies.

• The Entamoeba histolytica belongs to the phylum protozoa in the class Rhizopoda.



478. The part of life cycle of malarial parasite Plasmodium vivax, that is passed in female Anopheles is
(a) Sexual cycle
(b) Pre-erythrocytic schizogony
(c) Exoerythrocytic schizogony
(d) Post-erythrocytic schizogony

AIPMT-1992

Ans. (a) : The sexual stage in the life cycle of Plasmodium occurs in the abdomen of the mosquito. The sexual phase includes gametocytes, mega-gametophyte "female" and micro-gametocytes "male" that reach the abdomen of the female anopheles mosquito by sucking human blood.

479. Malignant tertian malaria parasite, belongs to does
(a) Plasmodium falciparum (b) P. vivax
(c) P. ovale (d) P. malariae

AIPMT-1991

Ans. (a) : Malignant tertian malaria is caused by *Plasmodium falciparum*. It is also known as pernicious malaria. The cycle of fever is of 48 hours. It affects the brain.

480. Kala azar and Oriental Sore are spread by
(a) housefly (b) bed bug
(c) sand fly (d) fruit fly

AIPMT-1990

Ans. (c) : Kala-azar and oriental sore are spread by sandfly. These parasites are transmitted to humans by the bite of an infected female Phlebotomine sandfly.

• Sandfly fever viruses are transmitted by sandflies of the Phelbotomus genus in the human-vector, human cycle especially during the warm season.

481. During unfavourable conditions Amoeba reproduces through :
(a) binary fission (b) sporulation
(c) multiple fission (d) conjugation

Punjab MET-2006
Rajasthan PMT-2004

Ans. (c) : During unfavourable condition amoeba reproduces through multiple fission.

• The type of asexual reproduction where may daughter cells are produced from a single parent cell is called as multiple fission.

482. When more than one species of Plasmodium infect a person, it is called:
(a) Quartan malaria
(b) Tertian malaria
(c) Aestivo- autumnal malaria
(d) Quotidian malaria

JCECE-2002

Ans. (d) : When more than one species of Plasmodium infect a person, it is called **quotidian malaria**.
Plasmodium are protozoa parasite, it causes malaria.
Four species causes disease in human -
Plasmodium falciparum – malignant tertian
P. vivax – tertian malaria
P. ovale – mild tertian
P. malariae – quartan malaria

483. In which species of Paramecium, autogamy is found?
(a) Paramecium caudatum
(b) Paramecium aurelia
(c) Paramecium bursaria
(d) All of the above

JCECE-2002

Ans. (b) : Paramecium is single celled protozoa which produce single parent cell called autogamy

- P. aurelia species autogamy is found P. aurelia has one macronucleus and two micronucleus.
- P. caudatum is unicellular cilliated protozoa. It reproduces by binary fission

eg. P. caudatum and P. bursaria - Binary fission

@apna_pdf

484. Which response Amoeba shows towards current of water?
(a) Galvanotaxis (b) Rheotaxis
(c) Geotaxis (d) Thigmotaxis
JCECE-2002

Ans. (b) : Rheotaxis is the movement of an organism response to current of water or air.
• Amoeba show rheotaxis by drifting towards the line of water. Amoeba exhibits positive rheotaxis.

485. NH_3 in Amoeba is excreted by:
(a) food vacuole (b) contractile vacuole
(c) plasma membrane (d) all of the above
JCECE-2006

Ans. (c) : In amoeba waste material NH_3 is excreted through diffusion or plasma membrane from the general body surface.
- Amoeba has no excretory organ.
- Food vacuole is a membrane enclose sac which has digestive function.
- Contractile vacuole is process of osmoregulation.

486. Which of the following is monogenetic parasite?
(a) Entamoeba histolytica
(b) Taenia solium
(c) Wuchereria bancrofti
(d) Plasmodium vivax
JCECE-2006

Ans. (a) : The *Entamoeba histolytica* is monogametic with humans as the only host. These monogametic parasites complete their life cycle in a single host. All other options are of digenetic parasites, as they complete their life cycle in two hosts.

487. Protozoans lack which of the following as locomotoryorgan?
(a) Cilia (b) Flagella
(c) Pseudopodia (d) Parapodia
AFMC-2003

Ans. (d) : Parapodia helps in locomotion, gas-exchange, protection, attachment, controlling water flow within a tube or can be reduced altogether. It is found in the class Polychaeta of phylum Annelida.

488. The cyst wall of Euglena is made up of
(a) carbohydrates (b) lipoproteins
(c) lipids (d) histones
Uttarakhand PMT-2010

Ans. (a) : The cyst wall of Euglena is made up of carbohydrates. Euglena cyst wall formed in tide over of unfavourable conditions.
- Euglena is green in colour, due to presence of chlorophyll pigment. Euglena are also heterotrophs.
- Lipid and fatty acid composition of *Euglena gracilis* after growth and various conduction of autotrophy and photoheterotrophy.

489. Schuffner's dots produced by Plasmodium are
(a) reserve food (b) antibodies
(c) hormones (d) antigens
Uttarakhand PMT-2010

Ans. (d) : Schuffner's dots are pigmented spots that appear in blood of malaria infected person.
- They are small red-coloured dots appearing in erythrocytes.
- Antibodies high risk of malaria in P-falciparum

Schuffner's dots – P-ovale, P-vivax
Maurer's dots – P-falciparum
Ziemann dots – P-malaria

490. Plasmodium falciparum causes which type of malaria?
(a) Pernicious Quartan (b) Pernicious
(c) Pernicious Tertian (d) Benign tertian
Uttarakhand PMT-2010

Ans. (b) : Plasmodium falciparum causes Maliganant tertian malaria, Cerebral malaria and Pernicious malaria.
P - malaria - Quartan malaria
P - vivax - Benign tertian malaria
P - ovale - Mild tertian malaria
P- falciparum - Malignant/Cerebral/Pernicious malaria.

491. Which is false for nutrition in Amoeba ?
(a) Omnivorous
(b) Pseudopodia feeder
(c) Holozoic nutrition
(d) Photoautotroph
Punjab MET-2008

Ans. (d) : Nutrition of amoeba occurs through process called **phagocytosis.**
- Holozoic nutrition– The engulf of food in plants on eating.
- Amoeba is an omnivorous because it feeds Algae, bacteria and protozoa.
- It has false feet known as pseudopodia.
- In Amoeba holozoic mode of nutrition and not photoautotrophs.

492. Two mating types of a variety of Paramecium are
(a) Morphologically different and physiologically similar
(b) Morphologically similar and physiologically different
(c) Physiologically similar
(d) Physiologically different
CMC Vellore-2012

Ans. (b) : Mating type of paramecium is morphologically similar and physiologically different.
Example– *Paramecium aurelia.*

493. A student observed a water drop under microscope. He found a photosynthetic organism. Its cell walls form two thin overlapping shells, which fit together as in a soap box.
Which of the following organism it is
(a) Euglenoid (b) Dinoflagellate
(c) Sporozoans (d) Diatom
AP EAMCET-2016

@apna_pdf

Ans. (d) : Diatoms are group of microscopic Protist.
- These are unicellular Protista it is composed of silica.
- The vesicle is arranged from plate-like structure called **frustules** which overlap to each other.
- The diatoms structure like soap case.

494. Chlamydomonas and Chlorella, earlier placed in algae within plants (both having cell wall) are now placed together in which new kingdom. Choose the correct option.
(a) Fungi (b) Animalia
(c) Protista (d) Monera

BCECE-2015

Ans. (c) Chlamydomonas and Chlorella have been included in kingdom Protista. Earlier, they were placed in the kingdom algae. But, according to R.H. Whittaker's classification, the classification depends not only on morphology or physiology but also on phylogeny.

495. Which of the following is not matched correctly ?
(a) Anabaena — Cyanobacteria
(b) Amoeba — Protozoa
(c) Gonyaulax — Dinoflagellates
(d) Thermoacidophiles — Archaebacteria
(e) Albugo — Chrysophytes

Kerala PMT-2011

Ans. (e) : Albugo candida commonly known as white rust. It belongs to Oomycetes.
(a) Anabaena - Cyanobacteria
(b) Amoeba - Protozoa
(c) Gonyaulax - Dinoflagellates
(d) Thermoacidophiles - Archeobacteria
(e) Albugo - Oomycetes

496. Which one of the following is a characteristic feature of Chrysophytes ?
(a) They are parasitic forms which cause disease in animals
(b) They have a protein rich layer called pellicle
(c) They have indestructible wall layer deposited with sillica
(d) They are commonly called Dinoflagellates
(e) They are saprophytic Protista

Kerala PMT-2011

Ans. (c) : Chrysophytes are algae, it is found in wide range of lake.
- Chrysophytes of the coloring of specific photosynthetic pigment. It is commonly called golden brown algae.
- A siliceous scale or plate is connected to the wall of some species.
- They have indestructible wall layer deposit with silica

497. Which of the following does not belong to the kingdom Protista ?
(a) Chrysophytes (b) Euglenoids
(c) Ascomycetes (d) Dinoflagellates
(e) Protozoans

Kerala PMT-2011

Ans. (c) : Ascomycetes doesn't belong to Protista.
- Ascospore are formed inside the cup shaped cell (ascus) called **ascomycetes.**

Example - Yeast, Penicillium, Aspergillus

498. Which one is a holophytic protozoa?
(a) Euglena (b) Amoeba
(c) Monocystis (d) Giardia

BCECE-2015

Ans. (a) : Euglena, a single-celled eukaryote, contain holophytic nutrition, as they have chloroplasts, which are used for photosynthesis. Autotrophic is another name for holophytic. These are organisms that can use inorganic elements to create food, such as green plants.

499. Mode of nutrition in Trypanosoma is:
(a) saprozoic (b) parasitic
(c) autotropic (d) phototropic

DUMET-2006

Ans. (b) : Parasitic mode of nutrition occurs in *Trypanosoma*
- *Trypanosoma* feed by absorbing nutrients, through their outer membrane, from the body fluids of the host.

500. Chagas disease is caused by:
(a) Trypanosoma gambiense
(b) Plasmodium sp.
(c) Trypanosoma cruzi
(d) Treponema pallidum

DUMET-2006

Ans. (c) : Chagas disease is caused by *Trypanosoma cruzi*. It causes infection is curable, if treatment is initiated soon after infection. In chronic patients, antiparasitic treatment can potentially prevent or curb disease progression and prevent transmission, for instance mother to child infection.

501. Marine protozoans lack contractile vacuole because
(a) osmoregulation is done by cell membrane
(b) they are hypo-osmotic to their environment
(c) they are isotonic with their environment
(d) their small body cannot accommodate it

DUMET-2002

Ans. (b) : The marine protozoan live in hypertonic environment. They loss water due to exosmosis. It prevents water loss and conserve water in the body.
- The marine protozoa lack contractile vacuole.
- They are hypo-osmotic to their environment contractile vacuole help to remove excess water and perform osmoregulation.

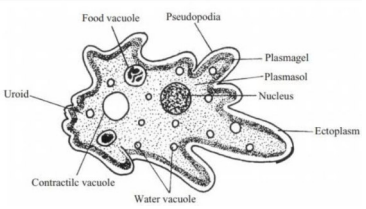
502. Amoeba is a/an:
(a) unicellular animal (b) octacellular animal
(c) multicellular animal (d) all of the above

DUMET-2005
UPCPMT-2003

Ans. (a) : Amoeba is a unicellular animal protozoa, it is single cell organism.
- Pseudopodia help in osmoregulation.

@apna_pdf

- No stomach present in amoeba storage of food and digestion take place inside the food vacuole in the cytoplasm of amoeba.



Structure of Amoeba

503. Sporogony of malarial parasite occur in:
(a) liver of man
(b) stomach wall of mosquito
(c) RBCs of man
(d) salivary glands of mosquito

DUMET-2004
BVP-2014, 2000

Ans. (b) : Sporogony of malarial parasite occurs in stomach wall of female Anopheles mosquito.
- Some merozoites form gametocytes which are sucked by mosquito along with blood followed by gamete formation inside the stomach of female Anopheles.

504. Which of the following results from conjugation in Paramecium?
(a) Cell death (b) Cell division
(c) Budding (d) Recombination

KVPY SB & SX-2014

Ans. (d) : In paramecium, conjugation is a form of sexual reproduction, which is a temporary union of two individuals of the same species for the mutual exchange of genetic materials. The ventral surfaces attach and the exchange of genetic material starts by the formation of the cytoplasmic bridge. Here, the male pronucleus fuses with the female pronucleus to form a diploid zygote which forms a mature organism. This results in recombination.

505. Name the protozoan parasite with a food vacuole.
(a) Leptomonas (b) Plasmodium
(c) Trypanosoma (d) Leishmania

AP EAMCET-1998

Ans. (b) : The protozoan parasite with a food vacuole is Plasmodium. Here food vacuole is a lysosome-like organelle, where erythrocyte hemoglobin digestion occurs.

506. Unicellular algae, diatoms and protozoans are the members of
(a) Monera (b) Fungi
(c) Protista (d) Plantae

J&K CET-2013

Ans. (c) : Protista is unicellular eukaryotic organism which include algae, diatoms and protozoans.

507. Schizogony of Plasmodium is also called as
(a) sporogony (b) gamogony
(c) agamogony (d) binary fission

Punjab MET-2011

Ans. (c) : Schizogony of Plasmodium is also called as **agamogony** because it is also the process of formation of new individual by cell division.
Agamogony is an asexual process and the product of schizogony generally grows into trophozoites.

508. In life cycle of Plasmodium, ex-flagellation leads to:
(a) formation of microgametes
(b) formation of flagella in sperm
(c) destruction of flagella from sperm
(d) formation of sporozoites

Rajasthan PMT-2002

Ans. (a) : Life cycle of Plasmodium ex-flagellation leads to formation of microgametes. Microgamete formation occurs inside the stomach of mosquito.
- It develops into 4 to 8 microgametes by the process of ex-flagellation. The macrogamete and microgamete fuse and form the zygote and then develops ookinetes, then oocyst further divides and form sporozoites.

509. What happens in anterior part of Amoeba at the time of formation of pseudopodia?
(a) plasma gel convert into plasma sol
(b) plasma sol convert into plasma gel
(c) ectoplasm convert into endoplasm
(d) endoplasm convert into ectoplasm

Rajasthan PMT-2002

Ans. (a) At the time of formation of pseudopodia, the plasma-gel converts into plasmasol, where it begins to flow. It is the beginning of pseudopodium formation. The constant flow of plasmasol results in the growth of the pseudopodium.

$$\text{Plasmasol} \underset{\text{Solation}}{\overset{\text{Gelation}}{\rightleftharpoons}} \text{Plasmagel}$$

510. Where does exoerythrocytic cycle take place in life cycle of Plasmodium?
(a) RBC of human
(b) Human liver
(c) Stomach of Anopheles mosquito
(d) Salivary gland of Anopheles mosquito

Rajasthan PMT-2002

Ans. (b) : The exoerythrocytic cycle take place in plasmodium in human liver.
- The sporozoites pickup by liver cell and change of merozoite in RBC.
- Stomach of Anopheles mosquito occurs in the gametocytes.
- Salivary gland of female Anopheles mosquito occurs in two salivary gland, two lateral lobe and one median lobe.

511. Which of the following class of Protozoa is totally class parasites ?
(a) Mastigophora (b) Ciliata
(c) Sporozoa (d) Rhizopoda

Rajasthan PMT-1999

Ans. (c) : Sporozoa have spore like cells and parasite. They do not contain locomotary organs.
- Sporozoa are parasitic and cause disease.
- They are pathogenic species which plasmodium sporozoa infect the host cell.

@apna_pdf

512. Dimorphism is present in which Protozoa ?
(a) Iobosa (b) Ciliata
(c) Sporozoans (d) Radiolarian
Rajasthan PMT-1999

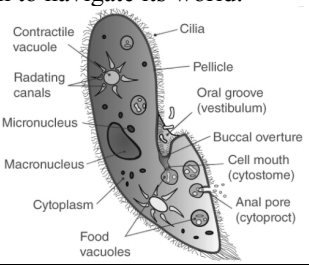
Ans. (b) : The presence of two different type of nuclei in the cell is called as dimorphism. It is a common characteristic of ciliated Protists such as Paramecium.

513. In Amoeba hyaline cap is formed by :
(a) around the food vacuole
(b) around the contractile vacuole
(c) around the nucleus
(d) on pseudopodia
Rajasthan PMT-1999
MGIMS Wardha-2012

Ans. (d) : In amoeba hyaline cap is formed by pseudopodia.
- Pseudopodia is called false feet, they are extension of cytoplasm thick liquid inside amoeba.
- Pseudopodia helps in the movement and capture of prey or in obtaining nutrition.
- The food particles are trapped by surrounding pseudopodia and they engulf it inside cell forming.

514. Slipper animalcule is :
(a) Paramecium (b) Trypanosoma
(c) Entamoeba (d) Protozoa
Manipal-2005

Ans. (a) : Paramecium is called **"slipper animalcules"** because of their slipper-like shape.
- This slipper-shaped ciliate is commonly found in fresh water ponds around the world.
- Paramecium is a genus of unicellular ciliated protozoa.
- They provide the "touch" sense that allows the Paramecium to navigate its world.



515. Sporozoite infectious stage of Plasmodium parasite contains
(a) two nucleus and a vacuole
(b) one nucleus and several vacuole
(c) vacuole and other cell organelles
(d) a nucleus
BVP-2014

Ans. (d) : The Plasmodium sporozoite constitutes the first form of the malaria parasite which enters the human body and provides the first and leading targets to control an infection.

516. Who discovered oocysts in the stomach of female Anapheles?
(a) Ronald Ross (b) Charles Lavern
(c) Golgi (d) Lamble
VMMC-2009

Ans. (a) : Ronald Ross first time discovered Oocytes of Plasmodium in the stomach of female Anopheles.
- Anopheles mosquito helps in the transmission of malaria parasite in human.
- In 1902, he was awarded the Nobel prize for medicine for his work an malaria, by which he had shown how it enters the organism.

517. Kinety system is present in
(a) Flagellates (b) Sarcodines
(c) Ciliates (d) Sporozoans
AP EAMCET-2015
TS EAMCET-2015

Ans. (c) : Kinety system present in the ciliates.
- A kinety frame-work is available in hair-like organelles that are similar in eukaryotes flagella.
- It is unit of structure in the Protozoa comprising the kinetosomes, the basal granules of the cilia and flagella and the kinetodesma, a fine strand running from the kinetosomes.

518. In the life cycle of Plasmodium vivax, Schizogony occurs in these cells of man
(A) Hepatocytes (B) Adipocytes
(C) Erythrocytes (D) Reticulocytes
(a) (A) and (C) (b) (A) and (B)
(c) (B) and (D) (d) (C) and (D)
TS EAMCET-15.05.2016

Ans. (a) : Protozoan parasite, Plasmodium vivax is a human pathogen which causes malaria. The sporozoites enters the human bloodstream and enters the liver cells (hepatocytes) where it undergoes exo-erythrocytic schizogony and produces merozoites. Then, merozoites are released into the bloodstream where they enter RBC (erythrocytes) and undergo erythrocytic schizogony.

519. Choose the correct statements with reference to the flagellum in Protozoa
(A) Nexins are linkers that interconnect peripheral doublets
(B) The 'B' tubule of each peripheral doublet bears dynein arms
(C) Axoneme is the central microtubular structure of flagellum
(D) There are two central and nine peripheral triplets in the basal granule
(a) (A) and (C) (b) (B) and (D)
(c) (A) and (D) (d) (B) and (C)
TS EAMCET-15.05.2016

Ans. (a) : Flagellum in protozoa with one or a small number of long whip-like hair called **flagella** that are used for locomotion.

520. Excretory substance of amoeba is:
(a) Ammonia (b) Urea
(c) Uric acid (d) Guanine
Rajasthan PMT-1995

Ans. (a) : The excretory substance of amoeba is ammonia and carbon dioxide. It is formed as end product of the processes of digestion and respiration.
- These waste materials are excreted out by the process of diffusion through the general body surface. They have no excretory organs are present so contractile vacuoles function as an excretory unit.

@apna_pdf

521. Which of the following only one host is present in life cycle?
(a) Entamoeba histolytica
(b) Plasmodium
(c) Taenia
(d) Liver fluke

Rajasthan PMT-1995

Ans. (a) : *Entamoeba histolytica* is a monogenetic parasite, only one host is present in the life cycle. It is responsible for a disease known as **Amoebiasis.** It usually occurs in the large intestine of humans. Its life cycle is monogenetic because it does not require any intermediate host.

522. Which of the following doesn't spread disease in human?
(a) Entamoeba histolytica
(b) Entamoeba gingivalis
(c) Entamoeba coli
(d) Plasmodium ovale

Rajasthan PMT-1995

Ans. (c) : *Entamoeba coli* does not spread disease in human.
• *Entamoeba coli* is common protozoa. It is non-pathogenic protozoa. It is transmitted though fecal-oral contact, and the mature cyst can be found in contaminated water. *Entamoeba histolytica* causes Amoebiasis and dysentery disease.
Entamoeba gingivalis **-** Pyorrhoea
Plasmodium ovale **-** Tertian malaria

523. Pseudopodia is characteristic of following class:
(a) Ciliata (b) Sporozoa
(c) Sarcodina (d) Mastigophora

Rajasthan PMT-1995

Ans. (c) : Pseudopodia is a characteristic of Class Sarcodina of phylum Protozoa.
• Pseudopodia help in locomotion and food capture.
• Class Sporozoa are non-motile.
• Class Mastigophora have flagella and Class Cilliata have cilia, help in locomotion.

524. Mode of feeding in free living protozoan is
(a) holozoic (b) saprozoic
(c) both [a] and [b] (d) none of these

DUMET-2007

Ans. (c) : The mode of feeding in free living protozoa is both holozoic and saprozoic. The intake of the complex substance, then breaking them down in simpler forms and gradually absorbing nutrition from it, is called **holozoic nutrition** whereas, the intake of simpler substances and absorbing nutrition from it, is called as **saprozoic nutrition.**

525. Which is correct?
(a) Slime moulds are haploid
(b) Protozoan lack cell wall
(c) Dinoflagellates are immotile
(d) Pellicle is absent in Euglena

DUMET-2007

Ans. (b) : The Protozonas lack cell wall. They are unicellular organisms found in freshwater and marine water. The slime moulds are diploid whereas dinoflagellates are motile. Pellicle is present in *Euglena.*

526. Pseudopodia are produced by
(a) Plasma cell (b) Mast cell
(c) Adipose cell (d) Fibroblast cell

WB JEE-2014

Ans. (d) : The pseudopodia are produced by fibroblast. They are the cells of the connective tissue. They produce the fibres like collagen and the extracellular matrix.

527. During conjugation in Paramecium
(a) Out of the four micronuclei formed, three nuclei degenerate
(b) Out of six macronuclei formed, four nuclei degenerate
(c) Zygote nucleus undergoes eight successive division in each conjugates
(d) Out of 16 nuclei, only four degenerate

BCECE-2012
Punjab MET-2004

Ans. (a) : In Paramecium, during conjugation, the micronucleus undergoes two successive divisions one of which is meiosis. The four haploid daughter nuclei are formed out of them three degenerate and one divides from them, to form two gametic nuclei, one male and one female.

528. Chromatoid bodies in Entamoeba histolytica are found in
(a) Cysts (b) Minuta
(c) Metacysts (d) Trophozoite

CMC Vellore-2011

Ans. (a) : The chromatoid bodies of Entamoeba histolytica are found in cysts i.e. the cyst enters the body of the host organism, they form trophozoites in the small intestine and then enters the large intestine and invade the cell, causing the disease Amoebiasis.
• The cysts of this parasite contains the active form with trophozoites.
• Cysts are present outside the body of the host, in soil, water, and food

529. *Entamoeba histolytica* is:
(a) found in intestine (b) found in liver
(c) found in coelom (d) all of these

Haryana PMT-2000

Ans. (a) : *Entamoeba histolytica* is anaerobic parasite that is found in the colon of intestine and cause disease called Amoebiasis or Dysentery.

530. Kingdom Protista includes :
(a) life cycle showing sporic meiosis
(b) life cycle showing zygotic meiosis
(c) life cycle showing gametic meiosis
(d) both b and c

Punjab MET-2005

Ans. (d) : Kingdom Protista includes the life cycle showing zygotic meiosis and gametic meiosis
• Protista is unicellular in nature.

531. Euglenoid species that have chlorophyll are :
(a) facultative autotrophs
(b) facultative heterotrophs
(c) obligate heterotrophs
(d) obligate autotrophs

Punjab MET-2005

@apna_pdf

Ans. (a) : Euglenoid species that have chlorophyll are facultative autotrophs.

- Facultative autotrophs are basically heterotrophs, which also have chlorophyll and make food through photosynthesis.

532. Which creatures are direct or indirect food of all creature on the oceans surface ?

(a) Protozoans (b) Phytoplankton
(c) Fish (d) Aquatic insects

Punjab MET-2005

Ans. (b) : Phytoplankton creature are direct or indirect food of all creature of ocean surface.

- They are the basis of marine food webs and serve as prey for zooplankton, fish larvae and other heterotrophic organisms.

533. Name one disease of mulberry silkworm caused by protozoa

(a) Pebrine (b) Grasserie
(c) Flacheria (d) Muscardine

WB JEE-2008

Ans. (a) : Pebrine, or 'pepper disease' is a disease of mulberry silk worm which is caused by Protozoa.

534. Which of the following groups of organisms have a protein rich layer called pellicle?

(a) Chrysophytes (b) Euglenoids
(c) Dinoflagellates (d) Slime moulds
(e) Protozoans

Kerala PMT-2014

Ans. (b) : The Euglenoids are unicellular, flagellate protists. The body is covered by thin and flexible pellicle which is a protein-rich layer. It is composed of fibrous elastic protein, small amount of lipid and carbohydrates and also maintains a definite shape.

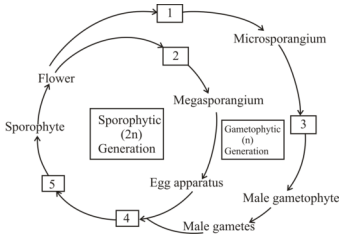
535. What is the main function of filiform apparatus present at the micropylar part of the ovule ?

(a) It prevents the entry of more than one pollen tube into the embryo sac.
(b) It brings about opening of the pollen tube.
(c) It helps in the entry of pollen tube into an antipodal cell.
(d) It helps the pollen tube to enter the ovule through chalazal end.
(e) It guides the entry of pollen tube into a synergid and discharge the male gametes.

Kerala PMT-2013

Ans. (e) : The synergid cell wall forming an extremely thick structure at the micropylar end is called the **filiform apparatus.** It guide the entry of pollen tube into a synergid and discharge the male gamete. The function of filiform apparatus is to guide entry of pollen tube and release of sperm cells.

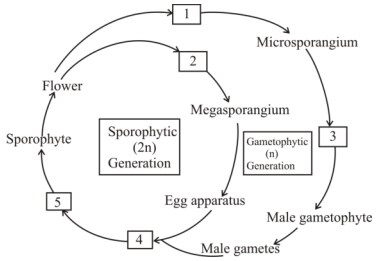
536. The diagram represents the life cycle pattern of an angiosperm. Choose the correct combination of labelling numbered as 1 to 5.



(a) 1. Anther 2. Ovary 3. Microspore 4. Zygote 5. Embryo
(b) 1. Embryo 2. Zygote 3. Anther 4. Ovary 5. Microspore
(c) 1. Ovary 2. Anther 3. Microspore 4. Zygote 5. Embryo
(d) 1. Anther 2. Ovary 3. Zygote 4. Embryo 5. Microspore
(e) 1. Zygote 2. Embryo 3. Anther 4. Ovary 5. Microspore

Kerala PMT-2013

Ans. (a) :



Life cycle Angiosperm:- 1- Anther, 2- Ovary, 3- Microspore, 4- Zygote, 5- Embryo

537. All stages of Plasmodium get digested in stomach of female Anopheles except:

(a) sporozoite (b) gametocyte
(c) erythrocyte (d) none of these

Rajasthan PMT-2005
UPCPMT-2002

Ans. (b) : When the female Anopheles mosquito sucks the infected blood then various phases of malaria parasite reach in their stomach, here digestive enzymes digest all phases besides gametocyte.

538. Chrysophytes, Euglenoids, Dinoflagellates and slime moulds are included in the kingdom

(a) Animalia (b) Monera
(c) Protista (d) Fungi

NEET-2016 Phase-I

Ans. (c) : Chrysophytes, Euglenoids, dinoflagellates and slime moulds are included in the Kingdom Protista. This kingdom includes all single celled eukaryotes.
R.H. Whittaker proposed a five kingdom classification in 1969, in which Protista is a kingdom which comprises organism which are unicellular but eukaryotic organism. These members may be autotrophic or heterotrophic. Primarily these are aquatic.

539. Single-celled eukaryotes are included in:

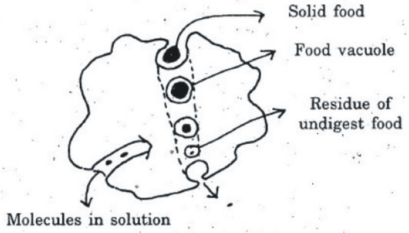
(a) Protista (b) Fungi
(c) Archaea (d) Monera

AIPMT (Screening)-2010

Ans. (a) : Single-celled eukaryotes are included in Kingdom Protista. It includes all unicellular eukaryotic organisms like flagellates, diatoms, dinoflagellate, slime mould, sarcodina, etc.

@apna_pdf

540. In the diagram, which of the following processes are shown in Amoeba?



(a) Phagocytosis (b) Pinocytosis
(c) Execytosis (d) All of these

Karnataka CET-2007

Ans. (d) : Phagocytosis is the process by which amoeba engulf solid food. **Pinocytosis** is the process by which amoeba engulf liquid food. Egestion of the undigest residue from the suface of the body is called **exocytosis.**

541. Yeast belongs to which class?

(a) Basidiomycetes (b) Ascomycetes
(c) Eumycetes (d) None of these

JIPMER-2004

Ans. (b) : The yeast (Saccharomyces) is a saprophytic fungus which belongs to class Ascomycetes.

542. Note the following

(1) During gametogenesis reduction division occurs and gametes formed are haploid according to Bano
(2) Erythrocytic cycle begins with the entry of either cryptozoites or micrometacryptozoites
(3) Maturation of gametocytes generally takes place in spleen and bone marrow
(4) The prepatent period is about 8 days
Which of the above statements are true for Plasmodium vivax?

(a) (1), (2) AND (3) (b) (2), (3) and (4)
(c) (1), (3) and (4) (d) (1), (2) and (4)

AP EAMCET-2007

Ans. (b) : Gametogony or gametogenesis is the development of gametes from gametocyte. In most Protozoa and other animals, reduction division occurs during the formation of gametes. Thus, only gametes are haploid while zygote and other stages are diploid. But in Plasmodium, (Bano 1959), meiosis or reduction division occurs in the first division of zygote. Consequently, only zygote is diploid, while gametes and other stages are haploid.

543. Assertion (A) : Conjugation is a temporary union between two ciliates belonging to two different mating types for the exchange and reconstitution of nuclear materials.
Reason (R) : Conjugation occurs between two inactive individuals which have gained their vigour and vitality due to chromosomal imbalance in their macronuclei, caused by repeated amitotic division
The correct answer is

(a) Both (A) and (R) are true and (R) explains (A)
(b) Both (A) and (R) are true but (R) cannot explain (A)
(c) Only (A) is correct but not (R)
(d) Both (A) and (R) are wrong

AP EAMCET-2007

Ans. (c) : Conjugation is a sexual method of reproduction. It involves fussion of similar gamete which is not free from the parent and form ciliates, where it exchange micronuclear material and separates. It's macronucleus losses its potential ability of metabolic activities.

544. Certain stages of *Plasmodium vivax* may survive for a long period in the liver of man as dormant stages and on reactivation enter into one of the following cycles

(a) erythrocytic schizogony
(b) exoerythrocytic schizogony
(c) cycle of Ross
(d) gametogony

AP EAMCET-2008

Ans. (a) : Plasmodium infected Anopheles mosquito bite human and transmits sporozoids migrates through the blood to the liver where they invade hepatocytes and divide to form multinucleate schizonts (pre-erythrocytic stage).

545. Which structure is formed at the time of exchange of gamete nuclei in given animal during sexual reproduction

(a) Cytoplasmic filaments (b) Plasmodesmata
(c) Internal tubule (d) Cytoplasmic bridge

GUJCET-2015

Ans. (d) : The Paramecium reproduces sexually by lateral conjugation, here the cytoplasmic bridge is formed between male and female individuals.

546. *Nosema bombycis* which causes pebrine in silk worms is a

(a) Virus (b) Bacterium
(c) Protozoan (d) Fungus

Karnataka CET-2009

Ans. (c) : *Nosema bombycis* is a protozoan that causes pebrine disease in silk worms and causes great economic loss. In this infections small brown spot cover the body of silkworm.
• Louis Pasteur identified the spores of *Nosema* as the disease agent in 1865 and suggested control by destruction of infected silkworm colonies and improved sanitation.

547. Which one of the following is unicellular, non motile desmid ?

(a) Clostridium (b) Chlorobium
(c) Cosmarium (d) Chromatium

Karnataka CET-2010

Ans. (c) : Cosmarium is a unicellular non motile desmids. It is a genus of fresh water organism belonging to the member of division Chlorophyta.

548. When fresh water protozoan is placed in marine water.

(a) The number of contractile vacuoles increase
(b) The contractile vacuoles become bigger in size
(c) The contractile vacuoles remain unchanged.

@apna_pdf

(d) the contractile vacuoles disappear.

Karnataka CET-2010

Ans. (d): The contractile vacuoles disappears, when a freshwater protozoan is placed in marine water. There function is to remove the excess water outside by the process of osmoregulation. In marine water, it is necessary to retain the water inside the body instead of expelling it out. If the contractile vacuoles, will not disappear, the cell will get dehydrated.

549. Slime-mould belongs to

(a) Kingdom Protista (b) Kingdom Monera
(c) Kingdom Fungi (d) Kingdom Plantae

JIPMER-2016

Ans. (a) : Slime moulds are the saprophytic unicellular eukaryotes. As they are unicellular eukaryotes, they belong to the kingdom Protista.

- Slime mould have both fungal and animal characteristics.
- Some Protista use appendages, hair-like cilia (paramecium), pseudopodia (Amoeba) or whip-like flagella (Euglena) for locomotion.

550. Number of layers in amoeboid cyst are

(a) 2 (b) 3
(c) 1 (d) 4

UP CPMT-2011

Ans. (b): Multiple fission or sporulation in Amoeba takes place during unfavorable condition after enhancement. There are three layer of cyst present.

551. Some of the events occur during life cycle of Plasmodium are given below. Identify the correct statement.

(a) The sporozoites reproduce sexually in liver cells.
(b) The gametocytes develop in RBC.
(c) Female mosquito take up sporozoites with blood meal.
(d) When mosquito bites a man, gametocytes are injected.

Karnataka CET-2016

Ans. (b) : The parasites (Plasmodium) have evolved to infect a wide range of vertebrate hosts including reptiles, birds and a variety of mammals from rodents to primates.

- The most commonly used animal models in malaria research are mice, birds, and non-human primates with each selected for a variety of reason including availability case of handing, and evolutionary relationship to human.
- The gametocytes of *Plasmodium falciparum* responsible for the transmission of this malaria parasite from human to mosquitoes accumulate and mature preferentially in the bone marrow.

552. Who discovered Amoeba?

(a) Russel von Rosenhoff
(b) Hyman
(c) Lamble and Losch
(d) Goldacre and Lorch

UP CPMT-2006

Ans. (a) : Amoeba was discovered by Russel von Rosenhoff in 1755, it is found in fresh water.

- Amoeba is unicellular and fresh water organism. It belongs to the kingdom of Protista.

553. Match the following lists.

List I	List II
(A) Reticulopodia	**(1) Lecithium**
(B) Lobopodia	**(2) Collozoum**
(C) Filopodia	**(3) Globigerina**
(D) Axopodia	**(4) Ceratium**
	(5) Entamoeba

The correct match is :

	A	B	C	D
(a)	3	4	2	1
(b)	3	5	1	2
(c)	4	5	1	3
(d)	2	3	1	4

AP EAMCET-2010

Ans. (b) :

List I	List II
(a) Reticulopodia	(3) Globigerina
(b) Lobopodia	(5) Entamoeba
(c) Filo podia	(1) Lecithium
(d) Axopodia	(2) Collozoum

554. Which one of the following sets of items in the option 1-4 are correctly categorised with one exception in it

	ITEM	CATEGORY	EXCEPTION
(a)	Plasmodium, Cuscuta, Trypanosoma	Protozoan Parasites/	Cuscuta
(b)	Typhoid, Pneumonia, Diphtheria	Bacterial diseases	Diphtheria
(c)	UAA, UAG, UGA	Stop codons	UAG
(d)	Kangaroo, Koala, Wombat	Australian marsupials	Wombat

AIPMT (Mains)-2012

Ans. (a) : Plasmodium, Cuscuta, Trypanosoma all are parasites.

- Plasmodium and Trypanosoma both are protozoan and Cuscuta is an angiosperm plant and parasite also.

555. Which of the following grouping is correct?

(a) Amoeba, Paramecium, Plasmodium
(b) Tape worm, Liver fluke, Ascaris
(c) Butterfly, Cockroach, Oyster
(d) Parrot, King fisher, Rana

JIPMER-1999

Ans. (a) : Amoeba, Paramecium, Plasmodium belongs to the phylum Protozoa of kingdom Protista. They are colonial unicellular eukaryotic organism

- Tapeworm, Liver fluke belongs to Platyhelminthes Butterfly and Cockroach belongs to Arthopoda
- Parrot and Kingfisher belongs to aves.
- *Rana tigrina* belongs to amphibia.

556. In an experiments, an Amoeba was transfered from a container A to container B, Amoeba developed a contractile vacuole. However, the vacuole disappeared again when the Amoeba was transfered back to container A.
The container A and B respectively contained

(a) Fresh and marine water
(b) Marine and freshwater
(c) Both contained freshwater
(d) Both contained marine water

AMU -2000

@apna_pdf

Ans. (b) : Container A and B contains marine water and freshwater respectively. When the marine amoeba or other protozona is placed in freshwater, it will develop contractile vacuole for osmoregulation. The formation of contractile vacuole ceases and disappearance of contractile vacuole takes place when again put back into marine water.

557. Phagocytosis was observed first time by:
(a) Huxley (b) Strassburger
(c) Metchnikoff (d) Haeckel

Uttarakhand-2005
BVP-2000

Ans. (c) : Phagocytosis was first time observed by Metchnikoff-
- Phagocytosis is a process by which a cell engulf a solid particles by forming as phagosome
- Phagocytosis are known as phagocytes or macrophages.
- Huxley - Father of taxonomy.
- Strassburger- Discovered cytoplasm.
- Haeckel - Recapitulation theory.

558. Kappa particles indicate:
(a) nuclear inheritance
(b) cytoplasmic inheritance
(c) mutation
(d) nucleo-cytoplasmic inheritance

JIPMER-2006

Ans. (b) : Kappa particles were discovered by Sonneborn.
- It is found in *Paramecium aurelia* and it produces toxins that kills many animals.
- It shows cytoplasmic inheritance. Nuclear inheritance occurs due to gene present on the chromosome.
- Kappa particle is denoted by 'K'.

559. The parasite of endothelial system of man is:
(a) Entamoeba (b) Schistosoma
(c) Taenia (d) Leishmania

AP EAMCET-2000

Ans. (d) : *Leishmania* is digenetic parasite. The primary host is man and secondary host is sandfly *(Phelobotamus)*.
- It is found in reticulo-endothelial system like liver, spleen, kidney and bone marrow. It causes the kala-azar.

560. Choose the correct statements with reference to reproduction in Paramecium
(I) The micronucleus divides by mitosis and the macronucleus by amitosis
(II) The micronucleus is polyploid and the macronucleus is diploid
(III) After karokinesis the parent cell divides into two daughter cells, anterior proter and posterior opisthe
(IV) It undergoes transverse binary fission during favorable conditions
(a) (I), (II) and (IV) (b) (II), (III) and (IV)
(c) (I), (III) and (IV) (d) (I), (II) and (III)

TS EAMCET-2015

Ans. (c) : The Paramecium reproduces asexually through binary fission. Here, the macronucleus splits by a type of amitosis and the micronuclei undergo mitosis during reproduction. The cell then divides transversally, and each new cell obtains a copy of the micronucleus and the macronucleus.

561. The phenomenon of metaboly is exhibited by
(a) Euglena (b) Noctiluca
(c) Physarum (d) Sponges

UP CPMT-2013

Ans. (a) : Euglena exhibits the phenomenon of metaboly, is wriggling type movement in which a wave of contraction and expansion passes from one end to other end of body.
- Many euglenoids can also glide and swim using their flagella.

562. Match the following and choose the correct combination from the options given

	Column I (Group Protista)		Column II (Example)
(A)	**Chrysophytes**	**(I)**	**Paramecium**
(B)	**Dinoflagellates**	**(II)**	**Euglena**
(C)	**Euglenoids**	**(III)**	**Gonyaulax**
(D)	**Protozoans**	**(IV)**	**Diatoms**

(a) (A)-(I), (B)-(III), (C)-(II), (D)-(IV)
(b) (A)-(I), (B)-(IV), (C)-(III), (D)-(II)
(c) (A)-(IV), (B)-(II), (C)-(III), (D)-(I)
(d) (A)-(III), (B)-(IV), (C)-(I), (D)-(II)
(e) (A)-(IV), (B)-(III), (C)-(II), (D)-(I)

Kerala PMT-2008

Ans. (e) :
Chrysophytes - Diatoms
Dinoflagellates - Gonyaulax
Euglenoids - Euglena
Protozoans - Paramecium

563. Obligate parasites live :
(a) on living host only
(b) on living host and dead organic matter
(c) on dead organic matter only
(d) on artificial liquid medium

AIIMS-1999

Ans. (a) : The parasite that depends entirely on its host is called an **obligate parasite**. Obligate parasite has evolved a variety of parasitic strategies to exploit their hosts, holoparasite and some hemiparasites are obligate.

564. What is common about Trypanosoma, Noctiluca, Monocystis and Giardia?
(a) These are all unicellular protists
(b) They have flagella
(c) They produce spores
(d) These are all parasites

BHU PMT (Mains)-2010

Ans. (a) : Trypanosoma, Noctiluca, Monocystis and Giardia are all single celled and have well defined nucleus. Therefore, they belong to kingdom Protista.

565. Schistosoma is a parasite found in:
(a) testes of frog (b) liver
(c) intestine (d) blood

BVP-2003

Ans. (b) : *Schistosoma* is commonly called **blood fluke.** It causes a parasitic disease in human known as *Schistosomiasis*. It lives in the hepatic portal system and mesenteric blood vessels of human beings. The symptoms are diarrhoea, enlargement of liver and spleen, pain and fever.

566. Reproduction in Paramecium is controlled by:
(a) flagella (b) micronucleus
(c) macronucleus (d) cell wall

BVP-2001 / Manipal-2002

@apna_pdf

Ans. (b) : Micronucleus controls reproduction in paramecium.
- Paramecium has two type nucleus-micronucleus and macronucleus.
- The macronucleus perform common cellular functions and micronucleus takes part in sexual reproduction.

567. The type of syngamy seen in Trichonympha is
(a) Conjugation (b) Hologamy
(c) Anisogamy (d) Isogamy

AP EAMCET-2014

Ans. (b) : The hologamy is the process where the adult individuals do not produce gametes, but they themselves act as gametes and fuse to form new individuals. For example: *Trichonympha.*

568. Which one of the following is not correctly matched
(a) Culex pipiens – Filariasis
(b) Aedes aegypti – Yellow fever
(c) Anopheles culifaciens – Leishmaniasis
(d) Glossina palpalis – Sleeping sickness

AIPMT-2004

Ans. (c) : Leishmaniasis is a vector born disease that is transmitted by sand flies and caused by Leishmania.
- Lieshmania also known as Kala-azar which is characterised by irregular bouts of fever, weight loss, enlargement of the spleen and liver and anemia.
- Most cases occurs in Brazil, east Africa and in India
- Cutaneous leishmaniasis is the most common form of leishmaniasis and causes skin lesions mainly ulcer.

569. Algae attached to stone is called
(a) epilithic (b) epifolic
(c) coenolithic (d) None of these

JCECE-2010

Ans. (a) : The epilithic algae grows on the surface of rocks.

570. A pathogen which cannot be cultured in an artificial medium is,
(a) protozoan (b) virus
(c) bacterium (d) fungus

KVPY (SA)-2013

Ans. (b) : A pathogen which cannot be cultured in an artificial medium is virus because these are obligate parasites and require living cells for the growth.

571. Cell wall is absent in:
(a) Amoeba (b) Chara
(c) Yeast (d) E. coli

AIIMS-2000

Ans. (a) : Cell wall is outer most covering of cell. It is absent in Amoeba. Amoeba have cell membrane instead of the cell wall.

572. The infective stage of Entamoeba histolytica is
(a) premature cyst (b) sporozoite
(c) trophozoite (d) mature cyst

UPCPMT-2009 / AIIMS-1998

Ans. (c) : Trophozoite and tetranucleated cyst is the infective stage of *Entamoeba histolytica* that enter by contaminated food and water
- It cause several disease amoebiasis (Diarrhoea and dysentery).

573. Trypanosoma causes sleeping sickness in man, it finally invades
(a) liver (b) blood
(c) brain (d) cerebro-spinal fluid

AIIMS-1998

Ans. (d) : Trypanosoma cause sleeping sickness in man, it finally invade cerebro-spinal fluid. Sleeping sickness is caused by *Trypanosoma brucei.*
- Trypanosoma is digentic parasite, primary host is man and secondary host is Tse-Tse fly.
- Symptoms of sleeping sickness - Iritation, swelling of brain, swelling of lymph node, mood change, skin rash, etc.

574. True nucleus is absent in :-
(a) Mucor (b) Waucheria
(c) Volvox (d) Anabaena

AIPMT-2015

Ans. (d) : True nucleus is absent in Anabaena. Anabaena is a prokaryotic organism. It is a cyanobacteria (blue green algae) which belong to kingdom Monera, all member of kingdom Monera are prokaryotic. Prokaryotes are the organism that lack a nucleus and other cell organelles. They have a region called **nucleoid** which contain the genetic material. All unicellular organism are prokaryotic.
Eukaryotic cells are cells that contains a nucleus and organelles, and are covered by a plasma membrane.

575. Carriers of Entamoeba histolytica are
(a) mosquito of genus, Anopheles
(b) cattle
(c) Musca domestica (housefly)
(d) healthy human host

UP CPMT-2007

Ans. (d) : Carrier of *Entamoeba histolytica* are healthy human host and housefly. *E. histolytica* is monogenetic i.e. only one host is required for its complete life cycle. It undergoes reproduction and complete, its life cycle only in man.

576. How many young amoebae hatch out from a cyst of E histolytica?
(a) One (b) Two
(c) Four (d) Six

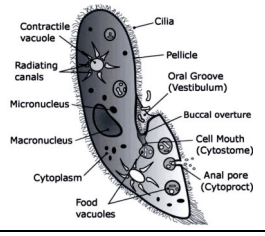
UP CPMT-2007

Ans. (a) : *Entamoeba histolytica* is a protozoan protest and is transmitted trough food or water contaminated with cysts. It is pathogenic in nature. In Entamoeba, a mature cyst is called quadric-nucleate cyst which has four nuclei and two chromatid bodies. Only one young Amoeba with four nuclei hatches out from a cyst of *Entamoeba histolytica.*

577. Which of the following unicellular organism has a macronucleus for trophic function and one or more micronuclei for reproduction –
(a) Trypanosoma (b) Paramecium
(c) Euglena (d) Amoeba

AIPMT-2005

Ans. (b) : Paramecium is unicellular and eukaryotic. They have two types of nuclei, **macronucleus** and **micronucleus**. The centre of all metabolic activities of the organism is macronucleus whereas micronucleus is a storage site for the genetic material of the organism.



@apna_pdf

578. Mycorrhiza is an example of:-
(a) Symbiotic relationship
(b) Ectoparasitism
(c) Endoparasitism
(d) Decomposers

AIPMT-2003

Ans. (a) : The symbiotic association between the plant roots and fungi is known as **mycorrhiza.** The relationship between plants and fungi is symbiotic because the plant obtains phosphate and other minerals through the fungus, while the fungus obtains sugars from the plant root.

579. The protists have:
(a) only free nucleic acid aggregates
(b) membrane-bound nucleoproteins lying embedded in the cytoplasm
(c) gene containing nucleoproteins condensed together in loose mass
(d) nucleoprotein in direct contact with the rest of the cell substance

AIPMT-1994 / Karnataka CET-2001
Haryana PMT-2000

Ans. (b) : Protists are eukaryotes as they possess a nucleus and other membrane- bound organelles.
• Protists include all unicellular and colonial eukaryotes except those of green and red algae, In protists, the nucleic acid aggregates do not lie freely in the cytoplasm.
Hence, the Protists has membrane- bound nucleo-proteins lying embedded in the cytoplasm.

580. Genetic information in Paramecium is contained in:
(a) micronucleus
(b) macronucleus
(c) both micronucleus and macronucleus
(d) mitochondria

AIPMT-1990

Ans. (a) : In Paramecium, micronucelus is a tiny and compact structure, spherical in form. It has the function of preserving genetic stability and ensuring that the desired genes are passed on to the next generation, which is also called the **generative nucleus** or **germline.**

581. Trypanosoma belongs to Class:
(a) Sarcodina (b) Zooflagellata
(c) Ciliata (d) Sporozoa

AIPMT-1989

Ans. (b) : Trypanosoma are unicellular, flagellated protozoans that belong to the family Kinetoplastea. These zooflagellates are generally uninucleate, occasionally multinucleate. The body is covered by a firm pellicle.

582. Protists are
(i) unicellular and prokaryote
(ii) unicellular and eukaryote
(iii) multicellular and eukaryote
(iv) autotroph or heterotroph
(a) (i), (ii) and (iii) (b) (ii), (iii) and (iv)
(c) (iii), (iv) (d) (ii), (iv)

JIPMER-2005

Ans. (d) : Protists are eukaryotes as they possess a nucleus and other membrane-bound organelles, In the popular five kingdom scheme proposed by Robert Whittaker in 1969, Protista was defined as eukaryotic organisms which are unicellular and which form no tissues.
They can either be autotrophic or heterotrophic in nature.

583. Movements by pseudopodia of Amoeba are due to change in
(a) pressure (b) atmosphere
(c) temperature (d) viscosity

JIPMER-2008

Ans. (d) : Amoebas are unicellular protozoans that belong to the order amoeboid. The movement of amoeba is known as **amoeboid movement** and is a type of crawling movement.
• The process of amoeboid movement occurs by utilizing the cytoplasmic flow, or the force of the fluid inside cell. This serves to pull the cell in the forward direction. Amoeba's locomotory organ is pseudopodia. For producing the pseudopodia, the cytoplasm of a cell goes through the various biochemical changes.
So, it can be said that amoeboid movement is like rhythmic interaction which takes place between the viscosity of the cytoplasmic fluid in different areas of the cell.

584. Myxomycetes are
(a) Saprobes or parasites, having mycelia, asexual reproduction by fragmentation, sexual reproduction by fusion of gametes
(b) Slimy mass of multinucleate protoplasm, having pseudopodia-like structures for engulfing food, reproduction through fragmentation of zoospores
(c) Prokaryotic organisms, cellular or a cellular, saprobes or autotrophic, reproduce by binary fission
(d) Eukaryotic, single-celled or filamentous, saprobes or autotrophic, asexual reproduction by division of haploid individuals, sexual reproduction by fusion of two cells or their nuclei

AIIMS-2006

Ans. (b) : Myxomycetes are generally placed under Fungi but are also placed under Protista. They are known as **slime mould** and are surrounded by plasma membrane only. They are multinucleate, showing amoeboid-like nature(pseudopodia for engulfing food).
• Both sexual and asexual mode of reproduction is found. They produce spores within sporangia.
• Asexual reproduction is by fragmentation and sexual reproduction by spores.

585. One of the following is a connecting link between protozoans and poriferans
(a) Cliona (b) Leucosolenia
(c) Oscarella (d) Proterospongia

AIIMS-2011

Ans. (d) : Proterospongia is the connecting link between protozoans and poriferans.
• Proterospongia is a colonial choanoflagellate protozoan that closely resembles a sponge and act as connecting link between Protozoa and Porifera. It is a genus of single-celled aquatic organism which form colonies. It consists of a number of cells embedded in a jelly-like matrix.

586. One of these protozoans is threat to apiculture and sericulture
(a) Eimeria (b) Ceratium
(c) Nosema (d) Monocystis

AIIMS-2011

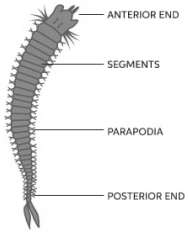
@apna_pdf

Ans. (c) : *Nosema* may be one-celled parasite. *Nosema* was discovered by Pasteur (1865), which causes chronic disease pebrine in silkworms and *Nosema* disease in honey bee. So, *Nosema* would be threat to sericulture and apiculture.

587. Which of the following is not the locomotory organ of Protozoa?
(a) Cilia (b) Flagella
(c) Parapodia (d) Pseudopodia

AFMC-2005

Ans. (c) : Parapodia are the locomotary organ of phylum Annelida, which are marine worms of belonging to class Polychaeta.
• Parapodia are usually the organ of locomotion used both in creeping and in swimming.



588. Which of the following pair is correct?
(a) E.coli-E. histolytica
(b) Culex-Elephantiasis
(c) Bed bug-Kala-azar
(d) Plasmodium-Sleeping sickness

BCECE-2005

Ans. (b) : Lymphatic filariasis, commonly known as elephantiasis, is a painful and profoundly disfiguring disease.
- The main symptom of Elephantiasis, is gross enlargement and swelling of area of body because of the accumulation of fluid.
- It is spreads from person to person through Culex mosquito.
- Elephantiasis is caused by parasitic worms that are spread by mosquito caused by organism *Wuchereria bancrofti.*

589. An intracellular parasite is
(a) Entamoeba (b) Ascaris
(c) Trypanosoma (d) Plasmodium

BCECE-2011

Ans. (d) : Plasmodium is a protozoan parasite i.e. complete their life-cycle into two host female Anopheles mosquito and mammals.
The *Plasmodium* lives as an intracellular parasite in liver cells and RBCs of man.

590. Which of the following is not a protist?
(a) Amoeba (b) Taenia
(c) Paramecium (d) Euglena

BCECE-2011

Ans. (b) : Taenia belongs to phylum Platyhelminthes and class Cestoda. It is found throughout the world and is most common in countries where pork is eaten.
- There are two form of human infection, one is primary hosting called **taeniasis** and is due to eating under-cooked pork that contains the cysts and results in adult worms in the intestine.
- The other form is called secondary hosting, **cysticercosis**, is due to eating contaminated food or water.

591. Which stages of Plasmodium are likely to be found in the stomach of a female Anopheles. Which has just taken a blood meal from a patient of malaria?
(a) Merozoites, trophozoites and gametocytes
(b) Sporozoites, trophozoites and gametes
(c) Merozoites, gametocytes and zygotes
(d) Gametocytes, ookinetes and gametes

BVP-2010

Ans. (a) : Plasmodium is known to infect the red blood cells in mammals like humans, birds, reptile etc.
• It causes a infectious disease known as malaria and transmitted by female anopheles.
• The merozoites infect red blood cells. The ring stage trophozoites mature into schizonts, which rupture releasing merozoites. Some parasites differentiate into sexual erythrocytic stages such that gametocytes.

592. Which is the characteristic feature of ookinete?
(a) It have microtubules
(b) It have more mitochondria and ribosomes
(c) It have contractile fibres
(d) It is non-motile

Rajasthan PMT-1996

Ans. (d) : An ookinete is the motile zygote that forms when the microgamete (derived from the male gametocyte) fertilizes the macrogamete (derived from the female gametocyte) during the sexual reproduction of certain sporozoans such as Plasmodium.
• The ookinete penetrates through the epithelial cells lining the midgut of the mosquito where it differentiates in to an oocyst.

593. In 1902 Nobel prize was given to :
(a) Grassi for observing plasmodium in RBC
(b) Laveron for discovering plasmodium
(c) Sir Ronald Ross for observing plasmodium
(d) Golgi for discovering eryhrocytic cycle

Rajasthan PMT-1996

Ans. (c) : Sir Ronald Ross was a British medical doctor who received the Noble prize for Physiology or Medicine in 1902 for his work on the transmission of malaria by the Anopheles mosquitoes and transmission of malaria parasites in humans.

594. Assistance provided during locomotion in Amoeba:
(a) Rough surface (b) Nematocyst
(c) Tantacles (d) Tons present in H_2O

Rajasthan PMT-1996

Ans. (a) : Amoeba's form temporary cell extensions called pseudopodia that are used for locomotion and feeding. The rough surface provides assistance to Amoeba during locomotion.

595. What conditions are optimum for activation of gametogenesis in Plasmodium in stomach/ alimentary canal of femal Anopheles?
(a) High temperature (b) Presence of enzymes
(c) Less temperature (d) Blood in stomach

Rajasthan PMT-1996

Ans. (c) : Both Anopheles and Plasmodium are sensitive to temperature because mosquitoes are ectotherms, each life stage is dependent on temperature in the development and mortality rate.
• Temperature is particularly critical, for example, at temperatures below 20^0C *Plasmodium falciparum* cannot complete its growth cycle in the Anopheles mosquito and thus can not be transmitted.

@apna_pdf

596. Incubation period of *Plasmodium falciparum* is:
(a) 10 days (b) 12 days
(c) 16 days (d) 28 days
Rajasthan PMT-1996

Ans. (b) : The incubation period of *Plasmodium falciparum* is the shortest period compared with all the other Plasmodium species.
• Incubation periods of 9–14 days for the immune and 6–14 days for the non-immune have been reported for *Plasmodium falciparum*.

597. Amoeba lack:
(a) Centrosome (b) Mitochondria
(c) Ribosome (d) E.R.
Rajasthan PMT-1996

Ans. (a) : Amoeba is a unicellular organism that has ability to change its shape, it is usually found in pond, lake etc. A centrosome comprises two microtubule rings known as centrioles. Its main function is to organize the microtubules and provide a structure to the cell.
Centrosome is absent in amoeba.

598. Plant like nutrition is present in
(a) Amoeba (b) Paramecium
(c) Euglena (d) Plasmodium
UP CPMT-2003

Ans. (c) : Plant like nutrition is present in euglena. Euglena is a single-celled eukaryote organism. In euglena plant like nutrition present because pigment of euglenoid are identical to those present in higher plants.

599. The disease caused by Entamoeba gingivalis is spread through
(a) air (b) kissing
(c) housefly (d) Anopheles
Manipal-2011

Ans. (b) : Entamoeba has no cyst in its life cycle therefore, it is transmitted either directly via kissing or indirectly through trophozoite contaminated food toothpicks etc.
• Pyorrhea is caused by a protozoan called *Entamoeba gingivalis* which live in the oral cavities.

600. Lime-knots of slime moulds are :
(a) swarm cells (b) spore
(c) capillitia (d) fruit bodies
AFMC -2011

Ans. (c) : Lime-knots of slime moulds are capillitia. This is a cancerous network formed by the deposition of calcium carbonate. Capillita are the mass of sterile fibre inside the fruting body of slime moulds.

601. Sand fly spreads a particular type of disease by its :
(a) proboscis (b) mandible
(c) salivary gland (d) none of these
Manipal-2004

Ans. (a) : A **proboscis** is an elongated feeding tube attached to the head of an animal.
• The most well known example of a proboscis in insects is the feeding tube used by adult butterflies a mouth and sand fly.
• Many diseases such as, Kala-azar, visceral leishmaniasis, oriental sore etc. are spread by sand fly through proboscis.

602. Nucleus of Monocystis is :
(a) bilobed (b) spherical
(c) multilobed (d) bean shaped
Manipal-2004

Ans. (b) : Monocystis lives as an intracellular parasites in its young stage, when it lives in the bundles of developing sperms and becomes extracellular during maturity.
• The nucleus is large, vascular spherical or ellipsoidal in shape. It is placed more anterior in the upper half of the body.

603. Plasmodium is an :
(a) endoparasite (b) ectoparasite
(c) intercellular parasite (d) both a and b
Manipal-2004

Ans. (a) : Plasmodium is a unicellular protozoan, endoparasite as it lives inside the organs of host.
• Plasmodium parasites were first identified in the late 19th century by Charles Laveran.
• Plasmodium parasite is transmitted through the bite of a female Anopheles mosquito and causes malaria.

604. Sexual mode of reproduction in Protozoa is :
(a) Anisogamy (b) Plasmogamy
(c) Plasmotomy (d) Schizogony
Uttarakhand PMT-2004

Ans. (a) : Sexual mode of reproduction in Protozoa is anisogamy. It involves fusion of gametes of different size. The small and motile gametes are male gametes and the large non-motile ones are the female gametes.

605. Octanucleated cyst stage is found in:
(a) Entamoeba coli (b) Entamoeba histolytica
(c) Leishmania (d) Trypanosoma
JIPMER-1997

Ans. (b) : Octanucleated cyst stage is found in *Entamoeba histolytica*. In octanucleated cystic form, the glycogen vacuole is reabsorbed. The nuclei may replicate until it has 16 nuclei in total.

606. The protists have:
(a) membrane bound nucleoproteins lying embedded is the cytoplasm
(b) gene containing nucleoproteins condensed together in loss mass
(c) nucleoproteins is direct contact with the rest of the cell substance
(d) only free nucleic acid aggregates
VMMC-2002

Ans. (a) : Protists are unicellular eukaryotic organisms. Membrane bound nucleoproteins are present in them. The nucleus is embedded in the cytoplasm.

607. Which of the following is a slime mould?
(a) Rhizopus (b) Physarum
(c) Thiobacillus (d) Anabaena
Rajasthan PMT-2010

Ans. (b) : Physarum is a myxomycete or plasmodial slime mould. The fruiting bodies (sporangia) are characterized by the presence of abundant amount of calcium salt. The order comprises 142 species which are placed under 12 genera.

608. Animal cell in which centrosome is not present is of
(a) Amoeba (b) Paramecium
(c) Trypanosoma (d) Plasmodium
AMU-1998

Ans. (d) : Centrosome is not present in Plasmodium.
The Plasmodium parasite that causes malaria is neither a virus nor a bacteria. It is a single-celled parasite that multiplies in red blood cells of humans as well as in the mosquitoes intestine.

@apna_pdf

609. Thigmotaxis is not shown by
(a) Paramecium (b) Amoeba
(c) Ascaris (d) Hydra
VMMC-2012

Ans. (c) : Ascaris do not show thigmotaxis as it is the internal parasite of humans. It is the most common worm for producing infection in humans.

610. Protozoan, Protista are differentiated on the basis of
(a) nuclei (b) size
(c) shape (d) locomotory structures
CG PMT-2007

Ans. (d) : Phylum protozoa is classified on the basis of locomotory organelles.
• Protozoans are believed to be primitive ancestors of animals belonging to the kingdom Protista. They are classified into four groups.

611. The type of pseudopodia seen in Lecithium is:
(a) axopodia (b) reticulopodia
(c) filopodia (d) lobopodia
AP EAMCET-2003

Ans. (c) : The type of pseudopodia seen in Lecithium is filopodia.
• It is a variety of pseudopodia according to appearance. They are actin -rich protrusion of plasma membrane, consisting mainly of ectoplasm and are more slender and filiform with pointed ends. They are supported by microfilaments. This is seen in Euglypha and Lecithium.

612. The intermediate host of the parasite that causes Tashkent ulcers is:
(a) Glossina palpalis
(b) Phlebotomus argentipes
(c) Phlebotomus papatassi
(d) Triatoma infestans
AP EAMCET-2004

Ans. (c) : The intermediate host for parasite which causes the Tashkent ulcer is *Phlebotomus papatassi*. The Tashkent ulcer is also known as cutaneous ulcer.

613. Study of protozoans is called:
(a) Parazoology (b) Protozoology
(c) Zoology (d) None of these
Haryana PMT-2002

Ans. (b) : Study of protozoan is called as protozoology. They are considered to be a subkingdom of Protista. They are free-living organisms that are found in almost every habitat.

614. The disease oriental sore is caused by :
(a) bacteria (b) virus
(c) protozoa (d) fungus
Haryana PMT-2004

Ans. (c) : Cutaneous leishmaniasis is the most common form of leishmaniasis affecting humans and causes oriental sore. It is a tropical condition which is caused by the single-celled microscropic parasite and its transmission takes place by the bite of the sandfly.

615. The structure in Amoeba functionally similar to human kidney is
(a) nucleus (b) plasmodesmata
(c) plasma membrane (d) contractile vacuole
AMU-2006

Ans. (d) : In amoeba, excretory waste such as ammonia is collected by contractile vacuole from the intra cellular fluid by both active transport and diffusion.
• The excretory organ of the amoeba is a contractile vacuole as the excretory organ is kidney of the human.

616. Protista includes :
(a) dinoflagellates, Amoeba, Paramecium
(b) mushroom, Paramecium, Euglena
(c) Hydra, Amoeba, Paramecium
(d) Yeast, Euglena, dinoflagellates
J&K CET-2006

Ans. (a) : Dinoflagellates are member of phylum pyrrophyta of kingdom Protista whereas Amoeba and paramecium belong to phylum protozoa of kingdom protista.

617. Nucleus of Monocystis is
(a) bilobed (b) spherical
(c) multilobed (d) bean shaped
AMU-2005

Ans. (b) : The nucleus is large, vascular and ovoid or spherical in Monocystis. It lies towards the anterior end and is bounded by a distinct nuclear membrane. It contains one or sometimes two nucleoli, endosomes or karyosomes.

618. Which is false for nutrition in Amoeba ?
(a) Omnivorous (b) Pseudopodia feeder
(c) Holozoic nutrition (d) Photoautotroph
AMU-2009

Ans. (d) : Nutrition in an Amoeba is accomplished through a process known as **phagocytosis**, in which the entire organism completely engulfs the food, it intends to consume . The term "holozoic nutrition" refers to the mode of nourishment used by Amoeba.

619. The number of daughter Vorticella formed after the second series of post-conjugation fissions is
(a) seven (b) six
(c) four (d) two
VMMC-2010

Ans. (a) : The number of daughter Vorticella formed after the second series of post conjugation fission are 7, each contains a macronucleus and a micronucleus.

620. Who has proposed the sol gel theory for amoeboid movement explanation?
(a) Pantin (b) Goldacre and love
(c) Hyman (d) Mast
BVP-2013

Ans. (c) : Sol gel theory was strongly advocated by Hyman (1971) and also adopted by Pantin (1923-1926) and Mast (1925). It is supposed to be the best to explain the locomotion in Amoeba. This theory is based on the reversible change of protoplasm from sol to gel state.

621. In Amoeba who gave contraction hydraulic theory ?
(a) Schultze (b) Claude
(c) Simpson (d) Swan
Rajasthan PMT-2000

Ans. (a) : Earlier it was given by Schultze and detailed explanation was given by Rinaldi. It explains how sol moves in the direction of locomotion. According to this, actin and myosin type of proteins are present in rear portion of Amoeba. Phase proteins produce hydraulic pressure by contraction. This pressure is maximum in front, minimum in middle and medium in rear.

@apna_pdf

622. In Plasmodium which one of the following is not distinct ?
(a) Mitochondria (b) Golgi body
(c) Cilia (d) Nucleus
Rajasthan PMT-2000

Ans. (c) : The Plasmodium does not possess cilia. Plasmodium is a large genus of parasite protozoa. This parasite has two hosts in its life cycle, a mosquito vector, and a vertebrate host. It has all the organelles like mitochondria, golgi body, and nucleus. However, it does not possess cilia.

623. An example of terrestrial protozoan is:
(a) Vorticella (b) Giardia
(c) Didymium (d) Plasmodium
AP EAMCET-1999

Ans. (c) : Didymium is an example of terrestrial protozoan.
• 'Terrestrial protozoa' are ubiquitous limnetic species tolerant of high CO_2 tensions and possessing efficient encystment mechanisms. Protozoa exploit tiny micro habitats unavailable to larger animals (e.g. nematodes).

624. Diatoms belong to which class?
(a) Phaeophyceae (b) Bacillariophyceae
(c) Chlorophyceae (d) Xanthophyceae
BCECE-2008
UP CPMT-2007

Ans. (b) : Diatoms are placed in Protista as they are unicellular and eukaryotic. Diatoms are formally classified as belonging to the division Chrysophyta, class Baciliariophyceae.

625. Why Amoeba has been kept in Protozoa?
(a) Due to contractile vacuole
(b) Because of nutrition being insectivorous
(c) Cell wall
(d) Unicellular body
BCECE-2002

Ans. (d) : Protozoa is a group of microscopic, and unicellular, eukaryotic animalcules without tissue and organs, having one or more nuclei. The contractile vacuole is for osmo-regulation. Amoeba is carnivorous and its mode of nutrition is holozoic i.e. it feed by phagocytosis.

626. The beautiful diatoms and desmids are placed under
(a) Chrysophytes (b) Dianoflagellates
(c) Euglenoids (d) Slime moulds
AMU-2012

Ans. (a) : Crysophytes belong to kingdom Protista. Chryosophytes are a group of algae commonly formed in lakes. They are sometimes referred to as gloden-brwon algae due to coloration from specific photosynthetic pigment. Chrysophytes are protists that resemble plants and are typically found in fresh water and marine habitats with low calcium.
• Chrysophytes are photosynthetic.

627. Diatoms float in water because they have
(a) flagella on the one end of the body
(b) flagella on the both ends of the body
(c) wing like structure in middle of the body
(d) light storage lipids in the body
AMU-2001

Ans. (c) : Diatoms are microscopic organisms of various colours and diverse forms. They are both aquatic and terrestrial. The aquatic forms are both freshwater and marine. Their chief characteristic is the silicified cell wall, consisting of two overlapping halves which are characteristic secondary structures.

628. Which of the following are the characters of Dinoflagellates?
1. Planktonic golden yellow algae with soap box like structure
2. Marine red biflagellated Protista
3. Appear yellow, green, brown, blue and red in colour
4. Biflagellated organisms with pellicle
5. Saprophytic(or) parasitic unicellular forms
(a) 1, 2 and 3 only (b) 2, 4 and 5 only
(c) 2 and 3 only (d) 2 and 5 only
(e) 3, 4 and 5 only
Kerala PMT-2012

Ans. (c) : Dinoflagellates are primarily found in marine waters and are photosynthetic. These creatures tend to move around and flagellate most frequently. Normally these have two flagella. There normally these have two fagella. Therefore, they are also known as biffagellates.
When blooming, dinoflagellates can be responsible for 'red tides'. So called because the large density of cells in the surface water induces a colour changes green, brown or red.

629. Diatoms do not decay easily because
(a) they have siliceous walls
(b) their body is impervious to water
(c) they are chitinous
(d) they are abundant in saline soil
AIIMS-2011

Ans. (a) : Diatoms do not decay easily because the wall are embedded with silica and thus the walls are indestructible. Thus, diatoms have left behind large amount of cell wall deposits in their habitat, this accumulation over billions of year is referred to as diatomaceous earth.

630. 'Red tide' is caused by
(a) Gonyaulax (b) Ceratium
(c) Triceratium (d) All of these
AIIMS-2014
VMMC-2014

Ans. (a) : Red tide is caused by gonyaulax.
Algal blooms, commonly referred to as red tides, are brought on by the rapid growth and buildup of microscopic algae (dianoflagelette), which while growing from a bunch like structure known as an algal bloom.
- Gonyaulax is a dinoflagellates and sometimes the number of these dinoflagellates increases tremendously in the sea.
- Ceratium is one on few dionflagellates which show sexual reproduction (Reproduction is by zygotic meiosis). Ceratium is not responsible for causing red tides.
- Triceratium too is not responsible for causing red tides.

@apna_pdf

D. Fungi

631. The reserved food of Albugo is:
(a) glycogen (b) cellulose
(c) starch (d) None of these
Haryana PMT-2010 / UP CPMT-2010
AMU-2009 / AFMC-2007
Rajasthan PMT-1996

Ans. (a) : Albugo the only genus of family Albuginaceae and is represented by more than 25 species. It has reserve food material in the form of oil drops and glycogen bodies.

632. Lomasomes are found in :
(a) algal cell (b)fungal cell
(c) yeast (d)E.coli
AP EAMCET-2011 / BVP-2000
Manipal-2002 / Haryana PMT-2001

Ans. (b) : Lomasome term coined by Moore and McAlear (1961). The outfolding at the plasma membrane in fungi is called the **lomasome**.
• Lomasomes are the membranous structure found between the cell wall and plasma membrane. They facilitate vesicular transport and increase the surface area.

633. Late blight of potato is caused by
(a) Ustilago
(b) Pseudomonas
(c) Phytophthora infestans
(d) Colletotrichum falcatum
BCECE-2010
Haryana PMT-2009
MGIMS Wardha-2008
AMU-1996

Ans. (c) : Late blight of potato is caused by *Phytophthora infestans*. It is an oomycete or water mould. It is a lethal disease which can have the potential to devastate the crop.

634. Cell wall of fungi is made up of
(a) fungal cellulose (b) hemicellulose
(c) fungal chitin (d) Both 'a' and 'c'
UP CPMT-2009 / JIPMER-2018
Rajasthan PMT-1997 / JIPMER-2011

Ans. (d) : The cell wall of fungi is made up mainly of glucans, chitin, and glycoproteins. Cellulose is the primary compound of the cell walls of the plant cell, and chitin is the primary compound of the cell walls of the fungi and exoskeletons of arthropods.
• Chitin is a complex homopolysaccharide and the second most abundant organic substance. It is found as the structural component of fungal walls and is also called **fungal cellulose**.
• Hemicellulose is a major component of plant cell walls. It is also known as **polyose**. They contribute in strengthening the cell wall by interacting with cellulose and, in some walls, with lignin.

635. Puffballs belongs to the following class
(a) Phycomycetes (b) Ascomycetes
(c) Basidiomycetes (d) Deuteromycetes
TS EAMCET-11.05.2023, Shift-I

Ans. (c) : Basidiomycetes are commonly known as mushroom *(Agaricus)*, bracket fungi or puffballs.
These fungi are found in soil or on decaying wood in grassy areas and woods.
They are named so because clouds of dust-like brown spores are release when the mature fruiting body bursts.

636. Identify the asexual reproductive structure associated with *Penicillium*:
(a) Buds (b)Zoospores
(c) Conidia (d)Gemmules
NEET-2022

Ans. (c) : Conidia are the asexual reproductive structures found in *Penicillium*.
• Buds are found in *Hydra*.
• Zoospores are found in *Chlamydomonas*.
• Gemmules are found in *Sponges*.

637. The enzyme (A) is needed for isolating genetic material from plant cells and enzyme (B) for isolating genetic material from fungus. Choose the correct pair of options from the following:
(a) (A) Cellulase (B) Protease
(b) (A) Cellulase (B) Chitinase
(c) (A) Chitinase (B) Lipase
(d) (A) Cellulase (B) Lipase
NEET (Re-Exam)-04.09.2022

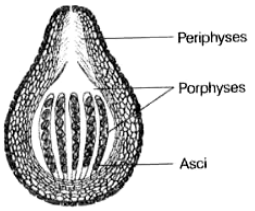
Ans. (b) : The enzyme cellulase is needed for isolating genetic material from plant cells and enzyme chitinase is required for isolating genetic material from fungus.

638. Deuteromycetes is called as Imperfect fungi because
(a) Sexual reproduction is absent
(b) Mycellium is monokaryotic and septate
(c) The fruitingbody is ascocarp
(d) They are saprophytes
AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Dueteromycetes are called imperfect fungi because sexual reproduction is absent, only the asexual and vegetative phases of these fungi are known.
⇒ The dueteromycetes reproduce only by asexual spores known as conidia, and the mycelium is septate and branched.

639. Perithecium is characterized by
(a) Un opened globose fruiting body
(b) Flask-shaped fruiting body without opening
(c) Flask-shaped fruiting body with apical opening
(d) Cup-shaped fruiting body
AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Perithecium is characterized by flask shaped fruiting body with an apical opening e.g. *Cleviceps purpurea.*



Perithecium

@apna_pdf

640. Match the following lists:

List-I	List-II
(A) Coprophilous	I. Trichoderma
(B) Karyogamy and meiosis occur in sac-like structures	II. Mucor
(C) Flask shaped fruiting bodies with an apical opening	III. Puccinia
(D) Asexual reproduction takes place by aplanospores	IV. Peritheciu m
	V. Dung
	VI. Penicillium
	VII. Alternaria

The correct match is:

	A	B	C	D
(a)	V	III	VII	II
(b)	VII	VI	I	III
(c)	III	I	IV	II
(d)	V	VI	IV	II

TS EAMCET-10.08.2021 Shift-I

Ans. (d) :

(A)	**Coporhilious**	**Dung**
(B)	**Karyogamy and meiosis occur in sac-like structures**	**Penicillium**
(C)	**Flask shaped fruting bodies with an apical opening**	**Peritheciu m**
(D)	**Asexual reproduction takes place by aplanospores**	**Mucor**

641. Identify the organism which did not cause ringworm?

(a) Microsporum (b) Trichophyton
(c) Epidermophyton (d) Trichonympha

TS EAMCET-09.08.2021 Shift-II

Ans. (d) : Ringworm is not causes by *Trichonympha*. It is a genus of single celled, anaerobic parabasalids of the order Hypermastigia, that is found exclusively in the hindgut of lower termites and wood roaches.

- **Microsporum-** Microsporum is a genus of fungi that causes *Tinea capitis, Tinea corporis*, ring-worm, and other dermatophytosis. Microsporum forms both macroconidia and microconidia on short conidiophores.
- **Tricophyton-** Trichophyton is a genus of fungi, which includes the parasitic varieties that cause Tinea, including athletes foot, ringworm, Jock itch, and similar infections of the nail, beard, skin and scalp. Trichyphyton fungi are molds characterized by the development of both smooth-walled macro and microconidia.
- **Epidermophyton-** Epidermophyton is a genus of fungus causing superficial and cutaneous mycoses, including *E. floccosum* and causes *Tinea corporis, Tinea cruris, Tinea pedis* etc.

642. Match the following fungi scientific names with their alternate names ?

Column-I	Column-II
(A) Ustilago	(i) Bracket
(B) Puccinia	(ii) Puff ball
(C) Polyepores	(iii) Mushroom
(D) Lycoperdon	(iv) Smut
	(v) Rust

Options:

	A	B	C	D
(a)	(iv)	(v)	(i)	(ii)
(b)	(v)	(i)	(ii)	(iii)
(c)	(i)	(ii)	(iii)	(iv)
(d)	(v)	(iv)	(iii)	(ii)

AP EAMCET-03.09.2021 Shift-II

Ans. (a)

Scientific Names	Alternate Names
(a) Ustilago	Smut
(b) Puccinia	Rust
(c) Polyepores	Bracket
(d) Lycoperdon	Puff ball

643. Organisms which are eukaryotic, non-cellulosic cell wall, heterotrophic belongs to _____

(a) Monera (b) Protista
(c) Mycota (d) Plantae

AP EAMCET-03.09.2021 Shift-II

Ans. (c) : Kingdom Mycota consists of eukaryotic organisms with non-cellulosic cell wall. They lack chlorophyll hence can't prepare their own food, hence also called as **heterotrophic**.

644. Identify the odd one out.

(a) Ustilago (b)Alternaria
(c) Colletotrichum (d)Trichoderma

Karnataka CET-2021

Ans. (a) : *Ustilago* belongs to class Basidiomycetes (Club fungi) which causes loose smut and covered smut of disease.

- *Alternaria*, *Colletotrichum* and *Trichoderma* are belongs to Deuteromycetes (Imperfect fungi).
- *Alternaria* causes early blight of potato.
- *Colletotrichum falcatum* causes red rot of sugarcane.
- *Trichoderma* is used for reducing the occurrence of plant disease.

645. Which among the following do not form asexual spores usually?

(a) Deuteromycetes (b) Basidiomycetes
(c) Ascomycetes (d) Phycomycetes

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Basidiomycetes are called **club fungi**. They generally do not show asexual spores. Instead, they produce their sexual spores, called **basidiospores**, on a club-shaped, spore-producing structure called a **basidium**.

646. The saprophytes like bacteria, actinomycetes and fungi are

(a) pioneers in ecological succession.

@apna_pdf

(b) climax communities in ecological succession.
(c) macro-consumers in an ecosystem,
(d) micro-consumers in an ecosystem.

MHT CET-07.10.2020 Shift-I

Ans. (d) : The saprophytes like bacteria, actinomycetes and fungi are micro-consumers in an ecosystem. Fungi along with some types of bacteria, belong to a group of microorganisms called saprophytes. These organisms play an important role in their ecosystem, making it possible for plants to thrive.

647. Column-I consists of names of fungi classes while Column-II consists of names of genera. Find out the correct option.

	Column-I		Column-II
I.	Phycomycetes	p.	Alternaria, Trichophyton
II.	Ascomycetes	q.	Agaricus, Puccinia
III.	Basidiomycetes	r.	Mucor, Rhizopus
IV.	Deuteromycetes	s.	Aspergillus, Penicillium

(a) I - r, II - s, III - q, IV - p
(b) I - p, II - q, III - r, IV - s
(c) I - q, II - r, III - s, IV - p
(d) I - s, II - r, III - p, IV - q

MHT CET-07.10.2020 Shift-I

Ans. (a) :
(I) Phycomycetes → Mucor, Rhizopus
(II) Ascomycetes → Aspergillus, Penicillium
(III) Basidiomycetes → Agaricus, Puccinia
(IV) Deuteromycetes → Alternaria, Trichophyton

648. Vernalization increases the resistance of plants for diseases caused by _____.

(a) Bacteria (b) Viroids
(c) Viruses (d) Fungi

MHT CET-06.10.2020 Shift-I

Ans. (d) : Vernalization increases the resistance of plant for disease caused by fungi. It increases the cold resistance of plants. The period of cold treatment is of few days to many weeks.

649. Fungus without any mycelium is _____

(a) Albugo (b) Phytophthora
(c) Agarius (d) Saccharomyces

AP EAMCET-24.09.2020 Shift-I

Ans. (d) : *Saccharomyces* is a genus of Fungi that includes many species of yeast. It is a unicellular and microscopic fungus in which hyphae or mycelium is absent. It is belong to the class Saccharomycetes. It is also known as **sugar fungus** and mainly participate in fermentation.

650. In which of the following group are *Neurospora* and *Penicillium* included?

(a) Phycomycetes (b) Basidiomycetes
(c) Zygomycetes (d) Ascomycetes

AP EAMCET-24.09.2020 Shift-I

Ans. (d) : Ascomycetes are commonly known as **sac fungi**. They produce spores through sac shaped cells called **Ascus**. They constitute the largest phylum of the kingdom Fungi.
Example– *Neurospora, Penicillium*

651. Which of the following is called "Drosophila of plant kingdom"?

(a) *E.coli* (b) *Acetabularia*
(c) *Neurospora* (d) *Chlorella*

AP EAMCET-24.09.2020 Shift-I

Ans. (c) : *Neurospora* is a genus of Ascomycete fungi. It is also called as **"Drosophila of plant kingdom"**. The genus name meaning "nerve spore" refers to the characteristic striations on the spores that resemble axons of a nerve. The best – known species of this genus is *Neurospora crassa,* which is used commonly as a model organism in biological.

652. Match the following:

	Column –I		Column - II
1.	*Trichoderma*	i.	Citric acid
2.	*Saccharomyces*	ii.	Acetic acid
3.	*Aspergillus Niger*	iii.	Statins
4.	*Acetobacter*	iv.	Toddy

(a) (1– iii), (2 – ii), (3 – iv), (4 – i)
(b) (1– iv), (2 – iii), (3 – ii), (4 – i)
(c) (1– ii), (2 – i), (3 – iii), (4 – iv)
(d) (1– iii), (2 – iv), (3 – i), (4 – ii)

AP EAMCET-24.09.2020 Shift-I

Ans. (d) :

Column-I		Column-II
1. *Trichoderma*	–	(iii) Statins
2. *Saccharomyces*	–	(iv) Toddy
3. *Aspergillus Niger*	–	(i) Citric acid
4. *Acetobacter*	–	(ii) Acetic acid

653. Yeast cell can progress through the cell cycle in about———

(a) 20 hours (b) 24 hours
(c) 90 minutes (d) 60 minutes

AP EAMCET-24.09.2020 Shift-I

Ans. (c) : Yeast cell can progress through the cell cycle in about 90 minutes. The duration of the cell cycle depends on the type of cell and external factors such as temperature, nutrients and oxygen supply. A bacterial cell can be divided in 20 minutes and a yeast cell can take approximately 90 minutes to divide.

654. Match the following

Transgenic Plant		Resistant to	
a.	Potato	i.	Herbicide tolerant
b.	Tomato	ii.	Phytophthora
c.	Basmati rice	iii.	Pseudomonas
d.	Roundup ready soya bean	iv.	Biotic, abiotic stress

(a) (a – ii), (b – iii), (c –iv), (d –i)
(b) (a – i), (b – ii), (c –iii), (d –iv)
(c) (a – ii), (b – iii), (c –i), (d –iv)
(d) (a – i), (b – ii), (c –iv), (d –iii)

AP EAMCET-24.09.2020 Shift-I

@apna_pdf

Ans. (a) :

Transgenic plant	Resistant
a. Potato	– Phytophthora
b. Tomato	– Pseudomonas
c. Basmati rice	– Biotic, abiotic stress
d. Roundup ready soya bean	– Herbicide tolerant

655. Which of the following statements is incorrect?

(a) Claviceps is a source of many alkaloids and
(b) Conidia are produced exogenously and ascospores endogenously.
(c) Yeasts have filamentous bodies with long thread-like hyphae.
(d) Morels and truffles are edible delicacies.

NEET-2019

Ans. (c) : Yeast is solitary cell or unicellular living being known as *Saccharomyces* because it is unicellular and lacks filamentous structure, however, it forms a short temporary filamentous structure called **pseudo-mycelium.**

656. Match the column

Column I	Column II
(i) Tricoderma	**(A) Deuteromycetes**
(ii) Yeast	**(B) Basidiomycetes**
(iii) Bread mould	**(C) Phycomycetes**
(iv) Smut	**(D) Ascomycetes**

(a) i–D, ii–A, iii–C, iv–B
(b) i–A, ii–D, iii–B, iv–C
(c) i–A, ii–D, iii–C, iv–B
(d) i–A, ii–C, iii–B, iv–D

AIIMS-25.05.2019 Shift-II

Ans. (c) :

Column-I	Column-II
(i) Tricoderma	(A) Deuteromycetes
(ii) Yeast	(D) Ascomycetes
(iii) Bread mould	(C) Phycomycetes
(iv) Smut	(B) Basidiomycetes

657. Match the column-I and column-II

Column-I	Column-II
(i) *Agaricus*	**(A) Ascomycetes**
(ii) *Colletotrichum*	**(B) Deuteromycetes**
(iii) *Albugo*	**(C) Phycomycetes**
(iv) *Neurospora*	**(D) Basidiomycetes**

(a) i–B, ii–A, iii–C, iv–D
(b) i–A, ii–B, iii–D, iv–C
(c) i–C, ii–B, iii–D, iv–A
(d) i–D, ii–B, iii–C, iv–A

AIIMS-26.05.2019 Shift-II

Ans. (d) :

(i)	*Agaricus*	(D)	Basidiomycetes
(ii)	*Colletotrichum*	(B)	Deuteromycetes
(iii)	*Albugo*	(C)	Phycomycetes
(iv)	*Neurospora*	(A)	Ascomycetes

658. A student while extracting DNA from <u>Aspergillus</u> fungus requires _____ enzyme to break open the cell wall.

(a) Lysozyme (b) Chitinase
(c) Cellulase (d) Pectinase

Karnataka CET-2019

Ans. (b) : Aspergillus is a fungus and their cell wall is made up of chitin, isolation of DNA from Aspergillus fungus need the enzyme chitinase to break open the cell wall.

659. Morphologically and Physiologically similar and usually motile and flagellated gametes are known as _____ and its correct example?

(a) Isogamete, Fucus
(b) Isogamete, Cladophora.
(c) Anisogamete, Spirogyra
(d) Anisogamete, Human gametes

GUJCET-2018

Ans. (b): Morphologically and Physiologically similar and usually motile and flagellated gametes are known as **isogamete** such as *Cladophora*.

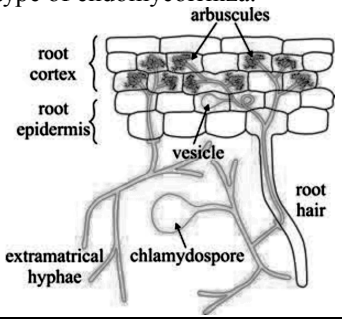
Isogametes, involves the fusion of gametes which do not differ morphologically but may be different physiologically. Such gametes are called Isogametes. **Ex– Cladophora.**

660. VAM is

(a) endomycorrhiza (b) ectomycorrhiza
(c) bioinsecticide (d) bioherbicide

SRM JEEE-2018

Ans. (a) : VAM full form is **Vesicular arbuscular mycorrhiza** which is formed due to the symbiotic association between certain fungi and angiospermic roots. It is a type of endomycorrhiza.



661. After karyogamy followed by meiosis, spores are produced exogenously in

(a) Neurospora (b) Alternaria
(c) Saccharomyces (d) Agaricus

NEET-2018

Ans. (d) : In Basidiomycetes (Agaricus), meiospores are produced exogenously after karyogamy and meiosis.

- In Agaricus, the fusion of two vegetative cells, a club-shaped structure is formed on every cell (basidium). After that, both the nuclei come into this basidium and fuse with each other and further, meiosis takes place as a result of which four haploid spores are formed on every basidium.
- Neurospora is a genus of ascomycetes that produces ascospores as meiospores but endogenously inside the ascus.
- Alternaria a genus of deuteromycetes does not produce sexual spores.
- Sacchromycetes produces ascospores endogenously.

@apna_pdf

662. Which of the following has chitinous cell wall ?
(a) Mycoplasma (b) Archaea
(c) Fungi (d) Bacteria

Tripura JEE-2017
Punjab MET-2008

Ans. (c) : Fungi body structure is unique. They are eukaryotes that lack chlorophyll. The fungal cell wall is made up of complex polysaccharides such as chitin, glycan and glycoproteins.

663. Macromolecule chitin is
(a) Nitrogen containing polysaccharide
(b) Phosphorous containing polysaccharide
(c) Sulphur containing polysaccharide
(d) Simple polysaccharide

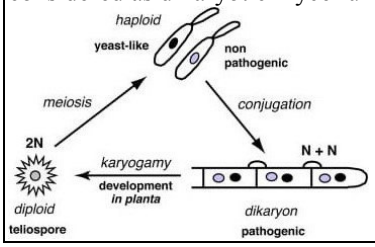
JIPMER-2017

Ans. (a) : Chitin is natural complex polysaccharide. It is linear polymer composed of repeating β (1, 4)- N-acetyl-glucosamine units (Nitrogen containing polysaccharide). It is composed of proteins and carbohydrates. It is a complex carbohydrate, similar to cellulose.

664. Dikaryotisation (n+n) in Agaricus is brought about by
(a) Clamp connections
(b) Somatogamay between two hyphae of different strains
(c) Both (a) and (b) are correct
(d) Basidiospores

AIIMS-2017

Ans. (c) : Dikaryotisation (n+n) in *Agaricus* is brought about by clamp connections and somatogamay between two hyphae of different strains.
The vegetative part of the mycelium consist of two filamentous hyphae that produces the basidiospores.
• In the beginning, the hyphae are nucleated but later two strains of hyphae are formed and both of them come in contact, as a result the nucleus passes from one to the other this process is termed as **somatogamy**. The cells become dikaryotic after the division by clamp and considered as dikaryotic mycelium.



665. Which of the following is correctly matched for the product produced by them?
(a) *Acetobacter aceti* : Antibiotics
(b) *Methanobacterium* : Lactic acid
(c) *Penicillium notatum* : Acetic acid
(d) *Saccharomyces cerevisiae* : Ethanol

NEET-2017

Ans. (d) : *Saccharomyces cerevisiae* is also called **Baker's yeast** and it used in the fermentation of sugars to produce ethanol and carbon dioxide.
• *Acetobacter aceti* produce acetic acid.
• *Methanobacterium* produce methane.
• *Penicillium notatum* and streptococcus produce antibiotics penicillin and streptomycin respectively.

666. Among plants, Pheromones are secreted by the cells of the following plants for given function:
(a) all plants for growth and development
(b) yeast for facilitating mating
(c) all fungi for sexual reproduction
(d) Rhizopus for formation of zygospore

Haryana PMT - 2005
BHU PMT-2003

Ans. (b) : Pheromones are also called **ectohormones** substance that are secreted outside by an individual and received by a second individual of the same species in which it induces a specific reaction.
• Pheromones may play a role in mate selection, which is "disassortative" regarding the human leukocyte antigen- (HLA) genotype.

667. Match column I with Column II and select the correct option using the codes given below.

Column I	Column II
A. Citric acid	**1. Trichoderma**
B. Cyclosporin A	**2. Clostridium**
C. Statins	**3. Aspergillus**
D. Butyric acid	**4. Monascus**

(a) A-3 B-1 C-2 D-4
(b) A-3 B-1 C-4 D-2
(c) A-1 B-4 C-2 D-3
(d) A-3 B-4 C-1 D-2

NEET-2016 Phase-II

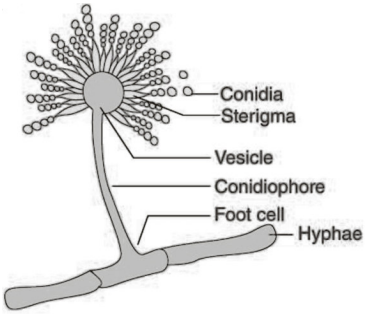
Ans. (b) :

Column-I		Column-II
A. Citric acid	–	(3) Aspergillus
B. Cyclosporin A	–	(1) Trichoderma
C. Statins	–	(4) Monascus
D. Butyric acid	–	(2) Clostridium

668. Which of the following secretes toxins during storage conditions of crop plants : -
(a) Aspergillus (b)Penicillium
(c) Fusarium (d)Colletotrichum

AIPMT-2002

Ans. (a) : Aspergillosis is an infection caused by Aspergillus (Black mould). It is usually found outdoor in dead leaves on plants. Aspergillus can cause allergic reactions, and invasive disease that spread to our brain, kidney, lungs, or causes asthma on inhaling their fungal spores.



@apna_pdf

669. The zygospore in Rhizopus develops into:
(a) zygospore (b) progametangium
(c) promycelium (d) gametangium
J&K CET-2002

Ans. (c) : The male (+) and female (–) gametangia fuse in Rhizopus, and the gametangial copulation leads to the formation of a zygospore, which contains many pairs of nuclei. These pairs of nuclei fuse to produce diploid nuclei, while others degenerate.
On germination, the inner layer comes out after cracking the outer walls and produces a promycelium.

670. Which is unicellular fungus?
(a) Yeast (b) E. coil
(c) Nostoc (d) Albugo
BHU PMT (Mains)-2010
AIIMS-2000 / Manipal-2002

Ans. (a) : Yeast belongs to class Ascomycetes. It is a colourless, unicellular, non-mycelial plant.
It is also called as "Sugar fungus" because it converts sugars and starches into alcohol and carbon dioxide during the fermentation process.

671. Which of the following cause disease in human beings?
(a) Rhizopus (b) Puccinia
(c) Aspergillus (d) Cystopus
BVP-2005

Ans. (c) : Aspergillosis is an infection caused by *Aspergillus* (Black mould). It is usually found outdoors in dead leaves on plants. It can cause allergic reaction and in active disease that spreads to our brain, kidney lungs or asthma inhale their fungal spores.

672. Slimy mass of protoplasm with many nuclei and an amoeba-like thalloid body is a characteristic feature of
(a) Ascomycetes (b) Actinomycetes
(c) Phycomycetes (d) Basidiomycetes
(e) Myxomycetes
Kerala PMT-2009

Ans. (e) : Myxomycetes (slime mould) are multinucleated. amoeboidal & diploid. They are found in decaying leaves, in soil, and dark & cool conditions. They are saprophytic and lack chlorophyll. The plasmodial stage resembles protozoa, and fruiting bodies from spores resembling fungi.

673. Match the following and choose the correct combination from the options given

Column - I (Group)	Column - II (Example)
A. Eubacteria	1. Trichoderma
B. Dinoflagellates	2. Albugo
C. Phycomycetes	3. Gonyaulax
D. Deuteromycetes	4. Anabaena

(a) A -1, B - 2, C - A, D - 4
(b) A- 2, B - 3, C - 4, D - 1
(c) A- 4, B - 3, C - 2, D - 1
(d) A- 3, B - 4, C - 1, D - 2
(e) A- 4, B - 3, C - 1, D - 2
Kerala PMT-2012

Ans. (c) :

Column-I (Group)		Column-II (Example)
A. Eubacteria	–	(4) Anabaena
B. Dinoflagellates	–	(3) Gonyaulax
C. Phycomycetes	–	(2) Albugo
D. Deuteromycetes	–	(1) Trichoderma

674. Fungi can be stained with :
(a) Fast green (b) Cotton blue
(c) Grams stain (d) PAS
BVP-2000

Ans. (b) : Fungi can be stained with **cotton blue**, which provide blue colour of chitinous cell wall.
- **Fast green** is used as a quantitative stain for histones at alkaline pH after acid extraction at DNA. It is also used as a protein stain in electrophoresis.
- **Gram stain** is a staining method used to classify bacteria into Gram positive & Gram negative.
- **Periodic-acid schiff (PAS)** is a staining method used to detect polysaccharides such as glycogen and mucosubstance.

675. Penicillium belongs to
(a) Phycomycetes (b) Ascomycetes
(c) Basidiomycetes (d) none of the these
BVP-2000

Ans. (b) : *Penicillium* belongs to the class Ascomycetes (sac fungi). In Ascomycetes, the main reproduction type is conidia, which develops on the conidiophore in the form of chains.

676. Organism which can respire in absence of O_2 is:
(a) Chlorella (b) Solanum
(c) Saccharum (d) Saccharomyces
BVP-2000

Ans. (d) : Organism that can respire in absence of O_2 is *Saccharomyces*. This process called **fermentation or Anaerobic respiration**. *Saccharomyces* are facultative anaerobes. They make ATP in the presence or absence of O_2.

677. When a fungus completes its life cycle on two hosts, it is called
(a) heterothallic (b) monothallic
(c) heteroecious (d) autoecious.
AMU-1995
CMC Vellore-2008

Ans. (c) : When a fungus completes its life cycle on two hosts, it is called **heteroecious**. It requires two unrelated hosts to complete their life cycle. The primary host is the host in which the parasites spends its adult life.
Example : *Puccinia graminis* : the primary host is **barley** and **barberry** is the alternate host.

678. The fruiting body of *Aspergillus* or *Penicillium* is
(a) Hypanthodium (b) Peritheium
(c) Apothecium (d) Cleistotheciun
AIIMS-1998
JCECE-2006

@apna_pdf

Ans. (d) : The fruiting body of *Aspergillus* or *Penicillium* is cleistothecium. It is closed spore-bearing structure of some fungi from which spores are released only by disintegration or decay.

- **Hypanthodium** is a special type of cymose inflorescence, eg:- Banyan *(Ficus bengalensis)*
- **Perithecium** is a fleshy and sessile fruiting body with wide opened saucer shaped or cup shaped fungi eg:- *Neurospora*.
- **Apothecium** is a spore bearing structure in many lichens and fungi consisiting of a discoid or cupped body bearing asci on the exposed flat or concave surface.

679. Which one of the following is wrong for fungi?

(a) They are eukaryotic
(b) All fungi possess a purely cellulosic cell wall
(c) They are heterotrophic.
(d) They are both unicellular and multicellular

NEET-2016 Phase-II

Ans. (b) : In fungi, the cell wall contains chitin or cellulose along with other polysaccharides, proteins and lipids. Therefore, all fungi do not have a purely cellulosic cell wall.

- Fungi are heterotrophic eukaryotic organisms with filamentous bodies called mycelium.

680. The imperfect fungi which are decomposers of litter and help in mineral cycling belong to :

(a) Ascomycetes (b) Deuteromycetes
(c) Basidiomycetes (d) Phycomycetes

AIPMT (Re-Exam)-2015

Ans. (b) : Deuteromycetes, also called **anamorphic fungi**, which are decomposers of litter and help in mineral cycling.

In this the true sexual state is uncommon or unknown.

Some member are saprophytes or parasites while a large number of them are decomposers of litter and help in mineral cycling.

eg. *Colletotrichum, Helminthosporium* etc.

Conidia stages are similar to those in the phylum Ascomycota, but those of some species show affinities to lower fungi and the phylum Basidiomycetes.

681. Choose the wrong statement

(a) Yeast is unicellular and useful in fermentation
(b) Penicillium is multicellular and produces antibiotics
(c) Neurospora is used in the study of biochemical genetics
(d) Morels and truffles are poisonous mushrooms

AIPMT (Re-Exam)-2015

Ans. (d) : Morels and truffles are ascomycetes and are edible mushrooms.

Ascomycetes in the largest phylum of the kingdom Fungi. It produces sexual, non-motile spores known as **ascospores**.

They are produced in a sac-like structures known as Ascus. Each ascus contain 4-8 ascospores.

They are commonly known as sac fungi.

682. Which one of the following fungi contains hallucinogens?

(a) Morchella esculenta (b) Amanita muscaria
(c) Neurospora sp. (d) Ustilago sp.

AIPMT-2014

Ans. (b) : ***Amanita muscaria*** is an attractive mushroom often appear in group, which belongs to class Basidiomycetes. It is also called **fly Agaric or fly Amanita,** is a hallucinogen and must be considered poisonous. Hallucinogen is the psychoactive agent that cause hallucination. It produces a toxic alkaloid, muscarine, which mimics the effects of acetylcholine. This leads to excitation of neurons bearing these receptors and hence hallucinations.

683. An eukaryote which causes disease comes under

(a) monerans (b) fungi
(c) virus (d) none of these

UP CPMT-2007

Ans. (b) : Fungi are members of the group of eukaryotic organisms. Most of the plant diseases are caused by fungi.

684. The black rust of wheat is a fungal disease caused by:

(a) Albugo candida
(b) Puccinia graminis tritici
(c) Melampsora lini
(d) Claviceps purpurea

AIPMT-1995

Ans. (b) : The black rust of wheat is a fungal disease caused by *Puccinia griminis tritici*. It is belongs to class Basidiomycetes. It is an internal obligate parasite. They cause dark patches in the leaves and stem. *Puccinia* requires a moist climate to grow.

685. Absorptive heterotrophic nutrition is exhibited by:

(a) algae (b) fungi
(c) bryophytes (d) pteridophytes

AIPMT-1990

Ans. (b) : Absorptive heterotrophic nutrition is exhibited by fungi. They may act as saprophyte and parasites. They obtain nutrition from the host by haustoria and exhibit the absorptive or holophytic type of nutrition.

686. Identify the fungus, which produces chlamydospores from dikaryotic mycelium

(a) Sphacelotheca sorghi
(b) Rhizopus stolonifer
(c) Pyricularia oryzae
(d) Colletotrichum falcatum

AP EAMCET-2008

Ans. (a) : *Sphacelotheca sorghi* is a plant pathogen that infects maize and sorghum. It is a dikaryotic fungi which reproduces vegetatively.

687. Yeast is not included in protozoans but in fungi because

(a) it has chlorophyll
(b) it shows saprotrophic mode of nutrition
(c) it has eukaryotic organization

@apna_pdf

(d) cell wall is made up of cellulose and reserve food materials as starch.

AIIMS-2016

Ans. (b) : Yeast are microscopic fungi consisting of solitary cells that reproduce by budding whereas protozoans exhibit reproduction by gamete formation or by conjugation. Yeast is therefore, not included in protozoans but in fungi because it shows saprotrophic mode of nutrition.

688. Among rust, smut and mushroom all the three

(a) Are pathogens (b) Are saprobes
(c) Bear ascocarps (d) Bear basidiocarps

AIIMS-2006

Ans. (a) : The rust, smuts and mushrooms belong to Basidiomycetes. They belong to the group of pathogenic fungi. Smuts belongs to order Ustilaginales whereas rusts come under order Uredinales and mushrooms under order Agaricales.

689. Which one of the following shows heterothallism?

(a) Rhizopus (b) Bacterium
(c) Cycas (d) Ricinus

AIIMS-2014

Ans. (a) : A.F. Blackeslee discovered heterothallism in *Rhizopus stolonifer* in 1904. In this phenomenon, the fungi shows fusion of gametes which belong to morphologically, genetically and physiologically dissimilar mycelia normally referred to as negative or positive strains.

690. Branched, aseptate, coenocytic mycelium present in :

(a) Aspergillus (b) Albugo
(c) Penicillium (d) Erysiphe

Punjab MET-2006
Rajasthan PMT-2002
JCECE-2003

Ans. (b) : The branched, aseptate, coenocytic mycelium is present in *Albugo*. It is an obligate parasite that can be found in a number of flowering plants. The vegetative part of the plant body is branched, non-septate or aseptate and has coenocytic hyphae which grows in the intercellular spaces of the host.

691. Which of the following groups is not comprised of sac-fungi?

(a) Yeasts (b) Truffles
(c) Mushrooms (d) Morels

JCECE-2002

Ans. (c) : The mushrooms are edible fungus that belongs to the kingdom Fungi but is a species of Basidiomycota and not of Ascomycota. It is a fleshy and spore - bearing fruiting body. It is also known as **toadstool** and does not contain sac fungi.

692. The scientific name of oyster mushroom, an edible fungus is:

(a) Tolyposporium penicillariae
(b) Colletotrichum falcatum
(c) Pleurotus ostreatus
(d) Citromyces purpurogenum

JCECE-2002

Ans. (c) : The scientific name of oyster mushroom, an edible fungus is *Pleurotus ostreatus*. It is rich in proteins, nutrients, minerals, etc. It also has different cancer preventing agents like selenium which shield body cells from harm that may cause illness.

693. Yeast is different from *Penicillium* and *Rhizopus* in being:

(a) acellular (b) unicellular
(c) having unseptate hyphae (d) multicellular

JCECE-2002

Ans. (b) : Yeast is different from *Penicillium* and *Rhizopus* in being unicellular. The *Penicillium* and *Rhizopus* are multicellular fungi.

694. Dikaryon formation is characteristic feature of

(a) Zygomycetes and Phycomycetes
(b) Phycomycetes and Ascomycetes
(c) Basidiomycetes and Phycomycetes
(d) Basidiomycetes and Ascomycetes

BVP-2014
MGIMS Wardha-2006

Ans. (d) : The dikaryon formation is the characteristic feature of basidiomycetes and ascomycetes.
In case of ascomycetes and basidiomycetes, it is found that plasmogamy precedes karyogamy and resulting in formation of dikaryon, which is a unique condition in these fungi.

695. A fungal disease of the poultry is:

(a) Coccidiosis (b) Monilliasis
(c) Coryza (d) Mareks

AP EAMCET-1998

Ans. (b) : Monilliasis is a fungal disease of poultry. It is a disease of the alimentary tract of chickens and sometimes other birds. The cause is the fungal yeast known as *Candida albicans*, and the condition is seen worldwide. Mortality and morbidity is usually low. The route of this infection is normally oral.

696. One of the major components of cell wall of most fungi is

(a) Hemicelluloses (b) Chitin
(c) Peptidoglycan (d) Cellulose

NEET-2016 Phase-I

Ans. (b) : Major components of cell wall of most fungi is chitin. The fungal cells wall is predominantly composed of carbohydrates polymers called **chitin.** The other major constituents of the fungal cell wall are glucans and glycoproteins.

697. Identify the diseases that are caused by the organisms of the same subdivision of Eumycota.

I. Citrus canker
II. Red rot of sugarcane
III. Grain smut of Sorghum
IV. Black neck of rice
The correct pair is

(a) I and IV (b) I and III
(c) II and III (d) II and IV

AP EAMCET-2007

@apna_pdf

Ans. (d) :

Disease	Causal Organism
Citrus Canker	*Xanthomonas citri* (bacteria)
Red rot of sugarcane	*Colletotrichum falcatum*
Grain smut of Sorghum	*Sphacelotheca sorghi*
Black neck of rice	*Pyricularia oryzae*

698. Study the following lists

List–I	List–II
(A) Sphaerotheca	**1. Three celled conidia**
(B) Colletotrichum	**2. Zoospores**
(C) Pyricularia	**3. Falcate conidia**
(D) Olpidium	**4. Suspensor**
	5. Columella

The correct match is

	A	B	C	D
(a)	4	2	5	3
(b)	3	4	2	5
(c)	5	3	1	2
(d)	2	1	3	4

AP EAMCET-2007

Ans. (c) :

List–I	List–II
(A) Sphaerotheca	Columella
(B) Colletotrichum	Falcate conidia
(C) Pyricularia	Three celled conidia
(D) Olpidium	Zoospores

699. The parthenospores of Rhizopus are

(a) Uninucleate (b) Binucleate
(c) Trinucleate (d) Multinucleate

AP EAMCET-2007

Ans. (d) : The parthenospores of *Rhizopus* are multinucleate because *Rhizopus* is a member of fungi and fungal body consists of a network of thread like structure called **hyphae**. It is made of continuous tubes filled with multinucleated cytoplasm these are called **coenocytic hyphae**.

700. Stored food in fungi:

(a) Starch (b) Proteins
(c) Glycogen (d) Chitin

AIPMT-2000

Ans. (c) : The glycogen is also known as **animal starch**, which is a form of stored food in fungi. The fungi get their nourishment from other sources as they are not capable of producing their food. They also have oil globules as reserved food material.

701. Black rust of wheat is caused by:

(a) Puccinia (b) Ustilago
(c) Albugo (d) Phytophthora

AIPMT-2000

Ans. (a) : Black stem rust is caused by *Puccinia graminis tritici.* It causes rust disease in many economic plants such as wheat, barley, oats, etc. It is called a **rust** because of the reddish brown color of the spores that are found chiefly upon the surface of the host leaves and stems.

702. *Monascus purpureus* is a yeast used commercially in the production of:

(a) Citric acid
(b) Blood cholesterol lowering statins
(c) Ethanol
(d) Streptokinase for removing clots from the blood vessels

AIPMT (Screening)-2012

Ans. (b) : *Monascus purpureus* is a yeast used commercially in the production of blood cholesterol lowering statins.

- *Monascus purpureus* is a species of mold that is purplish-red in color and known by the names such as, ang-khak rice mold, corn silage mold, maize silage mold and rice kernel discoloration.

703. Which one single organism or the pair of organisms is correctly assigned to its or their named taxonomic group?

(a) Yeast used in making bread and beer, is a fungus
(b) *Nostoc* and *Anabaena* are examples of Protista
(c) *Paramecium* and *Plasmodium* belong to the same kingdom as that of *Penicillium*
(d) Lichen is a composite organism formed from the symbiotic association of an algae and a protozoan

AIPMT (Screening)-2012

Ans. (a) : Yeast (*Saccharomyces cerevisiae*) is a fungi, which help in the production of bread and beer by the process of fermentation.
Yeast is a unicellular fungi of the class Ascomycota, they occur as single cell or as a group of chain of cells.

- *Paramecium* and *Plasmodium* are protista while *Penicillium* is a fungi.
- *Nostoc* and *Anabaena* are Monerans.

704. Yeast is used in the production of:

(a) Bread and beer
(b) Cheese and butter
(c) Citric acid and lactic acid
(d) Lipase and pectinase

AIPMT (Screening)-2012

Ans. (a) : Yeast is used in the production of bread and beer Microbes especially yeasts have been used from time immemorial for the production of beverages like wine, beer, whisky, brandy or rum. For this purpose the same yeast *Saccharomyces cerevisiae* used for bred-making and commonly called **brewer's yeast**, is used for fermenting malted cereals and fruit juices, to produce ethanol.

705. The highest number of species in the world is represented by:

(a) Algae (b) Lichens
(c) Fungi (d) Mosses

AIPMT (Screening)-2012

Ans. (c) : The highest number of species in the world is represented by fungi, around 1,00,000 species of fungi have been formally described by taxonomist. Fungi can be unicellular, multicellular or dimorphic. It also includes yeasts, rusts, slime molds, mild dews, and mushrooms.

@apna_pdf

706. Which one of the following is true for fungi?
(a) They are phagotrophs
(b) They lack a rigid cell wall
(c) They are heterotrophs
(d) They lack nuclear membrane

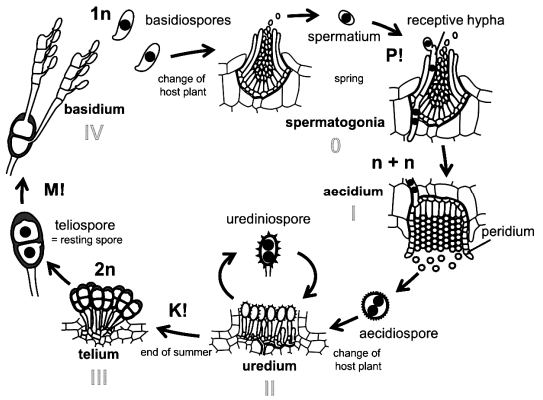
NEET (Karnataka)-2013

Ans. (c) : Fungi derive their nutrition from the other organisms which are living or dead. Therefore, fungi are heterotrophic in nature.

707. What is correct for stages of *Puccinia* :
(a) Telia and aecia on wheat
(b) Telia and uredo stage on wheat
(c) Telia and aecia on barberry
(d) None

AIPMT-1998

Ans. (b) : *Puccinia* is a heteroceous fungi it show obligate parasitism in wheat plant and are known as rusts. It causes black stem rust or cereal rust.
- The life cycle of fungus requires two hosts to complete its life cycle.
- The uredinia are present on the leaf sheaths as well as stems and leaves of the wheat plants.
- The fungus complete its life cycle in the two hosts, which are cereal plants and barberry.
- The important stages of the fungus in wheat are the telia and uredo stages.



708. *Saccharomyces cerevisiae* is used in the formation of
(a) Ethanol (b) Methanol
(c) Acetic acid (d) Antibiotics

MGIMS Wardha-2003
AIPMT-1998

Ans. (a) : *Saccharomyces cerevisiae* used for bread making and commonly called brewer's yeast. It is used for fermenting malted cereals and fruit juices to produce ethanol.

709. Which of the following yields citric acid :
(a) Penicillium citricum (b) Aspergillus niger
(c) Saccharomyces (d) Azospirilium

AIPMT-1998

Ans. (b) : *Aspergillus niger* a fungus which produce citric acid. It is a haploid filamentous fungus which is used for waste management and biotransformation in addition to its industrial uses.

710. Adhesive pad of fungi penetrate the host with the help of : -
(a) Mechanical pressure and enzymes
(b) Hooke and suckers
(c) Softening by enzymes
(d) Only by mechanical pressure

AIPMT-2001

Ans. (a) : Fungal pathogens use direct penetration of the plant surface to the host with the help of **mechanical pressure and enzyme** of natural opening or other. They have special enzymes to do this work.
• Fungi release cellulase to digest cellulose of the host cell wall so that the hypha is able to penetrate the host cell wall.

711. Which one of the following is wrongly matched?
(a) Cassia – Imbricate aestivation
(b) Root pressure-Guttation
(c) Puccinia – Smut
(d) Root – Exarch protoxylem

AIPMT (Screening)-2011

Ans. (c) : *Puccinia* is an obligate parasite, causes rust disease. Therefore, also known as **rust**.
- It is a heteroecious fungus (complete their life cycle in more than one host). The stem, cereal rusts are caused by these fungus.

712. Identify the correct sequence of the stages in the life cycle of Rhizopus after the reduction division of zygospore.
(a) Promycelium → germ sporangium → germ spores → mycelium
(b) Promycelium → germ spores → germ sporangium → mycelium
(c) Mycelium → promycelium → germ spores → germ sporangium
(d) Promycelium → mycelium → germ sporangium → zygospores

AP EAMCET-2010

Ans. (a) : *Rhizopus* is a genus under the phylum Zygomycota. Most of the *Rhizopus* species are heterothallic in nature. The life cycle is either haploid or haplontic. Therefore, on germination, the thick zygosporangium wall crack opens. The contents of zygospore remain surrounded by the endospore emerging a small upright hypha, the promycelium which bears the germ sporangium at its top. They produce either (+) or (–) strain germ spores or both which fall on suitable substratum to germinate and forms the mycelium.

713. Which option shows incorrectly matched group?
(a) Pseudopodiospores- Plasmodium - Sporulation
(b) Gemmules - Spongilla - Budding
(c) Zoospores - Aspergillus Sporulation
(d) Conidia - Penicillium - Asexual reproduction

GUJCET-2014

Ans. (c) : In *Aspergillus*, sporulation occurs in the form of condiospores that are developed from a stalk-like structure called the **condiophores**.

@apna_pdf

714. Which of the following groups of organisms are ecologically similar?
(a) Producer protists and consumer protists
(b) Monerans and producer protists
(c) Consumer protists and fungi
(d) Monerans and fungi

AP EAMCET-2008

Ans. (d) : Monerans and Fungi are ecologically similar. Fungi are heterotrophic, spore-bearing achlorophyllous organism. Their cell wall is made up of a chitin. Fungi vary from single cell **(yeast)** to multicellular **(mushroom)** and bracket fungi, may be saprophytic or parasitic.

715. Which pair of the following belongs to Basidiomycetes ?
(a) Morchella and Mushrooms
(b) Birds' nest fungi and Puffballs
(c) Pufballs and Claviceps
(d) Peziza and Stink horns

AIPMT-2007

Ans. (b) : Basidiomycetes are fungi usually referred to as **club-fungi** because they have club-shaped Basidiospores which are sexual spores.
- Bird's nest fungi are known as *Cyathus* and Puffballs are known as *Lycoperdon*.
- They use meiospores to reproduce sexually.
- Basidia are used by the bird's nest fungus and puffballs to create spores. They belong to basidiomycetes.

716. 'Clamp connections' are observed in
(a) Basidiomycetes (b) Zygomycetes
(c) Ascomycetes (d) Oomycetes

JIPMER-2009

Ans. (a) : Clamp connections are observed, in Basidiomycetes (club fungi). During nuclear divisions of the dikaryotic cells special structures called the clamp connections are formed. They are the large group of kingdom Fungi that are filamentous and are composed of hyphae that reproduce asexually with the formation of specialized cells known as **basidia** that bear external meiospores that are usually four in number.

717. Edible part of mushroom is
(a) Basidiocarp (b) Secondary mycelium
(c) Primary mycelium (d) Tertiary mycelium

JIPMER-2009

Ans. (a) : A sporophore, or fruiting body in which spores are formed sexually on the surface of club shaped structure are called **basidiocarp**. It is a edible part of mushroom.
- Fruiting body of a basidiomycetes is called basidiocarp.

718. Parasitic and saprophytic conditions are more familiar in
(a) fungi (b) bacteria
(c) algae (d) ferns

UP CPMT-2005

Ans. (a) : Parasitic and saprophytic conditions are more familiar in fungi. They are hetrotrophic organisms which means that they cannot prepare their own food and therefore, they live as either parasites or saprophytes.

719. Identify from the following examples, a fungus which is medicinal importance.
(a) Agaricus (b) Saccharomyces
(c) Penicillium (d) Cercospora

Karnataka CET-2006

Ans. (c) : *Penicillium* is a fungus which have medicinal importance. Penicillin is extracted from *Penicillium notatum* which fights bacterial infection. It belongs to Ascomycetes.

720. Which one is a wrong statement?
(a) Brown algae have chlorophyll a and c and fucoxanthin
(b) Archegonia are found in Bryophyta, Pteridophyta and Gymnosperms
(c) Mucor has biflagellate zoospores
(d) Haploid endosperm is typical feature of gymnosperms

AIPMT (Re-Exam)-2015

Ans. (c) :
- Mucor belongs to Zygomycetes, which produce non-motile, non-flagellated gametes.
- Zygomycetes are fungi belonging to the Eumycota, the true fungi that form extended mycelia and diverse asexual and sexual spore structure.
- Sexual reproduction in these organisms occurs when sexually opposite hyphae fuse and form spore called **zygospore.**
- The largest old zygomycetes is **mucorales**. Fungi in this order are known as **pink moulds,** which create black bread mould.

721. Powdery mildew of crops are caused by
(a) Bacteria (b) Ascomycetes
(c) Basidiomycetes (d) Phycomycetes

MGIMS Wardha-2010

Ans. (b) : Powdery mildew is the diseases resulting from infection by fungi that produce a white to gray, powdery growth on the surface of leaves and sometimes other plant parts.
It is caused by fungi belonging to family Erysiphaceae (class Ascomycetes).
Ascomycetes spores are harmful and it makes the crop vulnerable to its toxin.

722. LSD is obtained from :
(a) algae (b) virus
(c) fungus (d) bacteria

AFMC-2000

Ans. (c) : LSD (Lysergic acid diethylamide) is synthetically derived from the fungus, *Claviceps purpuria*. It is one of the most potent perception changing chemicals.

723. Fungal spores produced externally at the top of hyphae are:
(a) conidia (b) oidia
(c) aplanospore (d) sporangiopore

AFMC-2005

Ans. (a) : Fungal spore produced externally at the top of hyphae are conidia. They are asexual spore produced exogenously on the special mycelium called **conidiophores**. Conidia on germination produce mycelium.

@apna_pdf

724. Morels and truffles groups of fungi are classified under
(a) Phycomycetes (b) Deuteromycetes
(c) Basidiomycetes (d) Ascomycetes
AMU-2015

Ans. (d) : Morels and truffles groups of fungi are classified under Ascomycetes. They are commonly know as **sac-fungi**, are mostly multicellular. They are saprophytic decomposers, parasitic or caprophilous.

725. Multinucleated filament of Rhizopus is :
(a) coenocytic (b) conidia
(c) heterothallus (d) homothallus
BCECE-2005

Ans. (a) : Multinucleated filament of *Rhizopus* is coenocytic. It is multinucleate mass of protoplasm resulting from repeated nuclear division unaccompanied by cell fission.

726. A septum in Eumycota fungi, bearing a complex pore is called as:
(a) coenocytic (b) septate hyphae
(c) dolipore septum
(d) secondary simple pore
BHU PMT-2002

Ans. (c) : A septum in eumycota fungi, bearing a complex pore is called as **dolipore septum**.
Dolipore septa are specialized dividing walls between cells (septa) found in almost all species of fungi in the phylum Basidiomycota.

727. Which of the following shows formation of pseudo mycelium?
(a) Yeast (b) Aspergillus
(c) Rhizophora (d) Chara
BHU PMT-2002

Ans. (a) : Yeast shows formation of pseudo mycelium. Here, the cells join together like chain resembling a small true mycelia.

728. The basic unit of chitin is :
(a) N-acetyl glucosamine (b) glucose
(c) galactose (d) fructose
Punjab MET-2003

Ans. (a) : The basic unit of chitin is N-acetyl glucosamine which is a modified polysaccharide that contains nitrogen. It is also found in the cell walls of certain fungi and algae. The main function of chitin is to provide protection and strength to fragile bodies of these organism.

729. In which genera endospores are formed for reproduction ?
(a) Monococcus and Clostridium
(b) Bacillus and Clostridium
(c) Mucor and Bacillus
(d) None of the above
Punjab MET-2003

Ans. (b) : The endospore formation is more common in rod-shaped bacteria or bacillus forms. They are dormant alternate life forms produced by the genus *Bacillus*, the genus *Clostridium*.

730. Aflatoxins are mainly produced by:
(a) Algae (b) Fungi
(c) Bryophyta (d) Pteridophyta
Rajasthan PMT-1996

Ans. (b) : Aflatoxins are family of toxins produced by certain fungi that are found on agricultural crops like maize. The main fungi that produce aflatoxin is *Aspergillus flavvus*. It can lead to acute poisoning (aflatoxicosis) and can be life threatening usually through damage to the liver.

731. Flagella present in Zoospores of Albugo are:
(a) Two dissimilar, on lateral surface
(b) Two similar, on lateral surface
(c) Two similar, on anterior tip
(d) Two dissimilar, on anterior tip
Rajasthan PMT-1996

Ans. (a) : The flagella present in Zoospores of Albugo are two dissimilar, on lateral surface. The diploid nucleus undergoes meiosis, followed by several mitotic division in *Albugo*. After a period of rest, the zoospore germinates and produce reniform, biflagellate zoospores.

732. Water is not necessary for fertilization in which of the following?
(a) Pteridium (b) Spirogyra
(c) Marchantia (d) Albugo
Rajasthan PMT-1996

Ans. (d) : In Pteridium, Spirogyra and Marchantia, water is necessary for fertilization. But, in Albugo water is not necessary because they are terrestrial.

733. Match column I and column II and choose the right option.

Column I	Column II
A. Rhizopus	1. Ascomycetes
B. Penicillium	2. Basidiomycetes
C. Ustilago	3. Deuteromycetes
D. Alternaria	4. Phycomycetes

(a) A-4 B-3 C-1 D-2 (b) A-4 B-3 C-2 D-1
(c) A-4 B-1 C-2 D-3 (d) A-2 B-3 C-4 D-1
VMMC-2013

Ans. (c) :
(A) Rhizopus → (4) Phycomycetes
(B) Penicillium → (1) Ascomycetes
(C) Ustilago → (2) Basidiomycetes
(D) Alternaria → (3) Deuteromycetes

734. Which of the following produces spores, but lacks vasculature?
(a) Fungi (b) Dicots
(c) Pteridophytes (d) Gymnosperms
VMMC-2013

Ans. (a) : Fungi produces spores but lacks vascular system. It is a part of plant which is meant for supplying water and nutrient to the plants.

735. Fermentation products of yeast are
(a) $H_2O + CO_2$
(b) Methyl alcohol + CO_2
(c) Methyl alcohol + Water
(d) Ethyl alcohol + CO_2
MGIMS Wardha-2007

@apna_pdf

Ans. (d) : In alcoholic fermentation process, the unicellular organisms like yeast undergo an alternate pathway of respiration in which an organic substrate is broken down in absence of oxygen. The end products are ethyl alcohol and CO_2.

$C_6H_{12}O_6$ (aq) $\xrightarrow{\text{Yeast}}$ $2C_2H_5OH + 2CO_2$ + energy

It is used in fermentation because it contains enzyme like zymase that can metabolize the carbohydrate without oxygen.

736. Sexual dimorphism is absent in

(a) Ascomycetes (b) Deuteromycetes
(c) Basidiomycetes (d) Phycomycetes

Manipal-2012

Ans. (b) : Sexual dimorphism is absent in deuteromycetes. It refers to the morphological differences between males and females of the same species aside from the differences in sexual organs.

737. Gill of mushroom are meant for

(a) reproduction (b) respiration
(c) assimilation (d) nutrition

Manipal-2011

Ans. (a) : The gills of mushrooms are meant for reproduction. They are also known as the **lamella of the mushroom.**

They hang vertically beneath its cover which permits the spores to fall and drop on the ground and are dispersed by wind flows.

738. Mycobiont and phycobiont association is :

(a) symbiotic (b) commensalism
(c) parasitic (d) helotism

AFMC -2011

Ans. (d) : Helotism is a term used to describe the lichen symbiosis between algae and fungi.

The fungal component of lichen that protect algae and absorbs minerals are **mycobiont** whereas the **phycobiont** is a algal component of lichen that prepares the food for fungi.

739. The total number of ascospores in Penicillium are

(a) 8 (b) 16
(c) 4 (d) 2

VMMC - 2014
AFMC -2011

Ans. (a) : The diverse genus occuring worldwide and its species play important role an decomposers of organic materials is *Penicillium*. It belongs to Ascomycetes which produces spores in asci called **ascospores**. Single diploid ascus undergoes meiotic division and produces four haploid nuclei. These new nuclei undergo further mitotic division and produce four pairs of spores or 8 ascospores.

740. Laboratory weed is

(a) Neurospora (b) Chlamydomonas
(c) Aspergillus (d) Chara

BHU PMT (Mains)-2011

Ans. (c) : *Aspergillus* is regarded as **weed of laboratory** because it can grow in unwanted places contaminating bacteriological samples.

741. Heterothallism is common in :

(a) Mucor (b) Yeast
(c) Spirogyra (d) Ulothrix

BHU PMT-2001

Ans. (a) : The fusion of externally similar but physiologically different aplano-gametangia during sexual reproduction is called as **heterothallism**, discovered in **Rhizopus stolonifer** by Blackeslee. It is commonly found in *Mucor* and *Rhizopus.*

742. Club fungi is included in :

(a) Phycomycetes (b) Ascomycetes
(c) Basidiomycetes (d) Deuteromycetes

BHU PMT-2001

Ans. (c) : Club fungi is included in Basidiomycetes. It includes mushroom, puffballs and certain shelf fungi etc. They are known as **club -fungi**, due to their club-shaped basidia, which produces sexual spores.

743. Trichoderma species are potentially useful as

(a) biopesticides
(b) biofertilizers
(c) methanogens
(d) vectors for genetic engineering

DUMET-2010

Ans. (a) : *Trichoderma* species are potentially useful as biopesticides for it's well known biological control mechanism, it protects crops against plant pathogens. It is used to treat seeds and soils to eliminate pathogens.

744. Fungi differs from slime moulds by lacking of

(a) flagellated spores (b) ascospores
(c) basidiospores (d) zygospores

DUMET-2008

Ans. (a) : Fungi differs from slime moulds by lacking of flagellated spores. They do not possess a cell wall whereas fungal cell wall is composed of chitin and beta-glucan.

745. In Rhizopus, the fusion of two different thalli to form zygospore is called:

(a) spermaciation
(b) gametangial contact
(c) gametangial copulation
(d) both (a) and (b)

AFMC-2002

Ans. (c) : In *Rhizopus*, the fusion of two different thalli (hyphae) to form a zygospore is called plasmogamy or gametangial copulation. It undergoes sexual reproduction through the formation of specialized structures called gametangia.

746. Which of the following is an edible fungus?

(a) Neurospora (b) Penicillium
(c) Agaricus (d) Rhizopus

BHU PMT (Mains)-2008
JIPMER-2003, 2000, 1997

Ans. (c) : *Agaricus* is an edible fungus. These fungi are commonly known as **mushrooms**. They are common edible mushrooms, commercially cultivated in various parts of India. It is a saprophytic fungus which occurs on dead decaying leaves, wood logs, in rainy season.

@apna_pdf

747. Which one of the following is used extensively in biochemical and genetic work?
(a) Saccharomyces (b) Aspergillus
(c) Claviceps (d) Penicillium
(e) Neurospora

Kerala PMT-2015

Ans. (e) : *Neurospora*, has been used extensively in genetic and biochemical investigation. It is widely used in genetics as a model organism because it has the ability to quickly divide, easy to culture and survive on minimal media.

748. Match Column I with Column II and choose the right option

	Column-I		Column-II
(p)	Claviceps	(1)	Deuteromycetes
(q)	Puccinia	(2)	Ascomycetes
(r)	Trichoderma	(3)	Basidiomycetes

(a) (p) - (3), (q) - (1), (r) - (2)
(b) (p) - (2), (q) -(3), (r) - (1)
(c) (p) - (1), (q) - (3), (r) - (2)
(d) (p) - (3), (q) - (2), (r) - (1)
(e) (p) - (2), (q) - (1), (r) - (3)

Kerala PMT-2015

Ans. (b) :
(p) Claviceps → (2) Ascomycetes.
(q) Puccinia → (3) Basidiomycetes.
(r) Trichoderma → (1) Deuteromycetes.

749. Diplanetism is exhibited by
(a) Saprolegnia (b) Rhizopus and Mucor
(c) Ulothrix (d) Vauchena

AMU-2011

Ans. (a) : Diplanetism is exhibited by *Saprolegnia*. It is a phenomenon, having two mobile stages with a pauses between them. For instance, zoospores are released by *Saprolegnia* that forms a cyst right away, which will germinate to release its secondary zoospore later.

750. Heterotrophic fungi can live as
(a) saprophytes (b) symbionts
(c) parasites (d) All of these

AMU-2010

Ans. (d) : In fungi, mode of nutrition is heterotrophic therefore, they are parasitic, saprophytic and symbiotic. Those fungi which grow on dead organic matter are called **saprophytic fungi** whereas those who obtain their food from living hosts are called **parasitic fungi**, and those who live in symbiotic association with algae and form lichen thalli are **symbiotic fungi**.

751. Which organism was used by Beadle and Tatum to proposed one gene-one enzyme hypothesis?
(a) E. coli (b) Nostoc
(c) Drosophila (d) Neurospora

MGIMS Wardha-2004
UP CPMT-2004

Ans. (d) : Beadle and Tatum used *Neurospora* to propose one gene-one enzyme hypothesis. It is the idea that each gene encodes a single enzyme.

752. In the sporogonium of which plant, columella is present?
(a) Penicillium (b) Spirogyra
(c) Rhizopus (d) Ulothrix

MGIMS Wardha-2004
UP CPMT-2004

Ans. (c) : The columella is a specialized structure found in the sporangium of *Rhizopus*. The columella supports the sporangium which has asexual spores and helps nutrient exchange between the active protoplasm below and the developing spores.

753. The chemical produced by the host plant to protect themselves against fungal infection is :
(a) toxin (b) phytoalexin
(c) phytotoxin (d) hormone

Manipal-2000

Ans. (b) : The chemical produced by the host plant to protect themselves against fungal infection is **phytoalexins**. The chemical substances produced by plants in response to fungal infection and are toxic to fungi are phytoalexins. They are antibiotics produced by a plant in response to environmental stresses.

754. Basidiospores are produced by:
(a) Yeasts (b) Diatoms
(c) Agaricus (d) Bacteria

Karnataka CET-2003

Ans. (c) : Basidiospores are produced by *Agaricus*. It is a reproductive spore produced by Basidiomycete fungi. Each basidiospores contains are haploid nucleus through meiosis. They are produced on specialized club shaped cells named basidia.

755. Branched conidiophores are present in:
(a) Rhizopus (b) Penicillium
(c) Ustilago (d) Aspergillus

Uttarakhand-2005

Ans. (b) : Branched conidiophores are present in *Penicillium*. These are specialized branches of hyphae that bear the conidia. They species are often recognized by the branching patterns of conidiophores. These are not found in *Rhizopus, Ustilago* and *Aspergillus*.

756. A pathogen accumulates its secretion in the xylem vessels of a plant, whose seed epidermal hairs are of great economic importance. Identify the pathogen.
(a) Fusarium oxysporum (b) Xanthomonas citri
(c) Phytophthora infestans (d) Puccinia purpurea

AP EAMCET-2003

Ans. (a) : A *Fusarium oxysporum,* pathogen accumulates its secretion in the xylem vessels of a plant, whose seed epidermal hairs are of great economic importance. It causes fusarium wilt and infects Solanaceous crops and weeds.

757. Which of the following statements is correct with respect to *Agaricus bisporus*?
(a) It contains toxins hence not suitable for consumption
(b) It does not contain essential amino acids
(c) It is a good source of B-Vitamins
(d) Its cultivation on agro wastes is impossible

AP EAMCET-2004

Ans. (c) : *Agaricus bisporus* is a fungus which is commonly known as **mushroom**. They are edible fungi and are commercially cultivated and exported.
- They contains vitamin B, amino acids, and minerals.
- They are one of the richest source of proteins.

758. Which of the following statements is correct with respect to *Colletotrichum falcatum*?
(a) The conidia and conidiophores are aseptate mycelium and setae are septate

@apna_pdf

(b) The conidia, conidiophores, mycelium and setae are septate
(c) The conidia are aseptate conidiophores, mycelium and setae are septate
(d) The mycelium is septate conidia, conidiophores and setae are aseptate

AP EAMCET-2004

Ans. (a) : The conidia and conidiophores are aseptate while mycelium and setae are septate structure in *Colletotrichum falcatum*. They reproduce asexually through conidia and these are formed on conidiophore.

759. In Rhizopus, dome shaped sterile portions are found on erect structures that arise from stolons. These structures are referred to as:
(a) gametangia (b) progametangia
(c) zygosporangia (d) sporangiophores

AP EAMCET-2004

Ans. (d) : In Rhizopus, dome shaped sterile portions are found on erect structures that arise from stolons. These structures are referred to as sporangiophores.
The sporangia are black colored at the tips of the sporangiophores and are round. It produce numerous spores for asexual reproduction which are non-motile and multinucleated.

760. Name the fungus that is edible
(a) Penicillium (b) Mucor
(c) Rhizopus (d) Morchella

Haryana PMT-2009 CG PMT-2009 MGIMS Wardha-2009 Haryana PMT-2009

Ans. (d) : *Morchella esculenta* is an edible fungus that belongs to the family Morchellaceae of the Ascomycota. They are commonly known as morel, sponge morel, etc.

761. Early blight disease of potato is caused by
(a) Phytopthora infestans (b) Fusarium
(c) Alternaria solani (d) Pythium

VMMC-2014

Ans. (c) : Early blight of potato is caused by the fungal pathogen *Alternaria solani*. There is no known sexual stage and hence it is classified as a Deuteromycetes. The symptoms of early blight occur on fruit, stem, foliage and tubers of potatoes.

762. In Puccinia, infection from barberry leaf to wheat plant is caused by :
(a) pycnospores (b) aeciospores
(c) uredospores (d) teleutospores

JIPMER-2001

Ans. (b) : *Puccinia* is a fungus belonging to the class Basidiomycetes. On the leaf of barberry plant, basidiospores germinates forming germ tube and grows extensively forming haploid, septate, uninucleate mycelium. Hence, *Puccina* infection from barberry to wheat occurs through Aeciospores.

763. A species of Neurospora which can grow on a simple minimal medium is known as:
(a) autotroph (b) heterotroph
(c) prototroph (d) auxotroph

JIPMER-1995

Ans. (c) : A species of *Neurospora* which can grow on a simple minimal medium is known as **prototroph**.

764. Promycelium in Rhizopus develops from
(a) zygophore (b) chlamydospore
(c) zygospore (d) sporangiospore

AP EAMCET-2001

Ans. (c) : Promycelium in *Rhizopus* develops from zygospore. They are essentially found in the member of kingdom Fungi. In *Rhizopus*, the male (+) and female (-) gametangia undergo fusion. Zygospores are sexual spores whereas zoospores are asexually produced.

765. Common bread mould is
(a) yeast (b) Rhizopus
(c) bacteria (d) virus

CG PMT-2006

Ans. (b) : Common bread mould is *Rhizopus*. It is commonly known as **black bread mould**. It is a saprophytic fungus which is frequently observed growing on bread. It survives as a mass of mycelium which is a part of the vegetative filament portion of the organism.

766. What are the successive structures formed in course of sexual reproduction of Rhizopus?
(a) Zygospore, progametangium, gametangium, zygophore
(b) Progametangium, zygophore, gametangium, zygospore
(c) Progametangium, gametangium, zygospore, zygophore
(d) Zygophore, progametangium, gametangium, zygospore

VMMC-2010

Ans. (d) : Zygophore– It is a specialized hyphal branch giving rise to another that forms the gamete in some molds.
Progametangium– It is a hyphal thread in fungi at whose tip it will produce a gametangium and then a gamete.
Zygospore– It is a thick walled spore of some algae and fungi that is formed by union of two similar sexual cells, i.e. resting spore and produces the sporophytic phase.

767. Fungi considered as plant because of presence of
(a) chlorophyll (b) nucleus
(c) cell wall (d) sexual reproduction

VMMC-2010

Ans. (c) : Fungi is considered as plant because of presence of cell wall. The fungal cell wall is formed of cellulose or chitin. Chitin is basically made up of N-acetyle glucosamine.

768. When the mycelium of *Rhizopus oryzae* grows submerged in a nutritive medium such as sugar solution the young coenocytic hyphae develop septa and divide into short multinucleate segment known as
(a) oidia (b) endospores
(c) exospores (d) conidia

CMC Vellore-2007

Ans. (a) : When the mycelium of *Rhizopus oryzae* grows submerged in a nutritive medium such as sugar solution the young coenocytic hyphae develop septa and divide into short multinucleate segment which is known as **oidia**.

769. Yeast is a good source of
(a) protein
(b) riboflavin (vitamin -B_2)

@apna_pdf

(c) sugar
(d) ascorbic acid (vitamin -C)

CG PMT-2011

Ans. (b) : Yeast is important source of vitamin B, which is also known as **riboflavin**. It helps in body growth and makes the body stronger from inside, and is also important for the digestive functioning of the body.

770. Species belonging to this genus cause "downy mildew disease" :
(a) Uromyces (b) Fusarium
(c) Ustilago (d) Peronospora

AP EAMCET-2000

Ans. (d) : *Peronospora* is a genus of oomycetes that are obligate plant pathogen of many eudicots. This species causes downy mildew disease.

771. Vascular wilts are caused by this pathogen:
(a) Pyricularia (b) Puccinia
(c) Erwinia (d) Helminthosporium

AP EAMCET-2000

Ans. (c) : Vascular wilts are caused by the pathogen *Erwinia*. It is a pathogenic plant species and it causes bacterial wilt disease, which is a vascular tissue disease, which causes mechanical blockage of water transport system.

772. Which fungus causes black coal like spots of Anthracnose in plants:
(a) Gloeosporium (b) Tolyposporium
(c) Ustilago (d) Alternaria

AP EAMCET-2000

Ans. (a) : *Gloeosporium* fungus causes black coal - like spots of Anthrancnose in plants. Anthracnose causes the wilting, withering, and dying of tissues. It generally destroys the developing shoots and leaves.
Gloeosporium is also known as **Colletotrichum** which characteristically produces spores.

773. Powdery mildew of wheat is caused by a species of
(a) Puccinia (b) Erysiphe
(c) Ustilago (d) Albugo

Rajasthan PMT-2011

Ans. (b) : Powdery mildew of wheat is caused by a species of *Erysiphe* which is an obligate, host-specific fungus. It attacks wheat exclusively. They usually start off as circular powdery whit spots, which can appear on leaves, stem and also sometimes on fruits.

774. Which acid is not produced by various species of fungi?
(a) Gluconic acid (b) Acetic acid
(c) Sulphuric acid (d) Succinic acid

HP CET-2013
VMMC-2003

Ans. (c) : Sulphuric acid (H_2SO_4) is not produced by various species of fungi.

775. Fungal flagellum originates from
(a) dictyosomes (b) kinetosomes
(c) glyoxysomes (d) oxysomes

Manipal-2010

Ans. (b) : Fungal flagellum originates from kinetosomes. It is a structure in some flagellate protozoans which forms the base of the flagellum, consisting of a circular arrangement of microtubules.

776. Which organism forms perithecia in its life cycle?
(a) Colletotrichum (b) Pyricularia
(c) Helminthosporium (d) Sphaerotheca

Manipal-2010

Ans. (a) : Perithecium is common in class Ascomycetes. It is flask - shaped and has a definite apical pore, ostiole through which the ascospore escape. Here, sexual reproduction is absent.

777. Zygospore formation occurs in
(a) Mucor (b) Plasmodium
(c) Lentinum (d) Peziza

Manipal-2010

Ans. (a) : Zygospore formation occurs in *Mucor*, which is a type of sexual reproduction. Here, the tips of two multinucleate gametangia become fused and the protoplasm of both gametagia unit to form a zygospore.

778. Bakanae disease is caused by
(a) fungus (b) algae
(c) bacterium (d) virus

BHU-PMT (Screening)-2008

Ans. (a) : Bakanae disease is caused by a fungus *Gibberella fujikuroi*.
It is also called as **foolish seedling disease**. It affects the rice plants through the root. The affected seedling show abnormal elongation.

779. Fruiting body of mushrooms is present in :
(a) fungi
(b) algae
(c) like monocotyledon seeds
(d) like dicotyledon seeds

BCECE-2004

Ans. (a) : Mushrooms are edible fungus. They are spore-bearing, fleshy, fruiting body of a fungus. They are formed from hyphae, the tiny threads that make up the bulk of most fungi.

780. Mycology is related with:
(a) algae (b) fungi
(c) bacteria (d) yeast

BCECE-2004

Ans. (b) : Mycology is the branch of biological science dealing with the study of fungi, whereas the study of algae is known as **phycology**, and the study of bacteria is known as **bacteriology**.

781. This fungus is not edible
(a) Agaricus (b) Toadstool
(c) Puffballs (d) Morchella

BCECE-2009

Ans. (b) : Toadstool or mushroom is the fleshy, spore - bearing fruiting body of a fungus, typically produced above ground on soil, or its food source. It is poisonous to human.

E. Plantae

782. Yeast poison themselves to death, because
(a) Above 13% of alcohol is hazardous.
(b) Above 13% of lactic acid is hazardous
(c) Above 13% of pyruvic acid is hazardous.
(d) Low energy produced cannot support their growth.

AP EAPCET-23.05.2023, Shift-II

@apna_pdf

Ans. (a) : When the concentration of alcohol reaches about 13 percent than yeasts poison themselves to death. Therefore, wine and beer which is undistilled alcoholic beverages do not show alcohol percentage above 13%.
In absence of oxygen, yeast converts sugar into alcohol and CO_2, when the level of alcohol increases to 13% then yeast's death takes place.

783. Match the following:

List-I		List-II	
I)	Makoi	A)	Dracaena augustifolia
II)	Red dragon	B)	Smilax zeylanica
III)	Sarasaparilla	C)	Cestrum nocturnum
IV)	Night queen	D)	Solamum nigrum

	I	**II**	**III**	**IV**
(a)	C,	A,	D,	B
(b)	B,	D	A	C
(c)	C,	D,	A,	B
(d)	D,	A,	B,	C

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : (I)Makoi or Black nightshade- The botanical name of Makoi is *Solanum nigrum* usually grows as a used in moist habitats. It belongs to Solanaceae family.
(II) Red drageon - The botanical name of dragon tree are *Dracaena aungustifolia* It is narrow-leaf Dragon Tree which is an evergreen shrubby plant.
(III) Sarsaparilla- The botanical name of sarsaparilla is Smilax species.
(IV) Night queen - *Cestrum nocturnum* is the botanical name of Night queen.
It belongs to Solanaceae family.

784. Match the following:

List-I		List-II		List-III	
a)	Witches Broom	I)	Trypanosome	i)	Prokaryote
b)	Sleeping Sickness	II)	Sheep	ii)	Fungi
c)	Early blight	III)	Mycoplasma	iii)	Protozoa
d)	Scrapie	IV)	Alternaria	iv)	Virus

	A	**B**	**C**	**D**
(a)	II i,	I iii,	IV iv,	III ii
(b)	IV i,	III ii,	I iii,	II iv
(c)	III i,	I iii,	IV ii,	II iv
(d)	II i,	III ii,	I iii,	IV iv

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : (a) Witches Broom– It is a type of disease caused by stress or Mycoplasma. It is prokaryotic organism. Many mycoplasma are pathogenic in animals and plants.
(b) Sleeping Sickness– It is a wakefulness distrubances diseases also called as African Trypanosomiansis which is caused by protozoans of the genus Trypanosoma.
(c) Early Blight– It is a type of disease which infects the potato, tomato and other plants. Early blight of potato is caused by the fungus *Alternaria solani*.
(d) Scrapie– Scrapie is a neurodegenerative disease, caused by a prion (Virus) that affects shepp and less frequently goats.

785. A person suffering from Iodine deficiency may be recommended to take extracts of this plant preparation
(a) Sargassum (b) Porphyra
(c) Chlorella (d) Laminaria

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : Laminaria is a brown seaweed algae. It contains iodine, an element that the body needs to make thyroid hormones.
The chief extracts from Laminaria are algin, iodine and mannitol, products widely used in medicals, food manufacturing industries etc.

786. Hashish, Charas and Ganja are
(a) Cannabinoids (b) Coca alkaloids
(c) Barbiturates (d) Opioids

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : Hashish, Charas and Ganja are obtained from a *Cannabis sativa* plant which belongs to family cannabaceae.
The flower contain a chemical compound known as Cannabinoids that are consumed for recreational, medicinal and spiritual purposes.

787. Identify the plants in the order of Ephemeral, Succulent and Non-succulent type
(a) Tribulus, Solanum, Casuarina
(b) Casuarina, Tribulus, Opuntia
(c) Aloe, Casuarina, Tribulus
(d) Tribulus, Aloe, Casuarina

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : Tribulus– Plants which are growing in water scarce environment called xerophytic plants and are found in dry habitats.
Ephemerals are draught escapers. During the short span of rains these plants live for a brief period. Ex.- Tribulus, Euphorbia.
Aloe– Aloe vera are the succulent type of plants.
Succulents are thickened, fleshy and engorged plant which allowing the plant to retain water in arid areas.
Casuarina– It is woody, angiosperm evergreen trees. Casuarina is commonly known as coastal she-oak or horsetail she-oak.

788. Choose the set of wrong combinations

I	Acacia	Phyllode	Petiole
II	Nepenthes	Insectivorous plant	Nitrogen requirement
III	Hibiscus	Two leaves at each nodes	Alternate
IV	Neem	Number of leaflets attached at common point	Pinnately compound

(a) A C (b) C D
(c) B D (d) A D

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : In Hibiscus, only one leaf is originated from a single node at every branch and the arrangement of leaves are in alternate manner.
In Neem, the number of leaflets are present on a common axis, the rachis, which represents the midrib of the leaf called pinnately compound leaf in which number of leaflets attached at common point.

@apna_pdf

789. The correct combinations among the following

I	Artificial gene synthesis	H.G. Khorana	Cell Biology
II	Pollen Science	P.K.K. Nair	Polynology
III	Respiration	Arnon	Physiology
IV	Phylogenetic classification	Bessey	Taxonomy

(a) I III IV
(b) I II III
(c) II III IV
(d) I II IV

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Taxonomy, the science of classifing organisms, is based on phylogeny.

- Phylogenetic system of classification is based on evolutionary relationship of entities.
  The main features of Bessey's classification are- seed plants were consists of three phyla and are polyphyletic in origin.
- 'Hargovind Khorana' was awarded Nobel prize for the synthesis of an artificial gene is 1968. H.G. Khorana made important contributions to cell biology by building different RNA chains with the help of enzymes.
- P.K.K. Nair is known as the father of Indian 'palynology'. Palynology is the study of plant pollen, spores and certain microscopic plankton organisms in both living and fossil form.

790. The following plant is submerged and suspended in water

(a) Salvinia (b) Utricularia
(c) Nymphaea (d) Vallisneria

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : 'Utricularia' plant is submerged and suspended in water. Submerged hydrophytes are those plants that have their roots anchored at the bottom of the lake or pond. Some examples are Hydrilla, ceratophyllum and utricularia. Aquatic utricularia are often split into two categories : suspended and affixed aquatic.

791. The following plant has lateral branches of one internodal length

(a) Nerium (b) Oxalis
(c) Eichhornia (d) Dioscorea

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : Aquatic plants such as *Pistia* and *Eichhnornia* have a lateral branch with short internodes and each node with a rosette of leaves and a tuft of roots.

792. Which of the following plants are called as petro-plants?

(a) Jatropa and Banana
(b) Banana and Arnica
(c) Jatropa and Pongamia
(d) Pongamia and Banana

TS EAMCET-31.07.2022 Shift-II

Ans. (c) : The plants which provide liquid hydrocarbons as a substitute of liquid fuels are **petroplants**. The hydrocarbons present in these plants can be converted to petroleum hydrocarbons. The oil crisis during World war II had led the Italians and the French to switch over to petroplants for petroleum production.
Example- Jatropa and Pongamia.

793. Plant in which floral buds store food material

(a) Asparagus (b) Agave
(c) Dioscorea (d) Onion

AP EAPCET-12.07.2022 Shift-I

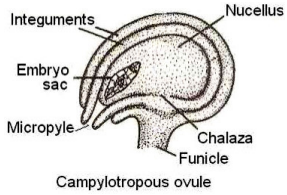
Ans. (b) : In Agave, floral buds store food materials. ***Agava americana*** also called century plant because it took 100 year for the plant to flower and it usually blooms after 10 to 25 years, dying after blooming.

794. The Campylotropous ovule is characterized by–

(a) Chalaza and Funicle on the same vertical line
(b) Micropyle lies close to funiculus
(c) Micropyle comes towards funiculus
(d) Completely inverted

AP EAMCET-24.09.2020 Shift-I

Ans. (c) : Campylotropous Ovule– It is the type of ovule in which the body of the ovule is curved or bent such that micropyle and chalaza do not lie in the same line.



Campylotropous ovule

795. Green plants are:

(a) autotrophs (b) heterotrophs
(c) chemotrophs (d) none of these

BVP-2000

Ans. (a) : An organism that can produce its own food using light, water, carbon dioxide, or other chemicals are called **autotroph.** Because autotroph produce their own food, they are sometimes called **producers**. So green plant are autotrophs.

796. Sex chromosomes for the first time was discovered in which plant?

(a) *Sphaerocarpus* (b) *Pisum sativum*
(c) *Neurospora* (d) *Lathyrus odoratus*

DUMET-2006

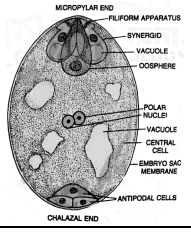
Ans. (a) : Sex chromosomes in plants were first reported in 1917 in the liverwort, *Sphaerocarpus*. Most flowering plants are monoecious and therefore, do not have sex chromosomes It has been reported in two plant species namely *Melandrium (Lychnis)* and *Sphaerocarpus.*

797. Polygonum type of embryo sac is:

(a) Monosporic octa (8) nucleate
(b) Monosporic tetra (4) nucleate
(c) Bisporic octa (8) nucleate
(d) Bisporic tetra (4) nucleate

MP PMT-2013

Ans. (a) : A Polygonum embryo sac is a monosporic embryo sac with 8 nuclei. About 130 species of flowering plants in the buckwheat and knotweed family Polygonaceae.



@apna_pdf

798. Insectivorous plant is

(a) Cuscuta (b) Drosera
(c) Striga (d) None of the above

MGIMS Wardha-2012

Ans. (b) : Insectivorous plants mainly grow in humid and bogs where plenty of sunlight and moisture can be found. However, nutrients are scarce in the soil, they capture insects to supplement the nutrients that they tend to lack.
Example : - Drosera, Pitcher plant, Venus flytrap, Cobra lily.

799. Which of the weed is most harmful?

(a) Azolla (b) Parthenium
(c) Salvinia (d) Salicornia

CMC Vellore-2011

Ans. (b) : Parthenium is the most harmful weed, which belongs to family Asteraceae. It is commonly called as **congress grass, Santa Maria** etc, which is native to American tropics and is invasive species in India, Australia, etc.

800. The movement of hairs in Drosera is

(a) thermonastic (b) thigmonastic
(c) seismonastic (d) photonastic

UP CPMT-2011

Ans. (b): The movements of hair in *Drosera* is thigmonastic. It is the nastic (non-directional) response of a plant or fungus to touch or vibration. It is also known as **seismonasty**.

801. Which of the following plant cells is not surrounded by a cell wall?

(a) Root hair cell (b) Stem hair cell
(c) Gamete cell (d) Bacterial cell

JIPMER-2012

Ans. (c) : Gamete cell is not surrounded by a cell wall. It is a sex cells of the flowering plants. It is haploid in nature. On the other hand, root hair cell, stem hair cell and bacterial cell, all possess a well defined cell wall.

802. How many sub-phyla are available in Tracheata, according to Tippos classification of kingdom plantae ?

(a) 4 (b) 6
(c) 8 (d) 10

WB JEE-2006

Ans. (a) : According to Tippo's classification of kingdom Plantae, there are four sub-phyla available in Tracheata. The four sub-phyla's are as follows :
(i) Pteropsida
(ii) Lycopsida
(iii) Sphenopsida
(iv) Psilopsida

803. Which group is evolutionary modern?

(a) Gymnosperms (b) Grasses
(c) Pteridophytes (d) Algae

Rajasthan PMT-2004

Ans. (b) : The evolutionary modern group is grasses (i.e. Angiosperms). The angiosperms are characterised by the presence of triploid endosperm, ovary and double fertilization.

804. Select the true statements (1) Aldrovanda is rootless, free floating insectivorous aquatic plant (2) Sarracenia is a pitcher like plant (3) Rafflesia is a total stem parasite (4) Striga is a parasite of khuskhus

(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (b) : The *Rafflesia* is a total root parasite whereas *Striga* is a parasite on sugarcane.
- *Aldrovanda* is a free - floating and rootless aquatic plant.
- American pitcher plant of the genus Sarracenia, having single nodding flowers and leaves modified as pitchers that trap and digest insect.

805. Aerenchyma provides :

(a) Flexibility to plants
(b) Mechanical strength to plants
(c) Buoyancy to hydrophytic plants
(d) Promoting nature of photosynthesis

Uttarakhand PMT-2004

Ans. (c) : Aerenchyma provides buoyancy to hydrophytic plants. It is the space of air channels in the leaves which provides buoyancy to hydrophytic plants and do not promote nature of photosynthesis, flexibility to plants or mechanical strength to plants.

806. Insectivorous plants grow in a soil :

(a) deficient in iron (b) rich in nitrogen
(c) deficient in nitrogen (d) deficient in calcium

HP CET-2011

Ans. (c) : Insectivorous plants grow in a soil deficient in nitrogen. These plants are green plants which synthesize their own food and use small insects only to fulfill their nitrogen requirements.

807. A branch of botany concerned with the classification, nomenclature and identification of plants is

(a) Physiology (b) Morphology
(c) Ecology (d) Systematic Botany

JIPMER-2000

Ans. (d) : A branch of botany concerned with the classification, nomenclature and identification of plants is **systematic botany**.
- It is concerned with the evolution of organisms relationships.

808. Which of the following is called stinging nettle?

(a) Utricaurens (b) Adhatoda
(c) Verbascum (d) None of these

AMU-2003

Ans. (a) : Utricaurens commonly called as annual nettle, dwarf nettle, small nettle, dog nettle or burning nettle, is a herbaceous annual flowering plant species in the nettle family Urticaceae which is native to Eurasia including the Himalayan regions of Kalimpong, Darjeeling and Sikkim in India and can be found in North America, etc. It contain silicious tips and have poison which is injected into the skin of animals rubbing against them.

@apna_pdf

F. Animalia

809. Assertion (A) : Pneumaticity of bones is the unique feature of reptiles.
Reason (R) : Air sacs associated with lungs of birds facilitate continuous oxygenation of blood.
(a) Both A and R correct explanation of A
(b) Both A and R are correct but R is not correct explanation of A.
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct.
AP EAPCET-22.05.2023, Shift-II

Ans. (d) : The penumatic bones is a typical characteristic feature of birds not a reptiles. Such bones have air cavities within, so as to reduce the overall body weight and thereby, make flight easier. It is also called as a hollow bone.
Respiration is by lungs in class Aves (birds). The lungs are spongy and inelastic. Air sacs are connected to the lungs to supplement respiration. It facilitate continuous oxygenation of blood in birds.
Hence, Assertion (A) is incorrect and Reason is correct.

810. Assertion (A) : Methanogens are present in the rumen of cattle.
Reason (R) : They help in breakdown of cellulose and nutrition of cattle.
(a) Both A and R correct explanation of A
(b) Both A and R are correct but R is not correct explanation of A.
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct.
AP EAPCET-22.05.2023, Shift-II

Ans. (b) : Methanogens are present in the gut of ruminant of cattle to digest the carbohyrate (cellulose) ingested by animals. Cellulose breakdown into glucose, thus providing a source of energy for the cattle. Hence, it is involved in providing nutrition to the cattle by forming carbohydrates. So, the (b) one is right where both (A) and (R) are correct but (R) is not correct explanation of (A).

811. Match List-I with List-II

	List-I		List-II
(A)	Contractile vacuole	(i)	Asterias
(B)	Water vascular system	(ii)	Amoeba
(C)	Canal system	(iii)	Spongilla
(D)	Flame cells	(iv)	Taenia

Choose the correct answer from the options given below:
(a) (A)-(iii), (B)-(ii), (C)-(i), (D)-(iv)
(b) (A)-(ii), (B)-(i), (C)-(iii), (D)-(iv)
(c) (A)-(iv), (B)-(ii), (C)-(i), (D)-(iii)
(d) (A)-(i), (B)-(iii), (C)-(ii), (D)-(iv)
RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Contractile vacuole is present in Amoeba and helps in osmoregulation . Water vascular system is the most distinctive feature of Echinoderms such as Asteriasis, Echinus etc. Sponges have water transport or canal system in spongilla.
Platyhelminthes like Taenia have specialized cells called flame cells that helps in osmoregulaion and excretion.
Contractile Vacuole → Amoeba
Water Vascular system → Asterias
Canal system → Spongilla
Flame cells → Taenia

812. Study of animal behaviour is
(a) Ecology (b) Evolution
(c) Ethology (d) Eugenics
TS EAMCET-31.07.2022 Shift-II

Ans. (c) : Study of animal behavior is called ethology. It focuses on the behaviors of diverse organisms in their natural environment.

813. Which of the following statements are correct in relation to host & parasites?
i) The host in which parasite undergoes asexual reproduction is secondary host
ii) Female Culex mosquito is the primary host for Wucheraria
iii) In primary host parasite undergoes sexual reproduction
iv) Man is the primary host for Plasmodium
v) The host that lodges the infective stages of a parasite in its body when the main host is not available is called Reservoir host
Options:
(a) Only (ii), (iii) and (iv) are correct, (i) and (v) are wrong
(b) Only (i), (iii) and (v) are correct, (ii) and (iv) are wrong
(c) Only (i) and (v) are correct but (ii), (iii) and (iv) are wrong
(d) Only (ii) and (iv) are correct, remaining are wrong
AP EAPCET-12.07.2022 Shift-I

Ans. (b) : The host in which parasite undergoes asexual reproduction is secondary host. In primary host parasite undergoes sexual reproduction, and the host that lodges the infective stages of a parasite in its body when the main host is not available is called reservoir host.
Hence, statement I, III and V are correct in the context of host and parasite while statement II and IV are not correct regarding host and parasite.

814. In Caecilians, vertebrae are
(a) Procoelous (b) Opisthocoelous
(c) Amphicoelous (d) Heterocoelous
AP EAPCET-12.07.2022 Shift-I

Ans. (c) : In Caecilians, vertebrae are Amphicoelous. Caecilians are a group of vermiform or serpentine amphibians.

815. Which of the following statements is correct ?
(a) All the enterocoelomates are deuterostomes and they exhibit radial and indeterminate cleavage

@apna_pdf

(b) All the enterocoelomates are protostomes and they exhibit radial and indeterminate cleaveage
(c) All the enterocoelomates are protostomes and they exhibit spiral and determinate cleavage
(d) All the enterocoelomates are protostomes and they exhibit spiral and determinate cleavage

AP EAMCET-11.07.2022 Shift-II

Ans. (a) : All the enterocoelomates are deuterostomes, because radial cleavage is characteristics of deuterostomes, and results in indeterminant cells.

816. Match the following:

List-I		List-II	
(A)	**Physalia**	**(i)**	**Pearl oyster**
(B)	**Limulus**	**(ii)**	**Portuguese Man of War**
(C)	**Ancylostoma**	**(iii)**	**Living fossil**
(D)	**Pinctada**	**(iv)**	**Hookworm**

Choose the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(i)	(iv)	(iii)	(ii)
(b)	(ii)	(iii)	(i)	(iv)
(c)	(iv)	(i)	(iii)	(ii)
(d)	(ii)	(iii)	(iv)	(i)

NEET-2021

Ans. (d) :

	List-I	List-II
(A)	Physalia	Portuguese Man of War
(B)	Limulus	Living fossil
(C)	Ancylostoma	Hookworm
(D)	Pinctada	Pearl oyster

817. Among the following, which one is not a deuterostome?
(a) Sea urchin (b) Earthworm
(c) Sand dollar (d) Ichthyophis

J&K CET-2011

Ans. (b) : Earthworm is not a deuterostome. Deuterostome is an animal from phylum which means "second mouth". They include Echinodermata and Chordata. An earthworm is a terrestrial invertebrate that belongs to the phylum Annelida. They exhibit a tube-within-a-tube body plan.

818. Which of the following statements are correct with regard to deuterostomes ?
I. The blastopore develops into anus in adult
II. The blastopore develops into mouth in adult
III. Cleavage is radial and indeterminate
IV. Cleavage is spiral and determinate
(a) I and III (b) I and II
(c) II and IV (d) II and III

AP EAMCET-2010

Ans. (a) : Deuterostomes are a super-phylum of animal they are distinguished by their embryonic development . In deuterosome the first opening (blastospore) becomes the anus while in **protostomes** becomes the mouth. They are also known as **enterocoelomate** because their colon develops through enterocoely. The cleavage is radial and indeterminate.

819. The possible beneficial aspect of grazing animals is the
(a) removal of wild animals and pests
(b) eradication of weeds
(c) removal of wild plants
(d) addition of their excreta into the soil

HP CET-2011

Ans. (d) : The possible beneficial aspect of grazing animals is the addition of their excreta into the soil.
Grazing of animals could destroy the greenery of the land by consuming grass and other wild crops. Overgrazing is considered as a significant reason for desertification. It leads to increased soil erosion and makes the soil compact but there is a positive effect of grazing even in agriculture too. Moderate grazing can be beneficial because it leads to the addition of excreta of the animals into the soil and this enriches organic matter to the soil so that it can provide essential mineral nutrition to the plants.

G. Notes on Viruses, Viroids, Prions and Lichens

820. Which of the following are most suitable indicators of SO_2 pollution in the environment?
(a) Fungi (b) Lichens
(c) Conifers (d) Algae

AIPMT (Re-Exam)-2015
UP CPMT-2007 / AIPMT-1992
JIPMER-2005

Ans. (b) : Lichens are most suitable indicators of SO_2 pollution in the environment.

821. Which of the following is a 'cyanophage'?
(a) S-13 (b) $\phi \times 174$
(c) SV-40 (d) LPP-1

AIIMS-2014
BVP-2001
AIIMS-1995
Manipal-2001

Ans. (d) LPP-1 was the first cyanophage which was discovered by **Safferman and Moris (1963).** This name was given to this cyanophage. The phages (viruses) that infect cyanobacteria are called as cyanophages. LPP-1 is a cyanophage and infects the blue-green algae *Plectonema boryanum*.

822. Select the viruses in the same order based on the morphology given below,
- **Spikes**
- **Roughly spherical envelop**
- **Rigid long rods**

(a) Rabies virus, polio virus, Measles virus
(b) Polio virus, Herpes simplex virus, Rabies virus
(c) Measles virus, Influenza virus, Rabies virus
(d) Rabies virus, Tobaco mosaic virus, Polio virus

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : Spikes, roughly spherical envelop, rigid long rods are present in measels virus and influenza virus and Rabies virus.

@apna_pdf

Measles virus contains single-stranded RNA of negative polarity. It has spikes. The influenza virus is an enveloped virus that derives its lipid bilayer from the plasma membrane of a host cell. It has roughly spherical envelop structure. Rabies virions are bullet-shaped. It has long rigid rods.

823. Which of the following viruses are cancer causing?

(a) Herpes, AIDS and Ebola
(b) Rabies and Neonatal Rubella
(c) Human Papilloma Virus and Chronic Hepatitis B
(d) Chicken pox and warts

TS EAMCET-11.05.2023, Shift-II

Ans. (c) : Human Papilloma Virus and Chronic Hepatitis B viruses are cancer causing. The viruses that cause human cancer include hepatitis B virus (liver cancer) and papilloma viruses (cervical and other anogential cancers). Cancer causing viruses are called 'Oncogenic viruses. These viruses cause cancer.

824. Assertion (A) : Viruses cannot multiply unless they invade a specific host cell and instruct its genetic and metabolic machinery to make and release daughter or progeny viruses
Reason (R) : Viruses are obligate intracellular parasites
The correct option among the following is

(a) (A) and (R) are true, (R) is the correct explanation for (A)
(b) (A) and (R) are true, but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : Viruses are small, intracellular and obligate parasite. They cannot reproduce or live separately.
Viruses are the machinery of the host cells to reproduce. They can only multiply inside the living cell of host because they lack organelles or a nucleus. Viruses do not have any specialized machinery to produce energy, grow, reproduce, or maintain homeostasis by themselves.

825. Match the following

List - I		List - II	
(I)	Helical virus	(A)	Bacteriophage
(II)	Glycoprotein	(B)	Rabies virus
(III)	Complex viruses	(C)	Influenza virus
(IV)	Enveloped virus	(D)	Measles virus

(a) I B II D III A IV C
(b) I B II C III D IV A
(c) I C II A III B IV D
(d) I B II A III C IV D

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : Helical Virus– In this virus, the viral nucleic acid coils into a helical shape and the capsid proteins wind around the inside or outside of the nucleic acid, forming a long tube or rod-like structure. Ex.- Rabies virus.
Glycoprotein– The glycoprotein of some viruses play an important role in host infection, especially in the recognition of the host cell. Ex.- Measles virus.
Complex Viruses– Virus possess capside which is neither purely helical, nor purely icosahedral and which may have extra structure such as protein tails or a complex outer wall. Ex.- Bacteriophage.
Enveloped Virus– In contain the viral genome and core proteins wrapped within one or more membranes. Ex.- In influenza viruses, the genome of which consists of segmented negative-sense single-strand RNA segments.

826. Bovine spongiform encephalitis disease is caused by _____

(a) Viroid (b) Bacteria
(c) Virus (d) Prions

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : Bovine Spongiform Encephalitis (BSE) disease is caused by prions. Prions are misfolded protein molecule, which become infectious due to their ability to transfer their faulty structure to their normal variants too. It is a progressive neurological disorder of cattle. BSE is also known as mad cow diseases, is a progressive and fatal neurologic diseases of cattle.

827. The virus which causes Bird flu is

(a) H_1N_1 (b) H_3N_2
(c) H_5N_1 (d) H_2N_2

TS EAMCET-30.07.2022 Shift-II

Ans. (c) : Highly Pathogenic Avian Influenza (HPAI) (H_5N_1) virus causes bird flu. These virus naturally spread among wild aquatic birds worldwide and can infect domestic poultry and other bird and animal species. Bird flu is viruses do not normally infect humans. Swine flu is caused by the H_1N_1 virus, which started in pigs.

828. Identify the phage that attacks a host cell but do not destroy it immediately

(a) Virulent phage (b) Mycophage
(c) Temperate phage (d) Zoophage

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Temperate phages exhibits lysogeny are considered as natural vectors for gene transmission among bacteria.
Escherichia coli viruses which are well-studied temperate phages can integrate their genomes into DNA at random transposition site-specific recombination.

829. Match List-I with List-II:

List-I		List-II	
A.	Bacteriophage Φ×174	i.	48502 base pairs
B.	Bacteriophage lambda	ii.	5386 nucleotides
C.	Escherichia coli	iii.	3.3×10^9 base pairs
D.	Haploid content of human DNA	iv.	4.6×10^6 base pairs

Choose the correct answer from the options given below:

(a) (A) - (i), (B) - (ii), (C) - (iii), (D) - (iv)
(b) (A) - (ii), (B) - (iv), (C) - (i), (D) - (iii)
(c) (A) - (ii), (B) - (i), (C) - (iv), (D) - (iii)
(d) (A) - (i), (B) - (ii), (C) - (iv), (D) - (iii)

NEET (Re-Exam)-04.09.2022

@apna_pdf

Ans. (c) :

(A)	Bacteriophage $\phi \times 174$	5386 nucleotides
(B)	Bacteriophage lambda	48502 base pairs
(C)	Escherichia coli	4.6×10^6 base pairs
(D)	Haploid content of human DNA	3.3×10^9 base pairs

830. Mad cow disease in cattle and Cr Jacob disease in humans are due to infection by _____.

(a) Bacterium (b) Virus
(c) Viroid (d) Prion

NEET (Re-Exam)-04.09.2022

Ans. (d) : Mad cow disease in cattle and Cr Jacob disease in humans are due to infection by prions. 'Mad cow disease' is commonly called as Bovine spongiform encephalopathy (BSE).
This disease is progressive neurological disorder in which the cattle experiences trouble while walking , weight loss and shows abnormal behavior. Prions were named by Stanley Prusiner.
Creutzfeldt - Jakob disease (CJD) is a rare brain disorder that causes unique changes in brain tissue and affects muscle coordination, thinking and memory.

831. Prophage is viral genome _____

(a) Freshly synthesized
(b) Inoculated to a bacterium
(c) Outside the host cell
(d) Incorporated and integrated to host genome

AP EAMCET-03.09.2021 Shift-II

Ans. (d) : Prophage is viral genome (bacteriophage) which is incorporated and integrated to the host genome. This is a latent form of a phage in which the viral genes are present in the bacterium without causing disruption of the bacterial cell.
Prophage is the first stage of cell division.

832. Identify the correct statements among the following.

(A) No virus contains both DNA and RNA
(B) Viroids were named by T.O. Diener.
(C) Scrapie disease of sheep is caused by proteins
(D) In six kingdom classification three domains are present

(a) A, B ,C (b) B, C, D
(c) A, B, D (d) A, C, D

TS EAMCET-09.08.2021 Shift-II

Ans. (a) : Virus is an extremely small entity which contains either RNA or DNA as the genetic material. They are also smaller than most bacteria.

- **In 1971 Theodor Diener** showed that the agent was not a virus, but a totally unexpected novel type of pathogen, the size of typical viruses, for which he proposed the term '**viroid'**.
- Scrapie is a neurodegenerative disease of sheep and goats and is also caused by Prions.
- The three-domains of Carl Woese's classification system include archaea, bacteria, eukaryotic and six kingdoms are Archaebacteria (ancient bacteria), Eubacteria (True bacteria), Protista, Fungi, Plantae, Animalia.

833. Match the following :

a.	**Viroid**	**i.**	**Pollution indicators**
b.	**Prions**	**ii.**	**Detection of toxic pollutants**
c.	**Biosensors**	**iii.**	**Potato spindle tuber disease**
d.	**Lichens**	**iv.**	**Scrapie disease**

(a) (a – iii), (b – iv), (c – ii), (d – i)
(b) (a – iii), (b – iv), (c – i), (d – ii)
(c) (a – i), (b – ii), (c – iv), (d – iii)
(d) (a – ii), (b – iii), (c – iv), (d – i)

AP EAMCET-25.09.2020 Shift-II

Ans. (a) : The disease of the potato spindle tuber is caused by viroid. The first viroid to be described was the potato spindle tuber viroid (PSTVd).

- Scrapie is a neurodegenerative disease of sheep and goats, is caused by prions. Classical scrapie is spread from an infected dam to her offspring and other sheep or goats.
- Biosensors usage is essential for monitoring actual is essential for monitoring actual conditions of soil, water and air samples to detect pollutants such as pesticides, pathogens and chemical compounds.
- Lichens are sensitive to atmospheric pollution such as nitrogen because they receive all their nutrients and water from wet and dry atmospheric deposition.

834. Classification of Virus is done by _____

(a) IBTV (b) ICBN
(c) ICTV (d) ICZN

AP EAMCET-25.09.2020 Shift-II

Ans. (c) : The formal taxonomic classification of viruses is the responsibility of the International Committee on Taxonomy of Viruses (ICTV) system. The ICTV was established in 1966 as the International Committee on Nomenclature of Viruses (ICNV), and was renamed the ICTV in 1977.

- ICBN-International Code of Botanical Nomenclature.
- ICZN-International Code of Zoological Nomenclature.
- TBTV - Infectious Bluetongue Viruses.

835. The algal partner of the lichen is called _____.

(a) photobiont or mycobiont
(b) phytobiont or mycorrhiza
(c) phycobiont or photobiont
(d) mycobiont or phycobiont

MHT CET-07.10.2020 Shift-I

Ans. (c) : Lichens are composite organisms that show the symbiotic association between algae and fungi.

- The algal component of a lichen is known as photobiont or phycobiont because the algae partner is photosynthetic. The fungal component is known as mycobiont.

836. The capsid of tobacco mosaic virus (TMV) has capsomere numbering ____

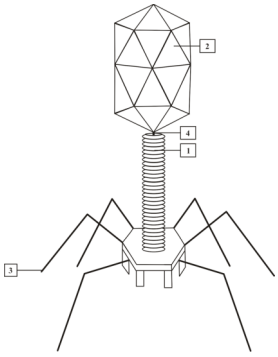
(a) 2130 (b) 1230
(c) 2310 (d) 3120

AP EAMCET-24.09.2020 Shift-I
KCET-2000

@apna_pdf

Ans. (a) : TMV is also known as the tobacco mosaic virus. TMV is a simple rod shaped helical virus that consist of single- stranded RNA enveloped by a protein coat called capsid. This capsid is made of 2130 subunits called capsomeres.

837. Identify the parts labelled 1,2,3,4 in the given figure



(a) 1. Sheath, 2. Head, 3. Tail fiber, 4. Collar
(b) 1. Head, 2. Sheath, 3. Collar, 4. Tail fiber
(c) 1. Collar, 2. Tail fiber, 3. Sheath, 4. Head
(d) 1. Tail fiber, 2. Collar 3. Sheath, 4. Head

AP EAMCET-24.09.2020 Shift-I

Ans. (a) : A bacteriophage is a bacteria - eating virus, these viruses are endoparasite of bacteria. A bacteriophage is type of virus or an envelope of protein that has genetic material such as DNA or RNA in it. Bacteriophase having the components can be understood by comparing if with the human body. As we move upside down, the uppermost part is the head and then comes the neck. The tails remains covered by the sheath, so the darkened part is the sheath. The last part should be the tail fibres.

838. Which of the following is correct about viroids?

(a) They have free RNA without protein coat
(b) They have DNA with protein coat
(c) They have free DNA without protein coat
(d) They have RNA with protein coat

NEET-2020 Phase-I

Ans. (a) : Viroids are small, circular single stranded RNA molecule without protein coat. They have unusual properties such as resistance to ribonulcease digestion and denaturation. Viroid is basically a plant pathogen that consists of short stretch of highly complementary, circular single stranded RNA. They are responsible for causing disease in plant like potato spindle tuber disease.

839. Match the column-I and column-II

Column-I	Column-II
(i) Viroid	**(A) Ramachandran**
(ii) Cell	**(B) Leeuwenhoek**
(iii) Virus	**(C) T.O. Diener**
(iv) Triple helical structure of collagen	**(D) Ivanovsky**

(a) i–B, ii–A, iii–C, iv–D
(b) i–A, ii–B, iii–D, iv–C
(c) i–C, ii–B, iii–D, iv–A
(d) i–D, ii–B, iii–C, iv–A

AIIMS-26.05.2019 Shift-II

Ans. (c) :

(i)	Viroid	T.O. Diener
(ii)	Cell	Leeuwenhoek
(iii)	Virus	Ivanovsky
(iv)	Triple helical structure of collagen	Ramachandran

- Viroids are the smallest infectious pathogens. They are composed of circular, single stranded RNA that has no protein coating. The term viroid was introduced by T.O. Diener.
- Leeuwenhoek with the improved microscope, discovered the free living cells in ponds water for the first time.
- Dmitri Ivanovsky, in studying a disease that affects tobacco plants, paved the way for the discovery of the infectious particle known as a virus.
- Collagen is the most abundant protein in our body. It is the major component of connective tissues that create several body parts, including tendons, ligaments, skin, and muscles. Prof. Ramachandran proposed the triple helical structure of collagen.

840. Which of the following statements is incorrect?

(a) Viruses are obligate parasites.
(b) Infective constituent in viruses is the protein coat.
(c) Prions consist of abnormally folded proteins.
(d) Viroids lack a protein coat.

NEET-2019

Ans. (b) : Infective constituent in virus is not the outer protein coat, but the genetic material inside the cell. Viruses can have either DNA or RNA as their genetic material. Viruses are obligate parasites, i.e they are found everywhere.

- Virus can not replicate alone.
- Viruses must infect cells and use components of the host cell to make copies of themselves.

Prions – Prions are misfolded protein with the ability to transmit their misfolded shape into normal variants of same protein.

Viroids- They are small infectious pathogen, they are composed of a short strand of circular, single stranded RNA that has no protein coat.

841. Mad cow disease in cattle is caused by an organism which have :

(a) Free DNA without protein coat
(b) Inert crystalline structure
(c) Abnormally folded protein
(d) Free RNA without protein coat

NEET (Odisha)-2019

Ans. (c) : The abnormally folded proteins known as prions. The causative agent of mad – cow disease is a prion. It is a fatal neurological disease or encephalopathy in cattle that causes a spongy degeneration in the brain and spinal cord. This disease is caused when a normal prion protein folds into an abnormal shape and no longer breaks down inside the body.

842. Which of the following statements is correct?

(a) Lichens are not good pollution indicators.
(b) Lichens do not grow in polluted areas.

@apna_pdf

(c) Algal component of lichens is called mycobiont
(d) Fungal component of lichens is called phycobiont.

NEET (Odisha)-2019

Ans. (b) : Lichens do not grow in polluted areas because lichens have no roots or protective surface, they can not filter what they absorb, so whatever in the air is taken straight inside. Some sensitive lichen species develop structural changes in response to air pollution including reduced photosynthesis and bleaching. Pollution can also cause the death of the lichen algae, discoloration and reduced growth of the lichen fungus, or kill a lichen completely.

843. HIV belongs to the Genus
(a) Hunnivirus (b) Lentivirus
(c) Lolavirus (d) Vitrivirus

AP EAMCET-25.04.2018 Shift-II

Ans. (b) : Genus Lentivirus – HIV is a lentivirus because it is a slow virus. It takes the virus to replicate enough to cause symptoms in the host.
The two human immunodeficiency viruses HIV-1, HIV-2 are members of the family of retroviruses in the genus of lentivirus.

844. Arrange the following steps in the order of their occurance in the lytic cycle of a phage.
(i) Maturation phase
(ii) Penetration phase
(iii) Attachment
(iv) Release phase
(v) Biosynthesis
The correct sequence is
(a) (iii), (i), (iv), (v), (ii) (b) (i) (iii), (iv), (v), (ii)
(c) (ii), (i), (iii), (v), (iv) (d) (iii), (ii), (v), (i), (iv)

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : Attachment – Attachment involves the bacteriophage attaching to the bacterial host cell.
Penetration – Penetration involved the movement of bacteriophage into the bacterial cell.
Biosynthesis- Biosynthesis involves the production of phage protein and genome replication.
Maturation- Maturation involves the assembly of new bacteriophage particles.
Release Phase– Involves the lysis of the bacterial cell resulting in the release of newly produced bacteriophage particles.

845. Study the following lists :

List-I	List-II
(A) Prions	**(i) Saprophytic and parasitic organisms**
(B) Viroids	**(ii) Lacks the protein coat and RNA is of low molecular weight**
(C) Phycobiont	**(iii) Infectious agents which possess only proteins but not nucleic acids**
(D) Mycoplasma	**(iv) The algal component in a symbiontic association**
	(v) Organisms that completely lack a cell wall and are pleomorphic

The correct answer is

	A	B	C	D
(a)	(iii)	(i)	(ii)	(iv)
(b)	(v)	(ii)	(iii)	(i)
(c)	(i)	(v)	(iv)	(ii)
(d)	(iii)	(ii)	(iv)	(v)

TS EAMCET-02.05.2018 Shift-II

Ans. (d) :

	List – I	List - II
a.	Prions	Infectious agents which possess only proteins but not nucleic acids
b.	Viroids	Lacks the protein coat, and RNA is of low molecular weight
c.	Phycobiont	The algal component in a symbiontic association
d.	Mycoplasma	Organisms that completely lack a cellwall and are pleomorphic

846. Match the column

(A) Virus	**(i) Schwann**
(B) Viroid	**(ii) T.O. Diener**
(C) Cell	**(iii) Pasteur**
(D) Ribosome	**(iv) Palade**

(a) A–iii, B–ii, C–i, D–iv
(b) A–ii, B–i, C–iv, D–iii
(c) A–i, B–ii, C–iii, D–iv
(d) A–iv, B–iii, C–i, D–ii

AIIMS-26.05.2018 Shift-I

Ans. (a) : Louis Pasteur developed the 1st vaccine against rabies virus
- T.O. Diener discovered a new infectious agent that was smaller than virus, called viroid. A viroid is a single stranded RNA that caused potato spindle tuber disease.
- Shliden and Schwann gave the cell theory.
- Ribosome's are also called Palade particles, discovered by George Palade in 1955 with the help of an electron microscope.

847. Viroids differ from viruses in having :
(a) DNA molecules with protein coat
(b) DNA molecules without protein coat
(c) RNA molecules with protein coat
(d) RNA molecules without protein coat

NEET-2017

Ans. (d) : Viroids differ from viruses in having RNA molecules without protein coat.

848. Which ONE of the following statements is CORRECT about the tobacco mosaic virus?
(a) It affects all monocotyledonous plants
(b) It affects photosynthetic tissue of the infected plants
(c) It does not infect other species belonging to the Solanaceae
(d) It infects gymnosperms

KVPY (SA)-05.11.2017

@apna_pdf

Ans. (b) : Tobacco mosaic virus affects photosynthetic of the infected plant. It affects all Solanaceae family, specially tobacco and tomato plants.
It affects the photosynthetic tissue, leaves of the infected plants. In the disease, there is mosaic - like motting and discoloration on the leaves is observed.

849. There exists a close association between the alga and the fungus within a lichen. The fungus
(a) Provides food for the alga
(b) Provides protection, anchorage and absorption for the alga
(c) Fixes the atmospheric nitrogen for the alga
(d) releases oxygen for the alga

AIPMT-2005

Ans. (b) : There exists a close association between the alga and the fungus within a lichen. The fungus provides protection, anchorage and absorption for the alga. fungus forms the body of lichen as well as it attaches and in absorbing mineral and nutrients.

850. Choose the wrong statement
(a) Mosaic disease in tobacco and AIDS in human being are caused by viruses
(b) The viroids were discovered by D.J. Ivanowsky
(c) W.M. Stanley showed that viruses could be crystallized
(d) The term contagium vivum fluidum was coined by M.W. Beijerinck
'contagium vivum fluidum'

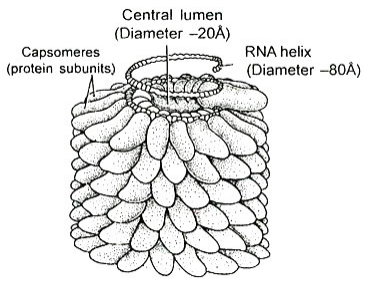
AIPMT (Re-Exam)-2015

Ans. (b) : Viroids were discovered by **T.O Diener** while D.J Ivanowsky discovered first virus, tobacco mosaic virus (TMV).

851. Which of the following shows coiled RNA strand and capsomeres?
(a) Polio virus (b) Tobacco mosaic virus
(c) Measles virus (d) Retrovirus

AIPMT-2014

Ans. (b) : Tobacco mosaic virus shows coiled RNA strand and capsomeres. It is a plant virus that is associated with genus Tobamovirus. It mainly infects tobacco plants, potatoes, tomato and other members which comes under Solanaceae family.
It is covered by a protective protein coat called capsid that covers the virus's genetic material.
- Polio virus has ss positive-sense RNA genome and a protein capsid.
- Measles virus is a ss, negative strand, enveloped RNA virus. Retrovirus is a family of enveloped viruses.



STRUCTURE OF TOBACCO MOSAIC VIRUS

852. Tobacco mosaic virus (TMV) genes are:
(a) single stranded RNA
(b) double stranded DNA
(c) proteinaceous
(d) double stranded RNA

AIPMT-1994 / BVP-2002

Ans. (a) : Tobacco mosaic virus (TMV) genes are single stranded RNA. It is a rod shaped helical virus consisting of centrally located single stranded RNA covered by a protein coat called capsid.

853. Viruses possess:
(a) ribosomes to synthesize protein
(b) organelle for its vital mechanism
(c) either DNA or RNA
(d) none of these

AIPMT-1997

Ans. (c) : All viruses have genetic material made of nucleic acid. The nucleic acid encodes the genetic information unique for each virus.
The nucleic acid may occur as single or double strands. Viruses contain either DNA or RNA, never both.

854. Most of the lichens consist of:
(a) green algae and ascomycetes
(b) brown algae and higher plant
(c) blue green algae and basidiomycetes
(d) red algae and ascomycetes

AIPMT-1997

Ans. (a) : Most of the lichens consist of green algae and ascomycetes.
Algal component, phycobiont which are mostly blue-green algae (Nostoc, Scytonema) or green algae (Trebouxia, Trentophila etc.)

855. Litmus is obtained from
(a) Rocella montagnei (b) Lasallia pustulata
(c) Both (a) and (b) (d) Cladonia crispata

JIPMER-2005

Ans. (c) : Litmus is obtained from *Rocella montagnei* and *Lasallia pustulata*. Litmus is a blue dye extracted from various species of lichen. It is used as an acid-base indicator. It gives red colour with acidic medium and blue colour with basic medium.

856. Retrovirus have genetic material
(a) DNA only
(b) RNA only
(c) DNA or RNA only
(d) either DNA or RNA only

JIPMER-2008

Ans. (b) : Retrovirus have genetic material RNA only because, a retrovirus is a virus that uses RNA as its genomic material. Upon infection with a retrovirus, a cell converts the retroviral RNA into DNA, which in turn is inserted into the DNA of the host cell. Most retroviruses are spherical particles, approximately 100 nm in diameter, consisting of an internal protein core surrounded by an envelope of glycoprotein's embedded in a lipid bilayer.

857. The genetic material in tobacco mosaic virus is
(a) ss DNA (b) ss RNA
(c) ds RNA (d) ds DNA

AIIMS-2016

@apna_pdf

Ans. (b) : The genetic material in tobacco mosaic virus is ssRNA. It is a plant virus that is associated with genus 'Tobamovirus'.
TMV is the most stable virus known. It can multiply only in the presence of a host.

858. Which of the following structure helps in the respiration of lichens?
(a) Soredia (b) Isidia
(c) Cyphella (d) Cephalodia.

AIIMS-2002

Ans. (c) : Cyphella is a genus of fungi in the family Cyphellaceae. Cyphella are the small pores or pits present in the lower cortex region of foliose lichens.
They are small circular depressions and are found irregularly scattered on the underside of some lichens such as Sticta. They contain definite rim made of spherical thin walled cells and open into the medulla of the lichen. They perform respiratory functions.

859. The antibiotics have no effect on viruses because:
(a) Viruses show metabolism of their own
(b) Viruses are too small in size for antibiotics to act upon them
(c) Viruses show no metabolism of their own
(d) Viruses produce a thick covering and encyst themselves as endospores

AIIMS-2015

Ans. (c) : Viruses do not have metabolism of their own, they use host cells to perform their activities for them.
Viruses called as connecting link between living and non-living. Viruses are surrounded by a protective protein coat instead of cell wall. A virus is not a living cell. A virus is just a protein coat and the genetic material sits inside this coat and it cannot make more of itself without a host. Hence, antibiotics can not affect viruses.

860. Viroids have:
(a) Single stranded RNA not enclosed by protein coat
(b) Single stranded DNA not enclosed by protein coat
(c) Double stranded DNA enclosed by protein coat
(d) Double stranded RNA enclosed by protein coat.

AIIMS-2003
Punjab MET-2006

Ans. (a) : Viroids have single stranded RNA not enclosed by protein coat. Viroids are typically called as **plant pathogens.** They are small, single-stranded, RNA particles. Viroids are single stranded covalently closed circular RNA molecules existing as highly base paired rod-like structure. They do not have a capsid or outer envelope of protein making them simpler than virus, but same as viruses, they can **reproduce only within a host cell**.

861. Which of the following statements is wrong for viroids
(a) Their RNA is of high molecular weight
(b) They lack a protein coat
(c) They are smaller than viruses
(d) They cause infections

NEET-2016 Phase-I

Ans. (a) : In viroid, RNA is of low molecular weight. They have no protein coating. Viroids are smaller than virus that is responsible for causing disease in plants. It is found to be a free RNA and is devoid of protein coat that is generally present in viruses viroids are single-stranded covalently closed circular RNA molecules existing as highly base-paired rod-like structure.

862. Infectious proteins are present in –
(a) Gemini viruses (b) Prions
(c) Viroids (d) Satellite viruses

AIPMT (Screening)-2010

Ans. (b) : A prion is a type of protein that triggers normal proteins in the brain to fold abnormally. It can cause disease in animals and humans.
Geminiviruses- It is a plant virus, it has single stranded DNA (ssDNA) .
Satellite viruses - It is a virus completely dependent on a helper virus for replication.

863. Which one of the following does not follow the central dogma of molecular biology ?
(a) Pea (b) Mucor
(c) Chlamydomonas (d) HIV/ HIV

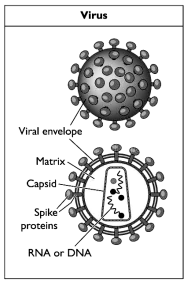
AIPMT (Screening)-2010

Ans. (d) : HIV belongs to retrovirus group which show reverse central dogma or reverse transcription. The biggest revolution in the central dogma was the discovery of retroviruses, which transcribe RNA into DNA through the use of a special enzyme called reverse transcriptase has resulted in an exception to the central dogma.

864. Virus envelope is known as –
(a) Capsid (b) Virion
(c) Nucleoprotein (d) Core

AIPMT (Screening)-2010

Ans. (a) : The virus envelope is known as a capsid. A virus consists of a nucleic acid core and outer protein coating called capsid. An outer envelope made of protein and phospholipids membranes derived from the host cell. The capsid is made up of protein subunits called capsomere.



865. 'Reindeer moss' is common name for
(a) Funaria hygrometrica (b) Marchantia sp
(c) Cladonia rangiferina (d) Polytrichum sp

JIPMER-2004

Ans. (c) : Reindeer moss is common name of *Cladonia rangiferina.* It rarely reaches more than 17cm in height. Reindeer moss has the ability to convert sunlight into food in low temperature and low light conditions.
Reindeer moss is a fruticose lichen found in arctic region.

866. There exists a close association between the alga and the fungus within a lichen. The fungus
(a) fixes the atmospheric nitrogen for the algae
(b) provides protection, anchorage and absorption for the algae

@apna_pdf

(c) provides food for the algae
(d) releases oxygen for the algae

JIPMER-2007

Ans. (b) : Lichen is the symbiotic relationship between algae and fungi. They exists a close association between the algae and fungus within a lichen. The fungus provides protection, anchorage and absorption for the algae.

867. Which of the following is true regarding the phage lambda, a virus which infects bacteria?
(a) In the lytic cycle, the bacterial host replicates viral DNA, passing it on to daughter cells during binary fission
(b) In the lysogenic cycle, the bacterial host replicates viral DNA, passing it to daughter cells during binary fission
(c) In the lytic cycle, viral DNA is integrated into the host genome
(d) In the lysogenic cycle, the host bacterial cell burst, releasing phases

JIPMER-2015

Ans. (b) : The lysogenic cycle is a type viral replication in which the nucleic acid of a bacteriophage is associated with a host. Viral DNA is passed into daughter cells as host cells reproduce.

868. A term helotism is used for the symbiosis of
(a) Algae and fungi (b) Algae and Cycas
(c) Algae and bacteria (d) Pinus and fungi

AP EAMCET-2007

Ans. (a) : Helotism term refers to the symbiotic association of algae and fungi which is commonly called **Lichen**. Lichen is a complex organism that comprises the association of two different living bodies, named algae or cyanobacteria and the fungi.
The phenomenon of controlled parasitism is called helotism.

869. Enzymes not found in:
(a) Fungi (b) Algae
(c) Virus (d) Cyanobacteria

AIPMT-2000 / JIPMER-2004

Ans. (c) : A virus is a submicroscopic non-living infectious agent that replicates only inside the living cells of other organisms. Virus is made of the genetic material which is either DNA or RNA that carry genetic information, a protein coat, called the capsid which surrounds and protects the genetic material and an envelope of lipids that surrounds the protein coat. **Viruses do not contain enzymes** or any other metabolic machinery so they use host machinery after infection.

870. Which statement is wrong for viruses?
(a) They have ability to synthesize nucleic acids and proteins
(b) Antibiotics have no effect on them
(c) All are parasites
(d) All of them have helical symmetry

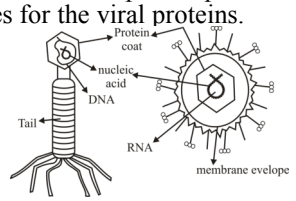
AIPMT (Screening)-2012

Ans. (d) : "All of them have helical symmetry" this statement is incorrect. While some viruses do have helical symmetry, not all viruses do have.
• Some viruses have icosahedral symmetry, while other have complex shapes.
• All virus are either plant or animal pathogen and have ability to synthesize nucleic acids and protein, showing all phenomenon like replication, transcription, reverse transcription and translation.
• Antibiotic are chemical compounds that act against the bacteria not virus.

871. Nucleic acid in HIV
(a) ss RNA (b) ds RNA
(c) ss DNA (d) ds DNA

AIPMT-1998

Ans. (a) : Nucleic acid in HIV (Human immunodeficiency virus) is single stranded RNA.
• The HIV is a lentivirus that causes HIV infection.
• It is composed of two copies of positive single stranded RNA that codes for the viral proteins.



872. Lichens can be used as
(a) Bio-indicator for water and air pollution
(b) Initial vegetation for waste lands
(c) Source of wood
(d) To check the air pollution

AIPMT-1999

Ans. (a) : Lichens are hypersensitive to sulphur dioxide pollution in the air because their efficient absorption system result in rapid accumulation of sulphur when exposed to high levels of sulphur dioxide pollution.
- Lichens are widely used as environmental indicators or bio-indicators.
- If air is very severely polluted with sulphur dioxide there may be no lichens present.
- If the air is clean, shrubby, hairy and leafy lichens become abundant.

873. Cauliflower mosaic virus contains : -
(a) ss RNA (b) ds RNA
(c) ds DNA (d) ss DNA

AIPMT-2001

Ans. (c) : Cauliflower mosaic virus (CaMV) is a member of the viruses which infect many plants especially the member of Cruciferae.
Cauliflower mosaic virus (CaMV) is an unusual plant virus which has a small genome of double-stranded DNA.

874. The latest view for the origin of viruses is
(a) these have arisen from nucleic acid and protein found in primitive soup
(b) these arise from bacteria as a result of the loss of cell wall, ribosome, etc
(c) these arise from some bacteria, which had developed a nucleus only
(d) these are modified plasmids, which are infact the fragments of the nucleic acids of the host

AP EAMCET-2011

Ans. (d) : Virus evolved from plasmids when pieces of DNA moved between cells. Many scientists believe that viruses are modified plasmids, which are the fragments of the nucleic acids of the host.

875. The agents which are known to cause CJD are
(a) A class of bacteria (b) A class of viruses
(c) Fungi (d) Protein particles

Karnataka CET-2009

Ans. (d) : Creutzfeldt- Jakob disease (CJD) is caused by prion protein is an invariably fatal degenerative brain disorder. Protein are molecules made up of amino acids that help the cells in our body function.
They are infectious and may cause severe problems including memory loss, impairment in sensory receptors etc.

@apna_pdf

876. Which part of animal virus is not reproduced in multiple copies?
(a) Capsid (b) Proteins
(c) Envelops (d) Ribosome
JIPMER-2014

Ans. (d) : Ribosome of animal virus is not reproduced in multiple copies because they uses its host cell ribosomes for its protein synthesis.

877. What is the total number of amino acids when the capsid of TMV contains 2130 capsomers?
(a) 336540 (b) 162622
(c) 948 (d) 387921
AP EAMCET-2013

Ans. (a): Tobacco mosaic virus has a rod-like appearance. Its capsids are made of 2130 molecule of coat protein and one molecule of singles strand RNA which is 6400 bases long. The protein monomer consists of 158 amino acids which are assembled into four main alpha helices which are joined by a prominent loop proximal to the axis of the virion. So, the total number of the amino acids is $2130 \times 158 = 336540$.

878. The following statements are associated with connecting link between living and non-living. Choose correct statement regarding them.
(a) These are associated with harmful and useful activities
(b) These are extensively used in recombinant DNA technology
(c) They possess usually RNA as genetic material
(d) They cause diseases in both plant and animals, however its protein coat does not take part in infective process
UP CPMT-2014

Ans. (d): Viruses are connecting link between living and non-living. Viruses are disease causing organisms in both plant and animals. These are not associated with any useful activities and posses either DNA or RNA as genetic material. However during infection their protein coat remain inactive.

879. Who discovered cyanophages?
(a) Shafferman and Morris (b) Stanier
(c) Hershey and Chase (d) None of the above
UP CPMT-2014

Ans. (a): Cyanophages were discovered by **Shafferman** and **Morris** in *Plectonema boryanum*.
- **Hershey** and **Chase** proved unequivocally that DNA is a genetic material.
- Roger Stanier was a Canadian microbiologist who gave contributions to the taxonomy of bacteria and blue green algae or cyanobacteria.

880. Identify the correct pair of events when temperate phages infect bacteria.
(i) No prophages are formed
(ii) Bacterial cell undergoes many divisions
(iii) Bacterial cell undergoes immediate lysis
(iv) Prophages are formed
The correct pair is
(a) (i), (ii) (b) (ii), (iii)
(c) (iii), (iv) (d) (ii), (iv)
AP EAMCET-2009

Ans. (d) : Temperate phages possess the ability to go through a lysogenic cycle, entering the host cell. Temperate phages are the avirulent lysogenic phages, whose nucleic acids get incorporated in the bacterial DNA (lysogenization).When these phage infect bacteria, the bacterial cell undergoes several divisions and prophages are formed .

881. The virus, that infects bacteria, are made up of:
(a) Protein only (b) RNA and protein
(c) DNA and lipid (d) DNA and protein
WB JEE-2006

Ans. (d) : The virus, that infects bacteria, are made up of DNA and protein. A bacteriophages is a type of virus that infects bacteria. In fact, the word "bacteriophages" literally means "bacteria eater" because bacteriophages destroy their host cells. All bacteriophages are composed of a nucleic acid molecule that is surrounded by a protein structure.
• Viruses are bundle of nucleic acid DNA or RNA that are enclosed by a protein shell known as a capsid.

882. Provirus is
(a) a free virus (b) primitive virus
(c) integrated viral genome (d) a free DNA
JCECE-2008

Ans. (c) : Integrated viral DNA is referred to as a provirus in the case of retroviruses or prophage. The integrated viral genome does not necessarily make new DNA copies of it self while integrated into a host genome for example, when HIV enters a host CD4 cell, HIV RNA is first changed to HIV DNA (provirus).

883. A lichen responsible for forest fire is
(a) Lecanora (b) Usnea
(c) Cladonia (d) Ramalina
BVP-2010

Ans. (b) : A lichen responsible for forest fire is Usnea. Usnea get dry & become highly inflammable. It is also known as old man's beard is highly inflammable & hence is known to be responsible for forest fires.

884. Virus is classified in which of the following class?
(a) Akaryota (b) Prokaryota
(c) Eukaryota (d) None of the above
Rajasthan PMT-1996

Ans. (a) : All viruses are kept under akaryota. It includes organism having no cells. The thallophyta are a polyphyletic group of non-mobile organisms traditionally described as "thalloid plants". Prokaryotes are single-celled organism. Whereas Eukaryotes includes all animals, plants, fungi and many unicellular organism.

885. The protein that reproduce within the living cells are termed as
(a) plasmids (b) phages
(c) prions (d) prophages
MGIMS Wardha-2014

Ans. (c) : The protein that reproduce within the living cells are termed as prions. It refers to the proteins which are abnormally folded. They mainly causes disease in animals such as–
Bovine Spongiform Encephalopathy (BSE) or mad cow disease in cattle and Creutzfeldt-Jakob disease (CJD) in humans.

886. Helical contractile sheath is found in
(a) virus (b) bacterium
(c) fungus (d) bacteriophage
Manipal-2011

Ans. (d) : Helical contractile sheath is found in bacteriophage tail. It is attached to one end of the head

@apna_pdf

axis. The tail consists of an inner hollow tube which is surrounded by a contractile sheath with 24 annular rings. The distal end consists of a basal plate with tail fibres at each corner. The bacteriophage attaches to the bacteria with the help of these tail fibres.

887. Lichens (1) are indicators of pollution (2) are also used in cosmetics (3) play important role in formation of soil (4) are algal and bacterial partners
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct
BHU PMT (Mains)-2011

Ans. (a) : Lichen is indicator of SO_2 pollution. They are also used in cosmetics and play important role in soil formation. They show mutualism because it supports both the fungi and the photosynthetic organism called photobionts, algae, cyanobacterium or green alga.

888. The common phycobiont of lichens is
(a) Trebouxia (b) Microcystis
(c) Euglena (d) Fucus
BHU PMT (Mains)-2011

Ans. (a) : The common phycobiont of lichens is Trebouxia. The algal component of lichen is called as phycobiont. Trebouxia is a unicellular green alga. It can either live in a symbiotic relationship with fungi in the form of lichen or it can survive independently as a free-living organism.

889. The process which cannot takes place in the absence of virus is:
(a) translocation (b) transduction
(c) transformation (d) conjugation
Karnataka CET-2002

Ans. (b) : The process which cannot takes place in the absence of virus is transduction. It is the process by which a virus transfer genetic material from one bacterium to another.

890. Polio is caused by a
(a) bacteriophage
(b) virus with a single-stranded RNA
(c) virus with a single-stranded DNA
(d) virus with double-stranded DNA
DUMET-2010

Ans. (b) : Polio is caused by a virus with a single-stranded RNA.
Polio virus is a virus which causes poliomyelitis disease and this disease is life threatening. This virus spreads from person to person which can affect the spinal cord which can cause paralysis.

891. The number of linkage group(s) present in *Escherichia coli* is
(a) one (b) two
(c) four (d) seven
DUMET-2010

Ans. (a) : The number of linkage group(s) present in *Escherichia coli* is one. It is a type of bacteria that generally lives in intestines and found in the gut of animals.

892. Rabies is caused by
(a) Virus (b) bacteria
(c) Protozoa (d) All of these
DUMET-2008

Ans. (a) : Rabies is caused by virus. It is transmitted if an infected animal bites a human or other animal.
The symptoms of rabies are uncontrolled excitement, hydrophobia, loss of consciousness and confusions.

893. Small proteins produced by vertebrate cells naturally in response to viral infections and which inhibit multiplication of viruses are called
(a) immunoglobulin's (b) interferons
(c) antitoxins (d) lipoproteins
AFMC-2007

Ans. (b) : Small proteins produced by vertebrate cells naturally in response to viral infections and which inhibit multiplication of viruses are called interferons. It helps the body's immune system to fight against infection and other diseases like cancer.

894. Viruses that infect bacteria multiply and cause their lysis, are called
(a) lysozymes (b) lipolytic
(c) lytic (d) lysogenic
Rajasthan PMT-2010

Ans. (c) : Viruses that infect bacteria, multiply and cause their lysis are called lytic cycle. It involves the reproduction of virus that uses a host cell to form more viruses and then the viruses burst out of the cell. Lytic cycle is commonly called reproductive cycle of bacteriophage. It is a 6-stage cycle-attachment, penetration, transcription, biosynthesis, maturation and lysis.

895. Animals virus contains mostly
(a) RNA (b) DNA
(c) RNA or DNA (d) Both (a) and (b)
AMU-2011

Ans. (b) : An animal virus is a small infectious agent that is unable to replicate outside a living animal cell. It contains only one kind of nucleic acid, either DNA or RNA but mostly contains DNA.

896. What is the genetic material in influenza virus?
(a) single-helix DNA (b) Double-helix DNA
(c) RNA (d) None of these
AMU-2011

Ans. (c) : Single stranded RNA is the genetic material in influenza virus. The RNA genes of influenza viruses are made up of chains of nucleotides that are bonded together with adenine, cytosine, guanine and uracil respectively.

897. Gemini viruses are plant viruses with
(a) Circular single stranded RNA
(b) Circular single stranded DNA
(c) Linear single stranded DNA
(d) Linear single stranded RNA.
AMU-1998

Ans. (b) : Gemini viruses are a family of plant viruses that cause economically important plant diseases worldwide. These viruses have circular single stranded DNA genomes and four to eight genes that are expressed from both strands of the double - stranded DNA replicative intermediate.

898. Bacteriophage is consist of :
(a) only proteins (b) nucleoproteins
(c) protein and lipid (d) only DNA
Rajasthan PMT-1998

Ans. (b) : Bacteriophages (viruses that infect the bacteria) are usually double stranded DNA viruses. The protein coat called capsid made of small subunits called capsomeres, protects the nucleic acid. The size and shape of capsomere vary in different species. It consists of a polyhedral head and tail.

@apna_pdf

899. Which of the following statement is correct?
(a) Viruses are obligate parasites
(b) All fungi are pathogenic
(c) All algae are eukaryotes
(d) Bacteria are always harmful to mankind
CG PMT-2009/ Haryana PMT-2009 / WB JEE-2006

Ans. (a) : The term obligate indicates some types of restriction in an organisms way of life from which it cannot depart and survive.
Ex. A virus and its host.
Viruses are obligate parasites because they cannot multiply or grow outside the host cells.

900. The virus which causes ring spot diseases in cherry is transmitted through:
(a) seeds (b) fungi
(c) insects (d) pollen grains
AP EAMCET-2001

Ans. (d) : Prunus necrotic ringspot virus (PNRSV) is a plant pathogenic virus causing ring spot diesease affecting species of the genus Prunus. The virus also has been shown to infect and transmit through pollen and seeds. PNRSV has been show to be transmitted by bees carrying infected pollen into orchards. The virus infect all seed parts, therefore infection of seed can occur from an infected pollen grain, ovule or both.

901. Fungus/lichens which grow on wood is:
(a) terricolous (b) saxicolous
(c) lignicolous (d) corticolous
AFMC-2004

Ans. (c) : The lichens grow in different habitats. They grow on rocks, bark, wood and soil. The lichens that grow on wood is called lignicolous.
- Terricolous are the lichens that grow on soil.
- Saxicolous are the lichens that grow on rocks.
- Corticolous are the lichens that grow on bark.

902. Basic structure of protein was given by:
(a) W.M Stanley (b) Nicholson
(c) Watson (d) F. Sanger
AFMC-2004

Ans. (d) : F. Sanger won his first nobel prize for chemistry in 1958 for his work on the structure of proteins. F. Sanger first time deciphered the sequence of amino acids in a protein, i.e. bovine insulin. Proteins are made up of amino acids and amino acids are held together by peptide bonds.

903. The smallest organisms, which cause disease among plant are
(a) viruses (b) fungi
(c) mycoplasma (d) bacteria
CG PMT-2006

Ans. (c) : Diseases in plants occurs quite frequently and are most caused by pathogens. Pathogens include bacteria, fungi, viruses, mycoplasma, protozoans, nematodes. Among them the smallest organism is mycoplasma.
- Mycoplasma is the smallest prokaryotic organism that is capable of independent growth, division and reproduction. Its diameter is 0.0001 mm.

904. Virus multiplies in:
(a) soil (b) dead tissue
(c) living tissue (d) culture medium
BHU-PMT (Screening)-2008 /Uttarakhand PMT-2008
BHU PMT-2004

Ans. (c) : Viruses are tiny infectious agents that rely on living tissue to multiply. They may use an animal, plant or bacteria host to survive and reproduce. They can only multiply inside the living cells of host by using host's cellular machinery. As such, there is some debate as to whether or not viruses should be considered living organisms.

905. Smallest animal virus is
(a) pox virus (b) coliphage
(c) rhino virus (d) polio virus
BHU PMT (Screening)-2011

Ans. (d) : Virus is a pathogen particle that can cause various disease. Smallest virus belongs to the family Picornaviridae. It is about 20-30nm in size. They have limited genetic information on them. Polio virus belongs to this family. It is the causative agent of polio. The virus enters the body through the mouth or can be spread through the stool of the infected person. Polio can be prevented by proper vaccination given to the children at an early age.

906. Potato spindle tuber disease is caused by
(a) a nematode (b) a virus
(c) a bacterium (d) a viroid
DUMET-2009

Ans. (d) : Viroids are the smallest infectious pathogens which are composed of circular single - stranded RNA without a protien coat. Viroid is a infectious agent that is smaller than viruses and cause potato spindle tuber disease. The first viroid to be described was potato spindle tuber viroid

907. Which one of the following are intracellular obligate parasites?
(a) Bacteria (b) Viruses
(c) Slime moulds (d) Blue-green algae
DUMET-2009

Ans. (b) : Viruses are non- cellular, infectious, intracellular, obligate parasites because they cannot multiply or grow outside the host cells.

908. Identify the correct pair that shows the double stranded RNA among the following
(a) Cauliflower mosaic virus and Dahlia mosaic virus
(b) Poliovirus and wound tumour virus
(c) Wound tumour virus and reovirus
(d) Tobacoo mosaic virus and reovirus
VMMC-2010

Ans. (c) : Wound tumour virus belongs to the genus phytoreovirus and the family reoviridae.
Wound tumour virus has a double- stranded RNA genome which is approximately 25,000 base pairs long and organised into twelve segments. The genome of Reovirus contain 10-12 segments of double stranded RNA.
- Polio virus contains ssRNA genome.
- Cauliflower mosaic virus has a circular dsDNA molecule.
- Dahlia mosaic virus has double-stranded DNA genome.
- Tobacco mosaic virus has ssRNA genome .

909. Bio-indicators are used for
(a) oxygen demand (b) air pollution
(c) mineral present (d) All of the above
Haryana PMT-2008

Ans. (d) : Bioindicators are those species which can reveal the status of the quality of the air of the environment. Thus, they are indicators of environmental health. Oxygen demand, presence of minerals,

@apna_pdf

occurence of petroleum products, radioactive minerals and pollution etc. are some of the responses that can be detected using bioindicators.

910. Interferons are synthesized in response to:
(a) bacteria (b) viruses
(c) fungi (d) mycoplasma
Haryana PMT-2003

Ans. (b) : Interferon is synthesized in response to the virus. Interferons are mostly secreted by virus infected cells to protect the adjacent cell from viral infection.
Interferons interfere with the replication of viruses thus they are commonly known as antiviral agent.
Interferons are from the family of cytokines or protein hormones and these molecules are used for triggering the immune system's protective defense mechanisms as they can communicate cell to cell and eradicate pathogens.

911. Which pair of disease is viral?
(a) AIDS, Rabies (b) Typhoid, Tetanus
(c) Rabies, Syphilis (d) Cholera, T.B.
Haryana PMT-2003

Ans. (a) : Rabies (hydrophobia) is caused by a virus named as rabies virus. Rabies virus is a type of rhabdovirus. AIDS is caused by a virus named as HIV. HIV is a virus that attacks the body's immune system. HIV is a genus of family Retroviridae.
• Typhoid, Tetanus, Syphilis, Cholera, T.B. all are bacterial diseases caused by different bacteria.

912. T series bacteriophage possess complex tail structure is
(a) T_1 (b) T_2
(c) T_3 (d) T_4
CG PMT-2010

Ans. (d) : Bacteriophage T4 consist of a head for protecting its genome and a sheathed tail for inserting its genome into a host.
Bacteriophage T4 has a tail sheath that is composed of 138 copies of gene product (gp)18. The tail tube inside the sheath is estimated to be assembled from as many (gp)19 subunits as there are (gp)18 subunits in the sheath. The mature phage has a 1150Å - long and 850 Å wide prolate head, which encapsidates the genome.

913. A virus that can reproduce without killing its host is called a
(a) Lyric virus (b) Retroactive virus
(c) Temperate virus (d) Virion
CG PMT-2010

Ans. (c) : It only consists of its genome that may or may not is encapsulated in a protein coat. A virus that can reproduce without killing its host is called a temperate virus. Temperate virus is a virus which upon infection of a host. It does not necessarily causes lysis but its genome may replicate in synchrony with that of the host.

914. Who is credited to show that Viruses are the cause of cancer?
(a) GJ Mendel (b) HG Khorana
(c) MS Swaminathan (d) Dulbecco
CMC Vellore-2014

Ans. (d) : Renato Dulbecco was an Italian virologist, who won the 1975 Nobel Prize in Physiology or Medicine for his work on oncoviruses which are viruses that can cause cancer when they infect animal cells.
• When viruses highjack host cell and insert their own DNA or RNA into the host cell, this can cause the host cells to become cancerous.

915. Virus cause swollen shoot disease in:
(a) tomato (b) brinjal
(c) potato (d) cocoa
AP EAMCET-1999

Ans. (d) : Swollen shoot is a viral disease transmitted to the plant by mealybugs that has devastated Ghanaian and Nigreian cocoa crops.
The CSSVD is caused by a badnavirus within the family caulimoviridae. It is transmitted by infectious mealybugs.

916. Tobacco mosaic virus is a tubular filament of size
(a) 300 × 20 nm (b) 700 × 30 nm
(c) 300 × 10 nm (d) 300 × 5 nm
VMMC-2007

Ans. (a) : The TMV has a rod like appearance that is 300 nm long with a diameter of 20nm. TMV is a ssRNA virus, that is the causative agent of mosaic in tobacco and other members of the Solanaceae.

917. Which has double-stranded RNA?
(a) Cauliflower mosaic virus (b) TMV
(c) $\phi \times 174$ (d) Reovirus
(e) None of the above
CMC Vellore-2010

Ans. (d) : Reovirus is a double - stranded RNA virus that infects mammals , birds and reptiles.
Reovirus belongs to the family Reoviridae. The genome of viruses in Reoviridae contain 10-12 segments of double stranded RNA.
• Cauliflower mosaic virus contains dsDNA molecule.
• TMV is a ssRNA virus.
• $\phi \times 174$ is a ssDNA virus.

918. Viruses that infect bacteria, multiply and cause their lysis are
(a) lysozymes (b) lipolytic
(c) lytic (d) lysogenic
CMC Ludhiana-2012

Ans. (c) : The lytic cycle involves the reproduction of viruses using a host cell to manufacture more viruses, the viruses then burst out of the cell. The lytic phase of bacteriophages (Virus that infects bacteria) includes multiplications of viral particles followed by the disruption of the host cell to the release the virion
The lysogenic cycle involves the incorporation of the viral genome into the host cell genome, infecting it from within. Viruses that infect bacteria, multiply and cause their lysis are called lytic.

919. Plant viruses contain
(a) DNA (b) RNA
(c) Both (a) and (b) (d) Plasmids
AMU-2003

Ans. (b) : Most virus that infect plants use RNA to carry their genomic information. Generally plant virus are single stranded RNA virus. However, the majority of plant virus do not use DNA at all.

920. Litmus is obtained from :
(a) Rocella montagnei (b) Lasallia postillalata
(c) both (a) and (b) (d) Cladonia crispate
Haryana PMT-2005

Ans. (c) : Litmus is a dye obtained from various species of lichen e.g. *Rocella montagnei, Lasallia postillalata* etc.

@apna_pdf

03 PLANT KINGDOM

A. Basic Classification of Plant

1. Which of the following is/are grouped under phanerogams?

(a) Angiosperms (b) Gymnosperms
(c) Pteridophytes (d) Both (a) and (b)

VMMC-2012, 2002
JIPMER-2009
CG PMT-2008
Uttarakhand PMT-2008
BVP-2007
BHU PMT-2004

Ans. (d) : Phanerogams are also known as seed-producing plants, as they have special reproductive organs that produce seeds.

2. Linnaeus system of plant classification is based on

(a) morphological and anatomical characters
(b) evolutionary trends
(c) floral characters
(d) None of the above

Rajasthan PMT-2009
CMC Vellore-2009
Punjab MET-2009
UP CPMT-2009

Ans. (c) : Linnaeus System of plant classification is based on floral character. Floral characters were preferred because the floral characters are less affected by environment than the vegetative parts.

3. Natural system of classification proposed in

(a) Families of Flowering plants
(b) Historial plantarum
(c) Genera plantarum
(d) Species plantarum

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : Natural system of clasification is prposed by benthom and Hooker in 1887 to 1911 the discribe the clasification on his book Genera platarum.

4. Match the three columns and identify the correct combination

Group-I		Group-II		Group-III	
1.	Puccinia	P.	White spots in Brassica	X.	Basidiomycetes
2.	Alternaria	Q.	Leaf rust in Wheat	Y.	Phycomycetes
3.	Albugo	R.	Early Blight in potato	Z.	Deuteromycetes

(a) 1 – R – X, 2 – Q – Z, 3 – P – Y
(b) 1 – Q – X, 2 – R – Z, 3 – P – Y
(c) 1 – Q – Z, 2 – P – X, 3 – R – Y
(d) 1 – Q – Y, 2 – R – X, 3 – P – Z

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : Puccinia– It is a fungus which belongs to Basidiomycetes class. Puccinia is a heteroecious fungus i.e., it requires two different hosts for completing their life cycles. The Rust of wheat is caused by the fungus-*Puccinia graminis*.
Alternaria– It belongs to Deuteromycetes class of fungi, commonly known as imperfecti fungi because only the asexual or vegetative phases of these fungi are known.
Early blight of potato is caused by these fungus-*Alterneria soleni*, which can cause disease in potato, tomato other members of the potato family.
Albugo– This fungus is belongs to phycomycetes class. Members of phycomycetes are found in aquatic habitats and on decaying wood in moist places or as obligate parasite on plant.
White spots in Brassica is caused by the fungus-*Albugo candida*. It affects many brassica crops including broccoli and cauliflower and some brassica weeds.

5. Four plants are observed 'A' is a primitive land plant. 'B' is embryophytic archegoniate phanerogam. 'C' is autotrophic thallophyte showing haplontic lifecycle. 'D' is nonflowering plant with heterosporous sporangium. The plants found respectively are

(a) Spirogyra, Mucor, Funaria, Cycas
(b) Marchantia, Ginkgo, Spirogyra, Selaginella
(c) Marchantia, Cycas, Laminaria, Sphagnum
(d) Volvox, Pinus, Funaria, Salvinia

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : • Marchantia is a primitive land plant, it is a member of Bryophyta.
• Ginkgo is a embryophytic archegoniate phanerogam, which is a gymnaspormic plant.
• Spirogyra is a autotrophic thallophyte showing haplontic life cycle.
• Selaginella is a non flowering plant with heterosporous sporangium, it is a pteridophytes.

6. Choose the correct answer from the following:
A student identified three xerophytes A, B and C consisting of succulent leaf, succulent stem tuberous root, respectively.
Identify those plants in the same order.

(a) Aloe, Opuntia and Asparagus
(b) Opuntia, Aloe and Asparagus
(c) Aloe, Asparagus and Opuntia
(d) Asparagus, Aloe and Opuntia

TS EAMCET-31.07.2022 Shift-II

Ans. (a) : Aloe, Opuntia and Asparagus plants in the same order. Aloevera is a sacculent that can be grown indoors as a house plants. The leaves may tend to drop when placed in a low light setting. Aloevera is grown by for the gel in the leaves. A low - spreading cactus species, opuntia basilaris is a bushy sacculent shrub with grey, blue. Tuberous root are found in number of plants inducing Asparagus, Dahlia, sweet potato etc. In these plants, swollen roots form at or near the base of the original plant.

@apna_pdf

7. Benthem & Hooker divided the following plants into 3 classes which includes _____

(a) Dicotyledonae, Angiospermae, Monocotyledonae
(b) Dicotyledonae, Gymnospermae, Monocotyledonae
(c) Pteridophyta, Bryophyta, Angiospremae
(d) Bryophyta, Pteridophyta, Gymnospermae

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Benthem and Hooker gave the natural system of classification and it is based on important characteristics of the plant. The outline of Bentham and Hooker's classification is, "The seeded plants are divided into three classes- Dicotyledonae, Gymnospermae and Monocotyledonae.

8. One of the following scientists was the earliest to attempt more scientific basis for classification ————

(a) Linnaeus (b) Theophrastus
(c) Aristotle (d) Whittaker

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : The first person to try a more rational basis for classification was Aristotle. He divided plants into trees, shrubs, and herbs using straight forward morphological characteristics. Additionally he separated animals into two categories. Those with red blood and those without.

9. Choose the incorrect statement among the following.

(a) Any unit in the classification is called Taxon
(b) System of classification based on the evolutionary relationship is called phylogenetic system
(c) Development of fruit in the soils called geocarpic as in Arachis
(d) Theophrastus classified plants based on floral characters

TS EAMCET-10.08.2021 Shift-I

Ans. (d) : Theophrastus (370-287 BC) was a Greek naturalist and pupil of Plato and Aristotle
Based on the habit, the classified the plants into
Four (4) groups:
(1) Herbs
(2) Under shrubs
(3) Shrubs
(4) Trees
System of classification based on the evolutionary relationship is called phylogentic system.
Development of fruit in the soil called geocarpic. It is present in arachis.

10. The book 'Die Naturlichen Pflanzen familien' was written by_____

(a) J. Hutchinson
(b) Engler and Prantl
(c) Bentham and Hooker
(d) Theophrastus

AP EAPCET-07.09.2021 Shift-I

Ans. (b) : Engler and Prantl its collaborator Karl prantl carried out a monograph. "Die". Naturlichen pflanzen familien" on a twenty volume basis covering all the recognized genera of plants from algae to phanerogams, as well as the key for plant identification.
And published - 1887- 1915
Language - German.

11. Which one of the following books were contributed by Linnaeus?

(a) Historia Plantarum (b) Systema Naturae
(c) Historia Naturalis (d) Genus Naturae

AP EAMCET-05.10.2021 Shift-I
BCECE-2012

Ans. (b) : As the foundation for linear taxonomy, Swedish botanist, Scientist and Physician Carolus Linneaus introduced a book of bionomial nomenclature. The word systematics is derived from latin word 'systema' which means systematic arrangement of organism, Linnaeus used systema naturae as the title of his publication.

12. Assertion (A) : Socrates, Plato and Aristotle were responsible for the development of Botany into a science.
Reason (R) : They are regarded as Father of Botany.
The correct option among the following is
Options:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (c) : Theophrastus is regarded as the father of botany as he could explain various plant processes. Aristotle is regarded as the father of zoology.
The father of modern Botany is Carolus Linnaeus. He is also known as the father of taxonomy.

13. In which of the following books, characters of evolutionary importance were not considered while classifying plants?

(A) Species plantarum
(B) Families of flowering plants
(C) Genera Plantarum
(D) Die Naturlichen pflanzen familien
The correct answer is
Options:

(a) A, D only (b) B, C only
(c) B, D only (d) A, C only

TS EAMCET-28.09.2020 Shift-I

Ans. (d) : Speices plantarum two volume work by botanist Carolus Linnaeus in which he established a precise and workable two work or binomial, system for naming plants. This system forms the basis of modern plant taxonomy and genera plantarum's first edition includes brief descriptions of the 935 Genera of plants known to linnaeus at the time.

14. Match the following lists:

List -I	List - II
(A) Protonema	**I. Useful in spore dispersal**
(B) Circinate vernation young	**II. Coiling of leaves in Pteridophytes**
(C) Elaters	**III. Storage food in Rhodophyceae**
(D) Floridean starch of	**IV. Juvenile stage Bryophytes**
	V. Naked ovules

The correct match is

@apna_pdf

Options:

	A	B	C	D
(a)	IV	II	I	III
(b)	IV	II	III	V
(c)	I	II	IV	III
(d)	II	IV	V	I

TS EAMCET-28.09.2020 Shift-I

Ans. (a) :

List-I	-	List-II
(A) Protonema	-	Juvenile stage Bryophytes
(B) Circinate	-	coiling of leaves in pteridophytes
(C) Elaters	-	Useful in spore dispersal
(D) Floridean starch of	-	Storage food in Rhodophyceae

15. New systematics introduced by Sir Julian Huxley is also called _____

(a) Phenetics
(b) Biosystematics
(c) Cladistics
(d) Numerical Taxonomy

AP EAMCET-25.09.2020 Shift-I

Ans. (b) : New systematics introduced by Sir Julian Huxley is also called biosystematics. The notion of systematic known as new systematic or biosystematic identifies taxonomic affinities bassed on morphological, genetic and evolutionary features. Cladistics or phylogenetic classification produced by new systematic.

16. Match the following books with their authors:

	Column-I		Column-II
1.	Families of flowering plants	i.	Species plantarum
2.	Linnaeus	ii.	Historia plantarum
3.	Bentham & Hooker	iii.	Hutchinson
4.	Theophrastus	iv.	Genera plantarum

(a) (1 – ii), (2 – iii), (3 – i), (4 – iv)
(b) (1 – i), (2 – iii), (3 – ii), (4 – iv)
(c) (1 – iii), (2 – i), (3 – iv), (4 – ii)
(d) (1 – iv), (2 – iii), (3 – ii), (4 – i)

AP EAMCET-25.09.2020 Shift-I

Ans. (c) :

Column-I	Column-II
(1) Families of flowering plant, volume - I (1926) & II volume-II (1934)	Hutchinson
(2) Linnaeus	Species plantarum (1753)
(3) Bentham and Hooker	Genera plantarum (1862)
(4) Theophrastus	Historia plantarum

17. Floral characters such as single whorl of perianth or no perianth and unisexual flowers pollinated by wind were considered as primitive characters in _____system of classification

(a) Natural (b) Artificial
(c) Phylogenetic (d) Botanical

SRM JEEE-2019

Ans. (c) : Floral characters such as single whorl of perianth or no perianth and unisexual flowers pollinated by wind were considered primitive characters in the phylogenetic system of classification.
A phylogenetic tree, also called an evolutionary tree, is a tree showing the evolutionary relationships among various biological species or other entities that are believed to have a common ancestor.

18. Match Column - I with Column - II

Column - I		Column - II
A. Saprophyte	**i.**	**Symbiotic association of fungi with plant roots**
B. Parasite	**ii.**	**Decomposition of dead organic materials**
C. Lichens	**iii.**	**Grow on living plants or animals**
D. Mycorrhiza	**iv.**	**Symbiotic association of algae and fungi**

Choose the correct answer from the option given below

	A	B	C	D
(a)	(iii)	(ii)	(i)	(iv)
(b)	(ii)	(i)	(iii)	(iv)
(c)	(ii)	(iii)	(iv)	(i)
(d)	(i)	(ii)	(iii)	(iv)

NEET-2019

Ans. (c) : • Decomposition of dead organic materials is know as saprophyte.
• Grow on/in living plants & animals is called as parasite.
• Symbiotic association of algae and fungi is called as Lichens
• Symbiotic association of fungi with roots of higher plant is called as Mycorrhiza.

19. Match the following lists:

List I		List II	
A.	**C.G.K. Ramanujam**	**(i)**	**de Historia plantarum**
B.	**Sutton and Boveri**	**(ii)**	**Palynology**
C.	**Theophrastus**	**(iii)**	**sexual sytem of classification**
D.	**Carolus Von Linnaeus**	**(iv)**	**sexual reproduction in plants**
		(v)	**chromosome theory of inheritance**

The correct answer is

	(A)	(B)	(C)	(D)
(a)	(i)	(ii)	(iii)	(iv)
(b)	(ii)	(v)	(i)	(iv)
(c)	(ii)	(v)	(iii)	(i)
(d)	(ii)	(v)	(i)	(iii)

TS EAMCET-02.05.2018 Shift-II

@apna_pdf

Ans. (d) :

C.G.K. Ramanujan	–	Palynology
Sutton and Boveri	–	Chromosome theory of inheritance
Theophrastus	–	de-Historia plantarum
Carolus von Linnaeus	–	Sexual system of classification

20. Identify the wrong combination

(a) Dryopteris — Rhizome
(b) Cycas — Coralloid roots
(c) Volvox — Colonial form
(d) Marchantia — Pseudoelaters

JIPMER-2017

Ans. (d) : The bryophyte marchantia is a member of the Hepapticopsida, a group of liverworts they have hygroscopic elasters, which form inside the capsule along with the spores. Elasters aid in the dehiscence of the capsule and spore release. Dryopteris is a terrestrial fern. In cycas, coralloid root is present. Volvox is a green algae.

21. Match the storage products listed under column I with the organism given under column II. Choose the appropriate option from the given options

Column I	Column II
A. Glycogen	1. Sargassum
B. Pyrenoids	2. Nostoc
C. Laminarin and mannitol	3. Polysiphonia
D. Floridean starch	4. Spirogyra 5. Agaricus

Codes

	A	B	C	D
(a)	3	4	1	5
(b)	4	3	5	2
(c)	5	4	1	3
(d)	2	1	4	3

JIPMER-2017

Ans. (c) :

(A) Glycogen → 5. Agaricus
(B) Pyrenoids → 4. Spirogyra
(C) Laminarin and Mannitol → 1. Sargassum
(D) Floridean Starch → 3. Polysiphonia

22. Which of the following is a merit in the Bentham and Hooker's system of classification?

(a) The position of Gymnosperm in between dicots and monocots
(b) Closely related families are placed apart
(c) The placement of family Asteraceae in the beginning of gamopetalae
(d) The placement of order Ranales in the beginning
(e) The placement of Orchidaceae in microspermae

Kerala PMT-2008

Ans. (d) : Bentham and Hooker propounded the system of seed plant classification which is the most well developed natural categorization. Their work was published in Genera plantarum in three volumes between 1862 to 1883 in Latin.
Hence, the placement of order Ranales in the beginning is a merit in Bentham and Hooker's system of classfication.

23. Assertion: Higher plant have meristematic region for indefinite growth.
Reason: Higher plants have root and shoot apices.
(A) If both (A) and (R) are true and the (R) is correct explanation of the (A).
(B) If both (A) and (R) are true but the (R) is not correct explanation of the (A).
(C) If the (A) is true but the (R) is false.
(D) If both the (A) and (R) are false.
(E) If (A) is false, but (R) is true.

(a) A (b) B
(c) C (d) D
(e) E

AIIMS-1999

Ans. (a) : Meristematic tissues are embryonic in origin. Higher plant have meristematic region for indefinite growth. It is mainly present in the shoot and root apices and is responsible for their continuous growth. Hence, (A) and (R) are true and the (R) is correct explanation of the (A).

24. In Bentham and Hooker's system of classification the sub-class polypetalae and Gamopetalae have the cohorts in the ratio of

(a) 3 : 2 (b) 1 : 1
(c) 2 : 1 (d) 2 : 3

AP EAMCET-2014

Ans. (b) : In Bentham and Hooker's system of classification the sub-class polypetalae and gamopetalae have the cohorts in the ratio of 1 : 1

25. Which one of the following statements is wrong?

(a) Agar - agar is obtained from Gelidium and Gracilaria
(b) Chlorella and Spirulina are used as space food
(c) Mannitol is stored food in Rhodophyceae
(d) Algin and carragen are products of algae

AIPMT-2015

Ans. (c) : Mannitol is stored food in fucus. They are grown algae which is found in intertidal zones of rocky seashores. Algae can reserve food in their body for their future requirements. Mannitol is a form of complex carbohydrates that is stored in fucus which belongs to phaeophyceae order.
In Rhodophyceae stored food material is floridean starch.
Hence, mannitol is stored food in Rhodophyceae is wrong statement.

26. Chromatophores take part in :

(a) Respiration (b) Photosynthesis
(c) Growth (d) Movement

AIPMT (Re-Exam)-2015

@apna_pdf

Ans. (b) : Chromatophore are specialized cells which contains or produce pigment to give the colour to the organism or a specific part.
Chromatophores, found in some forms of photosynthetic Bacteria, contain bacteriochlorophyll pigments and carotenoids. They are mainly found in cold blooded animals like fish, amphibians, reptiles, crustacean and cephalopods.
They are used to match the brightness of the background. It helps the animals to achieve general resemblance.

27. Tracheophyta consists of
(a) bryophytes only
(b) pteridophytes only
(c) gymnosperms and angiosperms
(d) Both (b) and (c)

UP CPMT-2009

Ans. (d) : Tracheophyta consist of the plant with vascular tissue such as pteridophyta, gymnosperm and angiosperm.
They have dominant sporophytes phase with roots, stems and leaves, the sporophytes of tracheophytes is independent. Only angiosperm have vessels in the xylem for conduction of water and minerals.

28. Plants reproducing by spores such as mosses and ferns are grouped under the general term:-
(a) Cryptogams (b) Bryophytes
(c) Sporophytes (d) Thallophytes

AIPMT-2003

Ans. (a): A cryptogam is a plant or a plant like organism that reproduces by spores, without flowers or seeds. The name cryptogam means "hidden reproduction". All spores producing plants such as mosses and ferns, are known as cryptogams.

29. Organisms which obtain energy by the oxidation of reduced inorganic compounds are called
(a) Photo autotrophs
(b) Chemoautotrophs
(c) Saprozoic
(d) Coproheterotrophs

AIPMT-2002

Ans. (b) : The organisms which obtain energy by the oxidation of reduced inorganic compounds are called **chemoautotrophs**.
- **Photoautotrophs** make their food by photosynthesis using the energy of sun.
- **Saprozoic organism** obtain food from the dead and decaying matter.

30. Artificial system of classification was first used by
(a) Linnaeus
(b) De Candolle
(c) Pliny the Edler
(d) Bentham and Hooker

AIIMS-1999,1998
AIPMT-1989

Ans. (a) : Artificial system of classification is mainly based on morphological feature. This was first proposed by Carl Linnaeus.

31. Phylogenetic classification is one which is based on
(a) overall similarities
(b) utilitarian system
(c) habits of plants
(d) common evolutionary descent

AIPMT-1994

Ans. (d) : The phylogenetic classification is based on the evolutionary descent of a group of entities. Relationship are exhibited via a cladogram and a phylogram.

32. Identify the scientists worked extensively on chlorophyllous and non chlorophyllous thallophytes, respectively
i. Iyengar **ii. Swaminathan**
iii. Mehta **iv. Maheshwari**
(a) i, iv (b) i, iii
(c) ii, iii (d) iii, iv

AP EAMCET-2008

Ans. (b) : M.S. Swaminathan - M.S. Swaminathan, Indian geneticist and international administration, renowned for his leading role in Indian's **''Green revolution''.**
Iyengar and **Mehta** are scientists who worked extensively on chlorophyllous and non-chlorophyllous Thallophytes.
Maheshwari- Dr. Panchanan Maheshwari (9 November 1904-18 may 1966) was a prominent Indian botanist **(Father of Indian Embryologist)** noted Chiefly for his **invention of the technique of test tube fertilization of angiosperms.**
This invention has allowed the creation of new hybrid plants that could not previously be crossbreed naturally.

33. Which of the following is correctly matched without exception in regard to plant classification?
(a) Family – Poaceae - ae
(b) Division – Pteridophyta- Phyta
(c) Class – Bryopsida-sida
(d) Genus – Solanum - um

AIIMS-2013

Ans. (c) : For other plants we generally use the suffix "sida" while for class we use the suffix "phyceae" if we talk about the algae specifically.
Bryopsida is the largest class of Bryophyta with approx 1400 species. They are generally known as mossess. For example- Funaria, Sphagnum and Polytrichum.

34. Phytochrome is found in:
(a) bryophytes (b) pteridophytes
(c) angiosperms (d) all of these

AFMC-2003

Ans. (d) : Phytochrome mainly found in angiosperm (flowering plants).
It Phytochrome is a blue-green pigment present in plant and helps to detect light. It is found in many flowering plants, where it regulates the flowering time based on the length of day and night.

35. Father of botany is
(a) Linnaeus (b) Leeuwenhoek
(c) Theophrastus (d) Aristotle

Punjab MET-2008

@apna_pdf

Ans. (c) : Father of Botony is Theophrastus. Theophrastus was a greek naturalist, who is called as the father of Botany was the pupil of the great philospher Plato and Aristotle. He classified the plants into four groups one the basis of their habit.
(I) Herbs,
(II) Under shrubs
(III) Shrubs
(IV) Trees.

36. A group of plants which are autotrophs, their sex organs are non-jacketed and whose zygotes secrete thick wall are called
(a) phycophytes (b) lichens
(c) bryophytes (d) thallophytes

Punjab MET-2007

Ans. (d) : The division of the plant kingdom known as thallophyta contains simple looking, early forms of plant life ranging from single celled to enormous algae, fungus and lichens. The term 'thallophytes' refers to the first ten phyla. They are straight forward plants without stalks, leaves, or roots. They don't include embryophyte.
A group of plants which are autotrophs, their sex organs are non-jacketed and whose zygotes secrete thick wall are called thallophytes.

37. Systema naturae is concerned with
(a) solar system
(b) ecosystem
(c) classification of plants and animals
(d) natural selection

CG PMT-2005

Ans. (c) : Systema Naturae is one of the famous book of zoologist Carolus linnaeus. It deals with classification of plants and animals.

38. Five kingdom classification includes:
(a) Monera, Protista, Fungi, Plantae, Animalia
(b) Algae, Fungi, Bryophyta, Pteridophyta, Gymnosperms
(c) Virus, Prokaryote, Fungi, Plantae, Animalia
(d) Monera, Protista, Animalia, Plantae, Algae

DUMET-2006

Ans. (a) : Five kingdom classification includes monera, protista, fungi, plantae, Animalia. The first person who divided living things into five broad kingdoms, was north American Ecologist Robert Whittaker.

39. Phylogenetic system is based on:
(a) evolutionary and genetic character
(b) reproductive characters
(c) morphological characters
(d) natural affinities

DUMET-2006

Ans. (a) : Phylogenetic system is based on evolutionary and genetic character that display with help of DNA and RNA sequencing.

40. Consider the following statements. Select the false statement.
(a) Scientists who study and contribute to the classification of organisms are known as systematists
(b) Carolus Linnaeus developed the first scientific system of naming species
(c) A five kingdom arrangement of organisms was introduced by RH Whittaker
(d) Phycomycetes are called club fungi because of a club shaped end of Mycelium known as basidium
(e) None of the above

CMC Vellore-2015

Ans. (d) : The study of biological diversity and the interactions, between species is frequently referred to as systematic.
• Carolus Linnaeus developed the first scientific system of naming species known as binomial nomenclature.
• A five kingdom arrangement of organisms was introduced by RH Whittaker it divided into 5 - animalia, plantae, protista, fungi and monera.
• Phycomycetes are called algal fungi, Ascomycetes are sac fungi, basidimycetes are club fungi.

41. Match the words of Column I with that of Column II and choose the correct answer given below:

Column – I	**Column - II**
(A) Algae	**(P) Gymnosperms**
(B) Riccia	**(Q) Pond scum**
(C) Spirogyra	**(R) Autotrophic**
(D) Gnetum	**(S) Liverwort**

	(A)	**(B)**	**(C)**	**(D)**
(a)	(R)	(S)	(Q)	(P)
(b)	(P)	(S)	(Q)	(R)
(c)	(S)	(P)	(R)	(Q)
(d)	(R)	(Q)	(S)	(P)

Karnataka CET-2013

Ans. (a) : correct match:-

(A) Algae	-	(R) Autotrophic
(B) Riccia	-	(S) Liverwort
(C) Spirogyra	-	(Q) Pond scum
(D) Gnetum	-	(P) Gymnosperm

42. Mosses and ferns are
(a) Thallophytes of plant kingdom
(b) Angiosperms of plant kingdom
(c) Gymnosperms of plant kingdom
(d) Amphibians of plant kingdom

Karnataka CET-2013

Ans. (d) : Moss and ferns are called Amphibians of the plants kingdom because they can live in soil but need water to reproduce sexually. Archegonia is immobile so antherozoids are mobile and swim in water and fertilize with the egg of archegonia.

43. Who proposed the natural system of classification?
(a) Carolus Linnaeus
(b) John Hutchinson
(c) Bentham and Hooker
(d) Oswald Tippo

BVP-2011
DUMET-2003
AIPMT-1988

Ans. (c) : Bentham and Hooker proposed the natural system of classification. The first part of Genera plantarum appeared in July 1862 and last part in April 1883. Natural system of classfication is based on natural affinities among the plants and consider not only the external features but also the internal features.

@apna_pdf

44. Oswald and Tippo has divided plant kingdom in to:
(a) two sub kingdoms (b) three sub kingdoms
(c) four sub kingdoms (d) five sub kingdoms
Rajasthan PMT-1997

Ans. (a) : Oswald and Tippo, classified plant kingdom into two sub-kingdom, thallophyta and embryophyta on the basis of absence and presence of an embryo, which was again divided into spermatophyta.

45. The basis of phenetic classification is
(a) sexual characteristic
(b) dendrogram based on DNA characteristic
(c) ancestral lineage of existing organisms
(d) observable characteristic of existing organisms
Manipal-2014

Ans. (d) : Phenetic classification of organism is based on observable characteristic of existing organism. Phenetics is an attempt to classify organisms on basis of overall similarity, usually by morphology or other observable traits, regardless of their phylogeny or evolutionary relation, observable characters refer to morphology and their traits that can be observed.

46. How many sub-phyla are present in tracheata according to Tippos classification of kingdom plantae?
(a) 3 (b) 6
(c) 4 (d) 5
Manipal-2001

Ans. (c) : There are 4 sub-phyla present in tracheata according to Tippos classification of kindgom plantae. psilopsida lycopsida, sphenopsida and pteropsida.

47. Botanical herbarium of India are classified according to classification of :
(a) Bentham and Hooker
(b) Hutchinson
(c) Engler and Prantl
(d) Bauhin
Rajasthan PMT-2001

Ans. (a) : Botanical Herbarium of India are classified according to classification of Bentham and Hooker.
Herbarium plant speciman are arranged according to Bentham and Hookers classification the majority considers the reproductive parts of the plants.

48. In the prothallus of a vascular cryptogam, the antherozoids and eggs mature at different times. As a result
(a) There is no change in success rate of fertilization
(b) There is high degree of sterility
(c) One can conclude that the plant is apomictic
(d) Self-fertilization is prevented
BCECE-2012

Ans. (d) : Out breeding device when antherozoids and eggs mature at different time in plant, then it is known as out breeding device. As a result, self fertilization is prevented and cross fertilization occurs. The success rate of self fertilization decreases while that of cross fertilization increases. In the prothallus of a vascular cryptogenic plant, maturation of antherozoids & eggs mature at different times.

49. The division of the plant kingdom into Prokaryota and Eukaryota is based on the character of
(a) nucleus only (b) chromosomes only
(c) cell organelles only (d) All of the above
CG PMT-2004

Ans. (a) : The primary distinction between a prokaryotic cell & Eukaryotic cell is based on the nucleus. A cell having a pro or primitive nucleus is called as prokaryotic. 'Karyon' means nucleus.
In prokaryotic cell, membrane-bound cell organelles are absent. Prokaryotic cell are generally smaller and multiply more rapidly than eukaryotic cells.
The cells with well developed nucleus are called as Eukaryotic.

50. Order - Inferae belongs to
(a) Polypetalae (b) Gamopetalae
(c) Monochlamydae (d) None of these
BVP-2011

Ans. (b) : Order Inferae belong to gamopetalae, inferae means ovary is inferior and stamens are equal to the number of corolla lobes. These characteristics are found in Asteraceae family.

51. Archegonia are not found in
(a) bryophytes (b) pteridophytes
(c) gymnosperms (d) angiosperms
BVP-2011

Ans. (d) : Archegonia are not found in flowering plant that is Angiosperm. These are two reproductive structures in Angiosperm namely the Stamen or the Androecium, the male part which produce the pollen and the female part, which is called Gynoecium or the pistil.
Archegonia is present in thallophytes, bryophytes, pteridophytes and gymnosperms.

52. In which book, Bentham and Hooker proposed their classification?
(a) Genera Plantarum (b) Species Plantarum
(c) Historia Plantarum (d) Historia Naturae
WB JEE-2008

Ans. (a) : • Historia plantarum is written by Theophrastus.
• Species plantarum is written by botanist Carolus linnaeus.
• Historia naturae is written by Pling the Elder.
•The Natural system of classification is given by Bentham and Hooker. It is published in their book genera plantarum.

53. I. In Rhodophyceae, food is stored in the form of mannitol and laminarin.
II. The ovules of Gymnosperms are not enclosed by ovary wall.
III. Salvinia is heterosporous.
IV In the diplontic life-cycle, the free living gametophyte represents the dominant phase. Of the above statements.
(a) II and III are correct but I and IV are wrong.
(b) II and IV are correct but I and III are wrong.
(c) III and IV are correct but I and II are wrong.
(d) I and II are correct but III and IV are wrong.
(e) I and IV are correct but II and III are wrong.
Kerala PMT-2013

@apna_pdf

Ans. (a) : (I) The ovules of gymnosperm are not enclosed by ovary wall.
(III) salvinia is heterosporous, where as in Rhodophyceae food is stored in the form of floridean starch. In the diplontic life-cycle, diploid sporophyte is dominant.

54. A system of classification in which a large number of traits are considered is
(a) phylogenetic system
(b) artificial system
(c) natural system
(d) synthetic system

Punjab MET-2010

Ans. (c) : The natural system of classification takes into accounts the similarities and dissimilarities between various organisms. Various features taken in to consideration are morphology, physiology, Anatomy, reproduction, cytochemistry, biochemistry etc. This was proposed by. Bentham and Hooker in "Genera plantarum".

55. Kingdom-Plantae was divided into….. divisions by Engler and Prantl
(a) 10 (b) 11
(c) 13 (d) 14

Punjab MET-2011

Ans. (c) : German botanists Adolf Engler (1843-1930) and Karl Prant (1849-1893) published their work as "Die Naturalichen Pflanzen Familien" (the natural plant families) in 23 valumes. The 303 families of flowring plants have been categorized they created 13 divisions to organize the plant kingdom.

56. The following plants are devoid of some vital organs. Arrange these in the order of absence root, stem, leaf, flower and fruit, respectively.
I. Rafflesia II. Equisetum
III. Ceratophyllum IV. Gnetum
V. Taeniophyllum
The correct order is
(a) V, I, III, II, IV (b) II, IV, I, III, V
(c) I, III, V, IV, II (d) III, I, V, II, IV

AP EAMCET-2010

Ans. (d) : Ceratophyllum these plants have no root system but some time they developes modified leaves which act as root that help to the plant body for attachment of the bottom surface.
Rafflesia :- These plants has no stem, leaves and true roots. It is an endoparasite of vein in the genus Terrastigma. It is a total root parasite.
Taeniophyllum:- It is a leafless orchid with an extremely reduce system and flattened assimilating root.
Equisetum It is the only living genus in the equisetaceae a family of vascular plant that produce by spore 12. **Gnetum:-** It is a genus of gymnosperm. They are tropical evergreen plant shrubs and lianas. Unlike other gymnosperm they possess vessel element in the xylems.

57. Which one shows the correct descending sequence with reference to the number of cohorts?
(a) Bicarpellatae, Disciflorae, Heteromerae, Calyciflorae
(b) Heteromerae, Inferae, Disciflorae, Calyciflorae,
(c) Thalamiflorae, Calyciflorae, Disciflorae, Inferae
(d) Disciflorae, Thalamiflorae, Calyciflorae, Heteromerae

AP EAMCET-2008

Ans. (c) : Thalamiflorae, Calyciflorae, Disciflorae and Inferae are show the correct descending sequence with reference to the number of cohorts.

58. The system of classification of plants proposed by these two botanists is claimed to be a natural system.
(a) Engler and Prantl
(b) Bentham and Hooker
(c) Aristotle and Theophrastus
(d) Darwin and Wallace

Karnataka CET-2012

Ans. (b) : The natural system of classification is given by Bentham and Hooker. It is based on natural observation of species.

59. Two plants can be conclusively said to belong to the same species if they :
(a) Have same number of chromosomes
(b) Can reproduce freely with each other and form seeds
(c) Have more than 90 percent similar genes
(d) Look similar and possess identical secondary metabolites.

AIPMT-2007

Ans. (b) : If two plants can reproduce freely with each other and form seeds, they are concluded to belong to the same species. Plants belonging to the same species have most of their every characteristics common and will be able to reproduce freely with each other to produce new generations.

60. According to classification of Ostwald Tippo; plant kingdom is divided into
(a) Thallophyta and vascular plants
(b) Spematophyta and Cryptogames
(c) Thallophyta and Embryophyta
(d) Phanerogames and Cryptogames

UP CPMT-2014

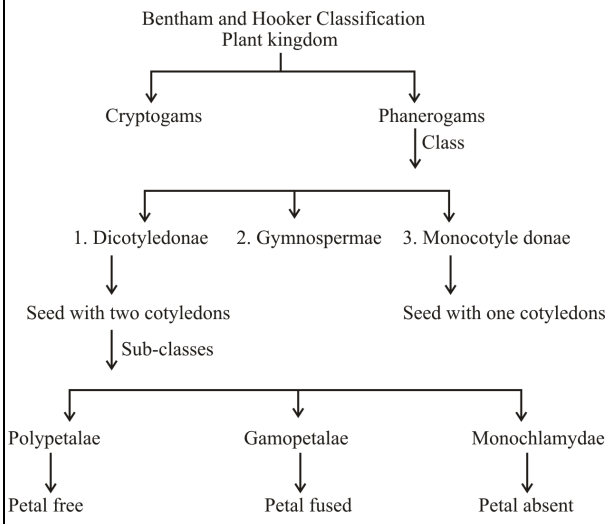
Ans. (c): Ostwald Tippo classification include plants into in which embryo are not formed (Thallophyta) and Embryophyta (in which embryo is formed).
Division- Thallophytic consists of algae and fungi, while embryophyta is further divided into Bryophyta, Pteridophyta, Gymnosperm and Angiosperm (division-phanerogames).

61. Bentham and Hooker had placed gymnosperms with dicotyledons and monocotyledons in their classification. Which are further divided into sub-classes and series? Under which series, family-Leguminosae is placed
(a) Coronarieae (b) Thalamifiorae
(c) Calyciflorae (d) Disciflorae

UP CPMT-2014

@apna_pdf

Ans. (c):



- Polypetalae has following series.

→ Thalamoflorae : - Petal and stamen (Hypogynous)
e.g. cruciferae, malvaceae

→ Disciflorae : - Petal and stamen (Hypogynous)
A Nectaferous disc at the base of ovary
e.g. Rutaceae.

→ Calyciflorae : - Petal and stamen perigynous/epigynous
e.g. Legumenaceae, cucurbetaceae.

Series calyciflorae include family legumenaceae under order - Rosales.

62. Heterothalism was discovered by

(a) Blakeslee
(b) Bessey
(c) Butler
(d) A. Flemming

UP CPMT-2006

Ans. (a) : The condition of sexual reproduction that Blakeslee observed in some species of mucorates where in conjugation is possible only through the interaction of two differing thalli is known as heterothallism. Blackeslee coined the term heterothallism in 1904.

63. Systematic botany means

(a) system analysis
(b) systematic arrangement of organs of plants
(c) systematic study of organelles and tissues
(d) methodical study of plants, dealing with identification, naming and classification

J&K CET-2009

Ans. (d) : The term systematics includes taxonomy and phylogeny i.e. identification, nomenclature, classification and evolutionary relationships.
- Taxonomy is also called systematic botany.
- The term systematic was given by C. Linnaeus.

64. Match the following lists

List -I		List – II	
(A)	Salvinia	(I)	Submerged, suspended hydrophyte
(B)	Lichens	(II)	Amphibious plant
(C)	Rhizophora	(III)	Heterosporus plant
(D)	Utricularia	(IV)	Soil formation
		(V)	Halophyte

The correct answer is

	(A)	(B)	(C)	(D)
(a)	(III)	(IV)	(V)	(I)
(b)	(III)	(II)	(V)	(I)
(c)	(V)	(III)	(IV)	(I)
(d)	(V)	(II)	(I)	(III)

AP EAMCET-2014

Ans. (a) :
Salvinia – Heterosporous plant
Lichen – Soil formation
Rhizophora – Halophyte
Utricularia – Submerged suspended hydrophyte

- Selaginella and salvinia are heterosporous pteridophytes.
- Lichens are symbiotic associations i.e. mutually useful associations, between alage and fungi. They help in soil formation.
- **Rhizophora:-** It is a facultative halophytes that grows in water of high salivity.
- **Utricularia:-** It is completely submerged and suspended in water, but not rooted.

65. A plant which lives for a few days is called

(a) annual (b) perennial
(c) biennial (d) ephemeral

JCECE-2010

Ans. (d) : Ephemeral plants are plant that grow and reproduce very quickly to take advantages of optimal conditions because of a very short growing season. These types of plant found near deserts for eg. Arabidopsis species.

66. Read the following five statements (A to E) and select the option with all correct statements:-

(A) Mosses and Lichens are the first organism to colonize a bare rock
(B) Selaginella is a homosporous pteridophyte
(C) Coralloid roots in Cycas have VAM (Main plant body in bryophytes is gametophytic, whereas in pteridophytes it is sporophytic
(D) In bryophyte the main plant is the gametophyte, whereas in pteridophyte it is the sporogenous plant.
(E) In gymnosperms, male and female gametophytes are present within sporangia located on sporophyte.

(a) (B), (C) and (D) (b) (A), (D) and (E)
(c) (B), (C) and (E) (d) (A), (C) and (D)

AIPMT-2015

Ans. (b) : Lichens and mosses are members of the pioneer species. They are the first living things to settle on an uninhabited rock. Pioneer community is the one which arises first on a bare rock or land. Bryophytes

@apna_pdf

have diploid sets of chromosomes, while Pteridophytes have haploid set of chromosomes.
The main plant body of bryophytes is gametophytic means they have two sets of chromosomes, they are non-vascular, that is xylem and phloem are not present, in them.
Gymnosperms, male and female gametophytes are present within sporangia located on sporophytes Gymnosperms are seed bearing plant.
Selaginella belong to pteriodophytes but they are heterosporous, that is spore are differentiated into males and females.
VAM is a type of Fungal association with plants in which fungal hyphae enters the roots of the plant via penetration and thus starts absorbing the plant nutrients, but in the root of cycas, cynobacteria are present, VAM is not present in root of cycas.

67. Which one pair of examples will correctly represent the grouping Spermatophyta according to one of the schemes of classifying plants: -

(a) Acacia, Sugarcane (b) Pinus, Cycas
(c) Rhizopus, Triticum (d) Ginkgo, Pisum

AIPMT-2003

Ans. (d): Gymnosperms and angiosperms are both members of the spermatophyte, which contains plants that produce seeds.

- Ginkgo is a gymnospermic plant so it comes before and pisum (Pea) is angiospermic plant.
- Rhizopus, triticum (Fungi and Angiosperm respectively)
- Pinus, cycas (both belongs gymnosperms)
- Acacia, sugercane (both belongs Angiosperms)

68. Match items in Column I with those in Column II –

Column I		Column II	
(A)	Peritrichous flagellation	(J)	Ginkgo
(B)	Living fossil	(K)	Macrocystis/
(C)	Rhizophore	(L)	Escherichia coli
(D)	Smallest flowering plant	(M)	Selaginella
(E)	Largest Perennial algae	(N)	Wolffia

Select the correct answer with the following

(a) A –L ; B –J; C –M ; D – N ; E – K
(b) A– K ; B – J; C – L ; D –M; E – N
(c) A– J ; B – K; C – N ; D –L; E – K
(d) A– N ; B – L; C – K ; D – N; E –J

AIPMT-2005

Ans. (a) : Ginkgo belongs from gymnosperm, as a living fossil.

- E. coli express as peritrichous flagellation.
- Rhizophore is the feature of selaginella.
- Wolffia is smallest flowering plant.
- Macrocystis is the three to four species of brown algae, which is largest alga in the world.

69. The oldest fossil belongs to which of the following group of plants/animals?

(a) Asteroideae (b) Rhodophyceae
(c) Blue green algae (d) Phaeophyceae

MGIMS Wardha-2013

Ans. (c) : The oldest fossils belongs to blue-green algae. They have an extensive fossil records. The oldest known fossils, of cyanobacteria (i.e. blue-green algae) is from Achaean rocks of western Australia, dated 3.5 billion years old.

70. Diversification in plant life appeared

(a) due to long periods of evolutionary changes
(b) due to abrupt mutations
(c) suddenly on earth
(d) by seed dispersal

Manipal-2007

Ans. (a) : The plants first grew as thalloid without any roots, stems, leaves, and developed non-vascular plants, such that no vascular tissues were present. It was the initial stage of diversification. The occurrence of such evolutionary changes took a longer period of time, due to which diversifications in plants appeared. The diversification in plant life appeared due to long periods of evolutionary changes.

71. Classification based on chromosome number is:

(a) cytotaxonomy
(b) numerical taxonomy
(c) karyotaxonomy
(d) biochemistry

BCECE-2005

Ans. (a) : Classification taxonomy has taken an account of the classification of organisms by taking data from various fields like morphology, anatomy, embryology, physiology, etc. The modern approach to taxonomic classification is based on acquiring data from other subjects or complex field of biology only. Thus, we can have :

Cytotaxonomy :- Cytotaxonomy is based on cytological information like chromosome number, cellular structure, meiotic behavior.

Numerical taxonomy :- Which is carried out using computers is based on all observable characteristics.

Karyotaxonomy– It is the classification of living organism based on the structure and the number of chromosome.

Biochemistry– Biochemistry explores chemical process related to living organisms.

72. Archegonia are not found in

(a) Bryophytes (b) Pteridophytes
(c) Gymnosperms (d) Angiosperms

BCECE-2011

Ans. (d) : Archegonia are female sex organs present in bryophytes (first land plants), pteridophytes (vascular cryptogams) and gymnosperms (non flowering plants). In angiosperms, archegonia are absent.

73. Heterospory is the production of :

(a) sexual and asexual spores
(b) large and small spores
(c) haploid and diploid spores
(d) diploid and tetraploid spores

Punjab MET-2003

@apna_pdf

Ans. (b) : Heterospory is a phenomenon in which two types of spores are formed by the same plant. The size of these spores are different. The smaller one is known as microspore and the larger one is known as megaspore. The megaspore germinates to form the female gametophyte and the microspore germinates to form the male gametophyte.
It is considered as an important step in evolution as it is a precursor to the seed habit. Heterospory was evolved first in pteridophytes such as Selaginella and Salvinia.

74. Which one of the following is considered important in the development of seed habit?
(a) Homospory
(b) Heterospory
(c) Dependent sporophyte
(d) Free living gametophyte
(e) Haplontic life-cycle

Kerala PMT-2015

Ans. (b) : Heterospory is an expression of sex determining spores of the plant.
It is the important evolutionary development in the vascular plants because it is precursor to seed development, e.g. Selaginella, Salvinia, Azolla, etc.

75. Fruits are formed in :
(a) Brassica (b) Fern
(c) Cycas (d) Funaria

MGIMS Wardha-2005

Ans. (a) : Fruit formation is the characteristic feature of angiospermic plants for eg. Brassica.

76. The non-nucleated, unicellular organisms of Whittaker's (1969) classification are included in the kingdom
(a) Protista (b) Monera
(c) Animalia (d) Plantae

CG PMT-2007

Ans. (b) : R.H. Whittaker (1969) proposed a five kingdom classification. The kingdom defined by him were named Monera, Protista, fungi, plantae and Animalia. The non-nucleated, unicellular organism are monera.
Kingdom Monera includes bacteria and they are the most abundant micro-organisms.

77. Two kingdom system of classification was given by:
(a) Linnaeus (b) John Ray
(c) Copeland (d) Whittaker

Haryana PMT-2002

Ans. (a) : Carolus Linnaeus in 1758 gave the two-kingdom classification system. He placed all the living organisms into two kingdoms. The two major kingdoms were Kingdom Plantae for plants and Kingdom Animalia for animals.
This classification laid the base for modern classification and was considered quite reasonable at the period of time, plants and animals in this system was very clearly distinguished.

78. Five-kingdom scheme to classify living beings has been proposed by
(a) JBS Haldane (b) GG Simpson
(c) E Mayr (d) R H Whittaker

CG PMT-2011, 2009

Ans. (d) : R. H. Whittaker proposed the five-kingdom classification. He divided the living organisms into five different kingdoms i.e. Monera, Protista, Fungi, Plantae and Animalia.
The important criteria of the five-kingdom classification were cell structure, body organization, mode of nutrition, reproduction, and phylogenetic relationships.

79. System of classification proposed by Linnaeus
(a) botanical system of classification
(b) sexual system of classification
(c) natural system of classification
(d) None of the above

Haryana PMT-2008
CG PMT-2006

Ans. (b) : Carolus Linnaeus proposed the artificial system of classification. Linneaus sexual system was presented by Ehret in 1736. It is mainly based on the morphological characters, non-evolutionary features.
Artificial system of classification is based on only one or a few characters. They were mainly based on vegetative characters or on the androecium structure. This is somewhat bold description.

80. Gall nuts on plants in produced by
(a) larva of dipterous insects
(b) larva of Anopheles
(c) microorganism
(d) fungi

BHU PMT (Screening)-2011

Ans. (a) : Gall nuts are pathological excrescences formed on young branches or twigs of plants, induced by insect attacks, as a result of deposition of the eggs. After sometimes the gall development stops. The insects becomes enclosed by the gall and starts feeding on gall tissues during its development. The holes on the outside of the gall indicate that the adult insects have emerged.
Gall wasps are considered to be the most important insects that induce plant galls.

81. Which of the following plant does not belong to embryophyta?
(a) Dryopteris (b) Funaria
(c) Cycas (d) Ulothrix

BHU PMT (Screening)-2011

Ans. (d) : Vascular tissue is transport of water and mineralls. It is absent in Algae (Ulothrix is a green algae). Non vascular embrophytes are the plants lacking vascular tissues, which help in transport of water and nutrients. They are also called as land plants. The embryophyta consists of bryophytes and polysporangiophytes. Living embryophytes therefore, includes hornworts, liverworts, mosses, lycophytes, ferns, gymnosperms and flowering plants.
Ulothrix does not belong to embryophyta because it is a genus of green algae. Since, algae lack embryo, they are placed in sub-kingdom Thallophyta.

82. In Bentham and Hooker's classification the way of arrangement of the three series of polypetalae reflects. This gradual evolution of flower from:
(a) dichlamydeous to monochlamydeous condition
(b) apocarpy to syncarpy
(c) hypogyny to epigyny
(d) bisexuality to unisexuality

AP EAMCET-2002

@apna_pdf

Ans. (c) : Dicotyledons were classified by Bentham and Hooker, into three sub-groups i.e. Ploypetalae, Gamopetalae and Monochlamydeae. They further classified Polypetalae into the flowing three series:-

1. Thalamiflorae - Plants with hypogynous flowers are included.
2. Discflorae - Plants with hypogynous flowers and nectariferous discs are included.
3. Calyciflorae - Plants with perigynous and epigynous flowers are included.

Thus the way of arrangement of three series of polypetalae reflects a gradual evolution from hypogyny to epigyny. The condition in which, the calyx, corolla and stamens are situated below the ovary and free from it, on the axis is known as hypogyny. The flowers having such arrangement are called as hypogynous flowers.

Epigyny is defined as a condition where the ovary is inferior with respect to the other parts of flower, and such a flower is known as an epigynous flower.

83. Huxley is father of

(a) classical taxonomy
(b) artificial taxonomy
(c) neo-taxonomy
(d) adansonian taxonomy

Haryana PMT-2008

Ans. (c) : Huxley is regarded as the father of neo-taxonomy. The branch of science which deals with the classification of the organism is known as the neo-taxonomy.

84. Which of the following taxonomist described classification of plant in families of flowering plant?

(a) Eichler (b) Hutchinson
(c) Thakhtajan (d) Benson

BVP-2013

Ans. (b) : The book 'Families of the flowering plants' written by John Hutchinson who was an English botanist and taxonomist. In his book 'Families of the flowering plants', he classified plants into two categories i.e. monocotyledons and dicotyledons, which were classified further.

The classification was based upon many characters such as the structure of their cells, mode of nutrition, organizations of their bodies, reproduction, etc.

85. The book "Historia Plantarum" was written by:

(a) Bauhin (b) Theophrastus
(c) Malpighi (d) Bentham

AP EAMCET-2000

Ans. (b) : The book "Historia Plantarum" was written by Theophrastus who is known as father of botany. He was a Greek philosopher and the first person that tried to classify plants on the basis of their morphological features. On the basis of their heights, girth and branches, the plants were classified as trees, shrubs, sub-shrubs and herbs.

86. Tracheophyta consists of

(a) bryophytes only
(b) pteridophytes only
(c) gymnosperms and angiosperms
(d) Both (b) and (c)

Rajasthan PMT-2009

Ans. (d) : Bryophyta, gymnosperm and angiosperms are present in tracheophyta. Tracheophytes are the plants which have vascular bundles, which includes xylem and phloem. They are conducting tissues of plants. They form diploid spores.

87. The vascular cryptogames are :

(a) bryophytes (b) pteridophytes
(c) angiosperms (d) none of these

Rajasthan PMT-2000

Ans. (b) : Due to the presence of xylem and phloem in their vascular bundles Pteridophytes are known as **vascular cryptogams.** They are seedless and the production of spores is seen in their life cycle.

88. Term New Systematic was given by

(a) Julian Huxley (b) Bateson
(c) Linnaeus (d) Darwin

BCECE-2008

Ans. (a) : Julian Huxley was the botanist who introduced the term 'New systematics' in 1940. As per 'New Systematics' approach, Huxley points are explained with evolutionary, genetic and morphological traits on the basis of which the new taxonomic affinities are brought.

89. Dense evergreen vegetation of broad sclerophyllous leaves and shrubs with fire resistant resinous plants is known as

(a) chaparral vegetation (b) savannah vegetation
(c) steppe grassland (d) tundra vegetation

Haryana PMT-2011

Ans. (a) : Dense evergreen vegetation of broad sclerophyllous leaves and shrubs with fire resistant resinous plants is known as chaparral vegetation. It is a shrubland or heathland plant community found primarily in Mexico. Chaparral vegetation occurs in mediterranean area, pacific coast of North America, Chile, South Africa and South Australia. The climate here is hot with dry summers and wet winters, with annual rainfall of 60-80 cm.

90. The genera that lacks cotyledons but is placed with dictoyledonous plants, in classification is

(a) Datura (b) Capsicum
(c) Triticum (d) Cascuta

AMU-2001

Ans. (d) : The cuscuta is a parasitic flowering plant that is found in the tropical and temperate regions. This plant lacks cotyledons and it is a parasitic plant.

B. Algae

91. Agar-agar is obtained from:

(a) green algae (b) blue-green algae
(c) red algae (d) brown algae

VMMC-2012, 2011, 2010
UP CPMT-2012, 2008
BVP-2012 / JIPMER-2009
MGIMS Wardha-2008
CMC Ludhiana-2008
AFMC-2003 / BCECE-2002
BVP-2001
Rajasthan PMT-2006, 2000
AMU-2006, 1996, 1995

@apna_pdf

Ans. (c) : Agar-agar is obtained from red algae for ex. Gelidium, Gracilaria and Eucheuma.

92. Which of the following is a phaeophycean algae?

(a) Gelidium (b) Polysiphonia
(c) Porphyra (d) Laminaria
(e) Gracilaria

Kerala PMT-2012
UP CPMT - 2010
Punjab MET - 2009
AFMC-2000
BVP-2000

Ans. (d) : The pheophycean algae or brown algae is a large group of mostly marine multicellular algae, including many sea weeds of colder northern hemisphere waters. They play an important role in marine environments both as food and for the habitats.

93. Zygote of Spirogyra produces four haploid nuclei, in which :

(a) one is functional (b) two are functional
(c) three are functional (d) all are functional

Uttarakhand PMT-2004
Manipal-2004
UP CPMT-2001
AMU-2005

Ans. (a) : The zygospore is the union of the protoplasmic mass of two gametes which is called zygote (zygospore). Zygospores are the only diploid stage in the life cycle of spirogyra. The diploid zygospore nucleus undergoes meiosis and forms 4 nuclei three of these aborts and only one is functional prior to germination. It undergoes transverse division to give, rise single filament.

94. Iodine is obtained from

(a) Laminaria (b) Chlorella
(c) Polysiphonia (d) Porphyra

CMC Vellor -2013
Haryana PMT - 2011
MGIMS Wardha-2008
JIPMER-2008
BHU PMT (Screening)-2007

Ans. (a) : Laminaria contains iodine, a component that the body needs to make thyroid hormone.
It is a type of seaweed known as laminaria is indigenous to Japan. additionally, it is a good source of potassium and iron.

95. Which of the following is an algal parasite?

(a) Volvox (b) Ulothrix
(c) Porphyra (d) Cephaleuros

BCECE-2014
Uttarakhand PMT-2008
BHU-PMT (Screening)-2008
Rajasthan PMT-2006
BHU PMT-2004

Ans. (d) : Cephaleuros is a parasitic because being green algae it grows on other plants for providing support, but as long as it resides on another plant, during favorable conditions it behaves as parasitic. It is a genus of parasitic thalloid green algae comprising approximately 14 species. It infects plants and causes red rust disease.

96. Which of the following is known as pond silk ?

(a) Spirogyra (b) Ulothrix
(c) Nostoc (d) Anabaena

HP CET-2011
CG PMT-2010
BCECE-2006
VMMC-2005
AMU-2004

Ans. (a) : Spirogyra possesses a spiral arrangement of chloroplast, which are chlorophyll, containing green pigments. Pond silk is another name for it. It has two-layered cell walls, the inner layer is made up of cellulose whereas the outer layer is made up of pectin.

97. Which one is a parasitic alga?

(a) Oedogonium (b) Cephaleuros
(c) Spirogyra (d) Cladophora

JIPMER-2018
Rajasthan PMT - 2005
Uttarkhand-2005
BVP - 2002
BHU PMT-2001

Ans. (b) : *Cephaleuros* is a genus of parasitic algae which causes red rust of tea and coffee.
- *Cephaleuros virescens* → causes red rust of tea.
- *Cephaleuros arabica* → caused red rust of coffee.

98. Floridean starch is the stored food in

(a) Gracilaria
(b) Spirogyra
(c) Sargassum
(d) Charia

TS EAMCET-10.05.2023, Shift-II

Ans. (a) : Floridean starch is food in graularia
- Floredian starch is the chorectristic photosynthesis reserbe sabtance of Red Algai ocuring Aboundantly in certain Basin shaped grain cells.
- Most Rhodophyceae store starch outside the chloroplast often As A cap over a bulging pyrenoid.
- The major corbohydrate storage product of Red Algai is a type of starch molecule (Florediah starch) that is more highly branched than Amylopactin

99. Match the following

List-I		List-II	
A.	Monoecious plant	1.	Cycas
B.	Vivipary	2.	Liverworts
C.	Gemma	3.	Rhizophora
D.	Heterogametes	4.	Chara

@apna_pdf

(a) A – II, B – III, C – I, D – IV
(b) A – III, B – IV, C – I, D – II
(c) A – IV, B – III, C – I, D – II
(d) A – IV, B – III, C – II, D – I

TS EAMCET 10.05.2023 Shift-I

Ans. (d) :

List-I		List-II	
A.	Monoecious plant	IV.	Chara
B.	Vivipary	III.	Rhizophora
C.	Gemma	II.	Liverworts
D.	Heterogametes	I.	Cycas

100. Assertion (A) : Most of the algal genera have haplontic life cycle
Reason (R) : Fucus show diplontic life cycle
The correct option among the following is
(a) (A) and (R) are true. (R) is the correct explanation for (A)
(b) (A) and (R) are true, (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET 10.05.2023 Shift-I

Ans. (b) : Most of the alga shows haplontic life cycle but some are shows different types of life cycle. e.g.
Diplontic- Fucus, Sargassum, diatoms etc.
Diplobiontic- Ulva, ectocarpus.
Triplobiontic- Batrachospermum.

101. Match the following

List-I		List-II	
A.	Nostoc	1.	Plasmodium
B.	Mycoplasma	2.	Auxospores
C.	Diatoms	3.	Witches broom
D.	Sporozoan	4.	Heterocyst

(a) A – III, B – IV, C – I, D – II
(b) A – II, B – III, C – IV, D – I
(c) A – IV, B – III, C – II, D – I
(d) A – IV, B – III, C – I, D – II

TS EAMCET 10.05.2023 Shift-I

Ans. (c) :

List-I		List-II	
A.	Nostoc	IV.	Heterocyst
B.	Mycoplasma	III.	Witches broom
C.	Diatoms	II.	Auxospores
D.	Sporozoan	I.	Plasmodium

102. Female sex organ in Polysiphonia of Rhodophyceae
(a) Spermatia
(b) Carpogonium
(c) Cystocarp
(d) Archegonium

TS EAMCET 10.05.2023 Shift-I

Ans. (b) : • Most of the Red algae are marine. Red colour due to the presence of phycoerythrin which reflects red light and absorb the blue light.
• reproduction is specialized with male gamete- spermatium being non motile. It is carried passively by the water currents and is lodged in the trichogyne of the female sex organ- **Carpogonium,** It is a flask- shaped structure, the basal part is swollen having a single egg.

103. Identify the correct pair from the following

A	**Golden algae**	**-diatoms**
B	**Trichodesmium erythrium**	**-Red Sea**
C	**Kieselguhr**	**- Chrysophytes**
D	**Red tides of Mediterranian sea**	**- Dinoflagellates**

(a) B C D (b) A B C
(c) A C D (d) A B D

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Correct pair is-

B	Trichodesmium erythrium	-Red Sea
C	Kieselguhr	-Chrysophytes
D	Red tides of Mediterranian sea	- Dinoflagellates

104. The following is extracted from Laminaria
(a) Algin (b) Agar
(c) Iodine (d) Carrageen

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : Iodine extracted from brown algae Laminaria which is belongs to class pheophyceae (brown algae).

105. Which classes of algae possess pigment fucoxanthin and pigment phycoerythrin, respectively?
(a) Chlorophyceae and Rhodophyceae
(b) Rhodophyceae and Phaeophyceae
(c) Phaeophyceae and Chlorophyceae
(d) Phaeophyceae and Rhodophyceae

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : Fucoxanthin is a xanthophylls carotenoid abundant in macro algae, such as brown sea weeds (pheophyceae).
• Phycoerythrin is a major light- harvesting pigment of red algae and cyanobacteria.
• The pheophyceae photosynthetic pigments include chlorophyll A, C and β carotene and xanthophylls like fucoxanthin.
• Fucoxanthin partially mask the chlorophyll and carotenoid there by giving the characteristic brown coloration.
• Rhodophyceae (Red algae) photosynthetic pigments chlorophyll A and D and biliproteins such as r-phycoerythrin and r-phycocyanin.

@apna_pdf

106. Reserve food in the form of floridean starch and the soluble sugar-floridoside is found in

(a) Phaeophyta (b) Chlorophyta
(c) Cyanophyta (d) Rhodophyta.

Karnataka CET - 2023
AMU-1998

Ans. (d) : In Rhodophyta, reserve food material is floridean starch. Floridean starch (which stains red with iodine solution) and also soluble sugars called floridoside and glycerol compounds. Rhodophyta are the only ones not to produce motile forms. Example of red algae are Porphyra and Gelidium.

107. Match the following. The correct combinations are

List-I	List-II	List-III
A) Cryptomonas	**i) Pantonematic**	**p) 1 row of lateral appendages**
B) Polytoma	**ii) Stichonematic**	**q) No lateral appendages and terminal filament**
C) Euglena	**iii) Acronematic**	**r) 2 rows of lateral appendages**
D) Monas	**iv) Anematic**	**s) Terminal filament**

(a) $(A-iv-r),(B-iii-p),(C-ii-q),(D-i-s)$
(b) $(A-iv-s),(B-iii-q),(C-ii-r),(D-i-p)$
(c) $(A-iv-q),(B-iii-s),(C-ii-p),(D-i-r)$
(d) $(A-iv-p),(B-iii-r),(C-ii-s),(D-i-q)$

AP EAPCET-11.07.2022 Shift-I

Ans. (c) :

	List-I	List-II	List-III
A	Cryptomonas	Anematic	No lateral appendages and terminal filaments
B	Polytoma	Acronematic	Terminal filaments
C	Euglema	Stichonematic	I row of lateral appendages
D	Monas	Pantonematic	2 rows of lateral appendages

i. Pantonematic- Two or more rows of lateral appendages present on both side of the flagellum.
Example- Monas
ii. Stichonematic- The lateral appendages are present on one side of the flagellum.
Example- Euglena
iii. Acronematic- The lateral appendages are absent and the distal ends of the flagellum end as a terminal nacked, axial filament.
Example- Polytoma
(iv) Anematic- The flagellum is simple without lateral appendages and or terminal nacked filament are absent.
Example- Cryptomonas

108. Agarose is a natural polymer extracted from

(a) Fungi (b) Bryophytes
(c) Sea Weeds (d) Pteridophytes

AP EAPCET-11.07.2022 Shift-I

Ans. (c) : D-galactose and 3, 6 anhydro-L-galactose are the two sugar that make up the natural polymer agarose, which is made from red algae, or seaweed.
Agarose is a main component as agar, which is a polysacharide extracted from seaweed.
• Agarose is most commonly used as the medium for analytical scale electrophoretic seperation in agarose gell electrophoresis gell made from purified agarose have a relativily large pore size, making them useful for seperation of large molecule such as proteins and protein complexes as well as DNA fragments.

109. Air bladders are found in the following plant

(a) Fucus (b) Laminaria
(c) Dictyota (d) Polysiphonia

AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Fucus is marine brown algae which belong class phaeophyceae. Plant body of fucus differentiated into basal discoid holdfast which anchors it to the substratum, a short stipe and a flattened, dichotomously branched frond.
• Air bladders occurs in the upper portion of the frond that give bouncy to the plant.

110. Read the following statements and identify the characters related to the alga shown in the diagram:

(A) It is a member of Chlorophyceae
(B) Food is stored in the form of starch
(C) It is a monoecious plant showing oogonium and antheridium
(D) Food is stored in the form of laminarin or mannitol
(E) It shows dominance of pigments Chlorophyll a, c and Fucoxanthin
Choose the correct answer from the options given below:

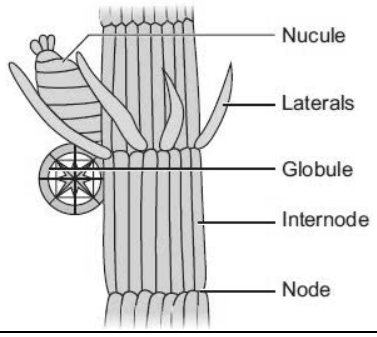
(a) (A) and (B) only
(b) (A), (B) and (C) only
(c) (A), (C) and (D) only
(d) (C), (D) and (E) only

NEET (Re-Exam)-04.09.2022

Ans. (b) : Chara is belong to class chlorophyceae. They are multicellular and superficially bear a resemblance to land plants because of stem-like and leaf-like structures. They are stored food in the form of starch and oil.

@apna_pdf

- Chara is commonly known as "Stonewort" The plant body of chara is encrusted with calcium and magnesium carbonated especially on the plants growing in heavy water.
- Sexual reproduction of chara is an advanced **oogamus type**.
- The sex organs are macroscopic and large.
- The male sex organ is spherical and yellow to red in colour called **globule** or antheridium.
- The female sex organ is more or less oval and green in colour called the **nucule** of oogonium.



111. Hydrocolloid carrageen is obtained from:
(a) Phaeophyceae only
(b) Chlorophyceae and Phaeophyceae
(c) Phaeophyceae and Rhodophyceae
(d) Rhodophyceae only

NEET-2022, 2021

Ans. (d) : Hydrocolloid are water holding substance for eg. **Carrageen,** which is obtained from red algae. Carrageen is extract from red seaweed commonly known as Irish moss (Chondrus Crispus). It is used as a thickener and emulsifier and commonly found in processed dairy products.

112. Which of the following is incorrectly matched?
(a) Volvox – Starch
(b) Ectocarpus – Fucoxanthin
(c) Ulothrix – Mannitol
(d) Porphyra – Floridian Starch

NEET-2022

Ans. (c) : Volvox is a member of chlorophyceae which is known as green algae. It contains starch.
Ectocarpu is a member of phoeophyceae, they contain fucoxanthin and found in marine habitats.
Ulothrix is a member of cholorophyceae and contains starch.
Mannitol is brown-algae and basically store food material.
Porphyra comes in the family of Rhodophyceae and contain floridian starch. Hence option (c) is incorrectly matched.

113. Match List - I with List - II:

List-I		List-II	
A.	**Chlamydomonas**	**i.**	**Moss**
B.	**Cycas**	**ii.**	**Pteridophyte**
C.	**Selaginella**	**iii.**	**Algae**
D.	**Sphagnum**	**iv.**	**Gymnosperm**

Choose the correct answer from the options given below:
(a) (A) - (iii), (B) - (i), (C) - (ii), (D) - (iv)
(b) (A) - (iii), (B) - (iv), (C) - (ii), (D) - (i)
(c) (A) - (iii), (B) - (ii), (C) - (i), (D) - (iv)
(d) (A) - (ii), (B) - (iii), (C) - (i), (D) - (iv)

NEET (Re-Exam)-04.09.2022

Ans. (b) : 1. Chlamydomonas is a green algae.
2. Cycas is a gymnosperm, it is tallest gymnosperm.
3. Selaginella is a pteridophyte, it is belong to class Lycopsida.
4. Sphagnum also known as peat moss.

114. Arrange the functions of the following respectively.
(A) Elaters (B)Indusium (C) Agar

A.	To grow microbes	Spore dispersal	covering of sorus
B.	Covering of sorus	Spore dispersal	To grow microbes
C.	Spore dispersal	To grow microbes	Covering of sorus
D.	Spore dispersal	Covering of sorus	To grow microbes

TS EAMCET-09.08.2021 Shift-II

Ans. (d) : Elaters aid in the spread of spores in some liverworts. The liverwort capsule has a cell component called elaters that attracts water. Its nature is hygroscopic.It helps in dispersal of Spores.
Indusium- A flap of tissue that protects the sori in some ferns. This can take a variety of forms. When spores are mature and ready for release, the indusial usually Shrivel or bend backwards to expose the **sporangia.**
Agar-agar- Agar-agar, is a jelly-like substance consisting of Polysaccharides obtained from the cell walls of some species of red algae, Primarily from ogonori (Gracilaria) and Tengusa (Gelidiaceae).

115. Study the following table and pick up the correct combinations :

S.No.	Type of flagellum	Lateral appendages	Example
I	Pantonematic	One row	Euglena
II	Stichonematic	One row	Astasia
III	Acronematic	Absent	Polytoma
IV	Pantacronematic	Two or more rows	Urceolus

(a) I, II (b) II, III
(c) III, IV (d) I, IV

TS EAMCET-10.08.2021 Shift-I

@apna_pdf

Ans. (c): Pantacronematic flagella- In these mastigonemes arranged in two opposite rows or radically. **Ex. - Pyronema**.
Stichonematic - The mastigonemes develop only on one side of the flagellum **Ex. - Euglena and Astasia.**
Acronematic -They have no mastigonemes **Ex. - Polytoma & chlamydomonas.**
Pantacronematic - With a terminal fibril. **Ex. - Mercilus, Urceolus.**

116. Assertion (A) : When a green alga Cladophora is placed in a suspension of aerobic bacteria, on illumination of different lights, only at blue and red light bacteria accumulated.
Reason (R) : The bacteria release O_2 by the process of photosynthesis.
The correct option among the following is :
(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-II

Ans. (c) : Engelmann (1843-1909) discovered the effect of different wavelength of light on photosynthesis and plotted the first action spectrum of photosynthesis. He split light into components by the prism and then illuminated green alga Cladophora that was placed in suspension of aeorbic bacteria. Conclusion of the Engelmann experiment is that, "evolution of oxygen" which is proved at blue and red light maximum showing oxygen.

117. In Oogamy, fertilization involves _____
(a) A small non motile female gamete and a large motile male gamete
(b) A large non motile female gamete and a small motile male gamete
(c) A large non motile female gamete and a small non-motile male gamete
(d) A large motile female gamete and a small non-motile male gamete

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Fusion between one large, non-motile (static) female gamete and a smaller, motile male gamete is termed as oogamous or oogamy. e.g. Volvox, Fucus. Whereas Anisogamous is fusion of two gametes dissimilar in size. Isogamous is fusion between two flagellated/unflagellated and similar in size gametes.

118. Green algae store food in the form of _A_ in specialized structures called _B_ located in _C_ . Fill in the blank with respect to A, B, C and choose the correct option?
(a) A-starch, B-pyrenoids, C-chloroplasts
(b) A-fat, B-ribosomes, C-pyrenoids
(c) A-protein, B-chlorophyll, C-pyrenoids
(d) A-carbohydrate, B-plastids, C-pyrenoids

AP EAMCET-03.09.2021 Shift-II

Ans. (a) : In Green algae stored food material is starch. Most of the members have one or more storage bodies called pyrenoids located in the chloroplast. Pyrenoids contain protein besides starch.

119. Which of the following algae contains mannitol as reserve food material?
(a) Ulothrix (b) Ectocarpus
(c) Gracilaria (d) Volvox

NEET-2021

Ans. (b) : Mannitol is a type of stored food present in phaeophyceae also known as **brown algae**.
Example - Ectocarpus, Fucus, Kelps, Sargassum etc.
• **Ulothrix** and Volvox belong to Chlorophyceae **(green algae)** members of this class have starch as reserve food material.
• **Gracilaria** is a genus of **red algae** (Rodophyta) reserved food material found in floridean starch.

120. The plant body having holdfast, stipe and frond is a characteristic of
(a) Laminaria (b) Volvox
(c) Gelidium (d) Porphyra

Karnataka CET-2021

Ans. (a) : Class-phaeophyceae, has a stalk called stip and a leaf-like photosynthetic organ called frond, and is typically held to the substrate by a hold fast. In Laminaria frond can be described as a leaf-like photosynthetic organ. The hold fast is used for attaching to the substratum while the stipe acts as a stalk.

121. Female reproductive structure of chara is
(a) Gynoecium (b) Carpel
(c) Nucule (d) Archegonium

AP EAMCET-25.09.2020 Shift-II

Ans. (c) : Chara has the capability to reproduce both sexualy and in a vegetative mode. The male sex organ is called the globule, whereas the female sex organ is called nucule or oogonium. It is more or less oval-shaped and green in colour. It is often found separately above the antheridium or globule.

122. Floridean starch has structure similar to
(a) Amylopectin and glycogen
(b) Mannitol and algin
(c) Laminarin and cellulose
(d) Starch and cellulose

NEET-2020 Phase-I
BHU PMT (Mains)-2011

Ans. (a) : Red algae (rhodophyceae) store their food in floridean starch. This substance shares a structure with glycogen and amylopectin. Amylopectin is a highly branched polymer of glucose found in plants where as glycogen is a highly branched polymer of glucose found in animals and some bacteria.

123. Phycoerythrin is the major pigment in
(a) Brown algae (b) Red algae
(c) Blue green algae (d) Green algae

NEET-2020 Phase-II

@apna_pdf

Ans. (b) : In Red algae major pigments are chlorophyll a, d and phycoerythrin. Blue-green algae (Cyanobacteria) contain chlorophyll-a along with yellowish carotenoids, the blue pigment phycocyanin. Green algae consist of chlorophyll-a, chlorophyll-b, β Carotene, Xanthophylls. Brown algae contains chlorophyll a, c and fucoxanthin.

124. Isogametes are found in:

(a) Focus (b) Homo-sapiens
(c) Cladophora (d) None of the above

GUJCET-2020

Ans. (c) : Isogametes are found in cladophora. It is a genus of reticulated filamentous ulvophyceae. It contains species that are very hard. They are green algae.

125. Assertion (A): In Algae, haplontic life cycle is the dominant phase.
Reason (R): In many algae zygote divides by meiosis immediately after karyogamy to form haploid spores.
The correct answer is:

(a) Both (A) and (R) are true. (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true.

TS EAMCET-09.05.2019 Shift-I

Ans. (a) : Gametes fuse in fertilization to produce a diploid zygote, but that zygote immediately undergoes meiosis to produce haploid spores.
Ex:- Green algae like Volvox, Spirogyra, Chlamydomonas etc.

126. The pigment chlorophyll 'C' is present in

i. Dictyota **ii. Ulothrix**
iii. Porphyra **iv. Sargassum**
The correct combination is

(a) i, ii (b) i, iv
(c) ii, iii (d) iii, iv

TS EAMCET-09.05.2019 Shift-I

Ans. (b) : The pigment cholophyll 'c' is present in members of pheophyceae (brown algae) e.g Dictyota & Sargassum.
Ulothrix is a green algae and non-branching filamentous. Porphyra is a red algae.

127. Choose the correct statement.

(a) Red colour of the red sea is due to dinoflagellates.
(b) Heterocysts of cyanobacteria fix atmospheric nitrogen.
(c) Mycoplasmas are pleomorphic due to the presence of cell wall.
(d) Presence of mycolic acid in the cell wall of diatoms is the reason for the left over cell deposits in large amounts in their habitats.

AP EAMCET-24.04.2019 Shift-II

Ans. (b) : Cynobacteria include anabaena. It is able to fix nitrogen from the atmosphere. Nitrogen is changed into ammonia by it. The heterocysts present in it are specialized cyanobacterial cells for nitrogen fixation. It contains enzymes Nitrogenase. Nitrogenase is inactivated by oxygen. Hence, the heterocyst creates a micro anaerobic environment.

128. Match the column-I and column-II

	Column-I		Column-II
(i)	**Chrysophyta**	**(A)**	**Fungi**
(ii)	**Gonyaulax**	**(B)**	**Diatom**
(iii)	**Penicillium**	**(C)**	**Plasmodium**
(iv)	**Slime mould**	**(D)**	**Dinoflagellate**

(a) (i) – A, (ii) – B, (iii) – C, (iv) – D
(b) (i) – B, (ii) – C, (iii) – A, (iv) – D
(c) (i) – B, (ii) – C, (iii) – D, (iv) – A
(d) (i) – B, (ii) – D, (iii) – A, (iv) – C

AIIMS-26.05.2019 Shift-II

Ans. (d) :

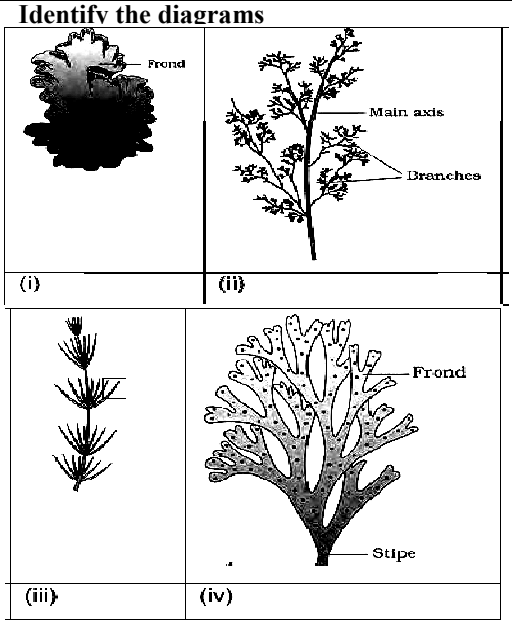
(i)	Chrysophyta	(B)	Diatom
(ii)	Gonyaulax	(D)	Dinoflagellate
(iii)	Penicillium	(A)	Fungi
(iv)	Slime mould	(C)	Plasmodium

- **Chrysophyta** are a group of algae commonly found in lakes. Brown algae as well as diatoms were formerly referred to as chrysophyte.
- **Gonyaulax-** *Gonyaulax* belongs to red dinoflagellates and commonly cuased red tides.
- **Penicillium-** *Penicillium* is a fungus it is included in the family *Aspergillaceae* of the class ascomycetes.

Example :
Penicillin A- *Penicillium chrysogenum*
Penicillin B- *Penicillium notatum.*

- **Plasmodium-** Slime moulds are a large single celled mass with thousands of nuclei called a plasmodium.

129. Identify the diagrams



(a) (i) – Porphyra, (ii) – Polysiphonia, (iii) – Chara, (iv) – Dictyota
(b) (i) – Polysiphonia, (ii) – Porphyra, (iii) – Chara, (iv) – Ectocarpus
(c) (i) – Laminaria, (ii) – Polysiphonia, (iii) – Chlamidomonas, (iv) – Fucus
(d) (i) – Dictyota, (ii) – Polysiphonia, (iii) – Chara, (iv) – Porphyra

AIIMS-26.05.2019 Shift-II

Ans. (a) : Porphyra- The phylum rhodophyta includes the red algal species porphyra. It is frequently discovered in shallow water and has significant economic impact as an edible seaweed.

@apna_pdf

- **Polysiphonia-** Polysiphonia belongs class Rhodophyceae. Most of the species are lithophytic (Growing on rock). Some are epiphytic growing on other algae. Polysiphonia large multiaxial annual or perennial thalli. Polysiphonia form thick tuft or dens bushes are brown or violet-red colour. They are attach by rhizoid to a rocky surface or other algae.
- **Chara-** In chara, both male and female sex organ present on same plant. i.e. monocious.
- **Dictyota-** A genus of brown seaweed in the Dictyotaceae family is called Dictyota.
  The majority of these species are found in tropical and subtropical oceans, and it is knwon that they contain a variety of compounds (diterpenes) that may be useful medically.

130. Which one is wrongly matched?

(a) Uniflagellate gametes – Polysiphonia
(b) Biflagellate zoospores – Brown algae
(c) Unicellular organism – Chlorella
(d) Gemma cups – Marchantia

NEET-2018

Ans. (a) : Polysiphonia is red algae in which reproduction is oogamous type i.e. where a asexual spores and gametes are non-motile or non-flagellated.
- Biflagellate zoospores – Brown algae
- Unicellular organism – Chlorella
- Gemma cups – Marchantia

131. The characteristic feature of Ectocarpus is

(I) Green, filamentous algae with simple branches
(II) Cells contain chlorophyl a, d, carotenoids and xanthophylls
(III) Life cycle is haplodiplontic
(IV) Zoospores are pyriform with two flagella attached laterally

Options:

(a) I, II (b) I, III
(c) III, IV (d) II, IV

AP EAMCET-25.04.2018 Shift-II

Ans. (c): Ectocarpus is a filamentous brown algae. Their life cycle is haplodiplontic and asexually reproduce by asexual zoospore formation which is pyriform and biflagelated flagella attaches laterally.

132. Study the following lists :

List-I	**List-II**
(A) Fucoxanthin	**(i) Liverworts**
(B) Chlorophyll D	**(ii) Strobili**
(C) Ginkgo	**(iii) Rhodophyceae**
(D) Amphibians	**(iv) Phaeophyceae**
	(v) Living fossil

The correct answer is

	A	**B**	**C**	**D**
(a)	(iii)	(iv)	(ii)	(v)
(b)	(iv)	(iii)	(v)	(i)
(c)	(ii)	(iv)	(iii)	(v)
(d)	(iv)	(iii)	(v)	(ii)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) :

	List – I	List - II
a.	Fucoxanthin	Phaeophyceae
b.	Chlorophyll. D	Rhodophyceae
c.	Ginkgo	Living fossil
d.	Amphibians	Liver worts

133. Which of the following shows heterotrichous habit?

(a) Ectocarpus (b) Euglena
(c) Ulothrix (d) Spirogyra

JIPMER-2018
AP EAMCET - 25-04-2018 Shift - II, 1996
JIPMER-1996

Ans. (a) : Heterotrichus condition (habit) shows in ectocarpus. It is consisting of prostrate and erect system. The filaments of the erect systemize from the filaments of prostrate system. Prostrate system consists of creeping irregularly branched filaments.

134. Which of the following bear a flagellum without lateral appendages and the terminal part of the axonema is naked without the outer sheath at its tip

A) Peranema
B) Monas
C) Polytoma
D) Chlamydomonas

(a) A, C (b) B, D
(c) A, B (d) C, D

TS EAMCET-03.05.2018 Shift-I

Ans. (d) : Acronematic - This type of flagellum does not bear lateral appendages and the terminal part of the axoneme is naked without the outer sheath at its tip.
Example – Chlamydomonas and polytoma there is no mastigonemes present in flagella, they are called acronematic flagella. This type of flagella found in chlamydomonas.

135. The major pigments present in the members of Rhodophyceae are

(a) Chlorophyll a, c and Carotenoids
(b) Chlorophyll a and b
(c) Chlorophyll a, d and phycoerythrin
(d) Chlorophyll a and Phycocyanin

TS EAMCET-03.05.2018 Shift-I
AFMC - 2007
AIPMT-2000

Ans. (c) : In Rhodophyceae major pigments are chlorophyll a, d and phycoerythrin. The members of rhodophyceae are commonly called red algae.

136. Members of Phaeophyceae possess

i) Gelatinous coating of algin
ii) Unequal and lateral flagellae
iii) Pyrenoids
iv) Phycobilisomes

(a) i & iii (b) i & ii
(c) iii & iv (d) ii & iv

TS EAMCET-03.05.2018 Shift-I

Ans. (b) : Phaeophyceae (brown algae) is a large group of mostly marine algae. Cell wall has cellulose and lignin or gelatinous coating of algin. Found in brown sea weeds.
Phaeophyceae contain fucoxanthin pigment responsible for their brownish green colour. They reproduce by flagellated spores. Their spores are pear shape and have 2 unequal flagella oriented in a lateral manner.

137. Shape of chloroplast of Ulothrix is

(a) star-shaped (b) band-shaped
(c) girdle-shaped (d) spinal-shaped

JIPMER-2018

@apna_pdf

Ans. (c) : Ulothrix has a girdle-shaped Chloroplast that houses one or more Pyrenoids.
Ulothrix has a filamentous, long, unbranched, multicellular thallus. It is a freshwater alga that grows on sand, rock and other types of soil.
Where as, a common sight floating a top stagnant water, algae of the genus zygnema can be identified microscopically by its two star shaped chloroplasts per cell.

138. Eyespot is seen in
(a) Chlamydomonas (b) Ulothrix
(c) Spirogyra (d) Polysiphonia
JIPMER-2018

Ans. (a) : The eye spot has a colourless biconvex photosensitive lense and curved pigmented plate found in chlamydomonas which lies the near anterior end of body.
• It is a photoreceptive organ and function as a primitive eye.

139. Palmella stage is present in
(a) Aspergillus (b) Cystopus
(c) Chlamydomonas (d) None of these
JIPMER-2018
BHU PMT - 2002

Ans. (c) : Algae, especially chlamydomonas and euglena, can reproduce asexually through the palmella stage. The palmella stage is formed under unfavourable conditions as shortage of water, excess of salts, etc. The protoplast of parent cell divides to make many daughter protoplasts but they do not form zoospores. The parent cell wall gelatinize to make mucilaginous sheath around daughter protoplasts.

140. Motile zoospores are produced by
(a) Chlamydomonas (b) Penicillium
(c) Bacteria (d) Amoeba
MHT CET-2017

Ans. (a) : Chlamydomonas reproduce by structure called zoospores. That usually microscopic motile structures. zoospores are flagellated asexual spores produced in chlorophyceae.

141. Which class of Algae reproduces asexually by non-motile spores and sexually by non-motile gametes?
(a) Rhodophyceae (b) Phaeophyceae
(c) Chlorophyceae (d) Cyanophyceae
Karnataka CET-2017

Ans. (a) : In member of rhodophyceae are presence of red pigment r-phycoerythrin in their body is known as red algae.
Rhodophyceae-group algae are capable of both sexual and asexual reproduction. The non-motile spores that eventually become the new cell body are created during asexual reproduction. The marging of the non-motile gamets to create the embryo, which then grows to form the new algal body, is the process of sexual reproduction.

142. Mac-Conkey medium is an example of
(a) Transport medium
(b) Enrichment medium
(c) Differential medium
(d) Simple medium
SRM JEEE -2017

Ans. (c) : A bacterial culture medium called macConkey agar (MAC) is named after the bacteriologist alfred T. macConkey (1861-1931). MacConkey agar is an example of medium that is both deferential and selective. The presence of bile salts, as well as crystal violet within the media prevent gram–positive organisms from growing.

143. A nitrogen fixing blue green alga is
(a) Ulothrix (b) Spirogyra
(c) Anabaena (d) Rhizobium
SRM JEEE -2017

Ans. (c) : Anabaena are known for their nitrogen fixing abilities, which is a blue- green algae. It is a unicellular prokaryotic organism.
• It fix atmospheric nitrogen into ammonia and make it available to the plants.

144. The simple type of plant body in which a single cell performs all the vital functions of life is referred to as_____
(a) Unicellular (b) Monocellular
(c) Acellular (d) Noncellular
SRM JEEE -2017

Ans. (a) : Unicellular algae are plant like autotrophs and contain chlorophyll.
They include groups that have both multicellular and unicellular species.
Euglenophyta flagellated mostly unicellular algae that occur often in fresh water.

145. Zygotic meiosis is characteristic of
(a) Marchantia (b) Fucus
(c) Funaria (d) Chlamydomonas
NEET-2017

Ans. (d) : Zygotic meiosis is the characterstic feature of lower algae like Clamydomonas which is haploid plant.
• In zygotic meiosis, meiotic division happens in zygote resulting in the development of hoploid individuals. Thallophytes have dominant gametophytic generation i.e. the proximity of hoploid individuals.

146. An example of colonial alga is
(a) Chlorella (b) Volvox
(c) Ulothrix (d) Spirogyra
NEET-2017
Manipal-2010

Ans. (b) : Volvox is a genus of a green algae. It is a colonial algae consisting of thousands of cells.
- **Colonial algae** is a kind of algae consisting of cells resembling free swimming unicells making groups.
- **Chlorella** is a unicellular algae and spirogyra and **Ulothrix** are filamentous and multicellular algae.

147. How many filaments of Spirogyra are produced by germination of 100 zygospores?
(a) 100 (b) 200
(c) 400 (d) 50
Uttarakhand PMT-2011

Ans. (a) : Spirogyra are produced by germination of 100 zygospores in 100 filaments.

148. Which of the following algae exhibits gametic meiosis?
(a) Chara (b) Sargassam
(c) Polysiphonia (d) Oedogonium
Uttarakhand PMT-2011

@apna_pdf

Ans. (b) : Sargassum algae exhibits gametic meiosis. It is a genus of brown macroalgae in the order fucales of the phaeophycae class.

149. Cyanophycean algae are much important from point of view of
(a) food and fodder value
(b) medicinal value
(c) fibres and oils
(d) soils fertility

Uttarakhand PMT-2011

Ans. (d) : Cyanophycean algae are much important from point of view of soil fertility and water retention and improve soil structure and stability.

150. Cell wall of Chlamydomonas contains:
(a) cellulose (b) glycoproteins
(c) protein (d) hemicelluloses

J&K CET-2002

Ans. (b) : Cell wall of Chlamydomonas contains glycoproteins. Glycoproteins which also appear in the extracellular matrix of multicellular green algae and higher plants makeup the cell wall of the unicellular green algae chlamydomonas.

151. The thallus of Volvox is called
(a) coenocytes (b) filament
(c) heterotrichous (d) coenobium

JCECE-2005
Manipal-2000
AIIMS-1994

Ans. (d) : A colonial green alga is called volvox. The plant body is called coenobium because the cells are undeniably organized. Among motile forms the coenobium of volvox are the baggers most distinctive and highly developed.

152. Iodine is obtained from the members of
(a) green algae (b) brown algae
(c) red algae (d) blue-green algae

CMC Vellore-2013

Ans. (b) : Iodine is obtained from the member of brown algae
Examples- Ectocarpus, Laminaria, Fucus Sargassum etc.

153. The microalgae of commercial interest would include (1) Spirulina (2) Spirogyra (3) Botryococcus (4) Dunaliella
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2010

Ans. (a) : The microalgae of commercial interest would include-
(i) Spirulina that is used as a biofertilizer in agriculture sector for their potential role in food safety and sustainable crop production.
(ii) Spirogyra is a non-motile, isogamous green algae.
(iii) Botrycoccus oils used as feed stock for hydrocracking in an oil refinery to produce octane (Gasoline) kerosene and diesel.

154. Hormogonia are vegetative reproductive structure of
(a) Spirogyra (b) Ulothrix
(c) Oscillatoria (d) Yeast

BHU PMT (Mains)-2010, 2006
Manipal - 2002

Ans. (c) : A myxophycean alga called oscillatoria reproduces by hormogonia. They are short broken filaments of trichome, which give rise to new filaments under favourable conditions. They are formed due to formation of separation discs while ulothrix reproduces vegetatively by fragmentation, asexually by non motile resting spore.

155. Agar-agar which is used in tissue culture is obtained from a:
(a) fungi (b) algae
(c) pteridophyte (d) bryophyte

BVP-2002
Karnataka CET-2000

Ans. (b) : Agar is a biological polysaccharide that is made by extracting seaweed from the ocean. The agar that was produced is a five uniform powder. In order to bind essential nutritional requirements into a growth medium for in vitro plant growing and development. agar is employed in plant tissue culture. The perfect conditions for these habitats are Provided by its strong binding strength and low mineral content.

156. Sexual reproduction in Spirogyra is morphologically characterized by :
(a) oogamy (b) anisogamy
(c) isogamy (d) both b and c

BVP-2002

Ans. (c) : Sexual reproduction in spirogyra is morphologically characterised by isogamy. Sexual reproduction of spirogyra involves conjugation, which can be defined as primitive type of isogamy that is known as planogametic isogamy.

157. Which of the following is a character of Rhodophyceae?
(a) Major pigments are chlorophyll –a and chlorophyll -b
(b) Commonly called brown algae
(c) Stored food materials are mannitol and laminarin
(d) Flagellum is absent
(e) Cell wall contains cellulose and algin

Kerala PMT-2012

Ans. (d) : Typically red algae reproduce vegetatively by fragmentation. They can reproduce sexually using non-motile gametes and non-motile spores like monospores. Flagella are therefore not present in Rhodophyceae.

158. The green algae rich in proteins used as food supplements even by space travellers is
(a) Chlamydomonas (b) Volvox
(c) Spirogyra (d) Spirulina
(e) Chlorella

Kerala PMT-2012
AIPMT-1997

Ans. (e) : Chlorella is a protein-rich green algae that is consumed as a food supplement even by space travelers. It is used for the consumption of carbon dioxide provided by the astronauts and the production of oxygen in space craft and also known as is space food.

@apna_pdf

159. Choose the correct order of colours with respect to pigments, chlorophyll, phycoerythin and fucoxanthin

(a) Green, Red and Brown
(b) Brown, Green and Red
(c) Red, Green and Brown
(d) Green, Brown and Red
(e) Brown, Red and Green

Kerala PMT-2012

Ans. (a) : Chlorophyll gives plants their green in colour because it does not absorb the green wave length of white light. That particular light wavelength is reflected from plant, so appear green.
Phycoerythrin is a red protein pigment that located in red algae and cryptophytes.
The **fucoxanthin** is the pigment found in brown algae or phaeophyceae.

160. Trichodesmium erythrium which gives colour to red sea is a

(a) Brown alga (b) Green alga
(c) Blue green alga (d) Red alga

AP EAMCET-2014

Ans. (c) : They are often seen to form blooms in polluted waters.
The red sea is named so because of the colour of its water.This colour is due to the blooms formed by the cyanobacteria, *Trichodesmium erythraeum*, which accumulates and muddies the usually transparent water. They appear as a red and pinkish blanket on the surface of the waters. After blooming, the trichodesmium erythraeum die, and they turn the sea redish-brown.

161. Incipient nucleus is present in :

(a) chlorophyceae (b) rhodophyceae
(c) myxophyceae (d) phaeophyceae

BVP-2000

Ans. (c) : The term incipient nucleus describes a nucleus in which the genetic material is not completely encased by a nuclear membrane. Incipient nucleus is not a true nucleus and is also known as nucleoid, it is found in prokaryotes.
● The group Myxophyceae comes under prokaryotes. It is present in myxophyceae which is commonly called as blue green algae.

162. Triphasic life cycle is found in

(a) Chondrus (b) Laminaria
(c) Polysiphonia (d) Macrocystis

AIIMS-1995

Ans. (c) : The life cycle of polysiphonia (red algae) is triphasic and haplodiplontic. Three different phase in the life cycle.
(I) Haploid phases represented by the male and female gametophytes.
(II) Diploid phase represented by carposporophyte (cystocarp).
(III) Diploid phase represented by tetra sporophyte.

163. In which of the following, reticulate chloroplast is found?

(a) Oedogonium (b) Spirogyra
(c) Ectocarpus (d) Ulothrix

AIIMS-1995

Ans. (a) : Reticulate chloroplast is found in oedogonium which belong to class chlorophyceae. The reticular chloroplast is a complex plastid that forms a cylindrical network in the peripheral region of the cells of some green algae. The green filamentous algae oedogenium has reticular chloroplasts that completely encircls the protoplast.

164. Which one of the following is wrong about Chara?

(a) Upper oogonium and lower round antheridium
(b) Globule and nucule present on the same plant
(c) Upper antheridium and lower oogonium
(d) Globule is male reproductive structure

AIPMT-2014
NEET-2013

Ans. (c) : Chara is a multicellular green alga. Sexual reproduction in Chara is oogamous. The male sex organ is called antheridium (**globule**). The female sex organ is called oogonium **(nucule).**
Most species of chara is a monoecious plant i.e. globule (Antheridia) and nucule (oogonium) are present at the node on same plant
• Globule present below the nucule i.e. oogonium are present at upper portion and antheridium is present at lower portion.

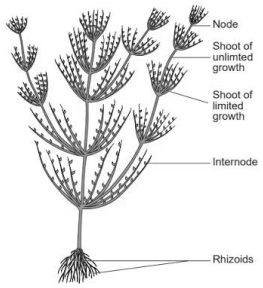


Figure 2.8: *Chara* Habit

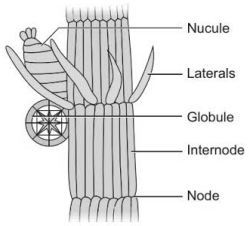

Figure 2.9: *Chara* sex organs

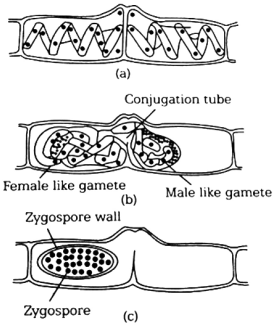
165. Which one of the following shows isogamy with non-flagellated gametes?

(a) Sargassum (b) Ectocarpus
(c) Ulothrix (d) Spirogyra

AIPMT-2014

Ans. (d) : Isogamy with non-flagellated gametes is seen in **spirogyra**. It can reproduce both by sexual and asexual (vegetative) means. They reproduce sexually by conjugation in which two non-flagellated morphologically similar but physiologically different gametes (isogamous) fuse together. One filament acts as male gamete and passes through the conjugation tube of another filament which acts as female gamete.



@apna_pdf

166. Which one of the following is an example of chlorophyllous thallophyte?
(a) Volvarialla (b) Spirogyra
(c) Nephrolepis (d) Gnetum
Karnataka CET-2011

Ans. (b) : The members of chlorophyceae are commonly called green algae ;
Some characteristics of chlorophyceae are :
The plant body might be filamentous, colonial, or unicellular. Due to the prevalence of the pigments chlorophyll a and b, they or typically grass-green.
• The pigments are localised in definite chloroplasts. The chloroplasts may be discoid plate like, reticulate, cup-shaped, spiral or ribon-shaped in different species.
• It has one or more storage bodies called pyrenoids located in the chloroplasts.
• Some commonly found green algae are:
Chlamydomonas, volvox, ulothrix, spirogyra and chara.

167. Sexual reproduction in Spirogyra is an advanced feature because it shows: -
(a) Different size of motile sex organs
(b) Same size of motile sex organs
(c) Morphologically different sex organs
(d) Physiologically differentiated sex organs
AIPMT-2003

Ans. (d) : Spirogyra is a freshwater green alga which belongs to class chlorophyceae. The sexual reproduction in spirogyra is called conjugation. It involves the fussion of two morphologically indentical but physiologically dissimilar non-ciliated gametes. For development of gametes, some of the cell start to act like male and female gametangia in which the cell contents become separated from the cell wall.
Shrink and ultimately forms gametes. The fusion of these gemetes takes place by scalariform conjugation or lateral conjugation.

168. Ulothrix filaments produce
(a) heterogametes (b) basidiospores
(c) isogametes (d) anisogametes
AIPMT-1997
BVP - 2001

Ans. (c) : Ulothrix is member of class chlorophyceae. The member of class chlorophyceae are commonly called green algae. Vegetative reproduction usually takes place by fragmentation or by formation of different types of spores.
The Ulothrix sexually reproduces by biflagellate gametes. The isogametes of Ulothrix are biflagellate. Their size is even smaller than micro zoospores.

169. Brown algae is characterised by the presence of
(a) fucoxanthin (b) haematochrome
(c) phycocyanin (d) phycoerythrin
AIPMT-1997

Ans. (a) : The members of phaeophyceae (Brown algae) are found primarily in marine habitate. They show great variation in size and form. They possess chlorophyll a,c carotenoids and xanthophylls.
They vary in colour from olive green to various shades of brown, depending upon the amount of the xanthophyll pigment, fucoxanthin present in them.

170. The pyrenoids are made up of
(a) proteinaceous centre and starchy sheath
(b) core of nucleic acid surrounded by protein sheath
(c) core of protein surrounded by fatty sheath
(d) core of starch surrounded by sheath of protein
UPCPMT-2011
JIPMER-1996
AIPMT-1995, 1993

Ans. (a) : Pyrenoids are tiny sub cellular compartments that can be found in the chloroplast of a variety of algae and land plants. Pyrenoids are linked to a process that concentrates carbon. Their major job is to create and maintain a CO_2 rich environment around RubisCo so that they can operate as centers of CO_2 fixation. Even when starch is produced in the cytosol as opposed to the chloroplast, a starch sheath is frequently generated or deposited at the edge of pyrenoids.

171. In Chlorophyceae, the mode of sexual reproduction is
(a) isogamy (b) anisogamy
(c) oogamy (d) all of these
AIPMT-1994
JIPMER-2004
Punjab MET-2003

Ans. (d) : In chlorophyceae the mode of sexual reproduction is either isogamaus or anisogamous or oogamous with specilised reproductive cells.
Isogamous :- The fusing gametes are morphologicaly similar but physiologicaly differ called isogametes one represented by positive strain and other negative strain. Both fuse to form 2n zygospore. It is simplest and most primitive type as ulothrix chlamydomonas, spirogyra etc.
Anisogamous: The fusing gametes morphologicaly and physiologicaly dissimilar called anisogametes small gamete is more active and large gamete is less active. Both fuse to form diploid zygote as *chlamdomonas braunii, Eudorina.*
Oogamous : It is advanced type sexual reproduction.
• Sex organ well developed, male sex organ called antheridia produced many motile male gametes called sperm, female sex organ called oogonium produced single large non motile female gamete called egg retained within the oogonium.

172. Chloroplast of Chlamydomonas is
(a) stellate (b) cup-shaped
(c) collar-shaped (d) spiral
AIPMT-1993

Ans. (b) : Chloroplast of chlamydomonas is cup-shaped . Chlamydomonas cells are ~10µm in diameter and about half of their volume is occupied by a single cup-shaped chloroplast where as, in spirogyra, the chloroplasts are spiral and ribbon like.

173. In Ulothrix/Spirogyra, reduction division (meiosis) occurs at the time of
(a) gamete formation
(b) zoospore formation
(c) zygospore germination
(d) vegetative reproduction
AIPMT-1993

@apna_pdf

Ans. (c) : Ulothrix and spirogyra is the members of chlorophyceae. It is green algal species. In spirogyra and ulothrix two isogametes from two different filaments come together and fuse by their anterior end to form zygospore.
At the time of zygospore, germination meiosis takes place in ulothrix / spirogyra under favorable conditions, zygospore, undergoes, zygotic meiosis to form motile tetra - flagellated meiospores or non- motile aplanomeiospores each meiospore (haploid) germinates to the new filaments of positive and negative strain.

174. The common mode of sexual reproduction in Chlamydomonas is
(a) isogamous (b) anisogamous
(c) oogamous (d) hologamous
AIPMT-1991

Ans. (a) : The common mode of sexual reproduction in chlamydomonas is isogamous.
Chlamydomonas has both asexual and sexual reproduction.
While sexual reproduction can be isogaus, anisogamous, or oogamous, asexual reproduction occurs through zoospores.
However, fusion frequently occurs between similor gametes, leading to isogamy as the method of reproduction.
Isogamy- It is a primitive type of sexual reproduction occurs in lower forms. The fusing gametes are morphologically similar in size, form and structure and are called isogametes. Isogamous sexual reproduction is common in some species of chlamydomonas.

175. The product of conjugation in Spirogyra or fertilization of Chlamydomonas is
(a) zygospore (b) zoospore
(c) oospore (d) carpospore
AIPMT-1991

Ans. (a) : Zygospore is the end result of conjugation in spirogyra or fertilization in chlamydomonas. Both are members of the green alga family in which gametes combine to produce zygotes, which then grow into zygospores with strong walls.

176. Which one of the following formed in Spirogyra is different based on its nucleus ?
(a) Zygospore (b) Azygospore
(c) Aplanospore (d) Akinete
AP EAMCET-2008

Ans. (a) : Asexual bodies in spirogyra include akinetes and aplanospores.
Zygospore-Zygospore is formed during sexual reproduction by fusion of two protoplasts. Prior to germination the diploid zygospore nucleus under goes meiosis.
Azygospore- A reproductive body found in certain fungi (Class phycomycetes) and in some algae that resembles azygospore but is formed without gametic fusion.
Aplanospore – A non motile asexual spore formed by rejuvenescene in certain algae and distinguished from an Akinete by developing a new cell wall distinct from that of the parent cell-compare hynospore, zoospore.
Akinete – An akinete is an envelope, thick-walled, non motile, dormant cell formed by filamentous, heterocyst forming cyanobacteria under the order Nostocales and Stigonematals. Akinetes are resistant to cold and desication.

177. Algae are useful because they
(a) Are large in number
(b) Are used in alcoholic fermentation
(c) Purify the atmosphere
(d) Are used in study of photosynthesis.
AIIMS-2002

Ans. (c) : Algae are useful because they purify the atmosphere. Since form olden days algae species are ultimately connected with human begins as a source food, medicine and other uses algae are the main oxygen producers in aquatic areas.
Algae fall under the kingdom plantae.
Hence they perform all the functions similar to a plant-like photosynthesis.
Since they trap the maximum amount of solar energy. They in turn, produce maximum oxygen. thereby, purifying the atmosphere.

178. In blue-green algae, photosystem-II contains important pigment concerned with photolysis of water. It is a:
(a) Phycocyanin (b) Cytochrome-c
(c) Chlorophyll-b (d) β-carotene
AIIMS-2015

Ans. (a) : In BGA (Blue Green Algae) Photo system-II contains important pigment concerned with photolysis of water. It is **phycocynin or phycoerythrin.**
It is an pigment protein complex found in cyanobacteria.

179. Water blooms are formed by:
(a) Planaktonic algae (b) Lemna
(c) Rhizopus (d) Wolffia
J&K CET-2000

Ans. (a) : Water blooms are formed by planktonic algae. Planktonic algae are microscopic plants that live in every drop of pond water, planktonic algae are important because they produce oxygen and food for the animals that live in the pond.
It forms a layer over the surface of the water. It is promoted by the release of the inorganic and organic compounds in the water body by the agricultural field run off, industrial discharge and untreated sewage. This is called eutrophication because it builds up the substratum of the water body. It depletes the dissolved oxygen level because the decomposing bacteria get activated to breakdown the organic compounds.

180. In chlamydomonas the life cycle:
(a) haplontic (b) diplobiontic
(c) isomorphic (d) haplodiplontic
J&K CET-2000

Ans. (a) : The life cycle of the chlamydomonas is haplontic. This is the simplest and most primitive type of life cycle. The main vegetative plant body is haploid (gametophyte). It bears haploid gametes. The gametic fusion which is known as syngamy produces zygote which is the only diploid phase (sporophyte) in the life cyle.

181. Which of the following algae shows physiological anisogamy?
(a) Spirogyra (b) Ulothrix
(c) Volvox (d) All of these
JCECE-2002

@apna_pdf

Ans. (a) : In spirogyra, all filamentous cells have the capacity to develop gametes, sometimes known as isogametes because of their identical morphology.
This phenomena of sexual reproduction is known as isogamous type of sexual reproduction. But at the time of conjugation one of the two isogametes shows motility and is considered as male gamete. This phenomenon is referred to as physiological anisogamy.

182. Which one set of genera are correctly matched?
(a) Chlorophyceae- Volvax, Laminaria, Fucus
(b) Phaeophyceae- Laminaria, Chlamydomonas
(c) Rhodophyceae- Gelidium, Gracilaria
(d) Phaeophyceae- Laminarea, Sargassum, Ulothrix

BVP-2014

Ans. (c) :
Rhodophyceae includes - Geliduim, Gracilaria, Porphyra and Polysiphonia.
Where as chorophyceae includes - Chlorella, Chlomydomonas, Spirogyra, Chara, Volvox, Ulothrix, phaeophyceae includes - kelp, Sargassum, Laminaria etc.

183. There exists a close association between the alga and the fungus within a lichen. The fungus
(a) fixes the atmospheric nitrogen for the alga
(b) provides protection, anchorage and absorption for the alga
(c) provides food for the alga
(d) releases oxygen for the alga

Uttarakhand PMT-2010

Ans. (b) : There exists a close association between the alga and the fungus with in a lichen. The fungus provides protection anchorage and absorption for the alga and blue green algae provide food and nutrition obtained by photosynthesis.

184. In Spirogyra, a brief period of tetranucleate condition is found in–
(a) hold fast (b) gametangium
(c) vegetative cell (d) germinating zygote

Uttarakhand PMT-2010

Ans. (d) : Spirogyra is an examples of chlorophyceae and sexual reproduction takes place through the fusion of two morphologically identical but physiologically dissimilar non- ciliated gametes. The fusion of both kinds of gametes results into formation of zygospores. The germinating diploid zygospores undergoes meiosis to maintain the haploid condition.
Thus, in the condition tetranucleate condition is found for a brief period of time.

185. Phycology is the study of
(a) algae (b) fern
(c) fungi (d) bryophytes

AMU-2009
Punjab MET-2008

Ans. (a) : 'Phycology' is the study of algae.
- Pteridology– The study of pteridophytes.
- Bryology– The study of bryophytes.

Mycology– The study of Fungi.

186. A ring of multicilliate zoogonidium is found in
(a) Ulothrix (b) Zygnema
(c) Oedogonium (d) Chara

Punjab MET-2007

Ans. (c) : The alga oedogonium contains a ring of multinucleotide zoogonidium. A zoogonidium is a photosynthetic cell in an algae that contains spores for reproduction. The zoospores are enclosed in a zoosporangium produced on the vegetative cells. The zoospores have a ring of flagella on the base. The zoospores are released from the vesicles and they float freely for some time to find a substratum and start dividing to form filaments once they find a substratum.

187. In Spirogyra during the germination of zygospore how many haploid nuclei takes part?
(a) Three (b) Two
(c) One (d) All four

JIPMER-2002

Ans. (c) : Spirogyra is a genus of filamentous charophyte green algae commonly known as water silk. It is very common in relatively clear eutropic developing slimy filamentous green masses.
Zygospore is a triple layered with brownish-orange coloured outer layer. Zygospores in the bottom of pond rest till the return of favorable season. During germination, zygospore nucleus divides meiotically and out of four daughter nuclei formed three disintegrate, leaving only one haploid Nucleus. The zygospore germinates, the two outer cost line burst and a new filament is formed.

188. Which of the following groups of algae do not have eukaryotic organization ?
(a) Blue green algae (b) Green algae
(c) Golden brown algae (d) Red algae

Karnataka CET-2005

Ans. (a) : Blue green algae do not have eukaryotic organization. Blue green algae are also called cyanobacteria. They are prokaryotes and also lack membrane-bound organelles like mitochondria, Golgi apparatus etc.
Ex. Anabaena, Nostoc

189. Algae have cell wall made up of –
(a) Cellulose, galactose and mannose
(b) Hemicellulose, pectins and proteins
(c) Pectins, cellulose and proteins
(d) Cellulose, hemicellulose and pectins

AIPMT (Screening)-2010

Ans. (d) : Algae include in kingdom plant cell wall is composed by cellulose, hemicellulose and pectins but the cell wall of blue green algae (cyanobacteria) is composed by peptidoglycan which is a prokaryotes placed under the kingdom Monera.

190. PGA as the first CO_2 fixation product was discovered in photosynthesis of –
(a) Bryophyte
(b) Gymnosperm
(c) Angiosperm
(d) Algae

AIPMT (Screening)-2010

Ans. (d) : Calvin worked on algae chlorella and Scenedesmus with radioactive ^{14}C in carbon dioxide.
- The path of CO_2 fixation was traced when algal suspension was illuminated and photosynthesis was carried out with normal carbon dioxide was supplied CO_2.

@apna_pdf

The algae was killed by the methanol at its boiling temperature. It immediately stopped photosynthesis activity due to denaturation of enzymes.
Alcohol was evaporated and after crushing the algae the product was made into paste. The paste was placed on paper chromatography and the different compound were separated by two dimensional chromatography.
- The radioactive compounds were identified by comparing their position on the chromatogram with standard chemicals. After three seconds, radioactivity appeared in phosphoglyceric acid or PGA.
Therefore the first stable product of phostosynthesis.

191. In Spirogyra sometimes a ladder like structure is present due to:
(a) vegetative reproduction
(b) asexual reproduction
(c) lateral conjugation
(d) scalariform conjugation

JIPMER-2004
Punjab PMT - 2003
Punjab MET-2003

Ans. (d) : Sexual reproduction in spirogyra occurs by conjugation. Scalariform conjugation occurs between cells belonging to different filaments. Therefore, these species are heterogametic. Lateral conjugation is primitive compared to scolar conjugation.

192. Mannitol is reserve food in
(a) Rhodophyceae
(b) Chlorophyceae
(c) Phaeophyceae
(d) Xanthophyceae

JIPMER-2004
PUNJAB - MET - 2003
AIPMT - 2009

Ans. (c) : The Phaeophyceae class included brown algae. Brown algae are marine plants. In Phaeophyceae, reserve food material is mannitol and laminarin.

193. Assertion (A) : K^+ ion accumulation found in Nitella depends on its respiratory activity.
Reason (R) : Absorption of all ions in plants completely depends on the usage of metabolic energy.
The correct answer is
(a) (A) and (R) are true and (R) is correct explanation of (A)
(b) (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2007

Ans. (c) : In **Nitella,** potassium is accumulated passively by both the cytosol and the vacuole, except when extra cellular K^+ concentrations are very low, in which case it is taken up actively.
In plants, not all ions are absorbed due to the use of metabolic energy.

194. Which one of the following is common to multicellular fungi, filamentous algae and protonema of mosses:
(a) Mode of Nutrition
(b) Multiplication by fragmentation
(c) Diplontic life cycle
(d) Members of kingdom plantae

AIPMT (Screening)-2012

Ans. (b) : Multiplication by fragmentation is common among filamentous algae and protonema of mosses all show multiplication by fragmentation.
Fragmentation is mode of asexual reproduction that involves breaking the parent body into several fragments and each fragments fungi, filamentous algae and protonema of mosses show the fragments.

195. Which one of the following is wrongly matched?
(a) *Nostoc*-Water blooms
(b) *Spirogyra*-Motile gametes
(c) *Sargassum*-Chlorophyll C
(d) Basidiomycetes-Puffballs

NEET (Karnataka)-2013

Ans. (b) : Spirogyra is belong to class chlorophyceae is known as fresh water green alga the sexual reproduction in spirogyra, gametes are non-motile and sexual reproduction takes place by Conjugation.
- Sargassum belongs to phaeophyceae which contains chlorophyll-a and Chlorophyll-c.
- Basidiomycetes include puffballs, Mushroom etc.
- Nostoc is a colonial cyanobacteria which causes algal bloom.

196. Specialized cells for fixing atmospheric nitrogen in Nostoc are
(a) Akinetes
(b) Heterocysts
(c) Hormogonia
(d) Nodules

NEET (Karnataka)-2013

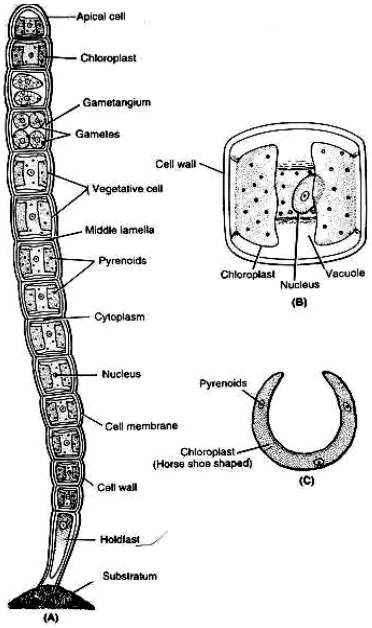
Ans. (b) : Nostoc and anabaena atmospheric nitrogen fixation by a specialized cells known as heterocyst.

197. True statement for *Ulothrix* :
(a) Filamentous thallus and flagellated reproductive structures
(b) Branched thallus
(c) Flagellated cells absent
(d) None of the above

AIPMT-1998

Ans. (a) : The thallus of ulothrix is filamentous, long, unbranched and multicellular, where the cells are arranged in a single row (i.e uniseriate).
- The filamentous are bright green in colour and remain attached at one end with the substratum such as stones, rocks or some other solid object.

@apna_pdf



198. How many zygospores are formed in a 100 celled filament of Spirogyra affinis, if all cells are involved in conjugation?

(a) 99 (b) 50
(c) 49 (d) 1

AP EAMCET-2010

Ans. (b) : 50 zygospore are formed in a 100 celled filament of **Spirogyra affinis**, if all are involve in conjugation.

199. Assertion : Red algae contribute in producing coral reefs.
Reason : Some red algae secrete and deposit calcium carbonate over their walls.

(a) Both Assertion and Reason are true and Reason is the correct explanation of the Assertion
(b) Both Assertion and Reason are true but the Reason is not the correct explanation of the Assertion
(c) Assertion is true, but Reason is false
(d) Both Assertion and Reason are false

AP EAMCET-2011

Ans. (a) : Calcium carbonate causes the cell walls to harden. thus, these algae are crucial far the development of coral reefs. Coral reefs are formed through the accumulation of calcareous exoskeletons of coral animal, calcareous red algae and mollusks. By secreting a calcium carbonate skeleton that protects the coral polyps, they lay the groundwork for reefs. The coral colony continuously secretes calcium carbonate.

200. Indentify the type of flagellum in Monas Urceolus and Polytoma in their sequential order from the following

(A) The flagellum is stichonematic.
(B) Two or more rows of lateral appendages
(C) The flagellum is pantacronematic.
(D) Lateral appendages are absent and axoneme ends as naked axial filament.

(a) A, B, D (b) A, C, D
(c) B, A, C (d) B, C, D

AP EAMCET-2008

Ans. (d) : Monas has pantacronematic flagellum with two or more rows of lateral appendages on the axoneme. Lateral appendages are absent in Polytoma. Pantacronematic flagellum is found in Urceolus.

201. Match the storage products listed under Column-I with the organisms given under Column-II; choose the appropriate option from the given choices.

Column-I	Column-II
A. Glycogen	p. Sargassum
B. Pyrenoids	q. Nostoc
C. Laminarin and mannitol	r. Polysiphonia
D. Floridean starch	s. Spirogyra
	t. Agaricus

(a) A-r, B-s, C-p, D-t (b) A-s, B-r, C-t, D-q
(c) A-t, B-s, C-p, D-r (d) A-q, B-p, C-s, D-r

Karnataka CET-2014

Ans.(c) :

Storage product	Organism
A. Glycogen	**T.** Agaricus
B. Pyrenoids	**S.** Spirogyra
C. Laminarin and mannitol	**P.** Sargassum
D. Floridean starch	**R.** Polysiphonia

(A) Glycogen:– In the glycogen large number of dense granular glycogen particles, a stored food material in fungi such as agaricus.
(B) Pyrenoids:– It occurs in many of large and associated with the chloroplast. They are present in spirogyra as well as green plant.
(C) Laminarin and monnitol:– Food reserve of sargassum is laminarian and mannitol.
(D) Floridean Starch:– The food is stored in the form of floridean starch in polysiphonia.

202. Assertion (A) : In Spirogyra, some cells in one of the two filaments become empty after conjugation.
Reason (R) : The aplanogametes from the cells of one filament pass through the conjugation tubes into the cells of the other filament.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2005

Ans. (a) : Sexual reproduction is Spirogyra is known as **conjugation**. In this process one cell, called **gametangium**. Function as female and receive male gamete of adjacent cell, called **aplanogamete** which is simply a non-Flagellated mass of protoplasm formed in the aplanogametangium. This transfer of aplanogametes to gametangium leave behind an empty cell. Here assertion and reason both are correct and reason is correct explanation of assertion.

203. If you are asked to classify the various algae into distinct groups, which of the following characters you should choose ?

(a) Chemical composition of the cell wall
(b) Types of pigments present in the cell

@apna_pdf

(c) Nature of stored food materials in the cell
(d) Structural organization of thallus

AIPMT-2007

Ans. (b) : Different types of pigment present in different group of algae. These are primarily basis of classification of algae. Most of the algal species have the same chemical composition in the cell wall and the same photosynthetic pigment.

Ex:- Chlorophyll a, b,
Carotenoids etc.

Classes	**Common name**	**Major pigments**
Chlorophyceae	Green algae	Chlorophyll a,b
Phaeophyceae	Brown algae	Chlorophyll a, c Fucoxanthin
Rhodophyceae	Red algae	Chlorophyll a,d, r-phycoerythrin
Cyanophyceae,	Blue green algae	Chloropyll a, c- phycocyanin c- phycoerythrin

204. The lower most cell of filamentous algae Ulothrix is characterised by
(a) Devoid of chlorophyll and enucleated
(b) Presence of nucleus and non-chlorophylls
(c) Presence of chlorophyll and nucleated
(d) Absence of chlorophyll and enucleated

UP CPMT-2014

Ans. (b): The lower most part of ulothrix algae is holdfast. This lower most cell of algae contain nucleus but it is a non-chlorophylls structure. Hence, the absence of chlorophyll, in the lowermost cell of ulothrix shows the beginning of labor division.

205. Smallest plant which contain green pigment such as higher green plant is
(a) Schizomycetes
(b) Rhodophyceae
(c) Chlorophyceae
(d) Phaeophyceae

UPCPMT-2002

Ans. (c) : Chlorophyceae is a very significant and sizable class of green algae. Members might be filamentous, colonial, or unicellular.

•The main features of the class (and most plant) are the use of starch as the principal food reserve and the green chloroplast with chlorophyll a and b.

•Schizomycetes is a class of unicellular or noncellular organism that lack chlorophyll, comprise all the bacteria, and are prokaryotes, although formerly classified as fungi.

vRhodophyceae (red algae) is of class a marine algae, most of them red in colour, whose basic shape is filamentous or membraneous. They tend to occur at greater depths than the green algae.

• **Phaeophyceae** – The brown algae comprising the class phaeophyceae, are a large group of multicellular algae, including many seaweeds located in cold water within the northern hemisphere

206. Match the following list

List I		**List II**
(A) Anucleate	(i)	Spirogyra gametangium
(B) Uninucleate	(ii)	Rhizopus chlamydospore
(C) Multinucleate	(iii)	Pteris neck canal cell
(D) Binucleate	(iv)	Vitis matured sieve element
	(v)	Akinite of Spirogyra

The correct match is

	A	B	C	D
(a)	(i)	(iv)	(v)	(ii)
(b)	(iv)	(i)	(iii)	(ii)
(c)	(i)	(iii)	(ii)	(iv)
(d)	(iv)	(i)	(ii)	(iii)

AP EAMCET-2013

Ans. (d): Anucleate- The sieve cells of the phloem of angiosperms like vitis are living cells. But at maturity they lake the nucleus called anucleate.
Uninucleate- The gametangium of spirogyra has single nucleus between the plant body of spirogyra is haploid undifferentiated and gametophytic. The gametes are produced in gametebearing cells of the thallus.
Multinucleate- Rhizopus belongs to the phycomycetes class of kingdom fungi. The body organization is like a fine thread called hyphae. Several hyphae come together to form a network called mycelium. The hyphae are coenocytic, aseptate and branched have many nuclei.
Binucleate- The neck canal cells of ferns like pteris are generally binucleate. There is a cylindrical neck consisting of the neck canal cell and the swollen ventre.

Thus, the correct option is (d).

207. Identify the correct pair of combination
(I) Chara - Monoecious – Chlorophyll a, b
(II) Salvinia – Homosporous – Free floating hydrophyte
(III) Ectocarpus – filmentous form – Chlorophyll a, d
(IV) Laminaria– Biflagellate gametes – Haplo - diplontic life cycle
(a) (II) , (III) (b) (I) , (IV)
(c) (I), (III) (d) (III), (IV)

TS EAMCET-2015

Ans. (b) : (i) Chara- Chara belong to the member of chlorophyceae are commonly called green algae. It is monosporous in nature and contains a pigments chlorophyll a and b.
(ii) Salvinia- Salvinia is a most popular free floating hydrophytes. It is heterosporous in nature.
(iii) Ectocarpus- It is a brown algae. They possess chlorophyll a and c.
Ectocarpus is a example of simple branched filamentous algae.
(iv) Laminaria- It is brown algae have biflagellate gametes and haplo diplontic type life cycle.

208. Select the wrong statement.
(a) The walls of diatoms are easily destructible
(b) 'Diatomaceous earth' is formed by the cell walls of diatoms
(c) Diatoms are chief producers in the ocean
(d) Diatoms are microscopic and float passively in water

NEET-2016 Phase-II

@apna_pdf

Ans. (a) : Chrysophytes (Protist) group includes diatoms and golden algae (desmids).
- They are microscopic and float passively in water.
- Diatomaceous earth is made from the fossilized remains diatoms frustules. These frustules are made up of Nano-silica SiO_2. Thus walls are indestructible.

209. Experiment to demonstrate importance of nucleus in the controlling growth and heredity were performed on :
(a) Acetabularia (b) Neurospora
(c) eucocytes (d) star fish

BVP-2006

Ans. (a) : Dr. J. Hammerling (1980) a German biologist who determined that the nucleus of a cell controls the development of organisms. His experimentation with the green algae Acetabularia prove that all the hereditary or genetic information is enclosed inside a nucleus. Concluded that the nucleus controls all the metabolic activities that take place in the cytoplasm of the cell.

210. Reserve food material of algae is :
(a) starch (b) glycogen
(c) fat (d) sugar

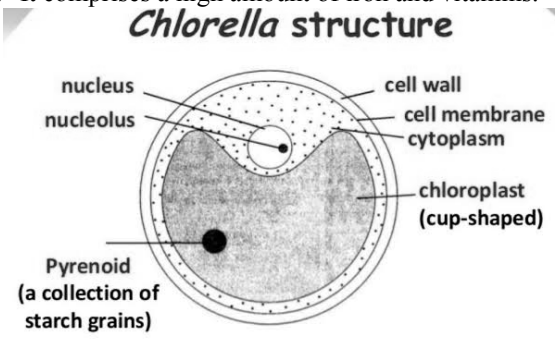
BCECE-2005

Ans. (a) : Algae are mostly aquatic (Freshwater and marina) simple, thalloid, autotrophic organisms that certain chlorophyll.
The algae reserves food material are starch, mannitols, laminarin, floridian starch.

211. Algae used in space programme is:
(a) Diatom (b) Dinoflagellates
(c) Chlamydomonas (d) Chlorella

BHU PMT-2003

Ans. (d) : Chlorella is a green algae, that has existed on earth for over 2.5 billion years. It is also known as space alga. It is used for the consumption of carbon dioxide provided by the astronauts and the production of oxygen in the Spacecrafts. The features that makes the Chlorella, the space alga are as follows:
→ Chlorella is a very good source of food which is rich in protein nutrient.
→ It can be grown very easily.
→ It comprises a high amount of iron and vitamins.



212. Phycocolloids are obtained from
(a) brown algae (b) breen algae
(c) blue- green algae (d) diatoms

UP CPMT-2010

Ans. (a) : The cellulose wall brown algae is covered in a colloidal layer made up of a variety of polysachrides referred to as phycocolloids. Example, alginic acid, algin, fucoidin and fucin. These prevents drying or freezing in water when algae are exposed to air during low tides and protect cells when waves beat them against the rocks.

213. Pigments common to all algae are
(a) chlorophyll-a and phycobilins
(b) chlorophyll-a and carotenoids
(c) chlorophyll-a and chlorophyll-b
(d) chlorophyll-b and carotenoids

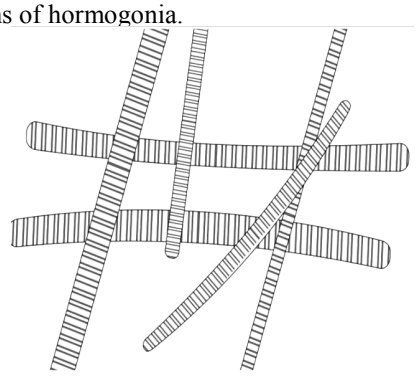
BVP-2012
MGIMS Wardha-2007

Ans. (b) : In algae, the chlorophyll- a pigment performs photosynthesis. Carotene is also a pigment that can trap radiant energy and convert into chemical energy. It appears to be a yellow color.
chlorophyll-a acts as a reaction center and carotene shows a wide range of light absorption for photosynthesis.
Chlorophyll a → $\mathbf{C_{55}H_{72}O_5N_4Mg}$
β Carotene → $\mathbf{C_{40}H_{56}}$

214. Hormogonia are vegetative reproductive structures of
(a) Ulothrix (b) Oscillatoria
(c) Spirogyra (d) Chara

Manipal-2012

Ans. (b) : • Ulothrix reproduces vegetatively by fragmentation.
• The mode of reproduction in chara is oogamous type.
• Spirogyra reproduces asexually by fragmentation.
• Oscillatoria is a myxophycean alga which reproduces by means of hormogonia.



HORMOGONIA IN OSCILLATORIA

215. Zygotic meiosis occurs in
(a) Pinus (b) Marchantia
(c) Dryopteris (d) Chlamydomonas

Manipal-2011

Ans. (d) : In chlamydomonas, zygotic meiosis is found. Chlamydomonas belogns to class chlorophyceae, it is unicellular grass green due to the dominance of pigment chlorophyll **a** and **b**.

216. In algae, the bacteriological filter is :
(a) Oscillatoria (b) Batrachospermum
(c) Nostoc (d) Cosmarium

AFMC -2011

@apna_pdf

Ans. (d) : Cosmarium belongs to green algae. The cell membrane of cosmarium is highly porous which can filter small organisms such as bacteria. Hence, it is used as a bacteriological filter. Two semi cells of Cosmarium are joined by the isthmus where the nucleus is present. It moves by mucilage propulsion as it absorbs water and swells which propels the cell to move forward.

217. Presence of basal rhizoidal cell in Ulothrix is an example of
(a) dead cell
(b) vestigial cell
(c) accessory cell
(d) beginning of division of labour

BHU PMT (Mains)-2009

Ans. (d) : The advanced alga uloturix has three different cell types; a green dome - shaped apical cell, a green intercalary cell, and a basal non-green intercalary cell.
Basal cell is non green but has nucleus and cytoplasm.
Its presence shows the beginning of the division of labour.

218. The plants of Cladophora crispata occur as :
(a) epiphyte (b) endophyte
(c) endozoic (d) epizoic

BHU PMT (Mains)-2005

Ans. (d) : Cladophora crispata is a type of green algae with branched filament that is known to live on the shells of snails. Because of the use of an animal as a place to live and grow, therefore, cladophora crispata is considered to be an epizoic plant.

219. Comparable to angiosperms, which of the following algae exhibits diplontic life cycle?
(a) Spirogyra (b) Ectocarpus
(c) Polysiphonia (d) Fucus

DUMET-2010

Ans. (d) : A brown alga known as fucus (rockweed) exhibits a diploid life history that is comparabt to that of angiosperms.
Spirogyra, Volvox exhibits haplontic pattern of life cycle whereas Ectocarpus, Polysiphonia & kelp are haplo-diplontic.

220. Chloroplasts of Spirogyra have:
(a) spiral margin
(b) smooth or waxy margin
(c) smooth margin
(d) none of the above

HP CET-2011
BCECE-2006

Ans. (b) : In Spirogyra, chloroplasts are ribbon, shaped serrated or scollped, and spirally organized. The margin of chloroplasts may be smooth or wavy or serrated. The Spirogyra chloroplasts are long, spirally coiled ribbon, smooth and may contract to form a rod structure.

221. Which one of the following classes is not a representative of green - algae?
(a) Chlorophyceae (b) Charophyceae
(c) Euglenophyceae (d) Chrysophyceae

MGIMS Wardha-2013

Ans. (d) : Chlorophyceae, Charophyceae and Euglenophyceae are representative of green algae. Chrysophyceae of class- algae is the representative of orange or brown algae. They are often called as **chrysophytes**. They are mostly found in freshwaters.
They are sometimes referred to as golden-brown algae due to their coloration from specific photosynthetic pigments. They are often unicellular and have a flagellum which allow them to move in water.

222. Major pigments found in Phaeophyceae, i.e. brown algae are
(a) chlorophyll a, d
(b) chlorophyll a, b, c
(c) chlorophyll a, c and fucoxanthin
(d) chlorophyll a, d and phycoerythrin

HP CET - 2013
J&K CET-2014

Ans. (c) : The phaeophyceae possess chlorophyll a, c carotenoids and xanthophylls. Fucoxanthin, a type of xanthophyll is present in brown algae.

223. Which of the following is obtained from algae?
(a) Carrageenan (b) Chocolate
(c) Butter (d) Wax

CMC Ludhiana - 2007
VMMC-2002

Ans. (a) : Carrageenan is a polysaccharide which is obtained from red algae *Chondrus crispus* (Iris mass). It is hydrocolloid (water holding substance).
Carrageenans are used in emulsion stabilization, for syneresis control and for binding and dispersion. Major uses are in foods and dairy application.

224. Mannitol is a stored food material found in members of which of the following classes?
(a) Chlorophyceae (b) Xanthophyceae
(c) Rhodophyceae (d) Phaeophyceae

J&K CET-2012

Ans. (d) : Mannitol is type of stored food present in Phaeophyceae, also known as brown algae. Mannitol is a form of complex carbohydrate stored as food in some definite algae.
Mannitol represents the major end product in these algae and is the main form of carbon storage. It is formed by reduction of fructose-6-phosphate.

225. If you are asked to classify the various algae into distinct groups, which of the following characters you should choose?
(a) Types of pigments present in the cell
(b) Nature of stored food materials in the cells
(c) Structural organization of thallus
(d) Chemical composition of the cell wall

Rajasthan PMT-2010

Ans. (a) : Algae are a group of chlorophyllous, non vascular plants with thallose plant body. Different algae show different pigments present in the cell like chlorophyll- a, b, xanthophylls, carotenes, etc. These pigments provide the base for classification.
The algae are divided into three main classes -
Chlorophyceae, Phaeophyceae and Rhodophyceae
Chlorophyceae : - They are usually grass green due to the dominance of pigments. Chlorophyll **a** and **b** e.g. - *Chlamydomonas, Volvox, Ulothrix, Chara, Spirogyra* etc.

@apna_pdf

Phaeophyceae : - They posses chlorophyll **a, c Carotenoids** and **Xanthophylls**. They vary in colour from olive green to various shades of brown depending upon the amount of the Xanthophyll pigment, Fucoxanthiin present in them. e.g. *Laminaria, Sargassum, Fucus* etc.
Rhodophyceae :- The members of Rhodophyceae are commonly called red algae because of the predominance of the red pigment, ***r-phycoerythrin*** in their body. e.g. *Porphyra, Gracilaria, Gelidium.*

226. Solar energy transducer is
(a) Agaricus (b) Rhizobium
(c) Orobanche (d) Chlorella
AMU-2011

Ans. (d) : Solar energy transducer is Chlorella. Chlorella is a green algac, which contain chlorophyll a and b in chloroplast. It traps the daylight and converts the sun based energy obtained by the sun to synthetic energy.

227. Algae which are called gulf weed are
(a) Chlamydomonas (b) Volvox
(c) Chara (d) Sargassum
AMU-2011

Ans. (d) : Saragassum is a brown algae, which is known as gulfweed or holly sea. The genus sargassum, having air bladders and forming dense floating masses in tropical atlantic water. It is used both as manure and fodder.

228. Like angiospermic parasite such as Cuscuta, there are some parasitic forms of Rhodophyta, which are colourless, heterotrophic and grow on other members of Rhodophyta. Select which one is a parasitic form of red algae ?
(a) Gelidium (b) Harveyella
(c) Choridras (d) Both (a) and (b)
AMU -2000

Ans. (b) : Rhodophytes are also known as red algae, which is a eukaryotic alga without flagelate. Around 7000 living species are known till now. Majority of the red algae are marine with greater concentrations found in the warmer areas, most of them are autotrophic except Harveyella which is colourless parasitic red algae. Most Harveyella are parasitic over Polysiphonia.

229. The commercially exploited algae include
(a) Caulerpa, Chara and Volvox
(b) Gelidium, Laminaria and Porphyra
(c) Acetabularia, Spirogyra and Ulothrix
(d) All of the above
AMU-1999

Ans. (b) : The commercially exploited algae include Gelidium, Laminaria, Porphyra. Laminaria is used in the manufacture of iodine and Gelidium in the production of agar.
Porphyra tenera (Red algae) is used as flavoring agent in soups and salads.

230. The red colour of rhodophyta is due to the preponderance of
(a) phycobilins (b) phycocyanin
(c) phycoerythrin (d) none of these
AMU-1999, 2012

Ans. (c) : Red colour of rhodophyta is due to the preponderance of phycoerythrin. Majority of the red algae are marine with greater concentrations found in the warmer areas. E.g. Polysiphonia, Porphyra, Gracilaria and gelidium.

231. A protein rich green alga is:
(a) Chlorella (b) Ulothrix
(c) Spirogyra (d) Volvox
MGIMS Wardha-2004
UP CPMT-2004

Ans. (a) : Chlorella is a type of freshwater green algae, which contains protein, iron, vitamins B and C, and other antioxidants. It is used as food suppliment by space travellar.

232. Cell wall of red algae contains:
(a) cellulose
(b) cellulose + alginic acid
(c) cellulose + pectin
(d) no cell wall
HP CET-2013

Ans. (c) : Algae have cell wall, made of cellulose, galactans, mannans and minerals like calcium corbonate. Red algae are classified as Rhodophyta. The cell wall composition of members belonging to class Rhodophyceae, are made up of cellulose, Pectin and a variety of polysaccharides.

233. Cell wall of green algae is made up of :
(a) cellulose (b) chitin
(c) glycogen (d) muramic acid
Rajasthan PMT-1998

Ans. (a) : Green algae are usually green grass due to the dominance of pigment chlorophyll **a** and **b.**
The cell wall of green algae is mode of an inner layer of cellulose and an outer layer of pectin.

234. Hold fast cell of Ulothrix shows as a :
(a) companion cell (b) dead cell
(c) division of labour (d) none of these
Rajasthan PMT-1998

Ans. (c) : Ulothrix is a genus of filamentous green algae found in marine and fresh water.
• The specialized cell for attachment is called the holdfast, and the filaments are typically unbranched.
Holdfast or basal cell is for attachment, for attachment, it has a nucleus and cytoplasm. Its presence shows the beginning of the division of labour.

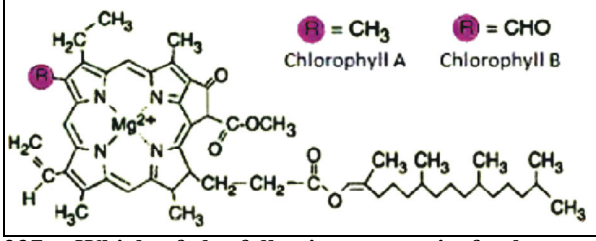
235. Laminaria (kelp) and Fucus (rock weed) are the example of
(a) green algae (b) brown algae
(c) red algae (d) golden brown algae
UP CPMT-2001

Ans. (b) : The members of phaeophyceae or brown algae are found primarily in marine habitate. They show great variation in size and form. Laminaria is also known as kelp. It is the largest and the most complex of the class of algae. Laminaria and Fucus have a xanthophyll pigment called the fucoxanthin which provides the characteristic color to them. Laminaria (kelp) and fucus (rock weed) are the example of brown algae.

@apna_pdf

236. Chlorophyll - b differs from chlorophyll - a in that it does not have
(a) CHO (b) COOH
(c) CH_3 and - CH (d) None of these
BVP-2013
CG PMT-2007

Ans. (a) : Chlorophyll is a green color pigment that is found in the leaves of the plant. Two forms of chlorophyll- a and b present themselves with various difference between them.
Chlorophyll-a differs from chlorophyll-b in that chlorophyll-a has a methyl ($-CH_3$) group while chlorophyll-b has a aldehyde group (-CHO) in place of a methyl group.



237. Which of the following occurs in fresh as well as marine water?
(a) Spirogyra (b) Cladophora
(c) Oedogonium (d) None of the above
Uttarakhand-2005

Ans. (b) : Cell wall of green algae is made up of cellulose and calcium corbonate. In green algae, major photosynthetic pigments are chlorophyll-a, chlorolphyll-b and carotenoids. Cladophora occurs in both fresh-water and marine habitat.

238. Which of the following characters are related to Spirogyra oogensis?
1. Dioecious conjugation
2. Attached species
3. Morphological anisogamy
The correct combination is:
(a) 1, 2 and 3 are correct
(b) only 1 and 2 are correct
(c) only 1 and 3 are correct
(d) only 2 and 3 are correct
AP EAMCET-2004

Ans. (d) : Spirogyra oogensis is a chlorophycian algae. It is an attached species and during reproduction produces anisogametes i.e., morphologically different male and female gametes.
Asexual reproduction is by flagellated zoospores produced in zoosporangia. The sexual reproduction shows considerable variation in the type and formation of sex cells and it may be Isogamous, Anisogamous or Oogamous.

239. Source of kelp is
(a) green algae (b) blue-green algae
(c) brown algae (d) red algae
Haryana PMT-2007

Ans. (c) : Brown algae show great variation in size and form. They range from simple branched, filamentous form (Ectocarpus) to profusely branched forms as represented by kelps, which may reach a height of 100 meters. Kelp is obtained from brown algae.

240. A term helotism is used for the symbiosis of
(a) algae and fungi (b) algae and cycas
(c) algae and bacteria (d) pinus and fungi
AMU-2006

Ans. (a) : Helotism refers to the symbiotic association of algae and fungi which is commonly called lichen symbiosis. Lichens are complex organisms that comprises of association between algae and the fungi.

241. Heterotrichous habit is shown by :
(a) Ulothrix (b) Oedogonium
(c) Chalmydomonas (d) Stigeoclonium
JIPMER-2000

Ans. (d) : In some algae, the plant body is very much evolved and consists of more than one type of filaments and thus, represents the heterotrichous habit. It is one of the characteristic feature of Chaetopharales of Chlorophyceae. For example; Stigeoclonium.

242. Agar-Agar is obtained from
(a) Gigartina (b) Gelidium
(c) Gracilaria (d) All of these
Manipal-2013
AFMC-2004
AMU-2002

Ans. (d) : Agar-Agar is obtained from the cell wall of red algae, mainly of the genus Gracilaria, Gelidium and Gigartina, etc. All of these algae are commonly characterized by belonging to the group of red algae because the predominance of the red pigment ***r-phycoerythrin*** in their body. These algae are small, have a reddish stem and are rich in mucilage, a type of fiber. These are extracted pouring hot water on them once they are dried in the sun.

243. The diploid phase in the life cycle of Spirogyra is represented by:
(a) female gamete (b) zygospore
(c) aplanospore (d) akinete
AP EAMCET-2001

Ans. (b) : In spirogyra, sexual reproduction has a cycle that alternates between a haploid gametophyte phase and a diploid zygospore phase. This zygospore grows and leads to a gametophyte. This sort of life cycle is known as, the haplontic life cycle. Spirogyra belongs to the class Chlorophyceae.

244. Characteristics of Cyanophyceae is
(a) phycocyanin (b) chlorophyll- b
(c) phycoerythrin (d) chlorophyll - a
CG PMT-2006

Ans. (a) : Cyanobacteria are photosynthetic bacteria, they are also known as Blue- Green algae. They posses phycocyanin pigment. It is blue photosynthetic pigment. It is a phycobiliprotein complex produced by cyanobacteria.

245. Synzoospore is found in
(a) Ulothrix (b) Volvox
(c) Vaucheria (d) Oedogonium
BHU PMT (Screening)-2011

Ans. (c) : Vaucheria grows in shallow freshwater or marine environments. In vaucheria, the multiflagellate compound zoospores, also known as synzoopores or conidiospores which are developed in these genus, usually in aquatic forms. A single compound zoospores develops in a single zoosporangium. Any distal branch of the thallus may convert into a zoosparangium. It is multi-flagellate. The zoospore swims for about 15 to 20 minutes. In Vaucheria, food is stored as oil globules.

@apna_pdf

246. Two adjacent filaments of Spirogyra affinis having 10 cells participating in reproduction. How many new Spirogyra plants are produced during sexual reproduction?
(a) 5 (b) 10
(c) 20 (d) 40
Manipal-2009

Ans. (b) : Spirogyra reproduces sexually through conjugation, in which a new individual is formed when the two parts of the adjacent filaments are combined. In it 10 cells participate in the sexual reproduction of Spirogyra, then 10 new individuals are formed from the filaments.
A conjugation tube is formed between the cells of adjacent filaments. The protoplast of one cell (male gamete) migrates to the other (female gamete), these protoplast fuse to form zygospores. These zygospores undergo meiosis and, on germination, give rise to new filaments.

247. External fertilization occurs in majority of
(a) fungi (b) algae
(c) liverworts (d) mosses
DUMET-2009

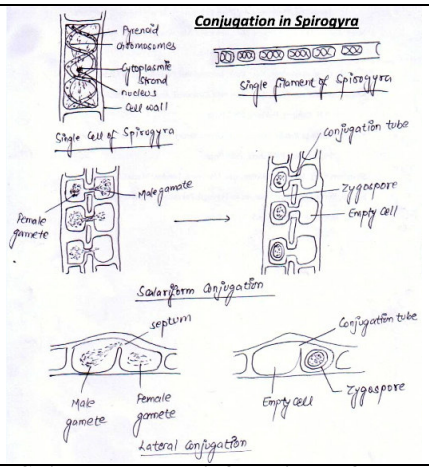
Ans. (b) : External fertilization is a type of sexual reproduction. It is a process in which the fusion of male and female gametes takes place outside the female body in an external medium, generally water.
External fertilization occurs in the majority of algae. The sexual reproduction in algae is of these types: Isogamy, anisogamy and oogamy. Here the gametes are formed, and the fertilization of gametes takes place outside the algal body. An advantage of it is that it leads to the formation of a large number of offspring. One disadvantage is that environmental hazards like predators greatly reduce the prospect of surviving into adulthood.

248. In which of the following, all listed genera belong to the same class of algae?
(a) Chara, Fucus, Polysiphonia
(b) Volvox, Spirogyra, Chlamydomonas
(c) Porphyra, Ectocarpus, Ulothrix
(d) Sargassum, Laminaria, Gracillaria
BVP-2013
DUMET-2009

Ans. (b) : Algae is the most primitive group of kingdom plantae. Alage further divided in to mainly three classes. Chlorophyceae (green algae), Rhodophyceae (red algae), and phaeophyceae (brown algae). Volvox, Spirogyra, Chlamydomonas belongs to same class chlorophyceae. Laminaria, Saragassum, Ectocarpus are members of brown algae. Polysiphonia, Porphyra, Gracilaria are members of red algae. Ulothrix is also a green algae.

249. Conjugation occurs in :
(a) Funaria (b) Oryza
(c) Spirogyra (d) Selaginella
DUMET-2001

Ans. (c) : Spirogyra is a common free-floating green, unbranched, filamentous, freshwater algae. Sexual reproduction only takes place under adverse conditions. Sexual reproduction in spirogyra takes place by conjugation. It is an Isogamous type. Fusion of non flagellate gametes resulted in zygospore. Two method of conjugation have been found: Lateral conjugation and Scalariform conjugation.



250. In Spirogyra a brief period of tetranucleate condition is found in:
(a) hold fast (b) gametangium
(c) vegetative cell (d) germinating zygote
AP EAMCET-2002

Ans. (d) : Spirogyra is an example of the Chlorophyceae. It is an unbranched, filamentous alga that is commonly found in freshwater. In Spirogyra, the asexual reproduction takes place through flagellated zoospores, the vegetative reproduction takes place through fragmentation, and the sexual reproduction takes place through conjugation. It takes place through the fusion of two non-ciliated gametes. The fusion of both kinds of gametes results in the formation of zygospores. The germinating diploid zygospores undergo meiosis to maintain the haploid. Condition, thus, in this condition, a tetranucleate condition is found for a brief period.

251. A water fern which is used as a green manure in rice fields is
(a) Salvinia (b) Mucor
(c) Aspergillus (d) Azolla
Haryana PMT-2010

Ans. (d) : Azolla belongs to the family of Salviniaceae. It is an aquatic fern that remains in Symbiotic association with the Anabena and helps in fixation of nitrogen. Azolla is used as green manure for rice crops, due to its high growth rate, nitrogen-fixing capacity, and ability to scavenge nutrients from soil and water.

252. Which of the following algae is used as a source of proteins ?
(a) porphyra tenera (b) chlorella
(c) spirulina (d) chara
CMC Ludhiana-2014

Ans. (c) : Spirulina is a non-toxic, blue-green algae that is a rich source of protein. It is named as the world's first super food because of its multiple benefits. It contains 70% full protein by biomass. It is used as protein supplement. It is also a source of vitamin B12.

253. The narrow middle part of chromatophore in Euglena is:
(a) pyrenoid (b) pyrenophore
(c) endosome (d) paramylum
AP EAMCET-2000

@apna_pdf

Ans. (b) : The chromatophores contain the green pigments chlorophyll-a and chlorophyll-b, along with β-carotene, and are also known as chloroplast. Each chromatophore consists of a thin central pyrenophore that is enclosed by pyernoid.

254. The red colour of red sea is due to which of the following blue-green algae?
(a) Chlamydomonas nivalis
(b) Anabaena
(c) Microcystis
(d) Trichodesmium

Rajasthan PMT-2006

Ans. (d) : The red sea is named for the Trichodesmium erythraeum algae, an occasional bloom of cyanobacteria that accumutates and muddies the normally translucent blue-green waters. On the surface of these lakes, these cyanobacteria appear as red and pinkish mats. Trichodesmium will die after flowering, and the sea will turn reddish-brown. During a "bloom" of cyanobacteria, the appearance of body of water changes dramatically. Trichodesmium erythraeum is also known as "sea sawdust".

255. Sexual reproduction in Spirogyra is an advanced feature because it shows
(a) morphologically differentiated sex organs
(b) physiologically differentiated sex organs
(c) different sizes of motile sex organs
(d) same size of motile sex organs

JCECE-2015

Ans. (b) : Spirogyra is a freshwater green alga which belongs to Class Chlorophyceae. The sexual reproduction in Spirogyra is called conjugation. It involves the fusion of two morphologically identical but physiologically dissimilar, non-ciliated gametes.
The Male cytoplasm migrates through the conjugation canal, fuses with the female. This union produces a zygospore.

256. Smallest plant which contain green pigment such as higher green plant is
(a) Schizomycetes (b) Chlorophyceae
(c) Rhodophyceae (d) Phaeophyceae

VMMC-2007

Ans. (b) : Chlorophyceae is an important class of green algae. They may be unicellullar, colonial, or filamentous. The main features of the class are the use of starch as the principal food reserve and the green chloroplasts with chlorophylls a and b, in different species the chloroplast may be discoid, reticulate, cup shaped, spiral or ribbon-shaped.

257. Which of the following is not visible through electron microscope in chlamydomonas ?
(a) Contractile vacuole
(b) Stigma
(c) Neuromotor apparatus
(d) All of the above

Rajasthan PMT-2000

Ans. (c) : Neuromotor apparatus in Chlamydomonas is not visible through electron microscope.
The neuromotor apparatus is a system of non contractile cytoplasmic fibrils that is often associated with a motorium in various protozoans and may be analogous to the nervous system of higher forms.

258. Red algae are able to grow deep in sea as
(a) they can trap blue light of short wavelength in deep layer of water
(b) they have phycoerythrin to trap blue green light in deep layer of water
(c) both (a) and (b)
(d) none of these

CMC Ludhiana-2007

Ans. (c) : Red algae are also known as Rhodophyceae.
In red algae, the red color is a result of ample formation of pigment phycoerythrin, other pigments are chlorophyll A and Phycocyanin. This can absorb blue-green wavelength of light. As it is short, such wavelengths can reach maximum depth in water because Phycoerythrin traps this wavelength of light, and thus the plant is able to perform photosynthesis, through which red algae can reach maximum depth in the sea where no other type of photosynthetic entity grows.

259. Ulothrix releases zoospore during
(a) Evening (b) Morning
(c) Night (d) Noon

BCECE-2008
UP CPMT-2006

Ans. (b) : Zoospore development is the typical strategy for multiplication when the states of life are favorable, every cell of ulothrix fiber with the exception of holdfast are equipped for propagation. Through a pore in the lateral wall the mature zoospores are released into a delicate vesicle.

260. Pigment common to all algae is
(a) Alginate (b) Carotenoids
(c) Phycocyanin (d) Chlorophyll

BCECE-2009

Ans. (d) : Chlorophyll a is a common pigment in all oxygenic photosynthetic algae. In all algae, chlorophyll acts as a reaction center which absorbs light energy and converts it into chemical energy, which makes photosynthesis possible.

261. Calcium encrustation and larvicidal properties are present in
(a) Chara (b) Oscillatoria
(c) Diatoms (d) Caulerapa

AMU-2003

Ans. (a) : Chara is commonly known as stone wort. Chara is a member of class Charophyceae which includes green Algae. Charales have larvicidal properties and hence, are used to control mosquitoes. Chara is found mostly in hard, fresh water rich in organic matter and calcium. Chara plants are often encrusted with calcium carbonate and are hence commonly called stone wort.

262. In Spirogyra
(a) filaments, in which lateral conjugation occur are homothallic
(b) filaments, in which sclariform conjugation occur are homothallic
(c) filaments, in which lateral conjugation occur are heterothallic
(d) a sexual reproduction occur by zoospores

AMU-2003

Ans. (a) : Spirogyra can reproduce both sexually and asexually. Asexual reproduction takes place through fragmentation of the filaments. Sexual reproduction occurs by lateral conjugation. Here, the two adjacent cells of same filament fuse together to form a zygospore.

@apna_pdf

C. Bryophytes

263. The amphibians of plant kingdom are
(a) multicellular non motile algae
(b) bryophytes with simple internal organisation
(c) unicellular motile algae
(d) pteridophytes with complex internal organisation

TS EAMCET-10.08.2021 Shift-I / HP CET-2013
BCECE-2009 /JIPMER-2004
VMMC-2003, 2002 /DUMET-2001
Haryana PMT - 2000 /AIPMT - 1996

Ans. (b) : Bryophytes are called amphibians of the plant kingdom because these plants though live in soil but they require water for sexual reproduction. The sperms of bryophyte are flagellate and need water to swim to the eggs. Bryophytes is to be non-vascular plants. Asexual reproduction is the main method of reproduction in bryophytes.

264. In Funaria capsule, dispersal of spores takes place through
(a) Peristomial teeth (b) Annulus
(c) Calyptra (d) Operculum

CMC Ludhiana-2011 /AP EAMCET-2011
VMMC-2011 /BHU PMT (Screening)-2009
Uttarakhand PMT-2009 / MP CPMT-2009
AMU-2005 / Manipal-2004 /UP CPMT-1995

Ans. (a) : Dispersal of spore take place due to hygroscopic nature of peristomial teeth. One or two rings of tooth-like appendages surround the capsule opening of masses known as peristomes. The teeth unfold under dry conditions to disperse spores gradually. Haplolepiodus consist of one ring of 16 peristomes. It arranged in 16+16.

265. Protonema occurs in the life cycle of
(a) Riccia (b) Funaria
(c) Anthoceros (d) Spirogya

JIPMER-2012 /BVP-2012 / Manipal-2012
VMMC-2011/ Uttarakhand PMT-2009
BHU PMT (Screening)-2009 / CG PMT-2006
AIPMT-1993, 1990

Ans. (b) : The earliest stage of a bryophytes (funaria) life cycle is called a protonema, and it is a cell chain that look like a thread. They reproduce by spore formation. They have no vascular system. At the point when a mass initially develops from the spore, it becomes as a protonema which forms into a verdant gametophore.

266. Which of the following is known as bog moss?
(a) Polytrichum (b) Funaria
(c) Sphagnum (d) Porella

AIPMT-2014 / Manipal - 2012 /AFMC - 2010
UP CPMT-2010/ CG PMT-2009/ Haryana PMT-2009

Ans. (c) : Bog moss is an aquatic moss also known as peat moss or cotton moss. Sphagnum is known as the bog moss, it is a living moss found in wet and boggy areas.
It can store water as both living and dead plants hold large quantities of water inside their cells. It also regulates moisture and air around the plant roots for making suitable conditions of root growth and development.

267. In Funaria, stomata are present on the
(a) stem (b) leaves
(c) capsule (d) archegonia

CG PMT-2010 / BCECE-2010
CMC Vellore-2009 / Punjab MET-2009
Rajasthan PMT-2009 / MGIMS Wardha-2008
Haryana PMT-2007 / UP CPMT-2001

Ans. (c) : In Funaria, stomata are absent in leaf and is present in capsule (apophysis). The stomata as present only in the apophysis, which is present at the basal part of the capsule.

268. In bryophytes
(a) both generations are independent
(b) gametophytes are dependent upon sporophytes
(c) sporophytes complete their life cycle
(d) sporophytes are dependent upon gametophytes

Punjab MET-2003 / AFMC - 2000
AIPMT-199 4/ Rajasthan PMT-1998

Ans. (d) : In bryophytes sporophytes are dependent upon gametophytes, the long–lived and conspicuous generation is the gametophyte, while in vascular plant it is sporophyte. Structures resembling stem, roots, and leaves are found on the gametophores of bryophytes in the vascular plant.

269. Bryophytes can be separated from algae, because they
(a) possess archegonia
(b) contain chloroplast
(c) are thalloid forms
(d) have no conducting tissue

VMMC-2002 / Haryana PMT-2000,2001
AIPMT-1997, 1999 /AIPMT-1997

Ans. (a) : Bryophytes can be separated from algae, because they possess archegonia. Both algae and bryophytes have motive sperm and need water for fertilization, but bryophyte can be separated from algae because archegonia originated from the first time in bryophytes in plant kingdom. It is a flask shaped structure with swollen base called venter and upper elongated neck.

270. Calyptra develops from
(a) venter wall of archegonium
(b) outgrowth of gametophyte
(c) neck wall of archegonium
(d) paraphysis of the archegonial branch

JIPMER-2012, 2009 / BHU PMT (Screening)-2009
Uttarakhand PMT-2009 / Rajasthan PMT - 1998

Ans.(a) : Calyptra develops from venter wall of archegonium. Calyptra is a covering that develops from the venter wall of archegonium in bryophytes and pteridophytes. Where this is an enlarged archegonia center that protects the capsule which in turns contains the embryonic sporophytes. It acts as a transpiration shield around the immature capsule and provides protection to the young capsule.

271. Funaria gametophyte is
(a) Dioecious (b) Heteroecious
(c) Autoecious (d) Monoecious and autoecious

MGIMS Wardha-2010 /MP PMT-2004, 2001
AIIMS-2001/ AMU-1990

@apna_pdf

Ans. (d) : Funaria is both monoecious and autoecious, such that male and female reproductive structures develop on different branches of the same plant. Autoecious means male & female sex organs one found on the same plant but one on different branches (green photosynthetic).

272. In bryophytes, the posterior part of archegonium grows to protect the embryo. It is

(a) paraphysis (b) apophysis
(c) hypophysis (d) calyptras

BHU PMT (Mains)-2009 / Haryana PMT-2008
Rajasthan PMT-2006 / BHU PMT-2002
Rajasthan PMT-1998

Ans. (d) : Calyptra is the layer of cells that develop from the posterior part of the archegonium and covers the developing sporophyte of mosses and liverworts. Calyptra is a small, maternal gametophytic structure that covers the apex of the offspring sporophyte and is critical for the transition from seta formation to capsule differentiation in many moss taxa.

273. Match the column – I with column –II and choose the correct option from the following:

Column –I (Plant groups)	**Column –II (Examples)**
(1) Bryophyta	**p. Pinus**
(2) Gymnosperm	**q. Adiantum**
(3) Algae	**r. Sphagnum**
(4) Pteridophyta	**s. Ectocarpus**

	1	**2**	**3**	**4**
(a)	q	s	p	r
(b)	s	r	q	p
(c)	r	p	s	q
(d)	q	p	s	r

Karnataka CET-20.05.2023

Ans. (c) :

1.	Bryophyta	r.	Sphagnum
2.	Gymnosperm	p.	Pinus
3.	Algae	s.	Ectocarpus
4,	Pteridophyta	q.	Adiantum

274. Selaginella belongs to the following class

(a) Pteropsida (b) Sphenopsida
(c) Psilopsida (d) Lycopsida

TS EAMCET-10.05.2023, Shift-II

Ans. (d) : Lycopodium and selaginella belongs to class Lycopsida(Pteridophyte).
Pteridophytes are also known as vascular cryptogams or snaks of plant kingdom. plant body is sporophyte and differentiated into root, stem and leaves.
Pteridophytes are divided in 4 classes psilopsida, Lycopsida, tpropsida, sphenopsida.

275. Choose the incorrect pair

(A) Photosynthesis - Arnon
(B) Study of Bryophytes - Stephen Hales
(C) Study of cell structure and function - Camararius
(D) Study of plant anatomical tissues - Nehemaiah Grew

(a) A, B (b) A, C
(c) B, C (d) C, D

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : Study of Bryophytes- Stephen Hales
Study of all structure - Camararious

- Study of Bryophyle is called Bryology.
- Bryophyta term given by Robert Braun
- Photosynthesis discovered by Jan Baptista Van Helmont. It is a Physilogist and physian.
- Study of plant Ahatonical tissue on Gottleib Haberlahdt.

276. Capsule producing spores and Pseudo-elaters are found in

(a) Funaria (b) Marchantia
(c) Anthoceros (d) Sphagnum

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : Capsule producing spores and pseudoelators are found in hornworts e.g. Anthoceros.
Pseudoelators are helpful in spore dispersion. Anthoceros occurs in moist, shaded habitats in subtropical and warm temperate regions. On the ventral surface of Anthoceros many smooth walled rhizoids are present which help is fixation.

277. Select the correct statements

A. In liverworts, mosses and ferns gametophytes are free living
B. Sporophyte in mosses are more elaborate than in liverworts
C. In Gymnosperms and Angiosperms gametophytes are independent
D. Pinus and Cycas are dioecious

(a) A and C are correct
(b) A and B are correct
(c) A, B and C are correct
(d) A, B, C and D are correct

TS EAMCET-11.05.2023, Shift-I

Ans. (b) : In mosses, liverwort, and ferns gametophyte are free living. and sporophyte of mosses are more developed than liverworts. Mosses gametophytes leafy and sporophyte have capsule on the end of stalk (setae). gametophyte of liverwort have leaves without midrib (costa) and leaves inserted at angle to stem. sporophyte has a transluscent stalk, capsule black and egg shaped.

278. Intercalary meristamatic zone, paraphyses, Elaeters are the characters of these Bryophytes respectively.

(a) Hepaticopsida, Anthocerotopsida, Bryopsida
(b) Anthocerotopsida, Hepaticopsida, Bryopsida
(c) Bryopsida, Hepaticopsida, Anthocerotopsida
(d) Anthocerotopsida, Bryopsida, Hepaticopsida

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : Intercalary meristamatic zone, paraphyses, Elaeters are the characters of Bryophytes respectively- Anthocerotopsida, Bryopsida, Hepaticopsida.
Pseudoelators present in Anthocerotopsida (Anthoceros). Elaters and pseucdoelators are helpful in spores dispersion.

279. Which of the following statements is true?

(a) Most algal genera are diplontic
(b) Most bryophytes do not have haplo-diplontic life cycle
(c) All pteridophytes exhibit haplo-diplontic pattern
(d) Seed bearing plants follow haplontic pattern

RE-NEET (UG)-06.06.2023 (Manipur)

@apna_pdf

Ans. (c) : The haplo-diplontic life cycle seen in all bryophytes and pteridophytes along with certain algae.

• Haplo-diplontic type of life cycle involves clear alternation of generation between haploid gamete produced by gametophyte and a diploid spore produced by sporophyte.

• Seed bearing plants are gymnosperms and angiosperms and both of them follow diplontic life cycle.

280. Assertion A : The first stage of gametophyte in the life cycle of moss is protonema stage.
Reason R : Protonema develops directly from spores produced in capsule.
In the light of the above statements, choose the most appropriate answer from the options given below
(a) A is not correct but R is correct.
(b) Both A and R are correct and R is the correct explanation of A.
(c) Both A and R are correct but R is NOT the correct explanation of A.
(d) A is correct but R is not correct.

NEET (UG) 07.05.2023

Ans. (b) : The plant body of mosses is very simple. It has a small branched stem with spirally arranged simple leaves, multicellular hairy out growths, called rhizoids.

• Protonema is a stage that is creepy, green, branching and frequently filamentous.

• Protonema is a haploid autonomous, gametophytic stage when a moss, first grow from the spore. It grow as a protonema which develop into leafy gametophyte.

281. The Juvenile stage in Mosses is called as
(a) Gametophore (b) Protonema
(c) Gemma (d) Paraphysis

AP EAMCET-12.07.2022 Shift-II

Ans. (b) : In case of Mosses the spores attain a green filamentous and branched structure called protonema that represents a juvenile stage of moss gametes. The moss lifecycle is completed in two distinct stages -the gametophyte and the sporophyte. The term that describes this type of life history is called alternation of heteromorphic generations.

282. Which one of the following is an example of aquatic floating bryophytes ?
(a) Ricca atlantica (b) Pteris vittata
(c) Riccia fluitans (d) Marchantia polymorpha

Tripura JEE-2021

Ans. (c) : Riccia fluitans is an aquatic floating plant of the liverwort. It normaly grows quickly at the surface. It can be found floating in ponds and under the water surface. Riccia fluitans is also known as floating crystalwort.

283. Gemmae are present in
(a) Some Liverworts (b) Mosses
(c) Pteridophytes (d) Some Gymnosperms

NEET-2021

Ans. (a) : Gemmae are green, multicellular asexual buds.

- The are produced by some liverworts like marchantia.
- Mosses reproduce vegetatively by fragmentation and budding of protonema.
- Pteridophytes and Gymnosperms normally do not reproduce asexually.

284. Which one of the following bryophytes is used as a fuel ?
(a) Funaria (b) Marchantia
(c) Sphagnum (d) Anthoceros

AP EAMCET-25.09.2020 Shift-II

Ans. (c) : Sphagnum in the form of peat is used as fuel and also used for trans-shipment of living material, as it has the water holding capacity. They are used to pack bulbs, cuttings and seedlings for shipment. Dried peat may be used as fuel.

285. Plants like <u>Marchantia</u> and <u>Funaria</u> produce gametes by mitosis, because
(a) Plant body is haploid
(b) Gametophyte is diploid
(c) They are gametophytes
(d) They are dioecious

Karnataka CET-2019

Ans. (a) : In Marchantia and Funaria plant body is haploid and posses tiny leaf like appendages. The leafy stage bears sex organs. They have vegetative reproduction takes place by fragmentation and budding in secondary protonema.

286. Which one of the following organisms is a bryophyte?
(a) Liverwort (b) Volvox
(c) Chlamydomonas (d) Fern

KVPY SA-2019

Ans. (a) : Bryophytes is the informal group name for liverworts, mosses, and hornworts. They are non-vascular plants, which means they have no roots or vascular tissue, but instead absorb water and nutrients from the air through surface.

287. Statement (S) : All bryophytes are homosporous
Reason (R) : In bryophytes, gametophytic and sporophytic bodies are conspicuously different and the life cycle is called haplo-diplontic.
Which of the following is true?
(a) Both (S) and (R) are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : All broyphytes are homosporous because the antheridium and the archegonia are present on the same plants.

Bryophytes exhibit haplo-diplontic life cycle as the gametophytic phase is prominant (60%) in their life cycle.

• The sporophytes is diploid, dependent on the gametohyte for nutrition and produces spores by mitosis.

288. Which of the following propagates through leaftip :-
(a) Sprout-leaf plant (b) Marchantia
(c) Moss (d) Walking fern

AIPMT-2004

Ans. (d) : Adiantum is commonly known as walking fern, and it is due to the fact that new plants grow wherever the arching leaves of the parents touch the ground, creating a walking effect, which is an outgrowth of vegetative reproduction process. Adventitious buds develop at the leaf

@apna_pdf

tips. When such leaf tips touch the soil, they form new plants. This continuous growth of the plants by propagating at the leaf tip appears as walking. Hence, They are known as walking ferns.

289. Female reproductive organ of Riccia is known as:
(a) Oedogonium (b) Archegonium
(c) Carpogonium (d) Oosphere

Rajasthan PMT-1996

Ans. (b) : In Bryophytes (like Riccia, Funaria etc.) dominant generation is gametophyte which is free-living, haploid and photosynthetic. In gametophytes, sex organs antheridium and archegonium are present from which antherozoid and egg are produced respectively. In Riccia, the antheridia and archegonia are scattererd and found embedded in the dorsal side of thallus.

290. Life cycle of Funaria is not completed without water. Choose the correct statement.
(a) As Funaria is a bryophyte plant
(b) As branches will not develop
(c) As fertilization takes place in presence of water only
(d) As plant is delicate and will become dry and die without water

Manipal-2013

Ans. (c) : The life cycle of Funaria is not completed without water because fertilization takes place in the presence of water only. Bryophytes are terrestrial, nonvascular plants (absence of xylem and phloem) that still require a moist environment to complete their life cycle.

291. The sporophyte of Funaria begins development within
(a) antheridia (b) capsule
(c) protonema (d) archegonium

UP CPMT-2010

Ans. (d) : Funaria's sporophyte starts to evolve within the archegonium. A mature archegonium is a flask-shaped structure borne on a short stalk. It has a swollen Venter portion and an elongated neck. A two-layered jacket covers the venter, while the jacket around neck is linked singly.
Hence, in the archegonium sporophyte is formed.

292. Vegetative reproduction in Funaria takes place by
(a) primary protonema (b) gemmae
(c) secondary protonema (d) All of the above

UP CPMT-2011

Ans. (d) : Vegetative reproduction is a type of asexual reproduction. Vegetative propagation in mosses is by fragmentation, gemmae formation, and budding in secondary protonema. Funaria is a example of mosses.

293. Funaria's male gametes are
(a) Poly flagellate (b) Mono flagellate
(c) Biflagellate (d) Tetra flagellate

AIPMT-1999

Ans. (c) : Funaria male gametes are biflagellate in which androcyte mother cells are formed from division and re-division of the primary and androgonial cell. Each androcyte mother cell divides to form two androcytes.
- The Androcytes transform into biflagellate antherozoids or sperms.

294. Apophysis in the capsule of Funaria is
(a) lower part (b) upper part
(c) middle part (d) fertile part

AIPMT-1990

Ans. (a) : Apophysis is the lower, solid, sterile portion of the capsule that contains a chloroplast and is sterile. The focal piece of the apophysis is comprised of extended flimsy walled cells forming a conducting strand.

295. Assertion (A) : The life cycle in Funaria is called diplohaplontic.
Reason (R) : In Funaria, there is alternation of haploid gametophytic and diploid sporophytic phases, one becoming parent to the other.
The correct answer is
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true.

AP EAMCET-2008

Ans. (a) : In the life cycle of Funaria there occurs two distinct individuals. One of these is haploid independent leafy moss plant. The other is diploid leafless sporogonium. It is partially dependent on the leafy gametophyte for its nutrition. Life cycle of Funaria diplohaplontic.

296. In a moss the sporophyte-
(a) is partially parasitic on the gametophyte.
(b) produces gametes that given rise to the gametophyte.
(c) Arises from a spore produced from the gametophyte.
(d) Manufactures food for itself, as well as for the gametophyte.

AIPMT-2006

Ans. (a) : Mosses, like funaria, are bryophytes. They are non-vascular plants. The main plant body is gametophytic (haploid) which is independent and foliose. It is a major part of the life cycle. The saprophytic phase starts with the zygote, which divides to form sporogenous tissue that is differentiated into foot, seta and capsule. The saprophytic phase is short lived. The foot absorbs nutrients and provides support to the sporophyte.

297. Which one has the largest gametophyte?
(a) Cycas (b) Angiosperm
(c) Selaginella (d) Moss

AIPMT-1991

Ans. (d) : The largest gametophyte is found in moss. It gets reduced in order as selaginella, Cycas, angiosperm. The gametophyte begins with the haploid spore and ends with the formation of haploid gametes.

298. The plant group that produces spores and embryo but lacks vascular tissues and seeds is
(a) Pteridophyta (b) Rhodophyta
(c) Bryophyta (d) Phaeophyta

Manipal - 2013
AIPMT-1992

@apna_pdf

Ans. (c) : Bryophytes are the plants that produce spores and embryos, but they do not have a vascular tissue system. Bryophytes consist of the thalloid body attached to the substratum by hair-like structure called rhizoid.

299. Multicellular branched rhizoids and leafy gametophytes are the characteristics of
(a) some bryophytes (b) pteridophytes
(c) all bryophytes (d) gymnosperms

AIPMT-1997

Ans. (a) : All the characteristics features given in above question found in some bryophytes like mosses. The member of bryopsida family have a main plant body that has a leafy gametophores made up of an axis with spirally arranged leaves.

300. Elater mechanism for spore dispersal is exhibited by
(a) liverworts (b) Marchantia
(c) Riccia (d) Funaria

AIIMS - 2002
AIPMT-1996

Ans. (b) : Elaters are the long spindle shaped structures and they are hygroscopic in nature. They change their shape in response to the moisture present in the environment. They are present inside the capsule of Marchantia and serve in spore dispersal. The spore once released are dispersed by air currents and once they settle somewhere moist, germinate.

301. Which one of the following is a saprophytic bryophyte?
(a) Riccia fluitans (b) Buxbaumia aphylla
(c) funaria hygrometrica (d) Sphagnum

JIPMER-2008

Ans. (b) : Buxbaumia is a genus of twelve species of moss (Bryophyta). Buxbaumia aphylla is a widely distributed species in the northern hemisphere, which belong to the saprophytic genera of liverworts and mosses that grow up on organic water such as rotten wood.

302. Chlorenchyma is known to develop in the
(a) cytoplasm of Chlorella
(b) mycelium of a green mould such as Aspergillum
(c) spore capsule of a moss
(d) pollen tube of Pinus

AIIMS-2008

Ans. (c) : Chlorenchyma is known to develop in the spore capsule of a moss. Chlorenchyma or parenchyma that possess abundant chloroplast in them. Which are capable of photosynthesis. Most of chlorenchyma cells are present in the mesophyll area of leaves.

303. Which one of the following is not a characteristic feature of bryophytes?
(a) Filamentous rhizoids
(b) Dominant gametophytic generation
(c) Vascular tissues
(d) Amphibious habitat

Karnataka CET-2005

Ans. (c) : Vascular tissues is not a characteristic feature of bryophytes are:
a) Filamentours rhizoids
b) Dominant gametophytic generation
c) Amphibious habitat
d) Water is essential for fertilization
Bryophytes have simple conducting strand to transport water, mineral and other food materials.

304. Meiosis in Funaria occurs in:
(a) antherozoids (b) zygote
(c) spore mother cells (d) egg

AP EAMCET-1998

Ans. (c) : Meiosis in Funaria occurs in spore mother cells, which results four haploid spores are formed. Funaria is a bryophyte. Its main plant body is gametophyte which is formed by gametophyte of haploid spore. Spores are formed in sporophyte plant by meiosis division in spore mother cells.

305. In bryophytes and pteridophytes, transport of male gametes requires
(a) Water (b) Wind
(c) Insects (d) Birds

NEET-2016 Phase-I

Ans. (a) : Majority of lower organisms (bryophytes and pteridophytes) require water to transport there gametes. So we can say without water they can't complete their lifecycle. The male gamete of bryophyte and pteridophyte are transferred to the female reproductive organ for fertilization.

306. Male and female gametophytes are independent and free-living in –
(a) Mustard (b) Castor
(c) Pinus (d) Sphagnum

AIPMT (Screening)-2010

Ans. (d) : Sphagnum is a moss (Bryophyte) in which gametophytes are independent and free living. Male and female gametophytes are highly reduced in gymnosperm (pinus) and angiosperm (Mustard and Castor) and dependent on sporophyte.

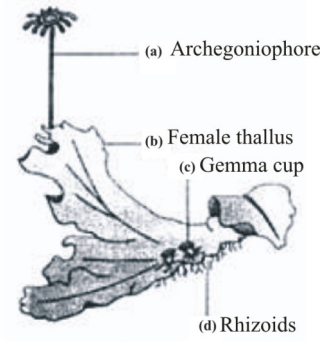
307. Examine the figure given below and select the right option giving all the four parts (a, b, c and d) correctly identified

	(1)	(2)	(3)	(4)
(a)	Antherid-iophore	Male thallus	Globule	Roots
(b)	Archego-niophore	Female thallus	Gemma-cup	Rhizoids
(c)	Archego-niophore	Female thallus	Bud	Foot
(d)	Seta	Sporo-phyte	Protonema	Rhizoids/

AIPMT (Mains)-2011

@apna_pdf

Ans. (b) : Above structure shows the thallus structure of the Marchantia of bryophytes.
(1) Archegoniophore
(2) Female thallus
(3) Gemma cup
(4) Rhizoids is the correct sequence of Marchantia in the female thallus.

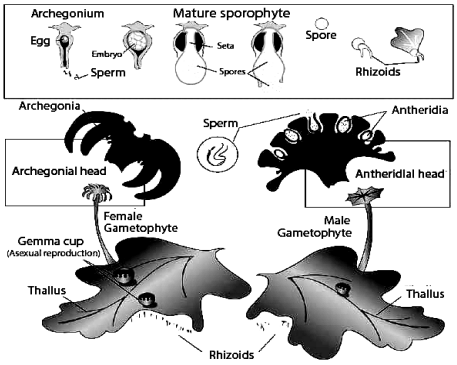


308. The plant body is thalloid in
(a) Funaria (b) Sphagnum
(c) Salvinia (d) Marchantia

NEET (Karnataka)-2013

Ans. (d) : Thalloid plant body lack real vegetative structure, in place of root, rhizoids are present.

- Marchantia belongs to class hepaticopsida of division bryophyta. It's plant body consist of a dichotomously branched thallus. They are also called liverworts. The plant body is a dorso-ventrally flattened thallus.



309. Which of the following statements is true for Bryophyta
(a) Along with water absorption roots also provide anchorment to plants
(b) Sporophyte is dominant
(c) Gametophyte is dominant and sporophyte is mostly parasitic
(d) Gametophyte is parasitic

AIPMT-1999

Ans. (c) : In life cycle of bryophyta gametophyte is dominant and sporophyte are mostly parasitic.

- The life cycle of bryophyta involves alternation of generation with a haploid gametophyte giving rise to diploid sporophyte.
- The sporophyte is not free living but attached to the photosynthetic gametophyte and derives nourishment from it.

310. Compared with the gametophytes of the bryophytes, the gametophytes of vascular plants tend to be
(a) smaller and to have smaller sex organs
(b) smaller but to have larger sex organs
(c) larger but to have smaller sex organs
(d) larger and to have larger sex organs

AIPMT (Screening)-2011

Ans. (a) : Bryophytes have a dominant gametophytes stage and produce structure called as antheridia and archegonia. In contrast, vascular plants have sporophytic plant body in most of the their life – cycle are reduced smaller gametophyte which have smaller sex organs.
Ex- Riccia, Marchantia, Porella etc.

311. Which gymnospermic order includes all fossil plants?
(a) Cycadales (b) Cycadofilicales
(c) Cycadeoidales (d) Coniferales

AP EAMCET-2011

Ans. (b): Cycadofilicales is an extinct order of gymnosperms that flourished in the carboniferous period. They possess characteristics of both the ferns and the seed plants but reproducing by means of seeds and yet retaining fern like leaves.

312. Assertion (A) : The life cycle in Funaria is called diplohaplontic.
Reason (R): In Funaria, there is alternation of haploid gametophytic and diploid sporophytic phases, one becoming parent to the other.
The correct answer is
(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A).
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2008

Ans. (a) : The life cycle of Funaria has two distinct individuals. One of these is haploid, independent, leafy moss plants, the other is diploid. There is alternation of haploid gametophytic and diploid sporophytic phases, one becoming parent to the other.

313. Marchantia is considered as a heterothallic plant because it is _____.
(a) Heterogametic (b) Bisexual
(c) Monoecious (d) Dioecious

Karnataka CET-2014

Ans. (d) : When male and female flowers are originate on different plants, they are called as dioecious plants.
Marchantia is a dioecius therefore, it is considered heterothallic. This means it has two distinct male and female plant.

314. Bryophytes resemble algae in the following aspects:
(a) Differentiation of plant body into root, stem and leaves and autotrophic
(b) Thallus like plant body, presence of roots and autotrophic nutrition
(c) Thallus like plant body, lack of vascular tissues and autotrophic nutrition.

@apna_pdf

(d) Filamentous body, presence of vascular tissues and autotrophic nutrition

Karnataka CET-2009 / Manipal - 2009

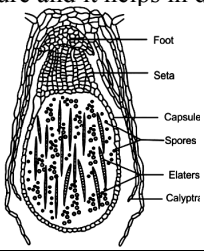
Ans. (c) : Bryophytes resemble algae in the aspects of thallus such as plant body, lack of vascular tissues and autotrophic nutrition. They are non flowering plants and do not produce flower and seeds.

315. Spore dissemination in some liverworts is aided by :

(a) Peristome teeth (b) Elaters
(c) Indusium (d) Calyptra

Rajasthan PMT-2010 / AIPMT-2007 / AIPMT-2007

Ans. (b) : Elaters are tubular cells with spiral thickenigs and often help in spore release. It is water attracting cell structure found in the capsule of liverworts. It is hygroscopic in nature and it helps in dispersal of spores.



316. Mosses are attached to substratum by

(a) roots (b) capsule
(c) rhizoids (d) main axis

HP CET - 2012
UP CPMT-2005

Ans. (c): Mosses are bryophytes with gametophytic plant body. They use rhizoids for anchoring the substratum. They are branched, slender and multicellular. They are stout, brown, almost cable like and form the main anchoring strands. The rhizoidal branches absorb water and minerals from the soil.

317. Identify the wrong statement in relation to *Funaria*

(a) Stomata are present in the epidermis of capsule
(b) Spores are viable for only one year
(c) Inner spore sac is one celled in thickness
(d) Trabeculae connect the innermost layer of the capsule wall with the outer spore sac

AP EAMCET-2013

Ans. (b): Spores of funaria hygrometrica have been reported to remain viable up to 9 years. In the present study spores were found to remain viable for 11 years. Funaria belongs to the family **Funariaceae.** It comprises of the cord mosses and being characterised by filamentous setae, a gibbous obtusely pyriform capsules and usually a double peristome of 16 teeth.

318. Which one is pioneer in gametophyte generation of bryophytes?

(a) Spore (n) (b) Protonema
(c) Sporogonium (d) Spore mother cell

UP CPMT-2014

Ans.(a): Spore is the 1st cell of the gametophytic generation. Spores are produced as a direct result of meiosis.

- These haploid pioneer structure of gametophytic generation are formed from spore mother cell by meiosis which in turn are produce within sporangium.

319. Mosses occurs in moist places because

(a) They can not grow on land
(b) Their gametes fuse in water
(c) They lack vascular tissue
(d) They lack root and stomata

VMMC-2006 / UPCPMT-2002

Ans. (b) : The reproduction in mosses takes place in water, thus they occur in moist place. As fertilization takes place only in the presence of water, through motile antherozoids that swim to reach the archegonium. They are also called as amphibians of plant kingdom due to dependence on water.

320. In ferns and mosses, movement of antherozoids towards female component is called :

(a) phtotaxis (b) chemotaxis
(c) hydrotropism (d) thigmotropism

Rajasthan PMT-1998

Ans. (b) : In fern and mosses (Bryophytes), movements of antherozoids towards female component archegonium is stimulated by a special chemical like sugar called chemotaxis movement.

321. In which of the following pairs of genera sporocarps are present ?

(a) Marsilea and Salvinia
(b) Marsilea and Isoetes
(c) Isoetes and Salvinia
(d) Marsilea and Lycopodium

Uttarakhand PMT-2006

Ans. (a) : The sporocarp develops when plant becomes mature in aquatic species water evaporate and they develop in shallow water but in terrestrial species they are developed when water completely dries. The primary function of sporocarp is the production and release of spores. The sporocarpars are present in the genera Marsilia and Salvinia.

322. Consider the following statements and select the true and false statements among the following codes given below.

I. Trimerous conditions of floral whorl is characteristic of dicotyledons.
II. Adiantum is also called as walking fern
III. In gymnosperms the vascular system consists of xylem without vessels and phloem with companion cells.
IV. Riccia and Marchantia are liverworts.

(a)

True	False
I, II	III, IV

(b)

True	False
I, III	II, IV

(c)

True	False
I,IV	II, III

(d)

True	False
II,IV	I, III

(e)

True	False
I, III	II, IV

CMC Vellore-2015

@apna_pdf

Ans. (d) : Adiantum is also called walking fern due to new plant grow when arching leaves of the fern touch the ground. Riccia and Marchantia both belong to the kingdom plantae and both are bryophytes. They are a genus of liverworts. Trimerous conditions of floral whorl is characteristic feature of monocots while the dicot flower shows dimerous, tetramerous or pentamerous conditious. The ferns, Gymnosperms, and flowering plants are all vascular plants. Because they possess vascular tissues.

323. At the base of seta of capsule of moss, there is a haploid brownish growth called:
(a) calyptra (b) perigonium
(c) veginula (d) perichaetial

CMC Ludhiana-2007 / Manipal-2006

Ans. (c) : Veginula is the part of venter of archegonium left at the base of seta. It is haploid in nature. In mosses, the ring or sheath enveloping the base of the seta, derived from the base of the archegonium and surrounding stem tissues and remaining after separation of the calyptra.

324. In capsule of moss, shock absorbers are:
(a) trabeculae (b) peristome teeth
(c) seta (d) annulus

Manipal-2006

Ans. (a) : Trabeculae are the shock absorbers in capsule of moss. It is one of the projections from the cell wall that extends across the cavity of the ducts of certain plants, or the plate of cells across the cavity of the sporangium of a moss.

325. Which of the following in moss capsule is haploid/gametophytic tissue?
(a) Anriulus and peristome
(b) Calyptra and spore
(c) Columella and theca
(d) Operculum foot and seta

Manipal-2006

Ans. (b) : Calyptra and spore are the haploid/ gametophytic tissue in moss capsule. Calyptra is a small, maternal gametophytic structure that covers the apex of the offspring sporophyte and is critical for the transition from seta formation to capsule differentiation in many moss taxa.

326. Difference between algae and bryophyte is:
(a) terrestrial habitat (b) sterile jacket
(c) biflagellate gametes (d) none of these

Rajasthan PMT-2004

Ans. (b) : The main difference between algae and bryophytes is the division of plant body. No division of observed in algae whereas the plan body of bryophytes internally divided into photosynthetic and storage zone and in bryophytes sex organs are always multicellular and protected by a jacket of sterile vegetative cells. But in the sex organ of algae are single celled without a jacket of sterile vegetative cells.

327. The positive evidence of aquatic ancestory of bryophytes is:
(a) peristomial teeth (b) ciliated sperms
(c) chemotaxis (d) gametophytic plant body

BHU PMT-2002

Ans. (b) : Ciliated sperms are positive evidence for aquatic ancestry of bryophytes. Each sperm usually consist of minute, slender, spirally curved body or furnished with two long, terminal whiplash type flagella.

328. In Funaria, calyptra is derived from:
(a) capsule (b) columella
(c) antheridium (d) archegonium

AFMC-2002

Ans. (d) : In Funaria, calyptra is derived from archegonium. Funaria is a moss. They don't have a vascular system. Funaria fertilization is dependent on water for the transfer of sperm to the egg. The main plant body is gametophyte which is independent and the sporophyte is partially or fully dependent on gametophytic generation. It is commonly called rope moss or cord moss. The calyptra is protective envelop around the developing embryo. It is formed by the basal part of the archegonium.

329. Which of the following is not a case of epimorphosis?
(a) Formation of sperms from small clumps of cells
(b) Regeneration of tail in a lizard
(c) Replacement of severed arm in starfish
(d) Replacement of limp in salamander

Rajasthan PMT 2009 / MGIMS Wardha-2004

Ans. (a) : The regeneration of the absent or disappeared, or disoriented tissues and organs through the process of redifferentiation of existing tissues or organs are termed as epimorphosis. Here, new growth is seen as in case of healing of wound, regeneration of lost parts, etc. The formation of sperms from small clumps cannot be a case of restorative regeneration or epimorphosis.

330. In Sphagnum, the gametophyte structure compensating for the absence of seta is known as:
(a) columella (b) elatrophore
(c) sporangiophore (d) pseudopodium

VMMC-2006

Ans. (d) : Pseudopodium is the gametophytic structure compensating for the absence of seta in Sphagnum.
Seta is one of the sporophytes which represents the spore of bryophytes, but in case of sphagnum, the seta is absent and other spores are present.

331. The protective device over the developing sporophyte is shoot calyptra in:
(a) Frullania (b) Sphagnum
(c) Anthoceros (d) Pellia

VMMC-2006

Ans. (a) : The protective device over the developing sporophyte is shoot Calyptra in Frullania. Frullania is the only genus of liverworts in family Frullaniaceae. Plant is dull green, leafy. The plant is dioecious.

332. Bryophytes lack true:
(a) roots (b) stem
(c) leaves (d) all the above

Uttarakhand-2005

Ans. (d) : Bryophytes lack true roots, stem and leaves. The plant body bryophytes is more differentiated than that of algae. They may possess root- like, leaf- like or stem- like structures. They don't have roots. Instead they have thin root like growths called rhizoids that help anchor them.

@apna_pdf

333. Sex organs in Funaria develop:
(a) is axil of leaf (b) at tip of gametophore
(c) inside capsule (d) in protonema
Uttarakhand-2005

Ans. (b) : In Funaria, sex organs develop at the tip of gametophores in cluster. In Funaria, sexual reproduction is oogamous. The male reproductive part is called the antheridium and the female reproductive part is called the archegonium.

334. Largest moss is
(a) Pogonatum (b) Funaria
(c) Dawsonia (d) Polytrichum
MGIMS Wardha-2009 / Haryana PMT-2009
CG PMT-2009

Ans. (c) : Dawsonia is largest robust terrestrial moss with stiff leaves that reaches 70 cm in length. It is found in New Zealand, Australia etc.

335. Thallus of Riccia is :
(a) tetraploid (b) triploid
(c) diploid (d) haploid
JIPMER-2001

Ans. (d) : Gametophytic plant body is dominant in bryophytes so thallus of Riccia is haploid (n) in nature. It is small, green flat and rather fleshy. They commonly grow in moist soil, particularly during and after rain.

336. Mosses are indicator of
(a) air pollution (b) water pollution
(c) radiation pollution (d) soil pollution
Manipal-2013

Ans. (a) : Mosses are bioindicator and bioaccumulators in air pollution because they have lack of roots. Air Pollutants affect the habitat and growth forms of Bryophytes.

337. The peculiar feature of Marchantia palmata is
(a) Absence of gemma cup
(b) Presence of androgynous receptacles
(c) Absence of elaters
(d) All of the above
VMMC-2005 / AMU-2004

Ans. (b) : The peculiar feature of Marchantia palmata is Presence of androgynous receptacles. In Marchantia, sex organs are borne on special stalked receptacles, the gametophores. These are specialized multicellular asexual reproductive bodies. Androgynous receptacle bears both archegonia and antheridia on same receptacle. Vegetative reproduction takes place with the help of gemma cup.

338. Embryo is found in
(a) Ulothrix (b) Spirogyra
(c) Funaria (d) Chlorella
CG PMT-2006

Ans. (c) : In Funaria, male and female reproductive organs are on the same plant but different branches. Funaria is protandrous i.e., male sex organs mature first. Water is essential for fertilization. The antherozoids reach to archegonial neck and swim down to venter. Any one antheroizoid fuses with egg to form zygote, it becomes oospore. Which divides and redivides to form embryo. Later, the embryo grows into a sporophyte.

339. Which of the following is important source of edible protein?
(a) Spirogyra (b) Porphyra
(c) Spirulina (d) Cephaleuros
MGIMS Wardha-2009

Ans. (c) : Spirulina is a genus of multicellular blue-green microalgae. Spirulina is the world's first superfood, and one of the most nutrient-rich foods on Earth.
This is highly rich in proteins, vitamin-B complex and minerals. Powdered Spirulina is being used in herbal tonics and biscuits.

340. Diatoms do not decay easily because
(a) they have siliceous walls
(b) their body is impervious to water
(c) they are chitinous
(d) they are abundant in saline soil
BHU PMT (Screening)-2011

Ans. (a) : Diatoms have unique double shells made up of opaline silica. Cell of Diatoms are surrounded by cell wall having to parts or frustules; frustules make two overlapping halves (the epitheca and the hypotheca).

341. The brown hairs present at the base of the petiole of Pteris are called:
(a) setae (b) ramenta
(c) spines (d) stipules
AP EAMCET-2002

Ans. (b) : The brown hair present at the base of the petiole of Pteris are known as ramenta. The epidermal cells gives rise to this uniseriate bicellular brown hairs on young leaves of the Pteris or on any fern. Ramenta provides Pteris with protection from external injuries.

342. A plant which is first terrestrial and then becomes epiphyte (space parasite)?
(a) Vanda (b) Cuscuta
(c) Rafflesia (d) Santalum
CG PMT-2011

Ans. (a) : Space parasite means a plant parasite which depends on other plants for space, for growth but not for nutrients and water.
Vanda plant is an epiphyte. It means those plants grow upon other plants. It depends on the host plant for shelter and nutrition without harming the host plant.

343. Who is regarded as father of Indian Bryology?
(a) KC Mehta (b) VK Kashyap
(c) SR Kashyap (d) RN Singh
BVP-2013

Ans. (c) : Shiv Ram Kashyap is known as "Father of Indian Bryology". He was a botanist in British India. He published the book 'Lahore district Flora' with family friend.

344. The sporogenous tissue is originated from amphithecium in which of the following ?
(a) Riccia (b) Marchantia
(c) Anthoceros (d) Funaria
Rajasthan PMT-2000

Ans. (c) : In Anthoceros, it extends from base to the top of the capsule. It originates from the inner layer of amphithecium. In anthoceros and sphagnum, the amphitheium give rise to the sporogenous tissue.

345. Which of the following is true about bryophytes ?
(a) They are thalloid
(b) They contain chloroplast

@apna_pdf

(c) They possess archegonia
(d) All of the above

BHU-PMT (Screening)-2008 / BHU PMT-2004
Uttarakhand PMT-2008

Ans. (d) : The plant body is thallus-like, i.e., prostrate or erect.
They contain chloroplast like pyrenoid.
They posses archegonia i.e. female sex which is flask shaped and generates one egg.

346. Spore of Funaria on germination gives rise to
(a) Protonema (b) Sporophyte
(c) Prothallus (d) Capsule

BCECE-2008

Ans. (a) : On germination, the spores of Funaria give rise to protonema. The protonema is an elongate, thread-like structure that develops from the germinated spore of mosses and some liverworts. It is the initial stage of the organism which turns to gametophyte at maturity. Protonema is a filamentous green chain of cells that forms the juvenile gametophyte stage. The buds forks on the chloronemata of protonema and differentiate into gametophores.

347. Tissue differentiation is well developed in
(a) Bryophyrtes (b) Fungi
(c) All algae (d) Virus

UP CPMT-2013

Ans. (a) : Tissue differentiation is well developed in Bryophytes. Hence the cells derived from optical meristem and perform specific functions is caused differentiation.

348. Which type of rhizoids are present in riccia?
(a) Unicellular smooth
(b) Multicellular smooth
(c) Unicellular smooth and tuberculated
(d) Multicellular smooth and tuberculated

Rajasthan PMT-2006

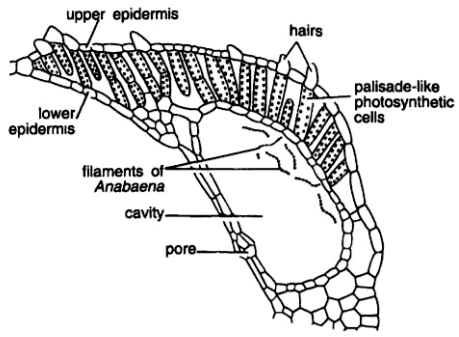
Ans. (c) : In Riccia, rhizoids are unicellular and unbranched structure. Rhizoids are a filamentous outgrowth similar to root hairs in structure. They anchor the thallus to the substratum and are usually of two types: smooth walled and tuberculated. Tuberculated rhizoids help in anchorage and absorption. Rhizoids are present in the mid-rib region of the thallus.

D. Pteridophytes

349. Aquatic fern is used to increase the yield in paddy crop:
(a) Azolla (b) Salvinia
(c) Marsilea (d) Isoetes

Tripura JEE-2022 / AMU-2007 / BCECE-2003
AIPMT-2001 / AIPMT-2000

Ans. (a) : Azolla plays a very important role in rice production. Azolla is nitrogen fixing partner, Anabaena, have been used as green manure to fertilize rice paddies and increase production. It is a biofertilizer, Biofuel, medicine, and food material. As a biofertilizer, Azolla is also used for the cultivation of paddy and many other crops for increasing their yield.



Azolla. T.s. through dorsal (floating) lobe of leaf.

350. If a sporangium is derived from a single cell, it is called
(a) Leptosporangiate (b) Eusporangiate
(c) Heterosporangiate (d) Monosporangiate

AMU-2005 / Manipal-2004
Uttarakhand PMT-2004 / AMU -2000

Ans. (a) : When sporangium is derived from a single cell it is called leptosporangiate. Such sporangia have lesser number of jacket layers and contain lesser number of spores.
Example- Azolla, Salvinia

351. Which of the following propagates through leaf-tip?
(a) Walking fern (b) Sprout-leaf plant
(c) Marchantia (d) Moss

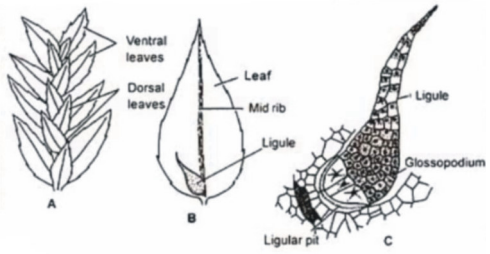
CMC Ludhiana-2009 / JCECE-2009
Manipal-2007 / AIPMT-1998

Ans. (a) : The scientific name of the walking fern is *Adiantum caudatum* are called 'walking fern' due to the fact that new plantlets grow when arching leaves of the fern touch the ground. The walking effect is due to vegetative reproduction.

352. In Selaginella, the adaxial outgrowth, from the base of leaf, is called :
(a) ligule (b) velum
(c) rhizophore (d) glossopodium

BHU PMT (Mains)-2009 / AMU-2005
Manipal-2004 / Uttarakhand PMT-2004

Ans. (a) : In Selaginella, the adaxial outgrowth, from the base of leaf, is called ligule. It is a minute structure present on the adaxial surface of the leaf. A ligule arises from the base of each leaf (ligulate) as an adaxial outgrowth. They are delicate, green with entire or serrate margin and acute apex.



SELAGINELLA
A. Branch B. Leaf with Ligule, C. L.S of Ligule.

@apna_pdf

353. Genera like Selaginella and salvinia produce two kinds of spores. Such plants are known as:

(a) Heterosporous (b) Homosorus
(c) Heterosorus (d) Homosporous

NEET-2021 / BHU PMT (Screening)-2010
AIPMT-2008 / BHU PMT-2002

Ans. (a) : A plant that produces two types of spores that vary in size and shape is called heterosporous spores. Plants like Selaginella and Salvinia produce two kinds of spore (Mircospores and Macrospores). Most of the pteridophytes produce single type of spores is called **homosporous.**

354. Plant that possess characters like ramenta, archaegonia, circinate

(a) Pinus (b) Dryopteris
(c) Cycas (d) Funaria

AP EAPCET-22.05.2023, Shift-I

Ans. (b) :Dryopteris:- It is commonly known as male shield fern.
Rhizome represents the modified underground stem. The entire surface of rhizome is covered with persistent leaf base and numerous, thin brown membranous scales called **ramenta**.
Leaves develops the apex of the rhizome in acropetal order. young leaves are circinately coiled (circinate vernation)
Archegonia is a female reproductive part of Dryopteris.

355. Match List-I with List - II.

	List-I		List-II
(A)	**Pteropsida**	**(i)**	**Psilotum**
(B)	**Lycopsida**	**(ii)**	**Equisetum**
(C)	**Psilopsida**	**(iii)**	**Adiantum**
(D)	**Sphenopsida**	**(iv)**	**Selaginella**

Choose the correct answer from the options given below:

(a) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(b) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)
(c) (A)-(ii), (B)-(iii), (C)-(i), (D)-(iv)
(d) (A)-(iii), (B)-(i), (C)-(iv), (D)-(ii)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Psilopsida (Subdivision) includes living as well as fossil plants, roots are absent, Aerial portion is sparingly or profusely branched. The branching is usually dichotomous type. Ex- Rhynia, Psilotum

- Lycopsida includes both fossil and living pteridophytes. The plant body is sporophytic and can be differentiated into root, stem and leaves, Ex–Lycopodium, Selaginella
- Sphenopsida, stem in majority of the forms is long jointed or articulated and is ribbed i.e. having ridges and grooves. Ex – Equisetum.
- Pteropsida sub-division includes the plants which are commonly known as 'ferns' Ex- Adiantum.

356. Identify the pair of heterosporous pteridophytes among the following :

(a) Equisetum and Salvinia
(b) Lycopodium and Selaginella
(c) Selaginella and salvinia
(d) psilotum and salvinia

NEET (UG) 07.05.2023

Ans. (c) : Some pteridophytes are produce two different types of spores such pteridophytes are known as heterosporous and the phenomenon is known as Heterospory.
Ex. Selaginella, Salvinia, marsilea, isoets etc.

- The development of the female gametophyte starts while the megraspore is still inside the mega sporangium.
- Some is true of microspores i.e they also start germinating into male gametophyte white they are still inside microsporangium.
- Female gametophyte derives its nourishment from the sporophyte i.e. female gametophyte is depend on sporophyte for its nourishment.
- The dependence of female gametophyte on sporophyte for its nourishment provides better starting point for the development of new embryo than an independent green prothallus which was to manufacture its own food.

357. Choose the incorrect statement among the following:

(A) Pteridology is the study of vascular cryptogams.
(B) Reciprocal relation between plants and environment is called palynology.
(C) Biophysics and molecular biology are pertinent to both plant and animal science.
(D) It is possible to produce disease free plants in large number with tissue and organ culture.

Options:

(a) A, B only (b) B, D only
(c) A, C only (d) B, C only

TS EAMCET-30.07.2022 Shift-II

Ans. (a) : (A) Pteridology is the study of pteridophytes. Pteridophytes have well developed tissue system and so these are higher cryptogams or vascular cryptogams.
(B) Palynology is the study of pollen grains.
(C) Biophysics and molecular biology are pertinent to both plant and animal science.
(D) Tissue culture is the technique of growing cells and tissue in an artificial medium separated from the organism. This technique is also called as micropropagation. It produce disease free plants in large number by meristem tip culture.

358. Following is not a common feature in both ferns and Gymnosperms

(a) Presence of Archegonia
(b) Circinate vernation
(c) Presence of ramenta
(d) Presence of ovules

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : Presence of ovules is not a common feature in both ferns and gymnosperms. Ferns are plants that do not bear flowers and do not have any seeds as well.
While gymnosperms have seeds, although seeds are not put inside an ovary.

359. Salient features like Embriophytic Tracheophytic, Cryptogams refers to ————

(a) Angiosperms (b) Gymnosperms
(c) Pteridophytes (d) Bryophytes

AP EAMCET-03.09.2021 Shift-I / UP CPMT-2012

@apna_pdf

Ans. (c) : Cryptogams are refers to those vascular plants that disperse spores i.e. Pteridophytes. Thus cryptogam refers to the production of a separate, small, archaegoniate gametophytes. The pteridophytes are the first terrestrial plants to possess vascular tissues.

360. Assertion (A) : In evolution the distribution of Bryophytes and Pteridophytes, was limited
Reason (R): The need of water for the transportation of male gametes and fertilization limited their distribution
The correct option among the following is
(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-10.08.2021 Shift-I

Ans. (a) : Bryophytes and Pteridophytes are limited in distribution and restricted to narrow geographical regions because they need water for the transportation of male gametes and fertilization. They grow in cool, damp and shady places.

361. Which statements regarding heterospory are correct?
(i) The megaspores and microspores germinate and give rise to female and male gametophytes respectively.
(ii) The female gametophytes in these plants are retained on the parent sporophytes for variable periods.
(iii) The development of the zygotes into young embryos takes place within the female gametophytes.
(iv) This event is a precursor to the seed habit considered as an important step in the evolution.
Options:
(a) (i), (ii) & (iii) only
(b) (ii) & (iv) only
(c) (i), (ii), (iii) & (iv)
(d) (i), (iii) & (iv) only

AP EAMCET-03.09.2021 Shift-II

Ans. (c) : Heteropspory is the production of spores of two different sizes and sexes by the sporophytes of land plants. The megaspores and microspores germinate and give rise to female and male gametophytes respectively. The female gametophytes in these plants are retained on the parent sporophytes for variable periods. The development of the zygotes into young embryos take place within the female gametophytes. This event is a precursor to seed habit and an important step in evolution.

362. Arrange the following plants with their respective classes in the same order.
Sphenopsida, Psilopsida, Pteropsida, Lycopsida, Gnetopsida
(A) Selaginella (B) Equisitum
(C) Sphagnum (D) Adiantum
(E) Psilotum (F) Gnetum
Options:
(a) B, C, D, A, E (b) B, E, D, A, F
(c) A, C, B, F, D (d) F, D, B, C, A

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Equisitum :- Belongs to the order Sphenopsida.
Psilotum :- Belongs to the order Psilopsida.
Adiantum: - Belongs to the order Pteropsida.
Selaginella :- Belongs to the order Lycopsida.
Gnetum : - Belongs to the order Gnetopsida.

363. From evolutionary point of view, retention of the female gametophyte with developing young embryo on the parent sporophyte for some time, is first observed in
(a) Mosses (b) Pteridophytes
(c) Gymnosperms (d) Liverworts

NEET-2019

Ans. (b) : Pteridophytes are considered as the first plants to be evolved on land. They are cryptogams, seedless and contain vascular tissue but lack xylem vessels and phloem companion cells.
- In pteridophytes, megaspore is retained for a significant amount of time within female gametophyte on the parent sporophyte, however the permanent retention of seed is seen in Gymnosperm. Thus, pteridophytes exhibit precursor to seed habit.

364. Assertion : Psilotum is living fossil.
Reason: Equisetum in heterosporous ptridophyte.
The correct answer is
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true.

AIIMS-26.05.2018 Shift-I

Ans. (c) : The whisk fern of the Psilotum species is a living fossil (primitive pteridophyte). Equisetum is a homosporous pteridophyte.
Hence, A is true but R is false.

365. Pteriodophytes, especially ferns possess the following characteristics
(i) Circinate vernation (ii) Ramenta
(iii) Eustele (iv) Paraphyses
Options:
(a) iii & iv (b) i & ii
(c) i, ii & iv (d) ii, iii & iv

TS EAMCET-02.05.2018 Shift-I

Ans. (b) : Circinate arrangement of young leaves & the presence of ramenta are charcteristic feature of ferns.
- Eustele is a type of stele found in mostly seeded plant. It is a type of siphonostele in which the vascular bundles are arranged in a ring pith surrounded primary vascular tissue.
- Paraphysis is a sterile hair like filament present among the reproductive organs in many lower plants, especially Broyphytes, Algae & Fungi.

366. Which one of the following pairs is wrongly matched
(a) Viroids - RNA

@apna_pdf

(b) Mustard - Synerigids
(c) Ginkgo – Archegonia
(d) Salvinia - Prothallus

AIPMT (Mains)-2012

Ans. (d) : Salvinia does not have prothallus because it is heterosporous in nature. Because it have two kind of spores, macro (large) and micro (small).

- The megaspore and microspore germinate and give rise to female and male gametophytes, respectively. The female gametophytes in these plants are retained on the parent sporophytes for variable periods.
- The development of zygotes into young embryos takes place within the female gametophyte. This event is a precursor the seed habit considered on important step in evolution.

367. A well developed archegonium with neck consisting of 4-6 rows and neck canal cells, characterises

(a) Gymnosperms and flowering plants
(b) Pteridophytes and gymnosperms
(c) Gymnosperms only
(d) Bryophytes and pteridophytes

AIPMT-1995

Ans. (d) : Archegonium is the flask shaped female reproductive body of bryophytes and pteridophytes. Archegonium usually consist of a tubular neck and a swollen venter. It consists of a neck with one canal cells that produce a single egg (female gamete).

368. Pteridophytes differ from mosses/bryophytes in possessing

(a) Independent gametophyte
(b) Well developed vascular system
(c) Archegonia
(d) Flagellate spermatozoids

MP PMT-2013 / AIPMT-1993

Ans. (b) : Pteriodophytes differs from bryophytes and thallophytes in having well developed vascular tissue system. Vascular tissue plays an important role in conducting water and food material to the plant. Ferns are peteridophytes where as mosses are bryophytes. Mosses do not possess the specialized vascular system.

369. Which of the following are homosporous pteridophytes?

I. Selaginella **II. Lycopodium**
III. Salvinia **IV. Equisetum**

(a) I and IV only (b) II and III only
(c) II and IV only (d) III and IV only

AIIMS-2016

Ans. (c) : Homosporous pteridophytes produce only one type of spore in their sporophytes.
Lycopodium is a genus of clubmosses, belonging to the family Lycopodiaceae.
Equisetum is the only living genus belonging to the family Equisetaceae.
Ex. Lycopodium, Equisetum

- Salvinia and Selaginella are heterosporous

370. Ectophloic siphonostele is found in

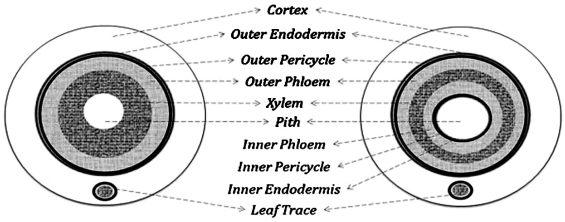
(a) Osmunda and Equisetum
(b) Marsilea and Botrychium
(c) Adiantum and Cucurbitaceae
(d) Dicksonia and Maidenhair fern

AIIMS-2008 / AIPMT-2005

Ans. (a) : Siphonostele are the principle types of steler orgnization in vascular plants. Ectophloic siphonostele a monostele type of siphonostele in which a ring of xylem occurs around the pitch and a ring of pholem outside the xylem.

- Siphnosteales are found in the stems of many ferns.
- **For example-** ***Osmunda and Equisetum.***

Amphiphloic siphonostele : - In this type of stele xylem is surrounded by phloem.



371. Match Column - I with Column- II and select the correct option from the codes given below.

	Column-I		Column-II
(A)	Chlorophyta	(i)	Equisetum
(B)	Lycopsida	(ii)	Chara
(C)	Phaeophyta	(iii)	Selaginella
(D)	Sphenopsida	(iv)	Ectocarpus

(a) A- (ii), B- (iii), C- (iv), D - (i)
(b) A- (iv), B- (i), C- (ii), D- (iii)
(c) A- (ii), B- (iii), C- (i), D- (iv)
(d) A- (iv), B- (i), C- (iii), D- (ii)

AIIMS-2013

Ans. (a) :
(A) Chlorophyta – (ii) Chara
(B) Lycopsida – (iii) Selaginella
(C) Phaeophyta – (iv) Ectocarpus
(D) Sphenopsida– (i) Equisetum

- **Chara** is a genus of **chlorophyta** green algae in the family Characeae. They are multicellular and resemble like land plants as they have stem and leaf-like structures.
- **Ectocarpus** is a genus of filamentous, marine brown algae, Ectocarpus belong to the **Phaeophyta**.
- **Selaginella** is a pteridophyta, it is also called spikemoss. They are seedless vascular plants. They are found mostly in shady areas, some species are also present in seasonal dry or xerophytic conditions. Selaginella belong to the **Lycopsida** class.
- **Equisetum** belong to the **Sphenopsida**. Sphenopsida is a class of vascular plants with fossil. Equisetum are commonly known as horsetails found mainly in wet areas.

372. Which of the following are heterosporous pteridophytes?

I. Lycopodium II. Selaginella III. Equisetum IV. Salvinia

(a) I and II only (b) II and III only
(c) III and IV only (d) II and IV only
(e) I and IV only

Kerala PMT-2014

@apna_pdf

Ans. (d) : Selaginella & Salvinia are heterosporous pteridophyta. Heterospory is the production of spores of two different sizes & of two different developmental patternes - smaller male or microspores and larger female or megaspore. Heterospory is the most important evolutionary development in vascular plants because it has ultimately led to seed development.

373. Prothallus of the fern produces

(a) spores (b) gametes
(c) Both (a) and (b) (d) cones

JIPMER-2012 / BHU PMT (Screening)-2009

Ans. (b) : Prothallus is the gametophyte of the plant that is they are responsible for producing the gametes
At maturity, regions of prothallus develop into small separate sexual organ. Antheridia produces the male sex cells and archegonia produces the female sex cells.

374. In ferns, Meiosis takes place at the time of:

(a) Spore formation
(b) Spore germination
(c) Gamete formation
(d) Antheridia and archegonia formation

AIPMT-2000

Ans. (a) : Spores are present inside the sporangium which are formed by reduction division and spores are haploid in nature and germinate to produce a prothallus that represents the gametophytic generation. Antheridium and archegonia are borne on this prothallus. Thus, **meiosis takes place at the stage of spore formation.**

375. Which one of the following is a correct statement?

(a) Antheridiophores and archegoniophores are present in pteridophytes
(b) Origin of seed habit can be traced in pteridophytes
(c) Pteridophyte gametophyte has a protonemal and leafy stage
(d) In gymnosperms female gametophyte is free living

AIPMT (Screening)-2012

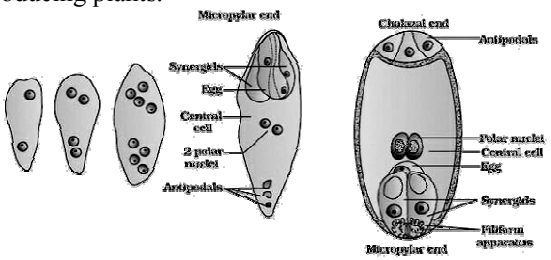
Ans. (b) : The origin of seed habit can be traced in pteridophytes. The development of zygote into young embryos takes place in the female gametophyte. This event is the precursor to the seed habit consider into an step of evolution.

376. Selaginella and Salvinia are considered to represent a significant step toward evolution of seed habit because

(a) Embryo develops in female gametophyte which is retained on parent sporophyte
(b) Female gametophyte is free and gets dispersed like seeds
(c) Female gametophyte lacks archegonia
(d) Megaspore possess endosperm and embryo surrounded by seed coat

AIPMT (Mains)-2011

Ans. (a) : The most successful method of sexual reproduction is the seed habit found in vascular plants. *Selaginella* and *Salvinia* are heterosporous meaning they produce two type of spores-
(a) **Microspores (small):-** Give rise to the male gametophyte.
(b) **Megaspores (Big):-** Give rise to the female gametophyte.
Heterospory is essential for seed habit. The female spore germinate within the sporophyte body and thus the germinated female gametophyte derives food and nutrition from the parent sporophyte. This retention of gametophyte inside the sporophyte is a precursor for seed habit.
So, Selaginella and Salvinia are an important evolutionary link between pteridophytes and seed-producing plants.



377. In eusporangiate ferns, sporangium is produced from

(a) a single, superficial sporangial initial
(b) a group of sporangial initial cells
(c) vegetative shoots
(d) root mass

AP EAMCET-2011

Ans. (b) : In Eusporangiate plants there is an enormous sporangium created from a few beginning cells delivering numerous spores. They divide into two component. The outer cells give rise to the cell wall whereas the sporogenous tissues arise from the inner cell wall. Ex. Lycopodium, Selaginella, Equisetum etc.

378. Pteridophytes are called vascular cryptogams, because they are non-seeded plants containing:

(a) Xylem and Phloem
(b) Only Xylem
(c) Only Phloem
(d) Neither Xylem nor Phloem

Karnataka CET-2012

Ans. (a) : Pteridophytes are vascular plants dispersing spores. They are sometimes referred to as cryptogams as they neither produce seeds nor flowers. Their mode of reproduction is cancelled or hidden. They are containing xylem and phloem. These tissues are together known as vascular bundles.

379. Dryopteris differs from Funaria in having:

(a) an independent gametophyte
(b) an independent sporophyte
(c) swimming antherozoids
(d) archegonia

J&K CET-2004

Ans. (b) : Dryopteris differs from Funaria in having an independent sporophyte. Dryopteris is a fern which belongs to pteridophyte and has spore bearing leaves while Funaria is a moss and they lack vascular system.

@apna_pdf

380. Read the following five statements (A–E) and answer as asked next to them

(A) In Equisetum the female gametophyte is retained on the parent sporophyte

(B) In Ginkgo male gametophyte is not independent

(C) The sporophyte in Riccia is more developed than that in Polytrichum

(D) Sexual reproduction in Volvox is isogamous

(E) The spores of slime molds lack cell walls

How many of the above statements are right

(a) Four (b) One

(c) Two (d) Three

AIPMT (Mains)-2012

Ans. (b) : The pteridophytes, Equisetum has free-living, thalloid mostly photosynthetic gametophyte called prothallus.

- Ginkgo belongs to the category of gymnosperms. In gymnosperm, the male and female gametophytes do not have independent existence.
- Riccia is a liverwort in which simplest sporophyte consists of capsule only while Polytrichum is a moss in which sporophyte consists of foot, seta and capsule.
- Oogamy is present in Volvox
- Slime moulds spores bear cell walls.

381. Study the following lists and match correctly

List-I	List-II
A. Siphonogamy & zooidogamy	**i. Amphibiants of plant kingdom**
B. Living fossil	**ii. Arachis**
C. Liver worts	**iii. Ginkgo**
D. Double fertilization	**iv. Cycas**
	v. Laminaria

The correct match is:

	A	B	C	D
(a)	v	iv	i	ii
(b)	ii	iv	i	iii
(c)	iv	iii	ii	i
(d)	iv	iii	i	ii

AP EAMCET-2016

Ans. (d):		
Siphonogamy and Zooidogamy	–	Cycas
Living fossil	–	Ginkgo
Liver worts	–	Amphibians of plant kingdom
Double fertilization	–	Arachis

382. Match the following column I column II

	Column I		Column II
A.	**Anthoceros**	**1.**	**Alga**
B.	**Adiantum**	**2.**	**Hornwort**
C.	**Sargassum**	**3.**	**Gametophyte**
D.	**Prothallus**	**4.**	**Inferae**
E.	**Asterales**	**5.**	**Walking fern**

(a) A-2 B-5 C-1 D-3 E-4

(b) A-5 B-4 C-3 D-2 E-1

(c) A-5 B-1 C-2 D-4 E-3

(d) A-3 B-2 C-1 D-5 E-4

(e) A-5 B-4 C-1 D-2 E-3

CMC Vellore-2015

Ans. (a) :		
Anthoceros	–	Hornwort
Adiantum	–	Walking fern
Sargassum	–	Alga
Prothallus	–	Gametophyte
Asterales	–	Inferae

383. Coal is the fossil wood of

(a) cryptogamic plants (b) spermatophytes

(c) thallophytes (d) bryophytes

BVP-2011

Ans. (a) : Coal is fossilized wood of Lepidodendron belong to Lycopsida. They grew up to 40 meters in height. During their juvenile stages, these plants grew as unbranched trunks with thin leaves.

384. The branch of biology that deals with the study of fossil is called

(a) anatomy (b) embryology

(c) morphology (d) palaeontology

J&K CET-2010

Ans. (d) : The branch of biology that deals with study of fossil is called palaeontology. It is the scientific investigation of past history of life on Earth through the study of fossil remains of animals and plants.

385. The trabeculae found in Selaginella are the modification of

(a) Epidermal cells (b) Cortical cells

(c) Endodermal cells (d) Pericycle cells

VMMC-2011 / BHU PMT (Screening)-2009

Uttarakhand PMT-2009

Ans. (c) : The trabeculae found in Selaginella are the modification of endodermal cells. The innermost layer of the cortex is called endodermis. It comprises a single layer of barrel - shaped cells without intercellular spaces.

386. Antherozoids of Dryopteris are

(a) multi ciliated and coiled

(b) multi ciliated and sickle-shaped

(c) biciliated and coiled

(d) biciliated and sickle-shaped

Punjab MET-2009

Ans. (a) : Antherozoids of Dryopteris are multiciliated and coiled, which have a prominent vesicle and a nucleus. Dryopteris consists of a mature antheridium which is made up of a layer of jacket cells, with two ring shaped each composed of either one or two cap cells.

387. Gametophytic and sporophytic phasess are independent in

(a) pteridophyte (b) bryophyte

(c) gymnosperms (d) phaeophytes

JCECE-2008

Ans. (a) : Gametophytic & sporophytic phases are independent in pteridophyte. They exhibit dominant sporophytic generation with an inconspicuous gametophytic generation. The sporophyte is differentiated into root, stem and leaves.

@apna_pdf

388. In pteridophytes, phloem is without
(a) bast fibers (b) sieve tubes
(c) companion cells (d) sieve cells
JIPMER-2013 / Manipal-2010

Ans. (c) : In pteridophytes, phloem is without companion cell. The companion cells are specialized parenchymal cells in the phloem tissue. They are nucleated living cells with several ribosome, plastids and mitochondria. These cell are present only in angiosperms.

389. The circinate vernation is the characteristic feature of ferns. It refers to
(a) coiling of young leaves
(b) arrangement of leaves on stem
(c) attachment of sori on leaves
(d) heterophilly
Rajasthan PMT-2005 / UP CPMT-2004

Ans. (a) : When in pteridophytes plants, the young leaves are coiled or tightly rolled but uncoil like a watch spring as these leaves grow. This condition of leaves is called circinate vernation.

390. Mesarch xylem is commonly found in
(a) fungi (b) ferns
(c) bryophytes (d) algae
Punjab MET-1999

Ans. (b) : Mesarch xylem are commonly found in fern. It develops in each direction from the center of the primary xylem's strand. Ferns stems and leaves have a mesarch form of development.

391. Dispersal of spores in fern takes place through
(a) annulus (b) stomium
(c) (a) and (b) (d) indusium
AFMC-2005

Ans. (c) : Dispersal of spores in fern takes place through both annulus and stomium. In ferns, sporangium consist of stalk and capsule, later is filled with sporocytes which undergo meiosis to produce haploid spores. The one layered wall of the capsule is thin and has a strip of cells called annulus. The cells of annulus have thickenings on the inner and radial walls or region of dehiscence of a fern sporangium. These regions are called stomium.

392. Antherozoids of pteridophyta are
(a) Much coiled and multiciliated
(b) Pear-shaped and biflagellate
(c) Cork screw-shaped and multiflagellated
(d) All of the above
BCECE-2011

Ans. (d) : Antherozoids of pteridophyta are All of the above. It is present in the gametophytic phase of cryptogams such as bryophytes and ferns and lower pteridophytes.

393. Sometimes, the fern plant arises from fern prothallus without fertilisation. This is an example of
(a) apospory (b) apogamy
(c) parthenocarpy (d) gametogenesis
BVP-2010

Ans. (b) : The apogamy is the process of formation of sporophyte from a gametophytic cell other than egg without fertilization. The prothallus is the gametophyte plant body of plants, like ferns.

394. How many meiosis occur in the sporangium of Nephrolepis ?
(a) 1 (b) 4
(c) 16 (d) Uncertain and variable
AFMC -2011

Ans. (a) : Only one meiosis occur in the sporangium of Nephrolepis. It is a type of fern whose main plant body is sporophytic which is differentiated into true roots, stem and leaves. During sporophytic phase adult plant produces diploid spores mother cells in the sporangium. Their main characteristic feature is the presence of sporophylls. These are leaves bearing sporangia. Several sporophylls condense to form a compact structure known as strobili or cones.

395. Elaters are not found in the sporangium of (1) sphagnum (2) Marchantia (3) selaginella (4) All of these
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct
BHU PMT (Mains)-2009

Ans. (d) : Elaters are absent in Sphagnum and Selaginella. The elaters are long, slender, filamentous, fusiform structures with tapering ends. They are present inside the capsule of bryophytes. These are hygroscopic in nature and helps in dispersal of spores in Marchantia.

396. Which of the following are not seed producers (1) Fern (2) Funaria (3) Ficus (4) Pinus?
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct
BHU PMT (Mains)-2009

Ans. (b) : Fern (pteridophyta) and Funaria are non-seed producing plants, while Ficus and Pinus are seed producing plants. In Ferns and Funaria, the spores function much like seeds which are produced in special structures called sporangia or special cup shaped structures called sori.

397. Selaginella nearly approaches seed habit because it shows (1) heterospory (2) retention of megaspore in mega sporangium till the development of young sporophyte (3) presence of ligulate leaves (4) sexual type of reproduction
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct
BHU PMT (Mains)-2009

Ans. (b) : Selaginella nearly approaches seed habit because it shows heterospory, where two different kinds of spores are produced, called microspores and megaspores, by the sporophyte, and the retention of female gametophyte on parent sporophyte for a considerable period of time is considered as a precursor to seed habit.

398. The species of the following plant, are sometimes described as 're-surrection plants':
(a) Pleopeltis (b) Lycopodium
(c) Equisetum (d) Selaginella
BHU PMT (Mains)-2005

Ans. (d) : The plants of Selaginella are marketed as curiosities in the name of re-surrection plants. The resurrection plant is any plant that can survive in dehydration conditions. It is a plant species native to North America, Central and South America, and sold as a novelty. It is used as an antimicrobial to treat sore throat and colds.

399. A venter is a part of :
(a) sporophyte (b) sporangium
(c) antheridium (d)
BHU PMT (Mains)-2005

@apna_pdf

Ans. (d) : A venter is a part of archegonium. They may also have a stalk. The neck contains neck canal cells and is capped by four cover cells. The venter contains a ventral canal cell and an egg. The sterile jacket has a cap cell, which disintegrates when turgor pressure rises (when surrounded by rain water).

400. The dominant generation in pteridophytes is
(a) sporophytic (b) gametophytic
(c) zygotic (d) None of these
UP CPMT-2012

Ans. (a) : In pteridophytes, dominant free-living generation is diploid sporophytic generation. They are generally herbaceous and rarely woody. Sporophyte is differentiated into true roots, stem and leaves. The sporophyte develop from the zygote which is formed by the fusion of haploid male gamete with the haploid female gamete.

401. The bladder serving as floats and for trapping insects is found in
(a) Zizyphus (b) Utricularia
(c) Nephenthes (d) Acacia
J&K CET-2009

Ans. (b) : Ultricularia is also known as the bladderwort, which is subrmerged aquatic insectivorous plant. Its rootless, floating stem bears highly dissected leaves. A portion of leaf is modified into sac-like bladders of about 1.3 mm in diameter. Each bladder is guarded by small valve, which opens inwardly. The bladder help in trapping prey and water.

402. Prothallus of Petridophytes is
(a) conspicuous, small, multicellular, free-living, photosynthetic thalloid gametophyte
(b) inconspicuous, small, multicellular, free-living, photosynthetic thalloid gametophyte
(c) inconspicuous, large, unicellular, free-living, photosynthetic thalloid gametophyte
(d) inconspicuous, small, multicellular, free-living, non-photosynthetic thalloid sporophyte
J&K CET-2014

Ans. (b) : Prothallus of pteridophytes is inconspicuous, small, multicellular, free-living, photosynthetic thalloid gametophyte. The magagametophytes (prothallus) produces the male sex organs called antheridia and female sex organs called archegonia.

403. The green upright sterile hair-like structures among the antheridia of are known as:
(a) apophysis (b) perigonial leaves
(c) trabeculae (d) paraphyses
JIPMER-1997

Ans. (d) : Paraphyses is a sterile hairlike filament present among the reproductive organ in many lower plants, especially bryophytes, algae & fungi.
It provides protection and in some species may be involved in dehiscenece.

404. A fern differs from a moss in having
(a) Swimming archegonia
(b) Swimming antherozoids
(c) Independent gametophytes
(d) Independent sporophytes
JIPMER-2012 / BHU PMT (Screening)-2009
Uttarakhand PMT-2009

Ans. (d) : Ferns contain a dominant sporophyte whereas mosses contain a dominant gametophyte. By sporophyte dominant it means that the sporopyte is larger and lives a longer time than the gametophytic generation. Fern and moss both have swimming antherozoids. They swim in the water and fertilise with the egg of the archegonium.

405. In which one of the following the male and female gamerophytes don't have free-living independent existence?
(a) Pteris (b) Funaria
(c) Polytrichum (d) Cedrus
BHU PMT (Screening)-2010

Ans. (d) :. In gymnosperms, the male and female gametophyte do not have an independent existence as they remain within the sporangia retained on the sporophyte's. Cedrus is a gymnospermic plant. In cedrus the female gametophyte retain within the megasporangium and male gametophyte within the microsporangium.

406. Club moss is the common name of :
(a) Selaginella (b) Funaria
(c) Potamogeton (d) Lycopodium
JIPMER-2003

Ans. (d) : Lycopodium belongs to the class Lycopsida of group Pteridophyta. They are commonly called "club moss". The plant body is differentiated into roots, stems and leaves.

407. In the prothallus of a vascular cryptogam, the antherozoids and eggs mature at different times. As a result of which
(a) there is no change in success rate of fertilization
(b) there is high degree of sterility
(c) one can conclude that the plant is apomitic
(d) Self - fertilization is prevented
Rajasthan PMT-2010

Ans. (d) : In the prothallus of a vascular cryptogam, the antherozoids and eggs mature at different times. As a result, of which self-fertilization is prevented.
The haploid gametophyte produces both male and female gametes but cross fertilization occurs because of the fact that archegonia (producing egg) and antheridia (producing antherozoids) mature at different times.

408. Azolla is used as a biofertilizer because it
(a) multiplies very fast to produce massive biomass
(b) has association of nitrogen-fixing Rhizobium
(c) has association of nitrogen - fixing cyanobacteria
(d) has association of mycorrhiza
Rajasthan PMT-2010

Ans. (c) : Biofertilizers are microbe-containing compounds that help to promote plant and tree growth by increasing the supply of vital nutrients to plants. The main sources of biofertilizers are bacteria, fungi and cyanobacteria. Azolla is water fern which is also used as a biofertilizer. Symbiotic cyanobacteria *Anabaena azollae* is responsible for nitrogen-fixation which increases the fertility of the soil and in turn enhances the yield. *Azolla pinnata*, is used as an excellent fertilizer in rice field.

409. Which of these does not show heterospory?
(a) Pinus (b) Selaginella
(c) Dryopteris and moss (d) sunflower
AMU-2011

Ans. (c) : The Dryopteris and Moss form monoecious gametophytes as all spores are uniform. The heterospory is the production of two different types of spores by the sporophytes of land plants. They are mostly found in some pteridophytes and all seed plants, i.e. Gymnosperms and Angiosperms, whereas the Bryophytes are not heterosporous.

@apna_pdf

410. The present day higher green plants are believed to have evolved from
(a) ferns (b) green algae
(c) liverworts (d) mosses
AMU-1999

Ans. (a) : The present day higher green plants are believed to have evolved from ferns. They are believed to be originated during the late Palaeozoic era (about 250 million years ago).

411. Telome theory of Zimmerman (1930) applies only to:
(a) bryophytes (b) pteridophytes
(c) tracheophytes (d) all plants
VMMC-2006

Ans. (b) : The 'Telome theory' was proposed by Zimmerman (1930), he explained the origin of the megaphyll as well as of reproductive branches in vascular plants i.e. pteridophytes. The complex structures such as leaves (megaphylls) roots, reproductive organs, and other vascular plants evolved by the modification of terminal branches (telomes) of stems.

412. Seed habit is developed first time in :
(a) some ferns (b) some pinus
(c) some monocots (d) some dicots
Rajasthan PMT-1998

Ans. (a) : Seed habit was developed first time in some ferns. It is one of the most important aspects of evolution of land plants. The origin and evolution of seed habit started in late Devonian times. The earlier seed plants or plants with seed-like structures were found to have existed in the Devonian seed ferns - Lyginopteris, an archetypal Pteridosperm.

413. The rhizoids in Funaria are
(a) tuberculated
(b) unicelluar and simple
(c) distinct, branched and coenocytic
(d) multicellular and oblique septate
UP CPMT-2001

Ans. (d) : In funaria, root like structures called rhizoids are present. In has a height of 3-5 cm, a radial symmetry with a differentiation of an axis or stem, leaves or phylloids and multicellular colorless branched rhizoids with oblique septa. These are primitive multicellular, autotrophic, shade loving, amphibious plants.

414. Fern gametophyte bears:
(a) archegonia (b) antheridia
(c) sporangia (d) Both (a) and (b)
Manipal-2000

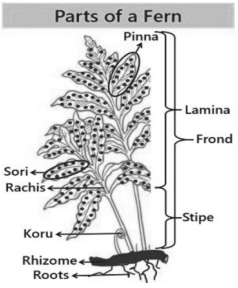
Ans. (d) : Fern gametophyte bears Both (a) and (b). The gametophyte of fern is called prothallus, which bears both archegonia and antheridia. Sporangia are found in the sori of sporophyte. In ferns, the antheridia are above the rhizoids and the archegonia are below the apical notch. They are found on the lower surface of the prothallus.

415. Which of the following plant shows multiple epidermis:
(a) Palm (b) Ficus
(c) Croton (d) Cucurbita
Uttarakhand-2005

Ans. (b) : The outermost protective layer which minimizes the loss of water by transpiration is called epidermis. Some plants, like Ficus elastica and Peperomia, which have periclinal cellular division within the protoderm of the leaves, have an epidermis with multiple cell layers.

416. Leaf in young condition in fern is called
(a) scale leaf (b) sporophyll
(c) circinate ptyris (d) none of these
CMC Ludhiana-2008 / AMU-2007

Ans. (c) : In ferns, the leaves during young conditions are called Circinate ptyris. It happens due to hyponasty in the fern leaves. The hyponasty is an upward bending or uncoiling of leaves resulting from greater growth of the lower side.



417. Haploid brown, hairlike, delicate unicellular outgrowths are:
(a) root hairs of gymnosperms
(b) paraphysis of mosses
(c) root nodules of pulses
(d) rhizoids of fern plants
AP EAMCET-2004

Ans. (d) : Haploid brown, hairlike, delicate unicellular outgrowths are rhizoids of fern plants.
The rhizoids are found in the gametophyte of fern but after an evolutionary change, they develop in the root hairs of vascular plants in their sporophytic stage.

418. The prothallus of Pteris is mostly:
(a) dioecious (b) monoecious
(c) synoecious (d) protogynous
Haryana PMT-2002

Ans. (b) : The prothallus of Pteris is mostly monoecious. It carries sex organs, including male antheridia and female archegonia. It is autotrophic in nature. It is thick in one cell normally formed by the heart or kidney and has no roots, stems or leaves, but it has rhizoids.

419. A tree fern is:
(a) Adiantum (b) Dryopteris
(c) Cyathea (d) Asplenium
Haryana PMT-2002

Ans. (c) : Cyathea is a genus of tree ferns, belongs to the order Cyatheales. The genus name Cyathea is derived from the Greek word 'Kyatheion', meaning "little cup", and refers to the cup-shaped sori on the underside of the fronds. They are mostly terrestrial ferns, usually with a single tall stem.

420. If number of chromosome in foot of fern embryo is 8, what should be the number in its spores?
(a) 4 (b) 8 (c) 23 (d) 16
Haryana PMT-2004 / Manipal-2003

Ans. (a) : The number of chromosomes in the foot of a fern embryo (2n) = 8; The number of spores (n) = 4. In ferns the embryo is a diploid structure as it is formed by the fusion of gametes while the spores are haploid structures formed due to meiosis in diploid spore mother cell.

@apna_pdf

421. A mature ligule having a prominent basal portion is called
(a) trrichocyst (b) heterocyst
(c) rhizophore (d) glossopodium
Manipal-2013

Ans. (d) : An elongated cell structure that is found at the base of ligule is called glossopodium. It is found in many species Selaginella. In Sellaginella, glossopodium is a bulb-like minute structure which is found at the base of the ligule.

422. Flagellate male gametes are present in the following except:
(a) Funaria (b) Dryopteris
(c) Pinus (d) none of these
JIPMER-1995

Ans. (c) : In Pinus, after pollination, the pollen tube grows and the generative cells divides to form a stalk cell and body cell. The body cell then divides to form two non-flagellate, male gametes.

423. Sporophyte of Dryopteris produces:
(a) seeds (b) spores
(c) gametes (d) none of these
JIPMER-1995

Ans. (b) : Sporophyte is a diploid, multicellular spore producing phase in the life cycle of the plant body. The haploid spore which give rise to the gametophyte which is the monoecious prothallus and bears sex organs on its ventral side. After fertilization, they give rise to the sporophyte which is the dominant asexual member in the life cycle of the plant.

424. Sex organs in Pteris are produced on:
(a) dorsal side of the prothallus
(b) ventral side of the prothallus
(c) margins of the fertile leaflets
(d) apices of sporophytic stem
AP EAMCET-2001

Ans. (b) : The cells of a prothallus contain chloroplasts. Therefore, it is photosynthetic and independent. The prothallus (gametophyte) produces male sex organs (antheridia) and female sex organs (archegonia) during sexual reproduction. These develop on the lower surface facing the soil. It is generally monoecious and the sex organs are developed on the ventral surface. Sex organs are exposed directly to moisture which is needed for the development and dehiscence.

425. Reduction (meiotic) division in Pteridophyta occurs:
(a) during gamete formation
(b) after spore formation
(c) during spore formation
(d) after gamete formation
AFMC-2004

Ans. (c) : Meiosis in pteridophytes occur during spore formation. It is the turning point in the life cycle. The diploid sporophytic generation ends with meiosis and the new haploid gametophytic generation begins with the formation of haploid spore. The spore (n) on germination produces haploid fern prothallus.

426. Which of the following is found in fern?
(a) Eustele (b) Atactostele
(c) Dictyostele (d) None of these
CG PMT-2006

Ans. (c) : The dictyostele is found in fern. It is a hollow stele with overlapping leaf gaps so the vascular cylinder appears as a hollow network of strands called meristeles.

427. In ferns and mosses, movement of antherozoids towards female component is called.
(a) phototaxis (b) chemonastic
(c) hydrotropism (d) thigmotropism
Haryana PMT-2006

Ans. (b) : The antherozoids of ferns and mosses are stimulated by special chemicals this movement is known as chemonastic. It is the nastic movement shown by plant in response to external chemical stimuli. The antherozoids are attracted towards archegonia in a fern plant due to chemonastic movement.

428. A tree growing in Indian Botanical Garden, Sibpur (Howrah, Calcutta) with age over 200 yr, circumference 404m, prop roots 1,600 and whose main stem has decayed is
(a) Ficus benghalensis
(b) Ficus religiosa
(c) *Eucalyptus regnans*
(d) No such tree exist
CMC Vellore-2007

Ans. (a) : *Ficus benghalensis* is also called the Great Banyan tree. The fruit is like a small fig and is eaten by some people. It tastes sweeter than fig. They grow from the little wet dust deposits on buildings because birds carry them around for eating. The fruit is red and when ripes gets softer.

429. Rhizophore of Selaginella is
(a) root (b) stem
(c) leaf (d) organ sui genesis
CG PMT-2011

Ans. (d) : The most accepted view is that rhizophores are organ sui-genesis that is a new organ of independent origin (Bower 1908, Goebel 1905). They are leafless and positively geotropic organs that have localised origin and develop from meristems.

430. Which pteridophyte is called as horse tail?
(a) Equisetum (b) Lycopodium
(c) Marsilea (d) Selaginella
Manipal-2010

Ans. (a) : Equisetum is called as horsetail as their branched species somewhat resembles a horse's tail. It is a living fossil as it is the only living genus of the entire class Equisetopsida.

431. Tracheophyta consists of
(a) bryophytes only
(b) pteridophytes only
(c) gymnosperms and angiosperms
(d) Both (b) and (c)
CMC Vellore-2009

Ans. (d) : The tracheophytes are plants, which have vascular tissue system. It includes pteridophyta, gymnosperms and angiosperms. The vascular tissues include xylem and phloem. They are conducting tissues of plants.

432. Leaf gap in the vascular cylinder in ferns is
(a) air spaces
(b) parenchymatous zone
(c) collenchymatous zone
(d) area exclusive of phloem
CMC Ludhiana-2011

@apna_pdf

Ans. (b) : Leaf gap in the vascular cylinder in ferns is parenchymatous zone. The parenchymatous region left behind in the main stele after the departure of the leaf traces called leaf gap. The point at which the stem bundle diverges from the vascular cylinder towards the leaf is a leaf gap, called a lacuna.

433. Botanical name of 'Sanjeevani' is
(a) Selaginella chrysocaulos
(b) Selaginella bryopteris
(c) Selaginella chrysorhizos
(d) None of the above

CMC Ludhiana-2008

Ans. (b) : Botanical name of 'Sanjeevani' is Selaginella bryopteris. The sanjeevani is known as a magical herb that cures serious nervous system problems. Till now the exact sanjeevani plant is not identified but there are several candid plant species that may be sanjeevani plant. These plants include Selaginella bryopteris. They grow on the hills of tropical areas, particularly the Arawali mountain terrains from east to west in India.

434. The rhyniophytes have
(a) leaves like today fern
(b) flourishing group of plants
(c) sporangia at the tips of thin branches
(d) sporangia near the base of shoot

JCECE-2014

Ans. (c) : Rhynophytes are member of the Rhynopsida class. They have vascular structures the sporangia which are branched stalks are found in the sporophytes. Rhyniophytes have sporangia at the tip of thin branches leaves and true roots are absent. The sporangia consist of spores and spores are categorised into microspore and megaspores.

435. Seed habit was first originated in members of :
(a) ferns (b) cycadofilicales
(c) gymnosperm (d) angiosperm

BVP-2006

Ans. (a) : The seed habit in pteridophytes is considered an important step in evolution which is due to heterospory. Heterospory is the occurrence of two kinds of spores in the plant. One smaller are called microspore and the larger are called as megaspore as in selaginella and salvinia. Seed habit first originated in seed ferns or pteridosperm.

436. Most primitive members in which roots are not present, is:
(a) Psilotum (b) Rhynia
(c) Lycopodium (d) Selaginella

BHU PMT (Screening)-2005

Ans. (b) : Early vascular plants like Rhynia date back to the lower Devonian. The Rhynia plants have short, upright branches, Rhynia is more primitive than psilotum and both lack true roots.

437. Which one of the following pairs of plants are not seed producers?
(a) Funaria and Ficus
(b) Fern and Funaria
(c) Funaria and Pinus
(d) Ficus and Chlamydomonas

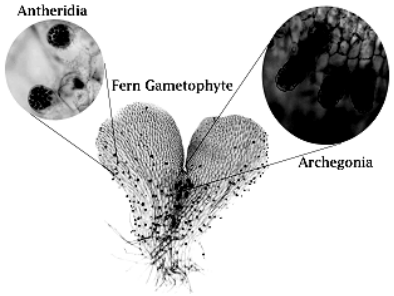
JIPMER-2013

Ans. (b) : The seed producing plants belong to spermatophyta, i.e. angiosperms and gymnosperms. While, the bryophytes, thallophytes and pteridophytes lack these features and thus, they do not reproduce by producing seeds.
Fern and Funaria do not bear flowers thus, they do not bear seeds. Fern and Funaria belongs to pteridophytes and bryophytes respectively. The spores functions like seeds which are produced in special structures called sporangia or special cup-shaped structures called sori.

438. Fern gametophyte bears:
(a) archegonia (b) antheridia
(c) sporangia (d) both (a) and (b)

JCECE-2005

Ans. (d) : The sex organs the antheridia and archegonia, are carried by the gametophyte of the fern or prothallus. So they referred to it as homothallic while archegonia are the female reproductive organs antheridia are the male sex organs.



439. Heterospory and seed habit are exhibited by a non - flowering plant which also possess:
(a) bract (b) ligule
(c) petiole (d) spathe

VMMC-2006, 2003
AMU-2006

Ans. (b) : The development of megaspores and microspores two different spore size is known as heterospory. It is true of bryophytes. Some pteridophytes, including selaginella, are where heterospory first appeared. Its common names Include clubmoss and spike moss. On the adaxial side of its leaves the ligules is an outgrowth that resembles to a flap.

440. First vascular plant is
(a) Thallophyta (b) Bryophyta
(c) Pteridophyta (d) Spermatophyta

AMU-2009

Ans. (c) : Terrestrial or land plant are other names for vascular plants. Vascular plants are those plants that have vascular tissues like xylum and phloem. The first vascular plant is Pteridophyta. They are also called first vascular cryptogams or spore-bearing vascular plants.
Vascular plants contains conducting system for the transport of minerals, water and food materials. They include gymnosperm and angiosperms and plants that reproduce through spores i.e. the fern.

441. In the chlorophyta, the reserve food of protein surrounded by starch, form a compact body termed as -
(a) paramylum (b) pyrenoid
(c) volutin (d) eye spot

JIPMER-1999

Ans. (b) : In the chlorophyta, the reserve food of protein surrounded by starch, form a compact body termed pyrenoid. Pyrenoid contain protein besides starch.

@apna_pdf

E. Gymnosperms

442. In Pinus/Cycas/gymnosperms, the endosperm is
(a) triploid (b) haploid
(c) diploid (d) tetraploid
TS EAMCET-28.09.2020 Shift-II / JIPMER - 2013
Punjab MET-2010 / Punjab MET-2008
Rajasthan PMT-1998 / AMU-2009
CG PMT-2011, 2007 / Haryana PMT-2007
Rajasthan PMT-2006 / BVP-2005 / AIPMT-1988
Haryana PMT-2004 / MGIMS Wardha-2003
Manipal-2002 / AMU-2002 / AP EAMCET-2001
AIPMT-1999 /AP EAMCET-1998 / JIPMER-1995

Ans. (b) : In pinus/cycas/gymnosperms the endosperm is haploids because it is produced before fertilization. In the gametophyte phase, which is haploid, male and female organs develop and produce egg and sperm through simple mitosis for sexual reproduction. When these unite in fertilization, the zygote then develop into the diploid sporophyte phase, which produce unicellular spore through meiosis.

443. Gymnosperms are called naked seed plants because these lack
(a) cotyledon (b) endosperm
(c) ovary wall (d) testa
BVP-2012 / CMC Ludhiana-2012/ UP CPMT-2011
MGIMS Wardha-2011 / BVP-2010
BHU PMT (Mains)-2010 /UP CPMT-2010
BHU PMT (Screening)-2009 / BVP-2009
Uttarakhand PMT-2009 / UP CPMT-2004
Rajasthan PMT-2004 / MGIMS Wardha-2004
JIPMER-2003 / Rajasthan PMT-2000
MP PMT-2009, 1996 / JIPMER-1999

Ans. (c) : Gymnosperms are the vascular plants with an exposed ovule. They are called naked seed plants because they lack ovary wall. The botanical term "gymnosperms" means "naked seeds" in Greek.
Gymnosperms include species such as conifers and cycads that do not enclose their seed in fruits.

444. Which of the following is a living fossil?
(a) Pinus (b) Gnetum
(c) Ginkgo (d) Riccia
Assam CEE-2014 / CG PMT-2009
AMU-2009 / Punjab MET-2008
Punjab MET-2007 / JIPMER-2006
AMU-2006 / Uttarakhand-2005
Rajasthan PMT-2001 / AMU-2001
Haryana PMT-2000 / Rajasthan PMT-2000, 1998

Ans. (c) : Ginkgo commonly called as "Ginkgo biloba" is also known as "maiden-hair tree" is a species of gymnosperm. It is the lost living species in the order Ginkgo ales. It is the oldest living seed plant. It is cultivated for its edible seeds in some parts of China and Japan. The plant body of ginkgo is saprophytic & the saprophytes resembles several conifers in general habit. Branches are dimorphic.

445. Male cone of Pinus possesses :
(a) mega sporophylls (b) microsporophyllus
(c) anthers (d) ligules
Manipal-2014 / BCECE-2012 /UP CMPT-2012
BVP-2012 / VMMC-2012 / BCECE-2010
JIPMER-2009 / CG PMT-2008/ BVP-2008
Rajasthan PMT-2008
CG PMT-2008
UP CPMT-2012, 2008
BHU PMT(Screening)-2006
MGIMS Wardha-2006
BHU PMT (Screening)-2005

Ans. (b) : Male cones consists of a spiral arrangement of tightly packed pollen-bearing structures or microsporophylls formed around a central axis. The lower surfaces of the microsporophylls have two chambers called microsporangia in which the pollen develops.

446. Which of the following is not the feature of gymnosperms?
(a) Parallel venation
(b) Perennial plants
(c) Distinct branches (long and short branches)
(d) Xylem with vessels
JIPMER-2009 / UP CPMT-2012
VMMC-2012 / VMMC-2011
UP CPMT-2008 / Rajasthan PMT-2008
CG PMT-2008 / BHU PMT(Screening)-2005

Ans. (d) : Most of the gymnosperms are tall, evergreen trees, none of them are herbs. Gymnosperms are characterized by parallel venation with almost no branching veins wherein secondary veins run parallel to each other. They are vascular plants & have xylem and phloem for transport of water & food respectively. The xylem tissue of gymnosperms consists of tracheids only, vessels are absent.
• Parallel venation is a vein configuration in which the veins run parallel to one another. Mostly found in monocot leaves.
• A perennial plant is a plant that lives more than two years.

447. *Cycas revoluta* is popularly known as:
(a) date palm (b) sago palm
(c) sea palm (d) royal palm
JIPMER-2013 / MGIMS Wardha-2012
UP CPMT-2010 / VMMC-2007
Rajasthan PMT-2005 /Rajasthan PMT-1999
UPCPMT-2002

Ans. (b) : *Cycas revoluta*, popularly known as "sago palm". It is not a real palm, but a cycad. It is a slow - growing evergreen, long lived, medium- sized palm like plant. It is the most popular species in the genus Cycas. This plant is popularly known as "King sago".

448. Which one of the following is categorized under living fossils?
(a) Selaginella (b) Metasequoia
(c) Pinus (d) Cycas
HP CET-2013 /AFMC -2011
Haryana PMT-2011 / Rajasthan PMT-2007
VMMC-2003 /Haryana PMT-2000

Ans. (d) : Cycas are often known as "living fossils" since they have survived virtually unchanged throughout the years. Cycads, a plant family with roughly 300 species are thought to be only a few million years old & are regarded as one of the living fossils.

449. Which of the following is absent in the primary and secondary structure of stem of Pinus?
(a) Sieve tubes (b) Mucilage duct
(c) Companion cells (d) Phloem parenchyma
AP EAMCET-2015 / AFMC-2000
BVP-2001 / Rajasthan PMT-1995

Ans. (c) : In gymnosperms, (including Pinus), the companion cells are lacking in the phloem. The albuminous cells are found in place of companion cells. Sieve cells in gymnosperms are associated with albuminous cells which lack starch.

@apna_pdf

450. Winged pollen grains are found in:
(a) Pinus (b) Selaginella
(c) Cetraria sp. (d) Parmelia sp.
BHU PMT (Screening)-2011 / MGIMS Wardha-2011
CG PMT-2007 / BHU PMT-2003 / BVP-2002

Ans. (a) : The pinus pollinate profusely giving rise to large number to pollens. The pollen grains of pinus are large due to the presence of sacs or bladders, giving them a winged format. It has two prominent walls, the outer exine made up of sporopollenin which is referred to as one of the most resistant organic material. The inner intine layer is made of cellulose and pectin. Winged pollen grain are found in pinus.

451. The smallest plant division-Gymnosperm has how many species.
(a) 640 (b) 900
(c) 100 (d) 300
VMMC-2013/JIPMER-2003/NEET-1996/IPMT-1996

Ans. (b) : Gymnosperms are a group of plants that produce seeds not enclosed within the ovary or fruit. It originated about 200 million years ago and were dominant species at that time. There are around 900 living species of this group. Zamia pygmia is the smallest gymnosperm.

452. Resin or turpentine oil is obtained from
(a) Pinus (b) Cedrus
(c) Cycas (d) None of these
Manipal-2011 /CG PMT-2006 / AIPMT-1992
MGIMS Wardha-2003 /Rajasthan PMT-2001

Ans. (a) : Turpentine oil is the liquid formed by the distillation of waxes collected from the pine tree or Pinus. Pinus is a coniferous gymnosperm. The stem of the Pinus is branched containing resin canals that are found in the cortex region. These canals secrete resins that contain turpentine oil. These canals are the type of schizogenous cavities in their origin. It is utilised as a mixture and oil based dyes. Blue pine tree on pinus wellichiana and pinus longifolia are commercial sources of extracting turpentine oil. Dried turpentine is used for flavoring foods and beverages. Resin is a hydrocarbon extract or secretion produced by confers.

453. Female cone of pinus is a
(a) Modified needles
(b) Modified long shoot
(c) Modified dwarf shoot
(d) Modified scale
JIPMER-2012 / BVP-2009
Uttarakhand PMT-2009 / BHU PMT (Screening)-2009

Ans. (b) : Pinus is a conifer that contains resinous substance. They are monoecious in nature which means they have male and female cones on the same tree. The female cone of Pinus is formed by the aggregation of meagasporophylls, which bear ovules. Each megasporophyll consists of a lower bract scale and a larger upper ovuliferous scale. The male and female reproductive structure are microsporangiate or male strabili and megasporangiate of female strobili respectively.

454. The young meristematic cells of leaves and stem of gymnosperm has 16 chromosomes, the number of chromosomes in the endosperm of the same gymnosperm shall be:
(a) 16 (b) 32
(c) 24 (d) 8
MP PMT-2013 / Manipal-2008
BVP-2007 / AIPMT-1996

Ans. (d) : The emergence of endosperms on haploid megaspores prior to fertilization is a characteristic features of gymnosperms. Here, the endosperm is gametophytic tissue and is haploid. A gymnospermic stem & leaves are somatic organs which have diploid chromosome number in its cells. According to question, the no. of chromosomes in leaf is 16 (2n) which means the haploid chromosome number is 8 (n). The megaspores, being the product of meiosis in megaspore mother cell (2n) are haploid & therefore chromosome number of its endosperm is n = 8.

455. The longest gymnospermic plant is :
(a) Sequoiadendron (b) Pinus
(c) Cycas (d) Cinchona
NEET-2016 Phase-I / Rajasthan PMT-1999
VMMC-2002 / AMU-2001

Ans. (a) : *Sequoiadendron gigantenum* also known as the "giant sequoia" is the largest and sole living species in the genus Sequoiadendron and one of the the species of coniferous trees known as redwoods, classified in the family Cupressaceae. It is known for its massiveness size (50-85 m). Due to their massive size, the branches at the bottom usually die from being in shade & are also retained.

456. Mycorrhiza is useful association because:
(a) it fixes atmospheric nitrogen
(b) it enhances absorption of nutrients from soil
(c) it kills pathogens
(d) it provides resistance against drought
CMC Ludhiana-2008 /DUMET-2006
AMU-2006 /UP CPMT-2003/BHU PMT-2001

Ans. (b) : Mycorrhiza are the symbiotic association between roots of higher plants & fungi. The fungi helps in absorbing water & nutrients from the soil. Mycorrhiza absorb mineral nutrients especially phosphorus from soil.

457. Chilgoza pinus is:
(a) Pinus gerardiana (b) Pinus roxburghi
(c) Pinus wallichiana (d) Pinus merkurii
BHU PMT (Screening)-2005 /J&K CET-2001
Rajasthan PMT-2001 /AMU-1999

Ans. (a) : Pinus gerardiana is commonly known as chilgoza pine. The trees are tall with usually deep, wide and open crowns with erect branches. The leaves are needle like, in groups of three and spread stiffly. They are glossy green on the outer surface with blue-green stomatal lines on the inner face. Seeds are found with a thin shell and a rudimentary wing.

458. Which of the following plants produces seeds but not flowers : -
(a) Maize (b) Mint
(c) Peepal (d) Pinus
Rajasthan PMT-2007/AIPMT-2002
JIPMER-2002/AIPMT-1992

Ans. (d) : Gymnosperms are seed-producing plants but they do not bear flowers.
Pinus is a gymnosperm and ovules lie uncovered on the megasporophyll, hence these do not have flower. However, it produces seeds (from ovule after fertilization) but maize, mint and Peepal bear flower, fruit and seeds.

459. Assertion (A) : Fertilization in cycas is called Siphonogamy and zooidogomy
Reason (R) : Male gametes are multiciliate and carried by pollen tube

@apna_pdf

(a) Both A and R are true and R is the correct explanation to A.
(b) Both A and R are true but R is not the correct explanation to A
(c) A is true but R is false
(d) A is false but R is true

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Gymnosperm:-
In cycas fertilization is siphonogamous i.e., by the pollen tube and zoodogamous e.g. -by the motile male gametes.
In cycas each spermatozoid (male gamete):- Top shaped, broad at the posterior and narrow at the anterior, 5-6 ciliary band 180-210μ in diameter. Largest in the plant and animal kingdom. haploid and multiciliated. Motile gamete are last cell of gametophyte generation.

460. Given below are two statements : One is labelled as Assertion A and the other is labelled as Reason R :
Assertion A : In gymnosperms the pollen grains are released from the microsporangium and carried by air currents.
Reason R : Air currents carry the pollen grains to the mouth of the archegonia where the male gametes are discharged and pollen tube is not formed.
In the light of the above statements, choose the correct answer from the options given below :
(a) A is false but R is true.
(b) Both A and R are true and R is the correct explanation of A .
(c) Both A and R are true but R is NOT the correct explanation of A.
(d) A is true but R is false.

NEET (UG) 07.05.2023

Ans. (d) : Gymnosperms laterally means naked seed i.e without ovary.
- Gymnosperm show connection between pteridophyte and gymnosperm
- Gymnosperms are wind pollinated. insect pollination common in angiosperms, is nearly absent in gymnosperms
- The female gametophyte or endosperm in post fertilization stages remains haploid in gymnosperm.
- Pollen grains are deposited on stigma either due to closeness of the anthers to the stigma or by pollinating agent.
- The attachment of the pollen on the stigma depends upon its wall sculpture and stickiness. In wet stigma adhesion is mostly a mechanical process.
- The stigmatic surface also provides boron and calcium which are required for germination.

461. Which unbranched tree hosts heterocystous symbiont in its modified roots ?
(a) Pinus (b) Cycas
(c) Ginkgo (d) Cedrus

TS EAMCET-30.07.2022 Shift-II

Ans. (b) : Cycas hosts heterocystous symbiont in its modified roots. Heterocysts are specialized nitrogen-fixing cells formed during nitrogen starvation by some filamentous cyanobacteriea. Heterocysts is the sites for nitrogen fixation under aerobic conditions.

462. Roots in some gymnospermic genera have fungal association in the form of A and B. Here A and B refers to_____
(a) A–lichen; B–cycas
(b) A–lichen; B–pinus
(c) A–mycorrhiza; B–cycas
(d) A–mycorrhiza; B–pinus

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : Pinus had fungal association to form mycorrhiza which helps in absorption of water and minerals. Mycorrhiza is a symbiotic association between plant roots and fungi. Their major role is to enhance nutrient & water uptake by the host plant by exploiting a larger volume of soil than roots alone can do.
Cycas:- Cycas have symbiotic association with the blue-green algae forming coralloid root.
Lichen:- Lichen is formed by the symbiotic relationship between fungus and an algae or cyanobacterium.

463. Assertion (A) : Cycas shows siphonogamous oogamy and zooidogamy.
Reason (R) : The pollen grains are released and pollination is anemophilous.
Pollen tube carrying male gametes grow towards archegonia in the ovule.
The correct option among the following is Options:
(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-28.09.2020 Shift-I

Ans. (a) : Cycas exhibits all siphonogamous, oogamous and zooidogamous types of fertilization.
Siphonogamy is a type of reproduction in plants, in which pollen tube gets developed from the transfer of male cells into the egg.
In zooidogamy, male gametes or antherozoids swim through a path of the water to the female gametes or archaegonia.

464. Gymnosperms lack which of the following ?
(a) Sieve tubes (b) Tracheids
(c) Sieve cells (d) Albuminous cells

AP EAMCET-25.09.2020 Shift-II

Ans. (a) : Seive tubes are specialized cells that helps the phloem, a highly organized tissue that transports organic molecules produced during photosynthesis.
- In the gymnosperms, having not seive tubes or companion cells.

465. Choose the correct option for the statements for Mycorrhiza:
(i) It absorbs phosphorus from soil.
(ii) It forms root nodules with the association of Rhizobium.
(iii) They are resistance to root-borne pathogens, tolerance to salinity & drought.
(iv) They fix atmospheric nitrogen.
(a) (i) and (ii) (b) (i), (ii) and (iii)
(c) (i) and (iii) (d) (ii) and (iv)

GUJCET-2020, 2008

@apna_pdf

Ans. (c) : Mycorrhiza are symbiotic association between higher plant roots & fungi. Their major role is to enhance nutrient & water uptake by the host plant. It absorbs phosphorus from soil and they are resistance to root-borne pathogens, tolerance to salinity, drought and an overall increase in plant growth and development. There are two types of mycorrhizal- ectomycorrhizae & endomycorrhizae.

466. Which of the following statements is incorrect about gymnosperms?
(a) Their seeds are not covered
(b) They are heterosporous
(c) Male and female gametophytes are free living
(d) Most of them have narrow leaves with thick cuticle

NEET-2020 Phase-II

Ans. (c) : Gymnosperms have naked seeds. All of them are heterosporous. Male and female gametophytes do not have independent existence hence are not free living. The male and female gametophytes of gymnosperms are highly reduced. They are dependent upon sporophytes and are not free living.

467. Zooidogamy is found in
(a) Cedrus (b) Pinus
(c) Cycas (d) Both (b) and (c)

JIPMER-2019

Ans. (c) : Zooidogamy is a type of plant reproduction in which male gametes (antherozoids) swim in a path of water to the female gametes. It is a type of reproduction which does not involve the pollen grains. This way the anther reaches the archegonium. Zooidogamy is found in algae, bryophytes, and some gymnosperm.

468. Small specialised roots called coralloid roots are associated with N_2-fixing cyanobacteria in
(a) Pinus (b) Cedrus
(c) Ginkgo (d) Cycas

TS EAMCET-08.05.2019 Shift-I

Ans. (d) : Cycas is perennial, slow growing evergreen plant and is referred as living fossil. Coralloid roots are special types of roots developed from the normal roots. These roots are negatively geotropic possess nitrogen fixing algae helping in N_2 fixation.

469. VAM is a type of
(a) Ectomycorrhiza (b) Bioinsecticide
(c) Endomycorrhiza (d) Bioherbicde

MHT CET-2019

Ans. (c) : VAM i.e., Vesicular arbuscular mycorrhiza is an endomycorrhiza. It is a type of fungi present in symbiotic relationship with roots of the plants. It directly penetrates within the cells of the plants & direct exchange of material takes place in the cell.
• Ectomycorrhiza is a form of symbiotic relationship that occurs between fungal symbiont or mycobiont and roots plants.
• Bioinsecticides are biological substances or organisms that damages, kills or repells organisms seen as pest.
• Bioherbicides are living microorganisms used for weed control.

470. Mycorrhiza is a relationship of roots of Pinus and;
(a) fungus (b) alga
(c) bacteria (d) ants

NEET-2019 / BVP-2001

Ans. (a) : Mycorrhiza is a symbiotic relationship between the roots of plant, such as pinus and fungi The term mycorrhiza refers to the role of the fungus in the plant's rhizosphere, its roots system. Mycorrhiza plays an important role in plant nutrition, soil biology & soil chemistry.

471. Which of the following statements is correct?
(a) Ovules are not enclosed by ovary wall in gymnosperms
(b) Selaginella is heterosporous, while Salvinia is homosporous
(c) Stems are usually unbranched in both Cycas and Cedrus
(d) Horsetails are gymnosperms

NEET-2018

Ans. (a) : Ovule are not enclosed by ovary wall in gymnosperms. In gymnosperm, seeds are naked, hence they do not occur inside the fruit.
The enclosed condition of their seeds contrasts with the seeds and ovules of flowering plants, which are enclosed within an ovary.

472. Gymnosperms lack
(a) herbs (b) shrubs
(c) trees (d) lianas

Uttarakhand PMT-2011
Manipal-2003

Ans. (a) : There is complete absence of herbs & climbers in gymnosperms.
• A shrub is a small to medium-sized perennial woody plant. In gymnosperm ephedra & gnetum are shrubs.
• Gymnospermic plants that are trees are- ginkgo, pinus, cedar, etc.

473. Seed of Pinus possesses:
(a) parent sporophyte as seed coat, perisperm etc.
(b) gametophyte like endosperm
(c) future saporophyte like embryo
(d) all of the above

J&K CET-2002

Ans. (d) : Seed of pinus is perisperm diploid (2n). The wing of seed is thin, membranous diploid (2n) and develops jointly from the basal upper surface (adaxial) of ovuliferous scale and outer layer of integument of the ovule. Seed shows the three generation-parent sporophyte, gametophyte & future sporophyte. Seed is a matured ovule. The matured ovule consists of a seed coat, megagametophyte & embryo.

474. Largest ovule in plant kingdom are found in
(a) Pinus (b) Cycas
(c) Thuja (d) Gnetum

BHU PMT (Mains)-2010
AIPMT-1998

Ans. (b) : The ovule is the structure in a plant that develop into a seed. Largest ovule in plant kingdom is found in cycas. Female cone consists of megasporophylls. Each megasporophyll bears 2-12 reddish ovules in the middle fertile part. Ovules of cycas are 6-7 cm. in diameter and it is considered as largest ovule.
• Pinus is genus belonging to the family pinaceae. They are generally conifer tree or shrubs.

@apna_pdf

475. Mycorrhiza exhibits the phenomenon of :
(a) antagonism (b) endemism
(c) parasitism (d) symbiosis

BVP-2002

Ans. (d) : The mycorrhiza is a symbiotic relationship that exhibits the phenomenon of mutualism or symbiosis. Symbiosis is a relationship or interaction between two or more species that share a common habitat.

476. Conifers are adapted to tolerate extreme environmental conditions because of
(a) broad hardy leaves
(b) superficial stomata
(c) thick cuticle
(d) the presence of vessels

NEET-2016 Phase-II

Ans. (c) : Conifers (Gymnosperms) are adapted to tolerate extreme environmental condition because of thick cuticle, sunken stomata and needle like leaves.
Thus, these leaves are well adapted to withstand the harsh and cold climate. They have sunken stomata to preserve water loss during physiological drought conditions.

477. In which of the following gametophyte is not independent free living?
(a) Marchantia (b) Pteris
(c) Pinus (d) Funaria

AIPMT-2015

Ans. (c) : The existence of male and female gametophytes is not independent and free-living in gymnosperms (pinus). They remains within the sporangia retained on the sporophytes. The pollen grain is released from the microsporangium. They are carried in air currents and come in contact with the opening of the ovules born on megasporophylls. The pollen tube carrying the male gametes grows towards archegonia in the ovules and discharge their contents near the mouth of the archegonia.

478. Top-shaped multiciliate male gametes and the mature seed which bears only one embryo with two cotyledons, are characteristic features of –
(a) Gamopetalous angiosperms
(b) Conifers
(c) Polypetalous angiosperms
(d) Cycas

AIPMT-2005

Ans. (d) : Cycas is an evergreen palm like plant. It belongs to order cycadales of gymnosperm, having largest top shaped multiciliate male gamete.
- Conifers have sperm that do not have flagella, but instead are conveyed to the egg via a pollen tube.
- It is important to note that the seeds of gymnosperm are not enclosed in their final state upon the cone.

479. In Pinus/gymnosperms, the haploid structure are
(a) megaspore, endosperm and embryo
(b) megaspore, pollen grain and endosperm
(c) megaspore, integument and root
(d) pollen grain, leaf and root

AIPMT-1989

Ans. (b) : Endosperms is produced before fertilization and hence it is haploid. The structure that are haploid in pinus are megaspore pollen grain and endosperm.

480. In Pinus, the pollen grain has 6 chromosomes then in its endosperm will have
(a) 12 (b) 18
(c) 6 (d) 24

AIPMT-1992

Ans. (c) : In pinus, if the pollen grain has 6 chromosome then its endosperm will also have 6 chromosome as endosperm and pollen grains are haploid structure. The gymnosperm pollen grain consist of four cell the tube cell the generative cells and two prothallial cell.

481. Though Cycas has 2 cotyledons, this is not included in dicot because
(a) naked ovule
(b) they have megaspore
(c) appears as palm tree
(d) has compound leaves

JIPMER-2005 / Haryana PMT-2005
BHU PMT-2003

Ans. (a) : Though cycas has 2 cotyledons but is not included in dicot because it has naked ovule. As cycas are not covered by ovary, so, they do not bear fruits. It produces largest ovules. The ovules are orthotropous and unitegmic.

482. In which of the following groups are seeds presents?
(a) Psilophyta (b) Ginkgopsida
(c) Lycopodiophyta (d) Bryophyta

AIIMS-2011

Ans. (b) : Ginkgopsida belongs to gymnosperms. In the gymnosperms seeds are formed but pteridophytes have sporophytic plants body, no seed formation.
- The pteridophytes are classified into four classes: Psilopsida (Psilotum), Lycopsida (Selaginella, Lycopodium), Sphenopsida (Equisetum) and pteropsida (Dryopteris, Pteris, Adiantum).
- Bryophyta includes embryophytes like mosses, hornworts and liver worts.

483. Select one of the following pairs of important features distinguishing Gnetum is from Cycas and Pinus and showing affinities with angiosperms.
(a) Perianth and two integuments.
(b) Embryo development and apical meristem.
(c) Absence of resin duct and leaf venation.
(d) Presence of vessel elements and absence of archegonia

AIIMS-2008

Ans. (d) : Gnetum is a genus of gymnosperms, the sole genus in the family Gnetaceae and order Gnetales.
- They are tropical ever green trees, shrubs and lianas, unlike other gymnosperms they possess vessel elements in the xylem.
- Gnetum has no archegonia, some free nuclei present as eggs but vessles are present. The female gametophyte initially is partially developed and developed fully after fertilization.
- The presence of short apices is the characteristic of Gnetum which is also found is angiosperms.
- The ovules of the Gnetum are also enclosed.

484. Cycas is classified as a gymnosperms due to its
(a) Motile sperms (b) Fruit formation
(c) Naked ovule (d) Phycnoxylic wood

AIIMS-2014

@apna_pdf

Ans. (c) : Cycas is classified as a gymnosperms. In this plant ovules are not enclosed by any ovary wall (naked ovule) and remain exposed, both before and after fertilization.

- Most of the seed plants have pollen, which contain and transports the sperm to fertilize the egg.
- As pollen is resistant to desiccation, the sperm can be transported between plants across large distances without drying up.
- The gymnosperms (naked seed plants) consists of four phyla: conifers, cycads, gingkoes and gnetophytes.
  Cycads produce pollen, but the sperm still swims down the pollen tube using flagella. As it also has a naked seed, it is classified as gymnosperm.

485. Megasporophyll of *Cycas* has the same nature as

(a) Stamen (b) Petal
(c) Sepal (d) Carpel.

AIIMS-2002

Ans. (d) : Megasporophyll of cycas is equivalent to carpel. In cycas megasporophyll are borne on female plant and they produce ovule. Carpel is also a female reproductive organ of flowering plant.

486. Sperm of Cycas is:

(a) multiflagellated and very large
(b) small and biflagellated
(c) multiflagellated and small
(d) large and biflagellated

JCECE-2006

Ans. (a) : Cycas has dominant diploid sporophyte phase in its life cycle. The male gametes (spermatozoids) of cycas & ginkgo are unique among all seeds plants. It is multiflagellate and very large. In cycas revoluta the size of the sperm ranges between 180-210 μm and clearly visible to the naked eye.

487. In Cycas, diploxylic condition is found in–

(a) stem (b) root
(c) coralloid root (d) leaflet

Uttarakhand PMT-2010

Ans. (d) : Leaflet of Cycas is diploxylic i.e., two type of xylem are present such as centripetal xylem which is exarch and centrifugal xylem which is endarch.

488. The gymnospermic endosperm differs from an angiospermic endosperm because in gymnosperms it is

(a) Haploid and developed from female gametophyte
(b) Diploid and developed from female gametophyte
(c) Triploid and developed after fertilization
(d) Triploid and developed before fertilization

MHT CET-2015

Ans. (a) : Gymnospermic endosperm differs from angiospermic endosperm because the endosperm in gymnosperm is haploid and developed from female gametophyte but in angiosperms it is post fertilization tissue and is generally triploid in nature.

489. Seeds of Pinus have:

(a) two cotyledons (b) three cotyledons
(c) many cotyledons (d) one cotyledons

JIPMER-1996

Ans. (c) : Pinus is Gymnospermic plant. It is include medium sized tree or tall tree and shrub. The mature seeds of Pinus is composed of hard testa, thin tegmen, endosperm, embryo and caplike perisperm. The embryo indudes a short-axis bearing ten cotyledons. Thus, Pinus has many cotyledons.

490. In Pinus, male and female reproductive structures occur?

(a) On different branches of the same plant
(b) On different plants
(c) On same branch
(d) None of the above

CG PMT-2005

Ans. (a) : Pinus is a monoecious plant with male & female cones on the same tree. But the male and female reproductive structures occurs on various branches of the same plant. The female cones are typically larger on a pinus tree. They are situated at the top of the tree branches. The male cone on the lower branches are smaller in size.

491. Transfusion tissue for lateral conduction of water and food are found in

(a) roots of gymnosperms
(b) stem of gymnosperms
(c) leaves of gymnosperms
(d) leaves of angiosperms
(e) None of the above

CMC Vellore-2015

Ans. (c) : Transfusion tissue or hydrostereom for conduction of water and food are found in leaves or leaflets of pinus and cycas. It is the tissue that is found characteristically around the vascular bundles of gymnosperm leaves consisting of parenchyma, lignified and non-lignified tracheids with bordered pits.

- The root system present in the gymnosperm is the taproot system. In some plants coralloid roots are found.
- The stem of gymnosperms can be branched or unbranched
- Angiosperm leaves typically have a blade or lamina, a flattened part with high chloroplast concentration.

492. Inverted omega-shaped vascular bundles are found in

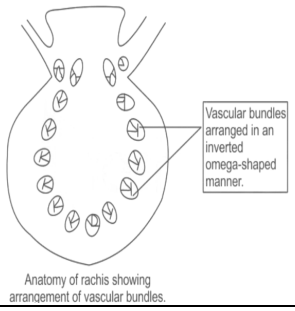
(a) rachis of Cycas (b) leaflet of Cycas
(c) roots of Cycas (d) old stew of Cycas
(e) None of the above

CMC Vellore-2015

Ans. (a) : Inverted omega shaped vascular bundles are found in rachis of cycas. The rachis is mostly found in compounds leaves where many leaves are attached to this single large structures which forms the main axis for the joining of leaves.

- In cycas leaflet, vascular bundle are conjoint, collateral and open.
- In young roots, the arrangement of vascular bundles in radial which means xylem and phloem are present on different radii.
- In stems of cycas the vascular bundles are arranged in the form of rings in the stem.

@apna_pdf



Anatomy of rachis showing arrangement of vascular bundles.

493. Wood of Cycas is:
(a) pycnoxylic only
(b) polyxylic only
(c) manoxylic and polyxylic
(d) none of the above

Punjab MET-2006
DUMET-2004

Ans. (c) : Secondary wood in cycas is manoxylic wood. It is a non-compact wood with large amount of parenchyma large pith and cortex mixed with xylem tracheids. It lacks vessels and is not used commercially as it is not durable.

• Pycnoxylic wood is a compact strong wood with large no. of xylem tracheids or wood and a small amount of cortex and pith with little parenchyma.

• Polyxylic wood is a dense wood with a high amount of secondary xylem.

494. Which of the following gymnosperm has the presence of vessel?
(a) Pinus (b) Ephedra
(c) Cycas (d) None of these

DUMET-2004

Ans. (b) : Ephedra belongs to gnetophyta which are the only gymnosperm, which possesses vessels or xylem vessels. Xylem vessels are the long tube like compositions which assist in the conduction of water. Ephedra is low climbing desert shrubs. The stems are green and photosynthetic leaves are opposite or whorled. The plants are mostly dioecious.

495. Cycas circinalis is a source of:
(a) Resin (b) Timber
(c) Essential oil (d) Starch

DUMET-2003

Ans. (d) : Cycas circinalis is an evergreen shrub growing upto 3.5 m at a slow rate. It is a gymnosperm. The pith is rich in carbohydrate and a sago i.e., starch can be made from it. It is also known as queen sago. The seeds of cycas circinalis is poisonous.

Resin:- Resin is a natural or synthetic compound consisting of a non-crystalline or viscous liquid substance.

Timber:- Timber refers to wood used for building materials. Timber can also be referred as wood at different stages of processing.

• An essential oil is a concentrated hydrophobic liquid containing volatile chemical compounds from plants.

496. Which of the following statement is correct regarding Cycas?
(a) Single sporophyll bears male and female sex organs
(b) Single cone bears male and female sporophylls
(c) Male and female sex organs are present on same plant
(d) Male cone and megasporophylls occur on separate plants

Manipal-2001

Ans. (d) : Cycas belongs to the order cycadales of Gymnosperms, having male cone and megasporophylls on separate plants. Cycas is dioecious i.e., male cone and female cone are borne on separate plants. Each microsporophyll of male cone bears many microsporangia in its adaxial surface. The female cone has loosely arranged megasporophylls which bears ovule in the middle part.

497. In Pinus :
(a) seed is winged but-pollen grains are not
(b) both seed and pollen grains are wingless
(c) pollen grains are winged but seed is not
(d) both seeds and pollen grains are winged

J&K CET-2001

Ans. (d) : In pinus both seeds and pollen grains are winged. In pinus, some of the surface tissue of the ovuliferous scale remains attached to the seed, forming a membranous wing. Winged seeds are believed to promote the long-distance dispersal through air. The pollen are designed to enable the grains to travel long distance in the air.

498. Which of the following characteristics does not occur in Pinus?
(a) The number of needles in a spur of Pinus roxburghii is three
(b) Each vascular bundle in the long shoot of Pinus consists of xylem facing towards the centre of the shoot
(c) Microsporophyll of Pinus bears two microsporangia
(d) Pinus is a homosporous gymnosperm

J&K CET-2003

Ans. (d) : Pinus is a heterosporous gymnosperm and not homosporous. Heterosporous refers to the presence of the types of spores on the same plant. Megaspore and microspore on the other hand homospore generates identical cells.

• Vascular bundles in pinus is collateral, endarch and open.

499. Which one of the following is a gymnosperm
(a) Mango (b) Walnut
(c) Funaria (d) Chilgoza

Rajasthan PMT-2003

Ans. (d) : Chilgoza or pinus gerardiana is a tall tree belonging to division gymnosperm. It is a tall tree with usually deep, wide and open crowns, with long, erect branches. The leaves are needle like, in groups, of three and spread stiffly. The seeds are broads, with a thin shell and a rudimentary wing.

500. Megasporophyll of Cycas is equivalent to
(a) stamen (b) sepal
(c) petal (d) carpel

Rajasthan PMT-2003

@apna_pdf

Ans. (d) : Megasporophyll is gynoecium. Megasporophyll has an ovary, stigma, and style. Ovules in gymnosperms are not contained in an ovary; instead, they are exposed on megasporophyll, which resemble large leaves.
Carpeles are thought to be phylogenetically derived from ovule- bearing leaves or leaf homologous (megasporophylls), which evolved to form a closed structure containing the ovules.

501. Cycas contains
(a) resin canal
(b) mucilagenous canal
(c) lactiferous canal
(d) none of the above

Rajasthan PMT-2001

Ans. (b) : The plant genus cycas is a member of the cycadaceae family. The body of these plants is divided into roots, stems and leaves. The pith is situated in the centre of the stem and shows the presence of irregularly scattered mucilage ducts. The mucilage is made of monosaccharides.

502. Mycorrhiza is found in
(a) oligotrophic soil (b) eutrophic soil
(c) both [a] and [b] (d) none of the above

DUMET-2007

Ans. (a) : In oligotrophic soil the availability of nutrient is very low. This type of soil found in tropical forest. A major adaptation of tropical plants is present of mycorrhizae.

503. Conifers differ from grasses in the
(a) production of seeds from ovules
(b) lack of xylem tracheids
(c) absence of pollen tubes
(d) formation of endosperm before fertilization

JCECE-2013

Ans. (d) : In the development of endosperm before to fertilization, conifers vary from grasses of all the seed plants, conifers are most rudimentary. A seed is made up of 2 parts: an endosperm that feeds the embryo and the embryo itself, which also receives nutrition from the endosperm.
In gymnosperms, the endosperm grows from a spore. Pollination may occur when cone is small, but the endosperm continuous to grow to completion before fertilization occurs. When fully grown the endosperm develops archegonia in which single large nuclei acts as egg cell.

504. Which one of the following gymnosperms shows the complete absence of archegonia in this ovules?
(a) Cycas (b) Ephedra
(c) Gnetum (d) Ginfego

BVP-2006

Ans. (c) : Gnetum belongs to the order gnetales of gymnosperms. They have vessel elements in the xylem. The leaves of the Gnetum shows reticulate venation which is the character found in the angiosperms. Gnetum has no archagonia.

505. If Gnetum is not a flowering plant, it may be mistaken for a:
(a) tree fem (b) monocot plant
(c) dicot plant (d) none of these

BVP-2006

Ans. (c) : Gnetum is easily mistaken for a dicot plant unless it is in flowering or fruiting stage. The plant body is differentiated into roots, stem and leaves. Gnetum resembles very much in its characteristics to an angiosperm than a gymnosperm.
- **Tree ferns** are a large group of ferns with tree-like forms.
- **Monocots** are grasses & grass like flowering plants, the seeds of which typically contain only one embryonic leaf or cotyledon.

506. Coralloid root is the feature of:
(a) Cycas (b) Mosses
(c) Pinus (d) Selaginella

BHU PMT (Screening)-2005

Ans. (a) : Corolloid roots are specialized roots present in cycas. They are associated with nitrogen-fixing cyanobacteria. These roots are produced in clusters at the base of the stem and protrudes out over the ground.

507. Pollen tube of Cycas acts (1) as an agent for carrying male gamete to the egg (2) as a haustorium (3) as endosperm (4) as female cone
(a) 1,2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (b) : The Pollen tube of cycas acts as a haustorium as it absorbs food materials from the nucleus and also acts as a sperm carrier. A Pollen tube is a tubular structure produced by the male gametophyte of seed plants when it germinates. Pollen tubes were first discovered by Geovanni Battista Amici in the 19th century.

508. Very delayed fertilization occurs in
(a) angiosperms (b) cycas and pinus
(c) spermatophytes (d) All of these

BVP-2011

Ans. (b) : Cycas & Pinus are example of gymnosperms, which are group of seed-bearing plants that do not produce flowers. Gymnosperms typically have reproductive structures called cones. In case of cycads, Male cones produce pollen and female cones produce ovules. In gymnosperms, including cycads and Pinus, fertilization is considered to be "very delayed" because there is a significant time gap between the pollination and fertilization process.

509. In gymnosperms, the pollen chamber represents
(a) a cell in the pollen grain in which the sperms are formed
(b) a cavity in the ovule in which pollen grains are stored after pollination
(c) an opening in the megagametophyte through which the pollen tube approaches the egg
(d) the microsporangium in which pollen grains develop

JIPMER-2011

@apna_pdf

Ans. (b) : In gymnospermes, the pollen chamber is cavity in the ovule in which pollen grains are stored after pollination within the pollen chamber. Pollen grain is first cell of gametophyte. Each pollen grain device asymmetrically into 2 cells - smaller prothallial cell and larger anthridial cell. Prothallial cell do not divide further. Anthridial cell divide to form generative cell and tube cell.

510. Sago which we use as food comes from this plant

(a) Calamus rotang (b) Metroxylon rumphii
(c) Areca catechu (d) Phoenix dactylifera

Punjab MET-2011

Ans. (b) : Sago is mainly extracted from *Metroxylon rumphii* which is also called sago palm. Sago is a starch extracted from the pith or spongy core tissue of various tropical palm stems. It is a major staple food for the lowland people of New Guinea & the Maluku island.

511. Which one is the hardest wood ?

(a) *Shorea robusta* (b) *Tectona grandis*
(c) *Cedrus deodara* (d) *Dalbergia sissoo*

Punjab MET-2011

Ans. (a) : *Shorea robusta* also called "Sal" is one of the most important sources of hardwood timber in India, with hard, coarse-grained wood that is light in colour when freshly cut & becoming dark brown with exposure. Sal trees are found in Burma, Assam, Bengal, Nepal, the Deccan plateau and foothills of Shivalik.

512. Which of the following is/are grouped under phanerogams?

(a) Angiosperms (b) Gymnosperms
(c) Pteridophytes (d) Both (a) and (b)

Rajasthan PMT-2008
BHU-PMT (Screening)-2008

Ans. (d) : Gymnosperms and angiosperms are the two types of phanerogams, depending on whether the seeds are enclosed in a fruit or not. Phanerogams are vascular plants with separate leaf, stem and root systems. These plants have well differentiated reproductive tissues.

- A pteridophyte is a vascular plant that disperses spores. They are sometimes referred to as "cryptogams" because they produce neither flowers nor seeds.

513. Water is not necessary for the fertilization of :

(a) algae (b) bryophyta
(c) Cycas (d) none of these

MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (c) : Cycas is a gymnospermic plant. Gymnosperms don't require water for fertilization because these are terrestrial plants. The movement of pollen grains from male reproductive part to the female reproductive part (ovules) mainly occurs by the air or with the help of biotic pollinators.

514. The coralloid root of Cycas has Anabaena (BGA), this type of association is called

(a) commensalism (b) parasitic
(c) symbiotic (d) antibiosis

UP CPMT-2012

Ans. (c) : The coralloid roots of Cycas has Anabaena, this type of association is called symbiotic relationship. In symbiosis, both the organisms in association is obligatory. The blue-green algae Anabaena reside in coralloid roots of Cycas for nitrogen fixation.

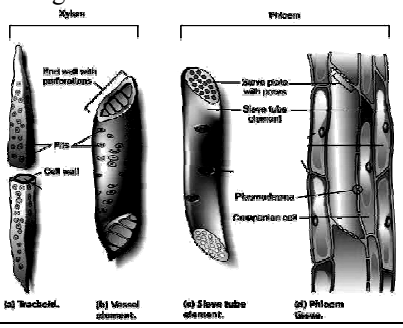
515. The chief water conducting elements of xylem in gymnosperms are :

(a) Vessels (b) Fibres
(c) Transfusion (d) Tracheids

AIPMT (Screening)-2010

Ans. (d) : In Gymnosperm water conduction occurs mainly through tracheids.

- Gymnosperm is non flowering seed bearing plants. Vascular bundles are present in the gymnosperms but vessels are absent in the xylem and the phloem lacks the companion cell. Thus water conduction occurs mainly through tracheids.



516. Which one of the following plants is monoecious?

(a) Papaya (b) Marchantia
(c) Pinus (d) Cycas

AIPMT (Mains)-2010 / AIPMT-2009

Ans. (c) : The term monoecious refers to plants that bears unisexual reproductive organs on the same plant. This feature can be found in Pinus. Plants that have reproductive organs, both female and male, or flowers called monoecious plants. These male and female sections are situated at various plant location.

517. In which one of the following, the male and female gametophytes don't have free-living independent existence?

(a) Pteris (b) Funaria
(c) Polytrichum (d) Cedrus

JIPMER-2012
AIPMT-2008

Ans. (d) : Cedrus belongs to the phylum gymnosperm. In this plant male and female gametophyte do not have an independent free living existence. Male gametophyte remain inside the microsporangium and female gametophyte remain inside the mega sporangium

518. Plant group with largest ovule, largest tree and largest gametes:

(a) Gymnosperm (b) Angiosperm
(c) Bryophyta (d) Pteridophyta

AIPMT-2000

Ans. (a) : Gymnosperms is that plant group which is characterized by naked seed bearing vascular plants. In this group Cycas have largest ovule and largest antherozoite. Sequoia is the largest plant of plant kingdom which belongs to Gymnosperms

@apna_pdf

519. Gymnosperms are also called soft wood spermatophytes because they lack:
(a) Thick-walled tracheids
(b) Xylem fibres
(c) Cambium
(d) Phloem fibres

AIPMT (Screening)-2012

Ans. (b) : Gymnosperm are also called softwood spermatophytes because they lack Xylem fiber and thick walled tracheids. In Gymnosperm large amount of parenchymatous cells are present with secondary xylem tracheids.

520. Cycas and Adiatum resemble each other in having:-
(a) Cambium (b) Vessels
(c) Seeds (d) Motile sperms

AIPMT (Screening)-2012

Ans. (d) : Cycas and Adiatum both a have muticilliated motile sperm.
- Adiatum also known as walking fern or maiden hair fern is a pteridophyte resembles with cycas.
- Nacked seed, cambium is usual in gymnosperms and lack in pteridophyte
- True vessels are lacking in both gymnosperm and pteridophytes. Adiatum known as a single hair fern
- Cycas plants are dioecious belong from family cycadaceae.

521. What is common in all the three, *Funaria, Dryopteris* and *Gingko?*
(a) Independent sporophyte
(b) Presence of archegonia
(c) Well developed vascular tissues
(d) Independent gametophyte

NEET (Karnataka)-2013

Ans. (b) : In Funaria, Dryopteris and Gingko all have the presence of archegonia i.e. female sex organ is common, and differences are seen in Dryopteris which lacks vascular bundle and have independent sporophyte while Gingko have independent gametophyte.

522. Which statement is wrong for *Cycas* :
(a) Xylem have vessels
(b) Female flowers well developed
(c) It has coralloid roots
(d) Circinate ptyxis

AIPMT-1998

Ans. (a) : Cycas belongs to the family cycadaceae like other gymnosperms, have xylem and phloem along with true leaves, stem and roots. The vessels are absent in the xylem tissue of cycas. So, xylem have vessels is a wrong statement for cycas.

523. Cycas have two cotyledons but not included in angiosperms becuase of : -
(a) Naked ovules (b) Seems like monocot
(c) Circinate ptyxis (d) Compound leaves

AIPMT-2001

Ans. (a) : Cycas possesses naked seed (i.e. seed is not enclosed inside fruit). Cycas belongs to the order cycadaly of gymnosperm. In cyas there is no double fertilization, so the endosperm produced is haploid rather than triploid. So, it is not included in angiosperms as they have ovules (or seeds) produced 46 inside fruit. This is the main difference between gymnosperms and angiosperm.

524. The gametophyte is not an independent, free living generation in :
(a) Pinus (b) Polytrichum
(c) Adiantum (d) Marchantia

AIPMT (Screening)-2011

Ans. (a) : In Gymnosperms (like pinus), the main plant body is sporophyte. Sporophytic generation (diploid) is dominant & independent. It greatly exceeds the reduced and dependent gametophyte generation (haploid).
- Pinus have needle - shaped leaf that remain on the trees throughout the whole year (evergreen plants). Pinus is a monoecious plant, which means that one plant produces individual male and female cones.

Note:-
- Adiantum belong to the group ferns
- Marchantia is a member of the group liverworts.
- Polytrichum is a member of the group moss.

525. A prokaryotic autotrophic nitrogen fixing symbiont is found in
(a) Pisum (b) Alnus
(c) Cycas (d) Cicer

AIPMT (Screening)-2011

Ans. (c) : Symbiont means two organism living together. In case of cycas plant have a special type of root known as coralloid root.
• Coralloid roots are formed soon after the primary root. Function of this root is N_2 fixation because of presence of cyanobacteria (a member of blue green algae).

526. False statement related to Cycas is
(a) Motile male gametes and pollen tubes are involved in fertilization
(b) Endosperm formation occurs before fertilization
(c) Ovule contains pollen chamber.
(d) Gametophytic tissue is not found in seeds

AP EAMCET-2010

Ans. (d) : Gametophytic tissue (endosperms) is found in Cycas Seed.
Cycas are dioecious plants with separate male and female plant and fertilization is effected by motile male gametes so called **Zooidogamous reproduction**.
The endosperm in cycas is a haploid gametophytic tissue formed before fertilization. Cycas ovule contains pollen chamber in which pollen grains are stored after pollination.

527. Read the following lists

List-I		List-II	
A.	Exarch	1.	Rhizome of Pteris
B.	Endarch	2.	Roots of Pteris
C.	Mesarch	3.	Pinnule of Cycas
D.	Pseudomesarch	4.	Primary stem of Pteris

The correct match is

	A	B	C	D
(a)	1	3	4	2
(b)	2	4	3	1
(c)	2	4	1	3
(d)	3	2	1	4

AP EAMCET-2008

@apna_pdf

Ans. (c) :
• Stele present in roots of pteris is protostele with diarch and exarch xylem.
• Primary stem of pteris contain endarch xylem.
• Mesarch type of xylem is found in rhizome of pteris (in ferns).
• Pseudomesarch is found in primary stem of pteris.

528. Choose the correct statement:
(a) Apophysis is the basal fertile part of the capsule in Funaria.
(b) Apophysis is the apical sterile part of the microsporophyll in Cycas.
(c) Apospory is the development of sporophyte from vegetative cells of the gametophyte.
(d) Apogamy is the development of gametrophyte from the vegetative cells of the sporophyte.

AP EAMCET-2005

Ans. (b) : Apophysis is the apical sterile portion of the microsporophyll in Cycas. Apospory is the formation of gametophyte directly from sporophyte. Apogamy is the formation of sporophyte directly from gametophyte.
Apophysis present in the microsporophyll of cycas. It is a wedge-shaped and dorsoventrally flattened structure. The basal part of the apophysis is sterile. The middle part is fertile and the apical part is a sterile region. The terminal part which has an expanded sterile tapering portion is called the **apophysis**.

529. Select one of the following pairs of important features distinguishing *Gnetum* from *Cycas* and *Pinus* and showing affinities with angiosperms:
(a) perianth and two integuments
(b) embryo development and apical meristem
(c) absensce of resin duct and leaf venation
(d) presence of vessel elements and absence of archegonia

AIPMT-2008

Ans. (d) : Gymnosperms are seed plants that do not produce flowers. Cycas, Pinus and Gnetum all belong to his group of plants, Gnetum with its 30 species belong to a very dissimilar genera of the family Gnetales. The important features distinguishing Gnetum from cycas and pinus and showing affinities with angiosperms are the presence of vessel elements and absence of archegonia.

530. In gymnosperms, the pollen chamber represents:
(a) The microsporangium in which pollen grains develop
(b) A cell in the pollen grain in which the sperms are formed
(c) A cavity in the ovule in which pollen grains are stored after pollination
(d) An opening in the megagametophyte through which the pollen tube approaches the egg

AIPMT-2007

Ans. (c) : The pollen chamber in gymnosperm is a cavity in the ovule in which pollen grains are deposited after pollination. The generative cell nucleus splits into 2 gametic nuclei inside the pollen chamber, and the cell lengthens to form the pollen tube.

531. In Cycas, pollination takes place in
(a) 3 celled stage (b) 4 celled stage
(c) 2 celled stage (d) 1 celled stage

JIPMER-2009

Ans. (a) : In cycas, pollination takes place in 3 celled stage. The pollination drop is dehydrated and the pollen grains are sucked in to the pollen chamber. The producing cell nucleus separates into two gametic nuclei within the pollen chamber and the tube cell becomes elongated to produce the pollen tube. The gametic nuclei can pass via the female gametophyte's is pollen tube. A zygote is formed when one unites with the female gamete.

532. Which economically important product is obtained from Cycas circinalis?
(a) Timber (b) Sago
(c) Essential oil (d) Resin

UP CPMT-2005

Ans. (b): Cycas cricinalis, commonly known as the Queen sago palm or Queen cycad, is a species of cycad native to India, Sir Lanka and several other countries in Southeast Asia. Sago is made from the pitch of cycas circinalis.

533. What is the ratio of mitotic divisions that take place in the microspore of Cycas before and after liberation from the microsporangium during the development of male gametophyte?
(a) 1 : 2 (b) 2 : 1
(c) 3 : 2 (d) 1 : 1

AP EAMCET-2013

Ans. (d): The ratio of mitotic division is 1:1 that take place in the microspore of Cycas before and after liberation from the microsporangium during the development of male gametophyte. After pollination the microspore or pollen grain produces stalk cell and body cell. The body cell then undergoes mitotic division to produce sperm in the ratio of 1:1.

534. The secondary xylem of Cycas is
(a) Manoxylic
(b) Manoxylic with large amount of parenchymatous cells
(c) Pycnoxylic and monoxylic
(d) Pycnoxylic with bordered pits

UP CPMT-2014

Ans. (b): The secondary xylem is also called as wood. It is manoxylic with large amount of parenchyma ions cells in Cycas. Wood of pinus is Pycnoxylic and used in furniture.

535. A gymnosperm, popularly known as sagopalm, possess two cotyledons, but is not classified as dicotyledons why?
(a) Due to production of largest multiciliate. mononucleate sperm
(b) Pollination takes place by wind
(c) Pollen grain are shed at 3-celled stage
(d) Due to open and exposed ovules on megasporophyll

UP CPMT-2014

@apna_pdf

Ans. (d): Cycas is popularly known as sagopalm, and possess two cotyledons. It is member of order cycadales of division gymnosperm.

- The later are characterized by presence of exposed ovules an megasponphyll, i.e., naked seed, therefore, Cycas is not include in dicotyledons.

536. The type of pollination in Cycas is

(a) entomophily (b) hydrophily
(c) anemophily (d) malacophily

UP CPMT-2011
VMMC-2010

Ans. (c): In cycas, the 3-celled microspore is shed off in the air after the dehiscence of the sporangium. They are very light-weight and are carried by air current (anemophily).

Entomophily- Entomophily or insect pollination is a form of pollination where by pollen of plant especially but not only of flowering plant is distributed by insect.

Hydrophily- Pollination of flowering plant by water is known as **hydrophiliy. E.g. - Valisenaria and zoostera**.

Malacophily- Pollination of flower by slugs and snails is called **malacophily. E.g. - Lemna**.

537. Match items in column-I with those in column-II

Column-I	Column-II
A. Peritrichous flagellation	1. Ginkgo
B. Living Fossil	2. Macrocystes
C. Rhizophore	3. Escherichia coli
D. Smallest flowering plant	4. Selaginella
E. Largest perennial alga	5. Wolffia

Select the correct answer from the following

	A	B	C	D	E
(a)	2	1	3	4	5
(b)	5	3	2	5	1
(c)	1	2	5	3	2
(d)	3	1	4	5	2

VMMC-2011
JIPMER-2007

Ans. (d) :

A. Peritrichous flagellation	3. Escherichia coli
B. Living fossil	1. Ginkgo
C. Rhizophore	4. Selaginella
D. Smallest flowering plant	5. Wolffia
E. Largest perennial alga	2. Macrocystes

538. Which of the following two characters are shared by Cycas and Pteris? Choose correct option from codes given below.

I. Formation of motile gametes.
II. Formation of haploid endosperm.
III. Formation of sporophyte directly from gametophyte without gametic union.
IV. Formation of archegonia in female gametophyte.

(a) I and IV (b) I and III
(c) II and IV (d) III and IV

BVP-2013

Ans. (a) : In cycas and pteris which belong to Gymnosperm and pteridophytes, the sperms are multiflagellate in nature, hence the male gametes are motile in nature and the female gametophyte contains archegonium.

539. Both heterospory and circinate ptyxis occur in

(a) Dryopteris (b) Pinus
(c) Cycas (d) Funaria

Punjab MET-2009
Rajasthan PMT-2009
Manipal-2003

Ans. (c) : Cycas and Pinus both are heterosporous plants because they produce two types of spores megaspores and microspores. But, circinate ptyxis is present in Cycas only. In circinate ptyxis, the leaf in a young stage coils in a special manner.

540. Number of archegonia in Cycas is

(a) 8 (b) 4
(c) 1 (d) 2

JCECE-2008
UP CPMT-2007

Ans. (b) : In Cycas, the archegonia are formed from the gametophytic cells lining the archegonial chamber. The number of archegonia formed in a gametophyte is variable, e.g, 3-8 in Cycas revoluta, 3-6 in Cycas rumphi and 3-8 in Cycas circinalis.

541. Pinus seed is originated in :

(a) capsule (b) microsporophyll
(c) microsporangia (d) megasporophyll

MGIMS Wardha-2003

Ans. (d) : Mesasporophylls present in the middle of the strobilus are very large and they decrease in size towards the base and apes. The seed is the result of fertilization and consequent of enlargement of the ovule. Two ovule or megasporangium are present on the adaxial side of ovuliferous scale. The scales and bracts constitute the megasporophyll. There are about 80-90 megasporophylls in a single female cone of Pinus.

542. In Cycas coralloid roots has

(a) Clostridium (b) Rhizobium
(c) Mycorrhiza (d) Anabaena

Punjab MET-1999

Ans. (d) : The symbiotic association exists between coralloid roots of cycas and cells of Anabaena (a blue-green alga). These coralloid roots are produced in the cluster at the base of the stem which because of its apogeotropic growth produce out over the ground. It is dichotomously branched and is in symbiosis with Anabaena allowing nitrogen fixation.

543. No vessels are found in the wood of

(a) Pine (b) Eucalyptus
(c) Teak (d) Shesham

AMU-2015

Ans. (a) : Vessel form the primary component of xylem and they are dead cell at maturity. The secondary xylem without vessels is called non-porous wood. It is found in the wood of gymnosperms. For example, Pine in which no vessels are found in the wood.

@apna_pdf

544. Mycorrhizal association is must for growth of
(a) Mushrooms (b) Orchids
(c) Sal and teak (d) None of these
BCECE-2011

Ans. (b) : Mycorrhiza is the product of a symbiotic association between fungi and plants. The seedling of orchids fail to grow longer unless they develop mycorrhizal association. Hence, orchids are usually propagated by vegetative means rather than by seeds.

545. Mycorrhiza acts as:
(a) root
(b) mechanical support
(c) root hairs with an advanced absorption capacity
(d) an organism
BHU PMT-2002

Ans. (c) : The mycorrhiza is the symbiotic relationship between plants and fungi of its host plant. A hair-like outgrowth of a plant root, which absorbs water and minerals from the soil. The root hairs are tubular extensions of the epidermis. It absorb nutrients and trans-located them back to the host plant.

546. Mycorrhiza is :
(a) association of root and bacteria
(b) association of root and fungi
(c) association of root and algae
(d) parasitic root
BHU PMT (Mains)-2005 / AMU-1998

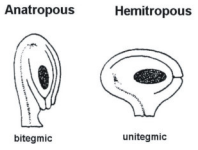
Ans. (b) : Mycorrhiza is a mutualistic interaction in which a fungus and a root involved. For eg. Boletus (fungus) and Pinus (root). The root provides food and shetter to the fungus. The fungus helps the plant in solubilization and absorption of minerals, water uptake and protection against pathogenic fungi.

547. In which of the following excurrent stem found?
(a) Cycas (b) Pinus
(c) Mango (d) Wheat
BHU PMT (Mains)-2011

Ans. (b) : An excurrent stem found in the plant Pinus. The side branch grows in an acropetal manner in which old flowers are arranged in the lower side and young flowers are at the upper side. A tree takes a pyramidal form due to development of racemose branching, it is excurrent e.g. pinus.

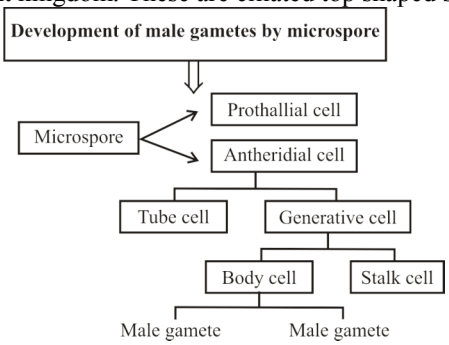
548. In gymnosperms, the ovules are
(a) Naked unitegmic
(b) covered multitegmic
(c) Bitegmic
(d) Covered unitegmic
BHU PMT (Mains)-2011

Ans. (a) : Unitegmic is the most advanced condition. It is usually seen that the less number of integuments present in the ovule, the more advanced integuments in its properties and function. An integument is a protective layer that surrounds the ovule of the plant. There are four types of integuments on the basis of the number of layers present in it. Unitgmic, Bitegmic, Tritegmic, Ategmic.



549. In Cycas male gametes are produced in the pollen tube by division of:
(a) body cell (b) stalk cell
(c) prothallial cell (d) tube cell
BHU PMT-2001

Ans. (a) : Cycas is a Gymnosperm plant. So, in Cycas male gamete is produced in the pollen tube by division of body cell. Male gametes of Cycas are the largest in plant kingdom. These are ciliated top shaped structures.



550. Which one of the following statements is false?
(a) Stomatal movement is governed by many factors including potassium
(b) All enzymes are proteins, but all proteins are not enzymes
(c) All factors which affect respiration affect photosynthesis as well, but its reverse is not true.
(d) All following plants are characterized by seed development but all seed plants are not flowering plants
JIPMER-1998

Ans. (d) : All the angiosperms are seed bearing plants. But there are also some seed bearing plants which are not angiosperms. The seed bearing plants which have a seed cover are called angiosperms and some seed bearing plants do not have a seat cover which are called gymnosperms. The plant angiosperms are enclosed inside fruits- they have non-motile gametes. These gametes have dissmilar morphological structures.

551. Resin duct of gymnospermous stem is an example of:
(a) lysigenous cavity
(b) lysogenous cavity
(c) shizogenous cavity
(d) shizolysigenous cavity
JCECE-2005 / Punjab MET-2001,2004
Manipal-2000

Ans. (c) : The Schizogenous cavities are formed by the splitting up of common walls and the separation of masses of cells from one another. The resin ducts arise as Schizogenous intercellular spaces due to the disjoining of parenchyma cells. Resin ducts ae formed due to wounding. Examples of this schizogenous cavity or ducts of asteraceae and apiaceae, secretory cavities of eucalyptus etc.

552. Which of the following features is true for Pinus?
(a) Haploid endosperm
(b) Biciliated sperms

@apna_pdf

(c) Double fertilization
(d) Presence of antheridia

JIPMER-1997

Ans. (a) : In Pinus, endosperm is produced before ferilization and hence it is haploid. The megaspore and pollen grains are structures of male gametophytes and is also haploid. Megaspore represents the first cell of the the female gametophyte produced by reduction division from magaspore mother cell.

553. Which of the following is a characteristic feature of gymnosperms?
(a) The gymnosperms are homosporous
(b) The male and female gametophytes do not have independent free living existence
(c) The sporophyte is dependent on the gametophyte
(d) The ovules are enclosed by the ovary
(e) The pollen grain is released from the megasporangium

Kerala PMT-2015

Ans. (b) : In gymnosperms, the male and female gametophytes do not have an independent free living existence. They remain within the sporangia retained on the sporophytes i.e., female gametophyte with megasporangium and male gametophyte within microsporangium.

554. Pick out the wrong statement
(A) Apoplast is the system of adjacent cell walls that is continuous throughout the plant
(B) Endodermis is impervious to water molecules
(C) Pinus seeds germinate and establish without the presence of mycorrhizae
(a) A and B (b) B and C
(c) C only (d) B only
(e) A only

Kerala PMT-2015

Ans. (c) : The mycorrhiza is a symbiotic association of a fungus with the roots of higher plants. Some plants like Pinus have an obligate association with the mycorrhizae. The fungal filaments form a network around the young root or they penetrate the root cells. The hyphae have a very large surface area that absorb mineral ions and water from the soil from a much larger volume of soil that perphaps a root cannot do. Therefore, Pinus seeds cannot germinate and establish without the presence of mycorrhizae. The fungus provides minerals and water to the roots in turn the roots provide sugars and N-containing compound to the micorrhizae.

555. The roots of some higher plants get associated with a fungal partner. The roots provide food to the fungus while the fungus supplies water to the roots. The structure so formed is known as
(a) lichen (b) mycorrhiza
(c) anabaena (d) rhizobium

KVPY SA-2012

Ans. (b) : A mycorrhiza is a symbiotic association between roots of higher plant and a fungus. The plant makes organic molecules such as sugar by photosynthesis and supplies them to the fungus and the fungus supplies to the plant water and mineral nutrients, such as phosphorus, taken from the soil.

556. In gymnosperms, the pollen chamber represent
(a) a cell in the pollen grain in which the sperms are formed
(b) a cavity in the ovule in which pollen grain are stored after pollination
(c) an opening in the megagametophyte through which the pollen tube approaches the egg
(d) the microsporangium in which pollen grains develop

Rajasthan PMT-2010

Ans. (b) : In gymnosperms, pollen chambers are the part that is responsible for the storage of pollen grains after pollination. This is because gymnosperms do not produce fruits to cover their seeds. This is cavity at the tip of the ovule lying under the integuments. When the plant matures and these cavities swell open, releasing the pollen grains for pollination to take place. The pollen chambers present in gymnosperms represent a cavity in the ovule in which pollen grain are stored after pollination.

557. Root pressure has never been observed in
(a) Pteridophytes (b) Gymnosperms
(c) Monocotyledons (d) Dicotyledons

AMU-2011

Ans. (b) : The root pressure is the force that helps to drive fluids upward into conducting vessels i.e. xylem. Because Gymnosperms are tall plants, root pressure cannot move water up to the height of the plant. Another factor is the absence of xylem arteries in gymnosperms, which prevents root pressures. The root pressure is thus not a feasible option for tall plants like gymnosperms for the transport of fluids.

558. Ectomycorrhiza is commonly found in
(a) Pinus (b) Quercus
(c) Rhododendron (d) Both (a) and (b)

AMU -2000

Ans. (d) : Mycorrhiza is a mutually beneficial association between a fungus and the roots of higher plants. The fungus absorbs water, salts and protects the plant from soil borne pathogens. In return, it gets shelter and nourishment from the plant. It is of two type : (i) Ectomycorrhiza are very common in nature on pines, (Pinus) oaks, (Querns), beech (ii) Endomycorrihza occur in red maple.

559. A mature pollen grain of Pinus has
(a) 2 cells (b) 3 cells
(c) 4 cells (d) 5 cells

Uttarakhand PMT-2009
BVP-2009
BHU PMT (Screening)-2009

Ans. (c) : In pinus, the micropore core separates by a periclinal wall and structure a tiny prothallial cell and large central cell. the central cell removes a second prothallial cell and antheridial cell. The core of the antheridial cell partitions to frame generative cell and tube cell.
Thus, die pollen grain of Pinus is shed at four cell stage when it consists of two vegetative prothallial cells, a generative cell and a tube cell.

@apna_pdf

560. Gymnospenn may be distinguish from angiosperm by which of the following characteristic ?
(a) Absence of true seed
(b) Absence of xerophytic nature
(c) Absence of secondary growth
(d) None of the above

Rajasthan PMT-1998

Ans. (a) : The Gymnosperms have no flowers or fruits, and have naked seeds on the surface of leaves or scales whereas the angiosperms are also known as flowering plants as they have seeds that are enclosed within an ovary. The characteristics that differentiate angiosperms from gymnosperms include flower, fruits and endosperms in the seeds.

561. Vegetative reproduction Cycas occurs by :
(a) bulbils (b) sporophylls
(c) fission (d) scale leaves

Rajasthan PMT-1998
Haryana PMT-2006

Ans. (a) : Cycas is a gymnosperm where reproduction occurs vegetatively and sexually. Vegetative reproduction occurs through bulbils. The decurrent base of the bulbil is covered with scale leaf. Those leaf bases which were extended down the stem below the insertion are said to be decurrent bases. During the favourable period or condition, they get separated from the parent plants and develop into an independent new plant. Some species of cycads are similar to palm trees, while others look like ferns at first glance.

562. What is the similarity between gymnosperms and angiosperms ?
(a) Phloem of both have companian cells
(b) Endosperm is formed before fertilization in both
(c) Origin of ovule and seed in similar in both
(d) Both have leaves, stem and roots

CG PMT-2007

Ans. (d) : The presence of stem, leaves, and roots is found in both angiosperm and gymnosperm.
- Angiosperm and gymnosperms both utilize seeds as the primary means of reproduction and both use pollen to facilitate fertilization.
- Gymnosperms and Angiosperms have a life cycle that involves the alternation of generation.
- It's both have a reduced gametophyte stage.
  Angiosperms like all vascular plant have a sporophytic-dominant life cycle, Gymnosperms also have sporophyte dominant life cycle as in other vascular plants .

563. Which is haploid in case of Cycas?
(a) Stem (b) Root
(c) Endosperm (d) All the above

Uttarakhand-2005

Ans. (c) : The lowermost functional megaspore becomes the embryo sac cell. It undergoes free nuclear divisions followed by wall formation to form the cellular endosperms, here the endosperm is formed before fertilization and is haploid.
- Endosperm is a tissue produced inside the seeds of most flowering plants around the time of fertilization.

564. The terminal sterile portion of an organ, considered to be an equivalent of angiospermous stamen in Cycas, is known as:
(a) columella (b) hapteron
(c) paraphysis (d) apophysis

AP EAMCET-2003

Ans. (d) : The sterile part of cycas is apophysis. The microsporophyll of cycas is wedge shaped dorsoventrally flattened structure with basal sterile, middle fertile and apical sterile regions.
- The terminal expanded sterile tapering portion is called as apophysis.
- Microsporophyll of cycas is equivalent to stamen of angiosperm. It bears a terminal sterile portion, known as apophysis.

565. Assertion (A) : Fertilization in Cycas is called zooidogamy.
Reason (R) : Fertilization in Cycas takes place by the formation of pollen tube.
The correct answer is:
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2004

Ans. (b) : Zooidogamy is a type of plant reproduction in which male gametes (antherozoids) swim in a path of water to the female gametes (archgonium).
- Siphonogamy is a condition in plant in which pollen tubes are developed for the transfer of male cells to the eggs. Siphonogamy is formation of pollen tube. Hence, both statment are correct but (R(is the not correct explanation of (A).

566. Sago of Cycas is given to patients with stomach disorders because it is
(a) with high nutritive value
(b) tastier
(c) easily digestible with less starch
(d) cheap

Haryana PMT-2002

Ans. (c): Sago of cycas is given to patient with stomach disorder because it is easily digestible with less starch. It is in the form of granule.
- The sago obtained from Cycas revoluta is easily digestible. It is a major staple food for people from new Guinea.
  Sago is not Particularly high is nutrients but it does contain some essential vitamins and minerals . It is good source of calcium, iron, and vitamin B complex.

567. Transfusion tissue is present in the leaves of
(a) Dryopteris (b) Cycas
(c) Pinus (d) Both (b) and (c)

Haryana PMT-2007
Manipal-2005
AIPMT-1998

Ans. (d) : Transfusion tissue is present in the leaves of gymnosperms. It is composed of three kinds of cell: thick walled tracheids, parenchyma and albuminous cells.

@apna_pdf

● The main function of transfusion tissue is beleived to be the transport of materials between the vascular bundles and the mesophyll.
The transfusion tissue's Primary job is to move substances between the mesophyll and the vascular bundle, this Performing the function of lateral veins.

568. Characters of both conifers and cycads are found in
(a) Ginkgo (b) Ephedra
(c) Cupressus (d) Tsuga
Haryana PMT-2009
CG PMT-2009

Ans. (a) : Characters of both conifers and cycads are found in Ginkgo. It shows the resemblance with both Cycadales and coniferales.
- Both have woody trunks and woody roots as well as stipulate leaf bases.
- Conifers have non-motile sperms whereas cycads have motile sperms.
Resemblances between - Ginkgo and Cycadales are well developed nucellar break and pollen chamber , houstorias nature of Pollen tube, multiflagellated Spermatozoids large egg. massive female gametophyte with well developed venter endoscopic embryo with to cotyledons, hypogeal seed germination.

569. Cork is obtained from
(a) Quercus suber (b) Pinus roxburghii
(c) Cedrus deodara (d) Mangifera indica
CG PMT-2009

Ans. (a) : The phellem layer of bark tissue is used to make cork. It is an impermeable bouyant that is largely extracted from the Southwest European and Northwest African tree species. Quercus suber for commercial use.
- The periderm layers of a Quercus suber plant are used to make cork.
- Suberin of hydrophobic substance makes up cork.
- The cork is processed to various thicknesses and sizes. The presence of air in its cells accounts for much of the cork's characteristics.

570. In gymnosperms, the seeds are naked because they lack
(a) integument (b) nucellus
(c) pericarp (d) perianth
Haryana PMT-2009
CG PMT-2009

Ans. (c) : Gymnosperms have naked seeds because in gymnosperms, ovary (pericarp) is absent.
- After fertlizaton, the ovary develops into fruit and ovary wall forms the fruit wall (pericarp).

571. In Cycas diploxylic vascular bundles are found in
(a) stem (b) root
(c) leaflet (d) rachis and leaflet
AMU-2006
AP EAMCET-2002

Ans. (d) : In cycas, rachis and leaflets have a diploxylic arrangement in vascular bundles.
- Diploxylic means an arrangement of vascular bundle, where two types of xylem are present. These are centripetal xylem and centrifugal xylem. The xylem and phloem, two types of vascular tissue, are combined to produce the vascular bundle, a transport mechanism in vascular plants.
While phloem mostly carries specific organic substances, xylem primarily carries water and a few nutrients.

572. Which of the following tissue is present in the leaves of Pinus and serve to conduct water and food ?
(a) Conducting tissue (b) Transfusion tissue
(c) Phloem (d) Xylem
JIPMER-2001

Ans. (b) : The tissue immediately surrounding at least part of the vascular bundles in the leaves of gymnosperm called transfusion tissue, Exa- Pinus.
- Transfusion tissue is a prominant feature of leaf surface protected by a thick cuticle and sometimes by an additional waxy layer.
- The main function of the transfusion tissue is believed to be transport of materials between the vascular bundle and mesophyll.
- Transfusion tissue is composed of trachieds.
- Transfusion tissue is composed of tracheids (transfusion tracheids). With conspicuos bordered pits and parenchyme cells tranfusion tracheids.

573. Cleavage polyembryony occurs in
(a) Pinus (b) Mini Cycas
(c) Cycas (d) Ephedra
BHU PMT (Mains)-2008

Ans. (a) : Presence of more than one embryo inside the seed is called polyembryony. The cleavage polyembryony commonly occurs in gymnosperms. In case of coniferous plants, all the four cells of the young embryo develop into four embryos. The three wither is off and the one completely develops– develops into a new plants. For example- pinus.
- In pinus seperation of embryonal cells is followed by the development of each of them potential embryos.

574. In Pinus, the third tier of embryonal cells from below is known as
(a) rosette tier (b) suspensor tier
(c) embryonal tier (d) free-nuclear tier
AMU-2005

Ans. (a) : The rosette cells of the rosette tier are formed in the late stages of development, when primary and secondary suspensor cells are formed.
- In pinus, the third tier of embryonal cells from below is known as rosette tier.

575. The sclerenchyma of the hypodermis in the Pinus needle helps in
(a) Increasing the absorptive surface of the cell
(b) checking transpiration
(c) mechanical support
(d) photosynthesis
VMMC-2005 / AMU-2004 / BVP-2003

Ans. (c) : Sclerenchyma provides mechanical support in the pinus needle as it has thick walls.
- Sclerenchyma tissues are permanent tissue that are long, dead, and thick cells without any intercellular spaces.

@apna_pdf

- Their function is to provide mechanical support to the plant which is due to the absence of interrelate spaces. Sclerenchyma can either be fibres or sclereid. A thick cuticle covers the outer part of the epidermis which helps to examine the transpiration.

576. Pollen grains in Pinus are
(a) Monosaccate (b) Bisaccate
(c) Trisaccate (d) Nonsaccate
J&K CET-2007

Ans. (b) : The pollen grains in pinus are Bisaccate. In Pinus, Pollen grains is unicellular, three layered: outer exine, the middle exointine and innermost intine.
- In some cases pollen grains of Pinus are bisaccate i.e. have two sacs (air sacs) within the wings like structure that are responsible for their bouyancy.

577. Coralloid roots in Cycas have a symbiotic blue green alga that forms an algal zone in such roots. This alga is
(a) Aulosira (b) Anabaena
(c) Oscillatoria (d) Chlorella
CG PMT-2011
Punjab MET-2011

Ans. (b) : Cyanobacteria live in symbiosis, only few species and one of the species is Anabaena. It shows a symbiotic relationship with cycas.
- Coralloid roots is observed in the cycas. It is developed in clusters at the base of the stem and comes out over the ground.
- Cyanobacteria play a role in fixation of nitrogen with the help of nitrogenase.

578. In the following statement about is in which characteristic not occur in this genus.
(a) The Pinus is homosporous gymnosperm, i.e. produce same type of spores
(b) The number of needles in spur of Pinus roxburghii is three
(c) Each vascular bundle in the long shoot of Pinus consists of xylem facing towards the centre of the shoot
(d) Microsporophyll of Pinus bear two micro sporangia
BVP-2013
CMC Ludhiana -2013

Ans. (a) : In gymnosperms, plants are heterosporous i.e. produce two kinds of spores: microspore (male) megaspore (female). Microspore and megaspore germination is in-situ, producing micro- and megagametophytes which are not autotrophic, and gymnosperms are not homosporous. Pinus is a monoecious gymnosperm that produced both male and female cone on the some plant as well as male and female strobili on distinct strobili.

579. The following species of Cycas is recorded in the forests of A.P.
(a) Cycas revoluta (b) Cycas pectinata
(c) Cycas beddomei (d) Cycas thomsonii
AP EAMCET-1999

Ans. (c) : In the forest of Andhra Pradesh, the cultivated species of cycas is cycas beddomei. It is grown mainly on Tirupti hills of Andhra Pradesh. Superficially similar to cycas revoluta, it has erect, solitary stem. The cycad in found in dry hot sites in the serublands of eastern India clumps of the plant are common vie pups only in mates. The plant is fairly free resistant, except as seeds and seedling, which are very vulneroble to annual grass fires.

580. Microsporangium of Cycas is placed in which of the following manner on microsporophyll ?
(a) Marginal (b) Adaxial
(c) Abaxial (d) Lateral
Rajasthan PMT-2000

Ans. (c) : The microsporophylls are arranged spirally and each microsporophylls has 2 (two) microsporangia which are arranged abaxial (away from the stem or leaves).
- Within sporangia two kinds of spores are produced one is arranged spirally along an axis to from lax or compact strobili or cones.

581. The non porous wood is present in which of the following ?
(a) Dicots (b) Monocots
(c) Gymnosperms (d) Cactus
Rajasthan PMT-2000

Ans. (c) : Gymnosperms are contemplated as 'non-porous' due to their scarcity of vessel pores. Pines are typically instances of softwood. So non-porous wood originates in gymnosperms.
- Non porous wood are the wood which do not permit transfer of water or air.

582. The term gymnosperm was introduced by
(a) Aristotle (b) Mendel
(c) Pasture (d) Theophrastus
CMC Ludhiana -2013

Ans. (d) : The tern gymnosperms was first introduced Theophrastus in 300 B.C. in his book "Enquiry into plants". Gymnosperm is derived from two Latin words. The term gymnos refers to naked and term sperms refers to the seed. These are seed producing plants in which the seed is found in an unclosed condition.

583. In Pinus, the approximate time for the fertilization after pollination is
(a) only a few hours (b) only a few days
(c) only a few weeks (d) about one year
CMC Ludhiana-2011

Ans. (d) : Pollination is the process of transferring pollen grains from the flowers male anther to female stigma.
• The pollination in pinus takes place by winds.
Fertilization takes place about 1 year after pollination, and seed maturation takes several additional months. Some seeds are shed as soon as the mature, whereas others remain within the female cones for weeks, months, or even years before being shed.

584. The gymnosperm plant nearest to angiosperm is
(a) Pinus (b) Taxus
(c) Cycas (d) Gnetum
CMC Ludhiana-2011

Ans. (d) : The gymnosperm plant nearest to angiosperm is Gnetum. Gnetophytes are closest relative to modern angiosperms and dissimilar genera of plants: Ephedra, Gnetum and Welwistchia. Like angiosperms, they have broad leaves. In tropical and subtropical zones, gnetophytes are vines or small shrub. Gnetum show

@apna_pdf

affinities with angiosperms besides, it resembles angiopserms in several other aspects like free nuclear divisions in the embryo sac, two cotyledonous embryo etc.

585. Many xerophytes accumulate this in response to stress

(a) Glucose (b) Proline
(c) Lysine (d) Fatty acids

BCECE-2009

Ans. (b) : Many xerophytes accumulate this in response to stress by proline. In order to trade over the stress phase, many xerophytes make suitable morphological and physiological adaptations. Accumulation of free proline under water deficit is one such physiological response.

586. If the number of chromosomes in the cells of nucellus in Pinus is 24, what would be the number of chromosomes in megaspore mother cell

(a) 72 (b) 24
(c) 12 (d) None of these

AMU-2001

Ans. (b) : In this case a megaspore mother cell is a diploid cell in plants in which meiosis will occur, resulting in the production of four megaspores.

Therefore in the given example the diploid chromosomes number is 24. All the somatic cells including the pollen mother cells would have 24 chromosomes.

587. "Algal zone" is found in

(a) normal roots of Cycas
(b) normal roots of Pinus
(c) coralloid roots of Cycas
(d) stem of Cycas

AMU-2001

Ans. (c) : Coralloid roots are a special type of root that is found in cycas that is interrelated with nitrogen Fixing cyanobacteria. Algal zone is also present in coralloid roots of cycas.

588. Study the following and identify two characters found in both Cycas and Pteris

I. Formation of motile male gametes.
II. Formation of haploid endosperm.
III. Formation of sporophyte directly from gametophyte without gametic union.
IV. Formation of archegonia in female gametophyte.

The correct match is

(a) I and IV (b) I and III
(c) II and IV (d) III and IV

AP EAMCET-2007

Ans. (a) : I and IV

• Formation of motile male gametes and Formation of archegonia in female gametophytes, both characters are same in Cycas and Pteris.

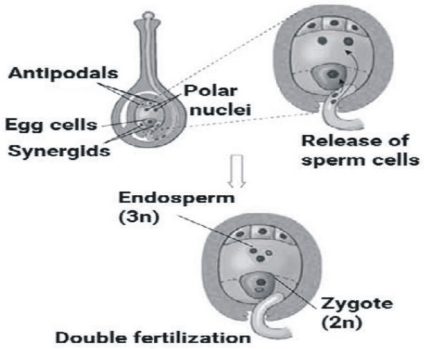
F. Angiosperms

589. Endosperm in angiosperms is:

(a) Tetraploid structure (b) Triploid structure
(c) Haploid (d) none of the above

AIIMS-2013 / J&K CET-2012
BHU PMT (Mains)-2010 / BVP-2008
Haryana PMT-2007 / Uttarakhand PMT-2007
VMMC-2007 / MHT CET-2006 / JCECE-2004
Haryana PMT-2003 /UPCPMT-2002 /J&K CET-2000

Ans. (b) : Endosperm is a triploid (3n) structure found in many seeds of angiosperm. It frequently stores food material which are broken down during germination. In angiosperm, the endosperm is the main nutritive tissue for embryo out of which two male gametes one fertilizes egg to form zygote and other fuses with secondary nuclei to form triploid endosperm. Hence, triploid nature of endosperm is the characteristic feature of angiosperm.



Double fertilization and triple fusion

590. In angiosperms, the fusion of male gamete with the secondary nucleus is considered as "Second fertilization" because

(a) It is fusion of two nuclei
(b) Secondary nucleus is a sister nucleus of the egg
(c) It takes place in embryo sac
(d) It takes place after pollination

AP EAMCET-12.07.2022 Shift-II / MHT CET-2018
J & K CET-2015 / Uttarakhand PMT-2008
MHT CET-2008 / Manipal-2008
BVP-2007 / VMMC-2006
JIPMER-2004 / BHU PMT-2004

Ans. (b) : In angiosperms, the fusion of male gamete with the secondary nucleus is considered as "second fertilization because secondary nucleus is a sister nucleus of the egg. The cells of an embryo of unfertilized ovule are 8 in number and arranged in the form of 3 + 2 + 3 (from top to bottom) 3 antipodal cell, 2 polar central nucleus, 2 sgnergids & 1 egg cell. One sperm fertilizes the egg cell and the other sperm combines with the two polar nuclei sperm. The haploid sperm and haploid egg combine to form a diploid zygote and this process is called as synngamy while other sperm and two haploid polar nuclei form a triploid nucleus (triple fusion).

591. Double fertilization was discovered by:

(a) Nawaschin (b) Strasburger
(c) Emerson (d) None of these

MHT CET-06.10.2020 Shift-I /MHT CET-2018
Haryana PMT-2005 / BHU PMT-2003

@apna_pdf

Ans. (a) : Double fertilization was discovered by Nawaschin and Guignard. Double fertilization is the characteristic of angiosperms. In this process, one male gamete fuses with the egg to form a zygote.

- Nawaschin discovered double fertilization in 1898, in the liliaceous plants.

592. In an angiospermic plant female, gametophyte is represented by:

(a) ovule (b) embryo sac
(c) endosperm (d) none of these

Rajasthan PMT-1996 /Rajasthan PMT-2011
UP CPMT-2010 / Haryana PMT-2002
AP EAMCET-2000

Ans. (b) : Female gametophyte is represented by embryo sac. The embryo sac develops from the functional megaspore. In angiosperms it is required for sexual and asexual seed development. It consists of 3-antipodal cells, one central cell one egg cell and two synergid cells.

593. Largest flower is

(a) *Rafflesia arnnoldi* (b) *Helianthus annuus*
(c) *Welwitschia mirabilis* (d) *Nelumbo nucifera*

KVPY SB & SX-2016 / Punjab MET-2008
AIIMS-1998 / Rajasthan PMT-1996

Ans. (a) : *Rafflesia arnnoldi* is a species of flowering plant in the parasitic genus Rafflesia. It is noted for producing the largest individual flower on earth. It has a very strong and horrible odour of decaying flesh, earning it the nickname "corpse flower"

594. The male gametophyte in angiosperm is reduced to

(a) one cell (b) two cells
(c) three cells (d) four cells

CMC Vellore-2009 / CG PMT-2009
Rajasthan PMT-2009 / UP CPMT-2009

Ans. (c) : In pinus the male gametophyte is much smaller than the female gametophyte. It is made up of three cells. The male gametophytes of angiosperms is composed of one tube cell and one generative cell. This generative cell divides to form two male gametes. So, the angiospermic male gametophyte is 3-celled.

595. Double fertilization is a characteristic of:

(a) angiosperms (b) gymnosperms
(c) thallophytes (d) all plants

CG PMT-2008 / Manipal-2008
BVP-2007 / BVP-2005

Ans. (a) : • Double fertilization is a characteristic of angiosperm. It was first discovered by S.G. Nawaschin (1898). Double fertilization where a triploid endosperm is formed as a result of the fusion of secondary polar nuclei a male gamete. A diploid zygote is formed by the fusion of a haploid egg cell and a haploid male gamete.

596. If an angiospermic male plant is diploid and female plant tetraploid, the ploidy level of endosperm will be:

(a) haploid (b) triploid
(c) tetraploid (d) pentaploid

HP CET-2013 / Uttarakhand PMT-2008
BHU PMT-2004 / VMMC-2003

Ans. (d) : When a diploid female plant is crossed with a tetraploid male. The ploidy of endosperm cells in the resulting seed is pentaploid. The endosperm is formed by fusion male gamete with two polar nuclei, i.e. fusion of two diploid polar nuclei and haploid male gamete will give pentaploid (5n). The primary endosperm nucleus and eventually pentaploid endosperm.

Male gamete +2 polor nuclei → Endosperm
(n) + (2n) + (2n) = (5N).

597. Double fertilization (or triple fusion) leading to initiation of endosperm in angiosperms, requires

(a) fusion of 4 or more polar nuclei and the second male gamete only
(b) fusion of 2 polar nuclei and second male gamete only
(c) fusion of one polar nucleus and second male gamete only
(d) all the above type of fusions in different types of angiosperms

Haryana PMT-2010/ AFMC-2007
AMU-2002 / UP CPMT-2001

Ans. (b) : Double fertilization (or triple fusion) leading to initiation of endosperm in angiosperms, requires fusion of Two polar nucleus and second male gamete only.

598. Male gametes in angiosperms are formed by the division of

(a) Microspore (b) Generative cell
(c) Vegetative cell (d) Microspore mother cell

Rajasthan PMT-2010 / Haryana PMT-2008
JIPMER-2008 / MHT CET-2004

Ans. (b) : Male gametes in angiosperms are formed by the division of generative cell. It is formed during the microspore's first division and divides into two sperm cells in the pollen grain or pollen tube. As a result, the generative cell is never "Free" from the vegetative cell.

599. Negative geotropism is shown by the roots of

(a) Orchids (b) Ficus
(c) Rhizophora (d) Trapabispinosa

BVP-2011 / Rajasthan PMT-2006
BVP-2004 / BCECE-2001

Ans. (c) : Negative geotropism is shown by the roots of Rhizophora. It is shown by roots called pneumatophores. These plants have pneumatophores which help in harnessing oxygen for respiration.

600. Which of the following is a total root parasite?

(a) Cuscuta (b) Rafflesia
(c) Santalum (d) Monotrapa

JIPMER-2012 / Uttarakhand PMT-2009
JIPMER-2010 / Haryana PMT-2000

Ans. (b) : Rafflesia arnoldii is a species of flowering plant which belongs to the parasitic genus Rafflesia. It is the most famous species as it produces the biggest individual flower on earth and is also known as the corpse lily or stinking corpse lily. They lack in chlorophyll and does not prepare their own food. They take their food along with water and minerals from the roots of the host plant and depend on the host, such plant is known as a total root parasite.

601. The smallest angiospermic flower is

(a) Wolffia (b) Renunculus
(c) Rafflesia (d) Stellaria

Punjab MET-2009 / CMC Vellore-2009
UP CPMT-2009 / Rajasthan PMT-2001

@apna_pdf

Ans. (a) : The smallest angiospermic flower is Wolffia, which is an aquatic plant. They are green or yellow-green and have no roots.
- It is less than 2 mm in measurement and it is a genus of 9-11 species, which include the smallest flowering plants.

602. Primary endosperm nucleus is formed by fusion of
(a) Two polar nuclei and two male gametes
(b) Two polar nuclei and one male gamete
(c) Ovum and male gamete
(d) One polar nucleus and male gamete

Karnataka CET-20.05.2023

Ans. (b) : In gymnosperms primary endosperm nucleus is formed by the fusion of two haploid polar nuclei and one haploid male gamete (nuclei).

603. Which of the following statements regarding endosperm of angiosperms are true?
A. Endosperm is formed by triple fusion
B. Endosperm is nutritive in function
C. It is a pre-fertilized structure
D. It may or may not be completely utilized by the developing embryo
(a) A, B & D (b) A, B & C
(c) B, C & D (d) A, C & D

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : In gymnosperm, endosperm is formed by the triple fusion/ double fertilization.
Endosperm rich in fat, carbohydrate and proteins which are used in the establishment of the seedling during seed germination. At the time of fertilization endosperm provide nutrition of developing embryo. Sometimes endosperm may or may not be completely used by the developing embryo.

604. Arrange the following events in the correct sequence during the process of fertilization in Angiosperms

I) Fusion of other male gamete with polar nuclei
II) Transfer of pollen grains form anther to stigma
III) Fusion of male gamete with egg nucleus
IV) Release of male gametes in to cytoplasm synergid
V) Pollen tube formation

(a) II III IV I II
(b) I IV V II III
(c) II V IV III I
(d) V IV I II III

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : The correct sequence during the process of fertilization in Angiosperm is-Transfer of pollen grains form anther to stigma→pollen tube formation→ Release of male gametes in to cytoplasm synergid→ fusion of male gamete with egg nucleus → fusion of other male gamete with polar unclei.

605. In angiosperms the correct sequence of events in formation of female gametophyte in the ovule is
(A) **3 successive free nuclear divisions in functional megaspores.**
(B) Degeneration of 3 megaspores.
(C) Meiotic division in megaspore mother cell.
(D) Migration of 3 nuclei towards each pole
(E) Formation of wall resulting in seven celled embryo sac.

Choose the correct answer from the options given below.
(a) (B), (C), (A), (D), (E)
(b) (C), (B), (A), (D), (E)
(c) (A),(B), (C), (D), (E)
(d) (C), (E), (A), (D), (B)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : The female gametophyte develops within the ovule and generally consists of three antipodal cells one central cell, two synergic cells and one egg cell.
- Female gametophyte is also commonly called the embryo sac or mega gametophyte.

(i) The megaspore mother cell undergoes meiosis and forms four haploid megaspores.
(ii) One remains functional and three degenerate.
(iii) 3 successive free nuclear divisions in functional megaspore take place.
(iv) Migration of 3 nuclei towards each pole.
(v) Formation of wall resulting in seven called embryo sac.

606. In angiosperm, the haploid, diploid and triploid structures of a fertilized embryo sac sequentially are :
(a) Synergids, antipodals and Polar nuclei
(b) Synergids, Primary endosperm nucleus and zygote
(c) Antipodals, synergids, and primary endosperm nucleus
(d) Synergids, Zygote and Primary endosperm nucleus

NEET (UG) 07.05.2023

Ans. (d) : Embryo sac or female gametophyte is an oval structure present in the ovule of flowering plants.
- Synergids are pair of haploid cells present at the micropylar end of embryo sac zygote which is a diploid structure undergoes divisions to form embryo, antipodal and polar nuclie are also haploid, diploid and triploid structures are synergid zygote and primary endosperm respectively.

607. Match the following :

	List-I		List-II
(A)	**Submerged suspended hydrophytes**	**(I)**	**Pistia**
(B)	**Root caps are absent**	**(II)**	**Sagittaria**
(C)	**Rooted hydrophytes with Floating leaves**	**(III)**	**Utriculaira**
(D)	**Plants live partly in water and partly in air**	**(IV)**	**Nymphaea**

The correct match is:

	A	B	C	D
(a)	II	IV	I	III
(b)	II	I	IV	III
(c)	III	I	IV	II
(d)	III	IV	I	II

TS EAMCET-31.07.2022 Shift-II

Ans. (c) : Submerged hydrophytes are the plants which have their roots anchored in the mud at me bottom of the water body. Example - Utricularia.
- Root cap is absent in hydrophytes instead root pockets are present in them. Example - Pistia
- Roots hydrophytes with floating leaves are the plants which are rooted in the mud but their leaves and flower float on the water surface. Example - Nymphea
- Plant living partly inside water and partly above it are called Halophytes. Example - Sagittaria

@apna_pdf

608. Identify free floating hydrophyte from the following.
(a) Lemna (b) Hydrilla
(c) Utricularia (d) Vallisneria

TS EAMCET-30.07.2022 Shift-I

Ans. (a) : Free floating hydrophyte are plants that float freely on the surface of water bodies constantly. For example Wolfia Lemna, Salvinia.

609. Number of cells in the Angiosperm pollen grains at the time of release are-
(a) 2 cells (b) 3 cells
(c) 1 cells (d) 4 cells

AP EAMCET-12.07.2022 Shift-II

Ans. (a) : In the angiosperm pollen grains at the time of release have 2 cells. That is vegetative cell and generative cell. Pollen grains of Angiosperms are most simplified of all the seed plants. Male gametophyte or pollen grain produces three cells one vegetative cell which later forms pollen tube and two sperm cells.
Inside the pollen are two cell that comprise the male gametophyte and the tube cell (also referred to as the tube nucleus) which develops into the pollen tube.

610. One of the 2000 years old viable seed, discovered during the archeological excavation at king herold's near dead sea
(a) Maize (b) Sunflower
(c) Lupin (d) Phoenix dactylifera

Karnataka CET-2022

Ans. (d) : Phoenix dactylifera which is also known as date palm. It is a flowering plant and belongs to arecaceae family. It is one of the 2000 years old viable seed, discovered during the archeological excavation at king herold's near dead sea.

611. Find the correct character related to double fertilization of Angiosperms.
(A) Male gametic nucleus fuses with egg cell.
(B) Male gametic nucleus fuses with antipodal cells.
(C) Male gamete fuses with synergids.
(D) Male gamete helps in the formation of primary endosperm cell.
Options:
(a) A, B only (b) A, D only
(c) A, C only (d) C, D only

TS EAMCET-31.07.2022 Shift-I

Ans. (b) : Double fertilization is the characteristic of angiosperm. In this process one male gamete fuses with the egg to form a zygote which is known as syngamy. The other male gametes fuses with the two polar nuclie in the central cell to form a triploid primary endosperm nucleus or PEN.
Hence, statement A & D are correct.

612. Match the following lists.

List-I		List-II	
A.	**Submerged rooted hydrophyte**	**I.**	**Hydrilla**
B.	**Rooted hydrophyte with floating leaves**	**II.**	**Salvinia**
C.	**Free floating hydrophyte**	**III.**	***Victoria regia***
D.	**Submerged suspended hydrophyte**	**IV.**	**Limnophila**
		V.	**Vallisneria**

The correct match is
Options:

	A	B	C	D
(a)	III	I	V	IV
(b)	V	III	II	I
(c)	V	I	IV	III
(d)	II	IV	III	I

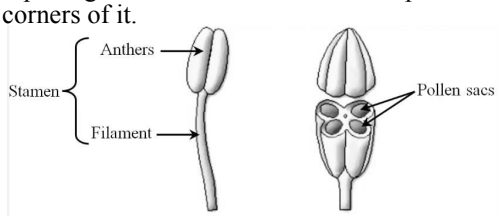
TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Vallisneria is a submerged rooted hydrophyte. They are immersed in water and their roots are embedded in the mud.
Victoria regia is rooted hydrophyte with floating leaves. These plants are rooted in mud but their leaves and flowers float on the water surface for example Nymphaea, Marsilea.
Free floating hydrophyte are plants that float on the surface of water bodies for example Salvinia.
Hydrilla is a submerged suspended hydrophyte and they grow below the water and do not come in contact with the atmosphere. Other examples of submerged suspended hydrophyte are ceratophyllum, Utricularia.

613. How many microsporangia are located at the corners of a typical bilobed anther of angiosperm?
(a) 2 (b) 4
(c) 8 (d) 1

Karnataka CET-2021

Ans. (b) : Four microsporangia are located at the corners of a typical bilobed anther of angiosperm. Microsporangium is a sporangial structures which produces spores. Anther of angiosperms shows two anther lobes. Each anther lobes develops into two microsporangium. Hence anther has four pollen sacs at four corners of it.



Structure of stamen

614. Vivipary is a peculiar characteristic of
(a) Mesophytes
(b) Xerophytes
(c) Mangrooves
(d) Emergent hydrophytes

MHT CET-01.10.2020 Shift-I
BVP-2014

Ans. (c) : Adaptation of vivipary has mostly occured in some halophytes. Vivipary plants grow in highly saline area. Mangrooves plant of high salt tolerent grows in water of high salinity.
• Mesophytes are plants that require a moderate amount of water.

615. In angiosperms, the endosperm is classified on the basis of which one of the following criteria?
(a) Development (b) Position
(c) Ploidy (d) Function

MHT CET-07.10.2020 Shift-I

@apna_pdf

Ans. (a) : In angiosperms, the endosperm is classified on the basis of development. Angiosperms have three types of endosperms which are categorized based on the timing of cell wall production by plant species. The nuclear, cellular & helobial endosperms are among them.
• Endosperm is present in the seeds of most of the angiosperms. It provides nourishment to the growing embryo.
• Ploidy level of endosperm in angiosperm is generally triploid or 3n.

616. Which one of the following pairs gives rise to fruit and seed, respectively, in a typical angiosperm plant?
(a) Ovule and ovary (b) Ovary and pollen
(c) Pollen and anther (d) Ovary and ovule
KVPY (SA)-2020

Ans. (d) : The fertilization in plants brings about various changes in the structure of a flower. In the majority of the cases, withdraw all the parts of the flower i.e. calyx, carolla and androecium except the ovary which remain on the thalamus. The ovary grows and eventually transforms into the fruit that contains the seeds. A fertilized mature ovary is what is known as a fruit.
• After fertilization, the megasporangium or ovule becomes the seed.

617. During the development of male gametes in angiosperms, the microspore mother cell undergoes _____ meiosis and _____ mitosis respectively.
(a) two and two (b) two and one
(c) one and two (d) one and three
MHT CET 5.10.2020 Shift-I

Ans. (c) : During the development of male gametes in angiosperms, the microspore mother cell undergoes one meiosis and two mitosis respectively.

618. The correct sequence of developmental stages of embryo in angiosperms is _____.
(a) octant → globular → heart shaped → horse shoe shaped
(b) globular → octant → heart shaped → horse shoe shaped
(c) octant → heart shaped → horse shoe shaped → globular
(d) octant → horse shoe shaped → heart shaped → globular
MHT CET-06.10.2020 Shift-I

Ans. (a) : Intialy, the single-celled zygote divides to form a proembryo. The zygote develops inside the seed. The sequence of development proceed through histo-differentiation, cell expansion and maturation drying. As the divisions proceed, the proembryo subsequently gives rise to the globular stage embryo. The globular stage embryo gives rise to a heart-shaped embryo which finally develops into a mature embryo. The mature dicot embryo has two cotyledons and an embryonal axis.

619. Which of the following cell-type is not dead at maturity in angiosperms ?
(a) Sieve tube elements (b) Phloem fibres
(c) Vessels (d) Xylem fibres
TS EAMCET-08.05.2019 Shift-I

Ans. (a) : In plant anatomy, sieve tube elements also called sieve tube members are highly specialized type of elongated cell in the phloem tissue of flowering plants unlike the water - conducting xylem vessel elements that are dead when mature sieve elements are living cells.
Phloem fibres are generally absent in the primary phloem but are found in the secondary phloem and hemp are made of dead sclerenchymatous cells.

620. In which of the following plants, hydrophily is a common phenomenon
(a) Water hyacinth (b) Water lily
(c) Hydrilla (d) Amorphophallus
TS EAMCET-08.05.2019 Shift-I
UP CPMT-2010

Ans. (c) : Pollination carried out through water is called Hydrophily.
• Pollination by water quit rare in flowering plant and it is limited to about 30 genera mostly monocotyledones.
• Some examples of water pollinated plants are vallisneria and Hydrilla which is grown in fresh water and several marine sea grasses such as zosteria.

621. Features which are highly unique to angiosperms.
(I) Multicellular, much reduced and dependent gametophyte
(II) Siphonogamous fertilization
(III) Fusion of male gametes with egg cell and secondary nucleus
(IV) Development of ovule into seed
Options:
(a) II & III (b) I & II
(c) I & III (d) II & IV
AP EAMCET-24.04.2019 Shift-I

Ans. (c) : (I) In angiosperms, the female gametophyte is 7-celled and 8 nucleated, but the male gametophyte, known as pollen grain, is confined to 2-3 cell. Both are greatly diminished and reliant on the sporophyte.
(II) Double fertilization is the unique characteristics of angiosperms. Fusion of male gametes with egg cell is called syngamy and Fusion of male gametes with secondary nucleus is called triple fusion.
(III) The fertilization in which a long pollen tube that carry male gametes near to the egg cell is known as siphonogamous fertilization.
(IV) The ovule develops into a seed both in angiosperm and gymnosperm.
Hence, statement I & III are highly unique to angiosperms.

622. The additional nuclear ploidy levels found in a diploid angiosperm species in full bloom compared to its vegetative stage are
(a) 1 N & 2N (b) 2N & 3N
(c) 3N & 4N (d) 1N & 3N
KVPY SB & SX-2019

Ans. (d) : In diploid species ploidy level is 2N, while additional ploidy level are 1N and 3N.
1N→found in gametes and 3N→found in endosperm (triploid).

623. Find the incorrect statements
(A) Lower plants shift to sexual method of reproduction just before the onset of adverse conditions takes place

@apna_pdf

(B) In South India, hilly areas transform into blue stretches by the flowering of Agave and Bamboo
(C) Single cell Zygote is the vital link that ensures continuity of the species from one generation to the next
(D) In Angiosperms pollen grains are shed at 3–celled stage

Options:

(a) A, B (b) C, D
(c) A, C (d) B, D

AP EAMCET-25.04.2018 Shift-II

Ans. (d): • In South India, Hilly areas transform in to blue stretches by the flowering of Neelakurinji (*Strobilanthes kunthiana*). It flowers only once in 12 years.
• In Angiosperms pollen grains are shed at 2-celled stage, contain one vegatative and one generative cell.

624. In plants growing under environmental stress condition, seeds germinate while they are on the mother plant. An example for such a condition is:

(a) Wolffia (b) Brown algae
(c) Rhizophora (d) Eucalyptus

TS EAMCET-02.05.2018 Shift-II

Ans. (c) : In plants growing under environmental stress condition (such as drought, high salinity low and high temperature and light condition), seed germination occurs on the mother plant. An example of such a condition is Rhizophora which grow on mangrove vegetation.

625. What is the correct order stages for monosporic development of female gametophyte in angiosperms, arrange in sequence.

(I) Functional megaspore
(II) Free nuclear divisions
(III) Embryosac
(IV) Linear tetrad of megaspore
(V) Megaspore mother cell

(a) II, I, IV, V, III (b) I, II, IV, V, III
(c) V. IV, I, II, III (d) IV, V, I, II, III

AP EAMCET-25.04.2018 Shift-I

Ans. (c) : Monosporic development refers to the formation of a female gametophyte or embryosac from a single functional megaspore. In most flowering plants a single megaspore mother cell present at the micropylar pole of the nucleus region of the ovule undergoes meiosis to form four haploid megaspores later, out of these four megaspores only one functional megaspore are found into the female gametophyte, while the remaining three degenerate. The functional megaspore elongates along micropylar chalazal axis which is followed by mitotic division and then develops into the female gametophyte.

626. Match the following

List -I		List-II	
(A)	**Amphibious plants**	**(i)**	**Tribulus**
(B)	**Submerged suspended hydrophytes**	**(ii)**	**Barley**
(C)	**Mesophytes**	**(iii)**	**Sagittaria**
(D)	**Xerophytes**	**(iv)**	**Lemna**
		(v)	**Utriculari a**

The correct answer is

	(a)	**(b)**	**(c)**	**(d)**
(a)	(iii)	(v)	(ii)	(i)
(b)	(iv)	(iii)	(i)	(ii)
(c)	(v)	(i)	(iv)	(iii)
(d)	(ii)	(iv)	(v)	(i)

TS EAMCET-03.05.2018 Shift-I

Ans. (a) : They are water living plants, needs moisture to complete its life cycle. Plant body is not differentiated into true root, stem and leaves. Hence, they are referred to as amphibious plants.
Ex: Sagittaria
• Submerged hydrophytes are the plants which have their roots anchored in the mud at the bottom of the water body.
Ex: Utricularia
• Mesophytes are terrestrial plants which are neither adopted to particularly dry nor particularly wet environment.
Ex: Barley
• A xerophytes is a species of plant that has adapted to survive in an environment with little water.
Ex: Tribulus

627. Select the mismatch :

(a) Pinus – Dioecious
(b) Cycas – Monoecious
(c) Salvinia – Heterosporous
(d) Equisetum – Homosporous

NEET-2017

Ans. (a) : Pinus is the gymnosperm which posses both male and female reproductive parts and thus called **monoecious** and is generated on the same plant.

• On other hand, cycas possess either male or female reproductive so, it is dioecious. Equisetum produces the same type spore (Homosporous) and Salvinia produces different types of spores (Heterosporous).

628. With respect to angiosperms, identify the incorrect pair from the following

(a) Antipodal–2n
(b) Vegetative cell of male gametophyte –n
(c) Primary endosperm nucleus –3n
(d) Cell of nucellus of ovule –2n

JIPMER-2017

Ans. (a) : All of the cells in the embryo sac are haploid, with the exception of the central cell, which is initially binucleate until fusing its polar nuclei to become diploid. A main endosperm nucleus carrying 3n is created upon fusing with one of the male gametophytes (n).The three cells on the chalazal end of the embryo sac are called antipodal cells. They are the haploid.

629. Study the following lists

List - I	List-II
(A) Convolvulaceae	**(i) Dicotyledons**
(B) Rosales	**(ii) Arthropoda**
(C) Mangifera	**(iii) Anacardiaceae**
(D) Insecta	**(iv) Polemoniales**
	(v) Monocotyledons

@apna_pdf

The correct answer is–

Options :

	A	B	C	D
(a)	iv	i	v	ii
(b)	iv	i	iii	ii
(c)	iv	i	v	iii
(d)	iv	i	ii	iii

AP EAMCET-28.04.2017 Shift-I

Ans. (b) :

A.	Convolvulaceae	Polemoniales
B.	Rosales	Dicotyledons
C.	Mangifera	Anacardiaceae
D.	Insecta	Arthropoda

Convolvulaceae:- is polemoniales as it includes plants families like convovulaceae mostly due to their floral and sexual characteristics.
A single superior complex ovary and flowers with stamens. That are adjacent to the corolla lobes.
Rosales : - Rosales are dicotyledonous flowering plants, containing a families, 261 genera, and more than 7,700 species.
Mangifera:- Mangifera indica belong to the family of Anacardiceae, commonly known as mango family.
Insecta :- The word 'arthropod' refers to all invertebrates with jointed legs. Arthropods have hard exoskeleton. They don't have bones inside their bodies like humanr

630. Study the following and identify the correct combinations :

S.No.	List–I	List–II	List–III
I.	**Calotropis**	**Cardiac glycosides**	**Highly poisonous**
II.	**Nicotine**	**Chemical substance**	**Defence against grazers and browsers**
III.	**Gause**	**Competitive exclusion**	**Superior species will eventually eliminate other inferior species**
IV.	**Mac Arthur**	**Co-existence**	**Same foraging pattern**

The correct combinations are

Options:

(a) I, III, IV
(b) I, II, III
(c) II, III
(d) II, III, IV

AP EAMCET-28.04.2017 Shift-II

Ans. (b) : (i) Calotropis- The species calotropis produces highly poisonous cardiac glycosides that distort the functioning of the heart.
(ii) Nicotine- Nicotine is the chemical substance used by plants for protection against active grazers and browsers.
(iii) Gause competitive exclusion principle states that "The two different species cannot occupy, the same niche in the same geographic area. If they do they will compete with one another for the same food and other resources. The superior species will eventually eliminate other inferior species.

631. If the cells of the nucellus in the angiosperm ovule contains 24 chromosomes, what will be the number of chromosomes in the endosperm of a self pollinated flower?

(a) 12 (b) 24
(c) 36 (d) 48

MHT CET-2017

Ans. (c) : Somatic cells of angiosperms are diploid.
The ovule is diploid
Hence, $2n = 24$
So $(n) = 12$
Since, the endosperm is triploid $3n = 3 \times 12 = 36$

632. The megasporangium proper of an angiosperm ovule is represented by

(a) Integument (b) Funicle
(c) Nucellus (d) Micropyle

MHT CET-2017

Ans. (c) : Nucellus is the megasporangium in an angio sperm ovule. Nucellus is the inner part of the ovule. Cells of nucellus are diploid. Sometime when the ovule is immature the nucellous contain the megaspore mother cell which divides meiotically to give rise to megaspore.

633. The plant Drosera is a

(a) saprophytic (b) insectivorous
(c) parasitic (d) endophytes

SRM JEEE -2017

Ans. (b) : Sundew, genus of approximately 152 carnivorous plant sp. in the family Droseraceae. Drosera or sundews are one of the most variegated species of insectivorous plants, which trap prey with the help of their mucilaginous gland covering their leaves, they trap flies insects, butterflies.

634. Triple fusion in angiosperm is the fusion of second sperm with

(a) Antipodal cell and one synergid cell
(b) Two antipodal cells
(c) Two synergid cells
(d) Two polar nuclei

Punjab MET-2008

Ans. (d) : Triple fusion in angiosperm is the fusion of second sperm with two polar nuclei. Fertilization in angiosperm comprises two important events-syngamy and triple fusion. In syngamy one of the sperm released by the pollen tube in the embryo sac fuses with the egg cell and forms a diploid zygote which further develops into embryo. "Triple fusion is a characteristic feature in angiosperm where the sperm nucleus fuses with the secondary polar nuclei in the embryo sac" and other sperm fuse with secondary polar nuclei form triploid Primary endosperm nucleus (PEN) which is develop into endosperm called triple fusion.

635. ……..is a CAM plant.

(a) Maize (b) Pineapple
(c) Onion (d) Pea

Punjab MET-2008

Ans. (b) : • Crassulacean acid metabolism also know as CAM photosynthesis is a carbon fixation pathway that evolved in some plants as an adaptation to arid conditions. Pineapple carries out CAM photosynthesis,

@apna_pdf

fixing carbon dioxide at height and storing it as the acid malate and then releasing it during the day aiding photosynthesis.

636. Sucking roots are present in the plant

(a) Betel (b) Cuscuta
(c) Mangifera (d) Solanum

Punjab MET-2008

Ans. (b) : sucking roots also known as houstorial roots are found in parasitic plants.
In parasitics plant adventitious roots form the stem sucking nourishment from the host plants tissue like cuscuta (dodder), cassytha and dendrophthoe are other example of sucking roots.

637. Which of the following is the first cell of female gametophytic generation in Angiosperms?

(a) Megaspore mother cell
(b) Microspore mother cell
(c) Functional megaspore
(d) Egg cell

MHT CET-2016

Ans. (c) : The mother cell of megasporangium goes through meiosis and form megaspore quadruplicate out of which one megaspore is functional. Functional megaspore divides from mitotically developed into embryo sac for example the female gametophyte. In this way the function/megaspore fills in as the primary cell of the female gametophyte.

638. In Angiosperms, megaspores formed after meiosis of megaspore mother cell are arranged in____

(a) Isobilateral tetrad (b) Linear tetrad
(c) Tetrahedral tetrad (d) T-shaped tetrad

MHT CET-2016

Ans. (b) : In Angiosperms, megaspores formed after meiosis of megaspore mother cell are arranged in linear tetrad. The development of megaspores from the megaspore mother cell is called megasporogenesis.
• Megaspore mother cell is a large cell with dense cytoplasm and differentiated nucleus.
• In most angiosperms the megaspore mother cell divides through meiosis and forms 4 megaspores.
• Three of these megaspore degenerate and only one is active.
• Active megaspore forms female gametophyte

639. The CORRECT sequence of events during double fertilization in Angiosperms is

(a) Triple fusion, syngamy, porogamy
(b) Syngamy, triple fusion, porogamy
(c) Porogamy, syngamy, triple fusion
(d) Syngamy, porogamy, triple fusion

MHT CET-2016

Ans. (c) : Double fertilization involves two sperm cell: one fertilizes the egg cell to form the zygote that process is called syngamy and other fuses with two polar nuclei to form endosperm and that process is called triple fusion.
The entry of the pollen tube in the egg apparatus through micropyle (porogamy) is followed by syngamy and triple fusion.
Thus, the correct sequence is porogamy, syngamy triple fusion.

640. In angiosperms, during development of embryo, the suspensor cells develop from

(a) Oospore (b) Integument
(c) Endosperm (d) Cotyledon

MHT CET-2015

Ans. (a) : In angiosperms during development of embryo the suspensor cells develop from the oospores. During the development of the embryo the zygote increases in size and is divided by a transverse division resulting in the formation of two unequal cells.
It is a fertilized female zygote which have a thick cellulose wall. The suspensor cell situated at the terminal end of the suspensor is called the hypophysis which undergoes numerous division and the cell then later on forms the initials of the radical root, protoderm and root cap.

641. Seeds of the orchids are :

(a) Minute and sticky (b) Light and dry
(c) Large and heavy (d) None of these

JIPMER-2002

Ans. (b) : Seed of the orchids are light, small and dry They are generally stored inside a pod-like structure and on average an orchid seed weighs 0.004 mg.

642. Double fertilization results in the production of :

(a) Haploid nucleus (b) Diploid nucleus
(c) Triploid nucleus (d) Tetraploid nucleus

J&K CET-2005
BHU PMT (Mains)-2011

Ans. (c) : Double fertilization results in the production of Triploid nucleus. In angiosperms, double fertilization results in the production of an embryo and endosperm both of which are critical for the development of viable seed. Diploid plants produce diploid embryos and triploid endosperm tissue. The endosperm has two genome of the maternal parent and one genome of the paternal parent. Nuclei that possess only one set of chromosome are haploid. The nuclei will possess a single gene copy allele for each trait. In Gymnosperm the nature of endosperm is haploid.

643. The phloem of angiosperms differs from that of other vascular plants by the presence of

(a) vessels (b) companion cells
(c) tylosoides (d) albuminous cells
(e)secretory cells

CMC Vellore-2008

Ans. (b) : The phloem of angiosperms differs from that of other vascular plants by the presence of companion cells. These are specialised thin walled parenchymatous cells present adjacent to sieve tube in the phloem.
It appears to regulates the activity of the adjacent sieve element and to take part in loading and unloading of sugar into the sieve element.

644. An angiospermic leaf carries 16 chromosomes. The number of chromosomes in its endosperm will be

(a) 16 (b) 24 (c) 12 (d) 8
(e) 32

CMC Vellore-2008

Ans. (b) : A somatic cell contains diploid number of chromosomes. In angiosperms, the endosperm is formed

@apna_pdf

by triple fusion such as fusion of two polar nuclei and second male gamete. Therefore, it is triploid (3n)
Hence, $2n = 16$

$$n = \frac{16}{2} = 8$$

Chromosomes number in endosperm will be 3n
$= 3 \times 8 = 24$

645. Conifers differ from grasses in the
(a) production of seed from ovules
(b) lack of xylem tracheids
(c) absence of pollen tubes
(d) formation of endosperm before fertilization

JCECE-2014

Ans. (d) : Formation of endosperm before fertilization (in gymnosperms) occurs in conifer while in grasses endosperm are formed after fertilization.
Poaceae is a large and nearly ubiquitous family of monocotyledonous flowering plant commonly known as grasses. Difference between conifers and grasses.

Conifers	Grasses
• The endosperm is formed before fertilization	• The endosperm is formed after fertilization
• Nutrition is provided to the embryo by archegonia	• Nutrition is provided to the embryo by endosperm

646. Which of the following plant shows multiple epidermis?
(a) Croton (b) Atlium
(c) Nerium (d) Cucurbits

BVP-2007

Ans. (c) : Nerium is xerophytes that shows multiple epidermis. They consist of many layers and are found in Nerium leaves.
Both the adaxial and abaxial epidermis in nerium are multiseriate, being composed of up to 3 layers of compactly arranged cells with heavily cutinized other walls.

647. *Pentadiplandra brazzeana* produces a protein called brazzein which is about 2,000 times as sweet as sugar. This plant belongs to :
(a) Australia (b) South America
(c) Africa (d) Canada

BVP-2006

Ans. (c) : *Pentadiplandra brazzeana* produces a protein called brazzein which is about 2,000 times as sweet as sugar. This plant belongs to africa.

648. The plants which can refix CO_2 released during respiration and use it during photosynthesis are known as :
(a) succulents (b) mesophytes
(c) hydrophytes (d) non- succulents

BVP-2006

Ans. (a) : The plants which can refix CO_2 released during respiration and use it during photosynthesis are known as succulents. They are plants with parts that are thickened, fleshy and engorged, usually to retain water in arid climates or soil conditions. The word succulent comes from the latin word sucus, meaning "juice or sap"

649. Which of the following does not obtain its nitrogen from captured animal i.e., is not an insectivorous plant ?
(a) Orobanche (b) Utricularia
(c) Drosera (d) All of these

BVP-2006

Ans. (a) : *Orobanche uniflora* (broomrapes) are generally small which is 10-60 cm. They are identified by the yellow to straw-coloured stem completely lacking chlorophyll bearing yellow, white or blue snapdragen-like flower. The flower shoot are scaly with a dense terminal spike of 10-20 flower in most species although single in one-flowered broomrape. These plants generally flower from late winter to late spring. The reproduction in these species occurs through spores.

650. Which of the following is not a feature of mangrove plant ?
(a) production of respiration roots called pneumatophores
(b) lack of slit like prop root
(c) viviparous method of germination of seeds
(d) all of the above

BVP-2006

Ans. (b) : Mangrove plants are found in marshy areas. In such plants many roots come out vertically above the ground. These are hollow roots and are called pneumatophores. They facilitate exchange of gases in roots.
In banyan trees hanging roots come out from branches. The hanging roots then go into the soil to provide additional support to the huge banyan tree such root are called prop roots.

651. In a dicot plant, the epibasal tier forms (1) cotyledons (2) Plumule (3) hypocotyl (4) radical
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (b) : In the dicot embryo the epibasal cells eventually form the two cotyledons and the plumule. The hypocotyl is the region between the cotyledons and the radicle. The radicle is the terminal tip of the hypocotyl and will form the primary roots. The epicotyl plays an important role in hypogeal germination.

652. Velamen tissue is found in :
(a) mesophytes (b) epiphytes
(c) hydrophytes (d) xerophytes

BCECE-2001

Ans. (b) : Velamen tissue is found in epiphytes. Such as in orchids and clivia species aerial roots. It is a multilayered tissue that is spongy in nature which covers the aerial roots of epiphytic plants such as Orchids. It helps in the absorption of water.

653. The ovule in which the funicle, chalaza and micropyle lie in one vertical plane, is called
(a) Campylotropous (b) Amphitropous
(c) Orthotropous (d) Anatropous

J&K CET-2011

@apna_pdf

Ans. (c) : The ovule in which the funicle, chalaza and micropyle lie in one vertical plane, is called orthotropous. Orthotropous ovule is the simplest and very primitive type of ovule. Micropyle, funicle and chalaza lie in one vertical plane. Examples of plants having orthotropous ovules are piper. Nigrum, polygonum, piper betal and all gymnosperms.

654. Which is regarded as urinary bladder of embryo?

(a) Amnion (b) Allantois
(c) Chorion (d) Yolk sac

BVP-2009

Ans. (b) : Allantois is regarded as urinary bladder of embryo. Allantois collect liquid waste from the embryo. It also helps in the exchange of respiratory gases. The chorionic fluid protects the embryo from exchange of nutrients, oxygen and waste products.

655. Double fertilization occurs in

(a) Riccia (b) Pteridium
(c) Cycas (d) Capsella

JIPMER-2011

Ans. (d) : Double fertilization occurs in capsella. It is the characteristic feature of angiosperms plants. Double fertilization in flowering plant reproduction, the fusion of the egg and sperm and the simultaneous fusion of a second sperm and 2 polar nuclei that ultimately results in the formation of the endosperm of the seed.

• Capsella is a biennial and a herbaceous plant present in brassicaceae of the mustard family.

656. The fertilization in which male gametes are carried through pollen tube is known as

(a) syngamy (b) porogamy
(c) siphonogamy (d) chalazogamy

Manipal-2008

Ans. (c) The fertilization in which male gametes are carried through pollen tube is known as siphonogamy. It is a condition in plants where pollen tubes are developed for the transfer of the male cells to the egg. The seed plants are siphonogamons while in lower plants the male cells usually swim to the eggs. As a consequence the spermatophytes are called as siphonogamons by some botanists.

657. Read the following statements and identify the correct options given

(A) Angiosperms range in size from microscopic Wolffia to tall trees of Eucalyptus
(B) In angiosperms, the seeds are enclosed by fruits
(C) Double fertilisation is an event unique to angiosperms
(D) In angiosperms, each cell of an embryo sac is diploid
(E) In angiosperms, the zygote develops into an endosperm

Of the above statements

(a) (A), (B) and (D) alone are correct
(b) (A), (B) and (E) alone are correct
(c) (A), (B) and (C) alone are correct
(d) (B), (C) and (D) alone are correct
(e) (B), (C) and (E) alone are correct

Kerala PMT-2014

Ans. (c) : Wolffia is one of the smallest flowering plants on the earth and wolffia is an example for aquatic plants and resembles corn meal specks that float on water.

• In the angiosperms, the seeds are surrounded by one of two integuments which develop into a seed coat that is usually hard.

• Double fertilization is a characteristic feature of angiosperms. In this process of double fertilization both diploid zygote and triploid endosperm are formed. Double fertilization is complex process where out of two sperm cells, one fuses with the egg cell and the other fuses with two polar nuclei which result in a diploid (2n) zygote and a triploid (3n) primary endosperm nucleus respectively.

658. The angiosperm showing symbiotic association with blue green algae is

(a) lens (b) cyamopsis
(c) trifolium (d) none of these

Punjab MET-2011

Ans. (c) : Clover or trefoil are common names for plants of the genus trifolium, flowering plants in the lagume or pea family fabaceae originating in Europe. It shows symbiotic association with blue- green algae.
Cyamopsis is also a genus of family fabaceae in its unmodified form, this food additive is used as a thickener in a large variety of food products.

659. Dolichos lablab is a

(a) straggler (b) climber
(c) twiner (d) runner

Punjab MET-2011

Ans. (c) : Dolichos is a genus of legume family. These are herbs and shrubs growing upright sometimes with climbing stem or spreading prostrate upon the ground. They have woody rhizomes.

660. Why is vivipary an undesirable character for annual crop plants?

(a) It reduces the vigour of plant
(b) The seeds cannot be stored under normal conditions for the next season
(c) The seeds exhibit long dormancy
(d) It adversely affects the fertility of the plant

JIPMER-2007

Ans. (b) : Vivipary is an undesirable character for annual crop plants because the seeds cannot be stored under normal conditions for the next season. It adversely affects the fertility of the plants. It is defined as the precocious and continuous growth of the offspring when still attached to the maternal parent.

661. The ability of the venus flytrap to capture insects is due to

(a) chemical stimulation by the prey
(b) a passive process requiring no special ability on the part of the plant
(c) specialized "muscle-like" cells
(d) rapid turgor pressure changes

JIPMER-2007

Ans. (d) : The ability of the venus flytrap to capture insects is due to change in rapid turgor pressure. It does not have muscle cell and chemical secreted by different insects does not affect the working of insectivorous plants.

@apna_pdf

662. Seeds possess spongy aril in

(a) Eichhornia (b) Potamogeton
(c) Sagittaria (d) Nymphaea

AP EAMCET-2007

Ans. (d) : Seeds possess spongy aril in Nymphaea. It is genus of hardy and tender aquatic plants in the family Nymphaeaceae.
The fruit dehisces by the swelling of mucilage surrounding the seeds.

663. Study the following lists.

List I	List II
(A) Ribbon-shaped leaves	**1. Calotropis**
(B) Shiny leaf surfaces	**2. Ceratophyllus**
(C) Swollen and spongy petiole	**3. Potamogeton**
(D) Dissected leaves	**4. Vallisneria**
	5. Eichhornia

The correct match is :

	A	B	C	D
(a)	3	4	1	2
(b)	4	1	5	2
(c)	5	1	2	3
(d)	4	2	5	3

AP EAMCET-2010

Ans. (b) : Vallisneria – It is a submerged plant that spread by runners and sometime forms all underwater meadows.
Calotropis – The leaves of ***Calotropis procera*** are said to be valuable as an antidote for snake bite, sinus fistula. The leave of ***Calotropis procera*** are also used to treat jaundice.
Eichhornia – Eichhornia, commonly called **water hyacinths** was a polyphyletic genus of the aquatic flowering plant family Pontederiaceae.
Dissected leave – Compound leaves have separate leaflet each having its own stalk petiole. Leaves may be double or triple dissected. May be entire or toothed lobbing shallow.

Match	
(a) Ribbon –Shaped leaves	Vallisneria
(b) Shiny leaf surfaces	Calotropis
(c) Swollen and Spongy petiole	Eichhornia
(d) Dissected leave	Ceratophyllus

664. Study the following lists.

List I	List II
(A) Heterophyllous Plant	**(i) Asparagus**
(B) Plant without root	**(ii) Wolffia**
(C) Plant with largest simple leaves	**(iii) Sagittaria**
(D) Plant with succulent roots	**(iv) Tribulus**
	(v) Victoria regia

The correct match is :

	A	B	C	D
(a)	3	2	5	1
(b)	3	4	2	1
(c)	1	5	3	2
(d)	3	1	2	5

AP EAMCET-2010

Ans. (a) : Sagittaria- Sagittaria is a heterophyllous plant. It is a perennial herb tall, with arrow-shaped, long leaves and white flower, buds, vintage line drawing or engraving illustration.
Wolffia- Wolffia species are free-floating thalli, green or yellow-green, and without roots. The flower is produced in a depression on the top surface of the plant body. It has one stamen and one pistil.
Victoria- ***Victoria amazonica*** is a species of flowering plant, the largest of the water lily family Nymphaeaceae. It is the national flower of Guyana.
Asparagus- Asparagus has succulent roots because the plant stores food in them making fleshy and helpful in perrenation. It is a fibrous vegetable that may support a healthy gut, as well as lower the blood pressure.

List I	List II
(A) Heterophyllous Plant	Sagittaria
(B) Plant without root	Wolffia
(C) Plant with largest simple leave	Victoria
(D) Plant with succulent root	Asparagus

665. The ratio of components of male flower of Smilax, female flower of *Ruscus*, modified reproductive shoots of *Scilla* and *Tephrosia* is.

(a) 4 : 3 : 5 : 7 (b) 7 : 5 : 4 : 3
(c) 7 : 3 : 5 : 4 (d) 4 : 7 : 5 : 4

AP EAMCET-2010

Ans. (c) : The ratio of components of male flower of smilax, female flower of Ruscus, modified reproductive shoots of scilla and Tephrosia is 7 : 3 : 5 : 4. The male flower have six stamens arranged in two whorls of three each. The female flowers have well developed pistils and remnants of anthers that are degenerated in the early developmental phases of flower bud.

666. Choose the group of plant belonging to xeropytes.

(a) Agave, Aloe, Sagittaria
(b) Calotropis, Casuarina, Helianthus
(c) Alfa-alfa, aloe, Ephedra
(d) Sonneratia, Casuarina, Agave

UP CPMT-2014

Ans. (c): xeropytes plants are a group of plants that are adapted to survive in arid regions like desert and snow-covered areas. It have stomata with microscopic opening and elongated leaves that store large amount of water. Alfa-alfa, aloe and ephedra belong to xerophytic plants.

667. Carnivorous plants are

(a) Autotrophic parasite and heterotrophic
(b) Parasite and behave as autotrophs
(c) Photoautotrophs and chemoautotrophs
(d) Autotrophs but show heterotrophic mode of nutrition

UP CPMT-2014

Ans. (d): Carnivore (insectivorous) plants are autotrophs plants. They perform process of photosynthesis. These plants usually grow in nitrogen deficient soil and capture insect to fulfill nitrogen deficiency. Therefore, show heterotrophic mode of nutrition.

668. During the process of microsporogenesis in angiosperms, how many tetrads are formed, from a single microspore?

(a) 1 (b) 2
(c) 8 (d) 4

UP CPMT-2014

@apna_pdf

Ans. (a): During the process of microsporogenesis in angiosperms a single microspore forms one tetrads. Young microspore mother cell is (polygonal and are tightly packed) get loosely scattered due to increase in size of pollen grains sac. Microspore mother cell is a diploid cell in plants that divide by meiosis to give rise to 4 haploid cells.

669. Which one group of organism possess minimum number of chromosome?

(a) Brassica oleracea and Mucor hemolysis
(b) Carica papaya and Haplopappous gracilis
(c) Pisum sativum and Mucor hemolysis
(d) Haplopappus gracilies and Mucor hemolysis

UP CPMT-2014

Ans. (d): *Haplopappus gracilis* and *Mucor hemolysis* are angiospermic plant and a bread mould fungi respectively. These two organism possess minimum number of chromosome. In *Mucor hemolysis* n = 2 and in *Haplopappus gracilies* 2n = 4, *Carica papaya* and *Pisum sativum* contain 18 and 14 number of chromosomes respectively.

670. During the characteristic feature of angiosperm (double fertilization) one of the sperm fuses with egg cell and other sperm fuses with

(a) Another egg cell to form 3n tissue
(b) Nuclear cell to form 2n tissue
(c) Central cell to form triploid tissue
(d) Two nuclei to form diploid tissue

UP CPMT-2014

Ans. (c): In angiosperm fertilization is carried out by syngamy (fusion of egg cell with sperm or male nucleus) and another nucleus fuses with secondary nucleus (two polar nuclei or central cell) to form triploid tissue, endosperm. Thus, fertilization is completed in two steps, it is referred as double fertilization.

671. Assertion (A) True xerophytes store water in the form of mucilage which helps to withstand prolonged period of drought.
Reason (R) Vascular and mechanical tissues are well developed in true xerophytes.
The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A).
(c) Only (A) is true, but (R) is not true
(d) (A) is not true but (R) is true

AP EAMCET-2009

Ans. (d) : Xerophytes are plant adapted to live in dry condition. Common leaf adaptation to reduce the rate of transpiration include; Thick waxy cuticle that act as a barrier to evaporation.
Sunken Stomata in pith in the epidermis trap moist air that reduces evaporation rate.
Xerophytes posses thick, waxy, cuticle, multilayered epidermis, well developed mechanical tissues because. They are exposed to winds. These mechanical tissues are composed of sclerenchyma or other lignified tissues in stem.

672. From evolutionary point of view, tracheids and sieve cells are more primitive than tracheae and sieve tubes respectively. The angiosperms have

(a) tracheae and sieve tubes
(b) tracheids, tracheae and sieve tubes
(c) tracheae, sieve cells and sieve tubes
(d) tracheids, tracheae and sieve cells

AP EAMCET-2009, 2011

Ans. (b) : In angiosperm, xylem consists of tracheids, vessels or tracheae, xylem fibre and xylem parenchyma. Sieve cells and tracheids are also primitive structure which are present in gymnosperms. Tracheae are absent in Pteridophytes and Gymnosperm.
In angiospermic phloem sieve elements are sieve tubes while, in gymnosperms and pteridophytes sieve cells are found.

673. Arrange the following in the order of their location from periphery to centre in the entire dicotyledonous plant body

(i) Fusiform cells
(ii) Trichoblasts
(iii) Collocytes
(iv) Tylosis
The correct sequence is

(a) (iv), (i), (ii), (iii)
(b) (ii), (iii), (i), (iv)
(c) (iii), (ii), (i), (iv)
(d) (i), (iv), (iii), (ii)

AP EAMCET-2009

Ans. (b) : The correct sequence of structures in order of their location from periphery to centre in a dicot is trichoblasts→ Collocytes→ Fusiform cell → Tyloses of both dicot root and dicot stem.
Fusiform cells are found in the vascular cambium of dicot root and stems.
Trichoblast present in the epidermis of root
Collocytes is present in the collenchymatous hypodermis a part of cortex.
Tylosis are balloon shaped structures present in the vessels of heart wood.

674. Which is correct regarding saprophytic angiosperm?

(a) They secrete enzyme outside the body and absorbes the nutrients.
(b) They have mycorrhiza with fungi
(c) They takes food and then digested it
(d) They are photosynthetic

UP CPMT-2006

Ans. (a) : Saprophytic organism break dead organic matters by secreting digestive enzymes and then absorb the nutrient molecules from dead organisms. They excrete hydrophytic enzyme into the external medium. These enzyme are cellulose, chitinase, amylase, proteinase etc. They hydrolyze different component for organic matter and then the simple and soluble substance are absorbed.

@apna_pdf

675. Match the following lists

List I	List II
(A) Turrill	(i) Tissue culture
(B) Goethe	(ii) Pollen grains
(C) Salisbury	(iii) Nucleosome
(D) oudet	(iv) Flower- a modified stem
	(v) Stomatal index

The correct match is

	A	B	C	D
(a)	(iii)	(i)	(iv)	(v)
(b)	(v)	(ii)	(iii)	(iv)
(c)	(iv)	(i)	(ii)	(iii)
(d)	(ii)	(iv)	(v)	(iii)

AP EAMCET-2013

Ans. (d) :
(a) Turill - (ii). Pollen grains
(b) Goethe - (iv). Flower- a modified stem
(c) Salisbury - (v).Stomatal index
(d) Oudet - (iii). Nucleosome
The study of pollen grams and palynology, its classification and nomeclature was studied by Turill.
Flower is a modified shoot because it develops in the axils of bracts like axillary shoots and leaves are modified into the floral structures.
Stomatal index- It is the percentage of the number of stomata cells present to the total number of epidermal cells. Stomatal index is a term introduced by Salisbury in 1927.
Oudet studied the linker histone dependent DNA structure in a linar mononucleosome.

676. Halophytes are
(a) Fire resistant (b) Cold resistant
(c) Salt resistant (d) Sand loving

AMU-2009
CMC Vellore-2010

Ans. (c) : Halophytes are the plants which grow in saline condition or high salt concentration of generally $NaCl_2$, $MgCl_2$, $MgSO_4$ etc. These plants thus face physiological dryness.

677. Of the known flowering plants, the number of species of monocots is a partly
(a) 5000 (b) 50,000
(c) 5,00,000 (d) 555,00,000

AMU-1999

Ans. (b) : Monocotyledons commonly referred to as monocots are grass and flowering plants, the seeds of which typically contain only one embryonic leaf or cotyledon. The monocots include about 60,000 species. The largest family in this group by number of species are the orchids (family orchidacea) with more than 20,000 species.

678. Which of the following is an insectivorous plant?
(a) Nepenthes (b) Solarium
(c) Cuscuta (d) Asparagus

AMU-2001

Ans. (a) : Insectivorous plants are a special type of plants commonly called as carnivorus plants that drive their nutrition by feeding on insect and other organisms because they grow in the soil with low nitrogen content. Nepenthes (pitcher plant) is an example of insectivorous plants. Other insectivorous plants are venus fly trap and bladder wort.

679. Match the following with correct combination

	Column I		Column II
(A)	**Cuscuta**	**(1)**	**Saprophyte**
(B)	**Eichornia**	**(2)**	**Pneumatophore**
(C)	**Monotropa**	**(3)**	**Insectivorous plant**
(D)	**Rhizophora**	**(4)**	**Parasite**
(E)	**Utricularia**	**(5)**	**Root pocket**

(a) A-4, B-3, C-1, D-5, E-2
(b) A-4, B-5, C-1, D-2, E-3
(c) A-2, B-3, C-1, D-5, E-4
(d) A-3, B-1, C-5, D-4, E-2
(e) A-2, B-5, C-4, D-3, E-1

Kerala PMT-2008

Ans. (b) :

A.	Cuscuta	Parasite
B.	Eichornia	Root pocket
C.	Monotropa	Saprophyte
D.	Rhizophora	Pneumatophore
E.	Utricularia	Insectivorous plant

A. Cuscuta is parasite of higher plant commonly called as dodder or Amarbel.
B. Eichornia or water hyacinth belongs to the genus of aquatic flowering plants which develop root pocket to float freely in the water.
C. Monotropa is a herbaceous perennial plants which is saprophyte.
D. Rhizophora belongs to the mangrove vegetation with adaptations such as pneumatophore.
E. Utricularia or bladderworts is an insectivorous plant.

680. One of these is not related to dicots
(a) Two cotyledons
(b) Leaves reticulated
(c) Secondary growth
(d) Pollen with three furrows

UP CPMT-2013

Ans. (d) : Dicotyledonous plants are also called angiosperms. Its root develop from the radicle and seed has two cotyledons. Their leaves have reticulate venation. Secondary growth is present in the dicot plant which occur with the help of vascular cambium and phellogen but they are not related to pollen with three furrows.

681. Utricularia grows in
(a) evergreen forests
(b) lakes and ponds as submerged hydrophyte
(c) bog as a marsh plant
(d) tropical deciduous forest

Uttarakhand PMT-2011

Ans. (b) : Utricularia grows in lakes and ponds as submerged floating hydrophytes. These plants remain under water completely and none of them have true roots. These can be grown in containers as house plants. It is carnivorous plants.

682. Choose the correct match
Bladderwort, sundew, venus flytrap : -
(a) Nepanthese, Dionaea, Drosera
(b) Nepanthese, Utricularia, Vanda
(c) Utricularia, Drosera, Dionaea
(d) Dionaea, Trapa, Vanda

AIPMT-2002

@apna_pdf

Ans. (c) : Scientific Name of bladderwort is Utricularia
Scientific Name of sundew is Drosera
Scientific Name of venus flytrap is Dionaea
It can be seen as exemplars of key traits genetically associated with carnivory i.e. trap leaf development, prey digestion and nutrient absorption.

683. Read the following lists.

List-I	List-II
(A) Extra foliar nectaries	**1. Achras**
(B) Schizogenous cavities	**2. Tropaeolum**
(C) Laticiferous ducts	**3. Passiflora**
(D) Hydathodes	**4. Eucalyptus**
	5. Pinus

	A	B	C	D
(a)	3	1	2	4
(b)	2	1	3	4
(c)	3	5	1	2
(d)	5	2	1	3

AP EAMCET-2008

Ans. (c) :
(a) Extra foliar Nectaries - Passiflora
(b) Schizogenous cavities - Pinus
(c) Laticiferous ducts - Achras
(d) Hydathodes - Tropaeolum

684. Read the following lists

List-I	List-II
(A) Gall flowers	**1. Theobroma**
(B) Sympodial axis	**2. Bougainvillea**
(C) Achlamydeous	**3. Ficus**
(D) Cauliflory	**4. Euphorbia**
	5. Hamelia

	A	B	C	D
(a)	3	5	1	2
(b)	3	4	2	1
(c)	3	4	1	2
(d)	3	5	4	1

AP EAMCET-2008

Ans. (d) : Gall flowers - Ficus
Sympodial axis - Hamelia
Achlamydeous - Euphorbia
Cauliflory - Theobroma

685. Study the following table

i.	Peperomia	Leaf succulent	Leaf epidermal cells store water
ii.	Calotropis	Non-succulent	Root with thickened cell walls
iii.	Tribulus	Ephemeral	Stem stores water
iv.	Ammophila	Dicot plant	Rolling in of leaves to check water loss

Identify the correct pair of answers.
(a) i, ii (b) i, iii
(c) ii, iii (d) ii, iv

AP EAMCET-2008

Ans. (a) : Peperomia – Peperomia are small plants which are similar to hoyas in their care. Both are succulent like with fleshy leaves and stems. Peperomia are commonly referred to as radiator plant and baby rubber plants. It occurs in all tropical and subtropical regions of the world.
(b) Calotropis – Calotropis is a genus of flowering plants in the family Apocynaceae, first described as a genus in 1810.
Calotropis has thick leaf but non-succulent but has thick cell wall in the root cells.

686. Match the following column-I with column-II.

Column-I	Column-II
A. Agrostology	1. Earth
B. Smallest flowering plant	2. Genetic engineering
C. Tectonic	3. Migration
D. Ecesis	4. Wolffia
E. Euphenics	5. Grass

	A	B	C	D	E
(a)	5	4	1	3	2
(b)	1	2	3	4	5
(c)	2	3	1	5	4
(d)	4	2	2	1	3

AIIMS-2015

Ans. (a) :

A.	Agrostology	1.	Grass
B.	Smallest flowering plant	2.	wolffia
C.	Tectonic	3.	Earth
D.	Ecesis	4.	Migration
E.	Euphenics	5.	Genetic engineering

687. Shock movement in touch me not plant is
(a) seismonasty (b) photonasty
(c) chemonasty (d) thermonasty

Punjab MET-2008

Ans. (a) : Shock movement in "touch me not plant" is seismonasty. It is due to the change in turgidity eg. Mimosa pudica. The leaf of Mimosa is compound having four pinna and each pinna is having pinnules. If a terminal pinnule is touched, the whole leaf droops down. This is due to fact that at the bases of pinnules, pinna and whole leaf, swollen structure called, pulvinus is present and drooping is due to loss of turgidity of lower portion of pulvinus.

688. Interxylary as well as intraxylary phloem is present in
(a) Bignonia (b) Mirabilis
(c) Strychnos (d) Achyranthes

Punjab MET-2007

Ans. (c) : In Strychnos bredemeyeri small segments of the cambium cease to produce secondary xylem temporarily and produce more phloem centrifugally. A new segment of the cambium differentiates outside to this phloem, which unite with the regular cylinder to form a complete ring by leaving the cambium segment in the furrow. Such repeated activity of cambium results in inclusion of phloem islands within the secondary xylem called intraxylary phloem. Beside interxylary phloem, intraxylary phloem is added from the marginal pith cells.

689. Identify the pair of wrong statements from the following
(I) Branches of limited growth in Asparagus perform photosynthesis.
(II) petiole of Australian Acacia helps in climbing
(III) Floral bud of Agave store food materials

@apna_pdf

(IV) Aerial roots of Taeniophyllum helps in vegetative propagation.

(a) I, IV (b) I, II
(c) III, IV (d) II, IV

AP EAMCET-2016

Ans. (d) :
(ii) Petiole of Australian Acacia helps in photosynthesis because petiole is modified into leaf like structure called phyllode which performs the function of synthesis of food.
(iv) The aerial roots Taeniophyllum orchids have velamen tissue which absorb moisture from the air.

690. The branch of biology that deals with study of grasses is known as

(a) anatomy (b) agrostology
(c) anthology (d) agronomy
(e) ecology

CMC Vellore-2015

Ans. (b) : The branch of biology that deals with the study of grasses is known as Agrostology.
• Anatomy is the science that studies the structure of the body.
• Anthology is the study of flowers and flowering plants. Anthos means a flower and logia means collection.
• Agronomy is a branch of agriculture dealing with the field crop production and soil management.
• Ecology is the study of organism, and how they interact with the environment around them.

691. The most common type of ovule in angiosperms is

(a) amphitropous (b) atropous
(c) anatropous (d) circinotropous

Punjab MET-2009

Ans. (c) : The most common type of ovule is the anatropous ovule found in angiosperm. An ovule is a small body that contains the female germs cells of a plant.
• An anatropous ovule is one in which curvature during development results in displacement of the micropyle to a position adjacent to the funiculus base.

692. The most thoroughly studied of the known bacteria-plant interactions is the

(a) cyanobacterial symbiosis with some aquatic ferns
(b) gall formation on certain angiosperms by Agrobacterium
(c) nodulation of Sesbania stems by nitrogen fixing bacteria
(d) plant growth stimulation by phosphate solubilizing bacteria

Manipal-2007

Ans. (b) : There are several types of plant microbe interactions such as, competition, Commensalism, Mutualism, Parasitism.
Plants and bacteria do interact with one another in a variety of ways. The agrobacterium crown gall phenomenon is to date the most thoroughly studied and best documented of the known bacteria-plant interactions. This bacterium contains a large Ti plasmid which is extensively used as natural genetic engineer in plant genetic engineering.

693. Rarely among angiosperms the pollen grains influenced the endosperm. This is called as

(a) metaxenia
(b) nemec phenomenon
(c) xenia
(d) mesogamy

UP CPMT-2004

Ans. (c) : The classical example of pollen grain influence of endosperm can be seen in maize commonly known as mays. The transfer of character by a male gametes and its influence on endosperm is known as xenia.
• The term xenia was originally coined to refer direct effect of pollens on seed and fruit characters or effect of gene from male parent on development of fruit and seed.

694. Which of the following is a saprophytic angiosperm?

(a) Agaricus (b) Cuscuta
(c) Neottia (d) Eucalyptus

AFMC-2000

Ans. (c) : The plants belonging to genus Neottia lack leaves and chlorophyll and obtain their nutrition from fungi or by Saprophytic nutrition.
• Saprophytes cannot produce their own food as autotrophs, where as heterotrophs cannot produce or manufacture their own food.

695. A plant which lives on another plant but do not take food or anything from plant is called:

(a) endophyte (b) epiphyte
(c) parasite (d) host

AFMC-2005

Ans. (b) : Epiphytes are those plants which are attached to another plant but do not grow parasitically upon it merely uses it for support.
• Epiphytes have no attachment to the ground or other obvious nutrient source and are not parasitic on the supporting plants.
Example- Orchids, mosses etc.

696. The ploidy of the pollen grain in Cyperus is:

(a) 4n (b) 3n
(c) 2n (d) n

BHU PMT-2003

Ans. (d) : The ploidy of the pollen grain in cyperus is haploid (n). Pollen grains are sperm producing structure therefore represent the male gametophyte or microgametophyte.

697. In Ficus inflorescence is :

(a) hypanthodium (b) cymose
(c) raceme (d) none of these

Punjab MET-2003

Ans. (a) : The specialized inflorescence in ficus is called Hypanthodium. The receptacle is fleshy and forms a hollow ball-like structure having an opening in hypanthodium.
• An important characteristics feature of figs is their unique style of inflorescence.
• Ficus forms a large group of woody plants called fig trees or figs.

698. In CAM plants :

(a) stomata open in day and close at night
(b) stomata remain open in day and night both

@apna_pdf

(c) stomata remain closed in day and night both
(d) stomata open at night and close in day

Rajasthan PMT-2009 / JIPMER-2004
Punjab MET-2003

Ans. (d) : In plant using full CAM, the stomata in the leaves remains closed during the day to reduce evapotranspiration, but open at night and close in day. It collects the CO_2 in night.

- CAM (crassulacean acid metabolism) also known as CAM Photosynthesis, is a carbon fixation pathway that evolved in some plants as an adaptation to arid condition.

699. The Orobanche plant is:
(a) partial stem parasite (b) total root parasite
(c) symbiont (d) total stem parasite

Punjab MET-2003

Ans. (b) : Orobanche is a root parasite, commonly known as broomrape, is a genus of over 200 species of small parasitic herbaceous plants.
Most of the plants are autotrophic. However some plants are heterotrophs and obtain their nutrition parasites and saprotrophs.

- It attaches to the root of the plants and absorb water from plant and nutrition. Example- Rafflesia and Cuscuta.

700. How many cells are present in female gametophyte of Capsella just before fertilization?
(a) 2 (b) 3
(c) 5 (d) 7

Rajasthan PMT-1996

Ans. (d) : The female gametophyte develops from a single functional megaspore. The megaspore undergoes many mitotic divisions to form 7-cells.

- In the female ovule, among four meiotic products only one megaspore cell survives and undergoes three synctial divisions producing the embryo sac with 7-8 nuclei.

701. Vivipary is present in:
(a) Peepal (b) Neem
(c) Rhizophora (d) Jamoon

J&K CET-2009
Rajasthan PMT-1996

Ans. (c) : Plant vivipary is the process of giving birth to young seedlings in advanced stages of development. It is a special type of seeds germination occurring in plants growing in sea cost and salt lakes like Rhizophora, Sonneratia and Heritiera.

- Vivipary is the condition where the embryo (the young plant within the seed) grows first to break through the seed coat then out of the fruit wall while still attached to the parent plant.

702. How many cells are present in mature male gametophyte capsella?
(a) 1 (b) 2
(c) 3 (d) 4

Rajasthan PMT-1996

Ans. (c) : Three cells are present in mature male gametophyte capsella. In some species of angiosperms, the generative cells divides to form two male gametes before pollination and the mature pollen is released at the 3- celled stage.

703. How many male nuclei takes part in double fertilization of capsella?
(a) 1 (b) 2
(c) 3 (d) 5

Rajasthan PMT-1996

Ans. (b) : Three male nuclei takes part in double fertilization of capsella. It is a fusion of two male gametes brought by a pollen tube to two different cells of the same female gametophyte to form zygote and endosperm.

704. CAM plants ecologically comes under which of the following category?
(a) Succulent plants (b) Mangrove plants
(c) Halophytes (d) None of these

Rajasthan PMT-1996

Ans. (a) : Succulent plants grow in habitats with less or no water. They store H_2O whenever it is available.
They have succulent & fleshy organs like stems, leaves & roots which serve as H_2O storage organs and accumulate large amounts of water during the brief rainy seasons, For example - Opuntia.

705. Cuscuta is a
(a) parasitic plant (b) symbiotic plant
(c) predator (d) decomposer

UP CPMT-2003
AIPMT-2002
BVP-2000

Ans. (a) : Cuscuta is a parasitic plant. It has no chlorophyll and can not make it own food by photosynthesis. They are also called as holo parasite

706. Angiosperms differ from gymnosperms in
(a) seeds
(b) fruits
(c) male gametophyte
(d) female gametophyte

UP CPMT-2003

Ans. (b) : Angiosperms differ from gymnosperms in fruit. It is also flowering plants, angiosperms have seeds that are enclosed within an ovary.
Gymnosperms have no flowers or fruits and have unenclosed seeds on the surface of scales or leaves. The seed of angiosperms develop in the ovaries of flowers and are surrounded by a protective fruit.

707. A material which arrests cell division, is obtained from
(a) Crocus (b) Colchicum
(c) Dalbergia (d) Chrysanthemum

Uttarakhand PMT-2007

Ans. (b) : Colchicine is a chemical that is derived from the corms of a plant called colchicum. This can cause somatic doubling, which means that the number of chromosomes in a cell can double.

708. Leucaena leucocephala is
(a) A small leguminous tree with edible fruits and seeds.
(b) A fodder plant as its pods and leaves are consumed by cattle
(c) Called subabul in India
(d) All of the above

VMMC-2013

@apna_pdf

Ans. (d) : Leucaena leucocephale (wild Tamarind) is a small fast growing mimosoid tree. They are evergreen shrub or tree with fairly open, rounded crown. It can grow upto 5 to 20 meter tall. They are small leguminous tree with edible fruit and seeds. Its pods and leaves are consumed by the cattle and generally known as subabul in India.

709. Coconut fruit is dispersed by

(a) man (b) wind
(c) birds (d) water

Manipal-2011

Ans. (d) : Coconut fruit is dispersed by water. Cocos nucifera commonly known as coconut palm comes in the family of Arecaceae. The seeds have spongy or fibrous outer coat which float on water. It becomes light in weight in water and it is able to cover a large distance.

710. Haustorial root is exceptional to

(a) Zea mays (b) cactus
(c) Cuscuta (d) Monotropa

AFMC -2011

Ans. (c) : Cuscuta is a parasite plant because it is a leafless plant with yellow stem. It can not synthesis its own food due to the absence of chlorophyll. Haustorial root is exceptional to cuscuta.

711. According to engler and prantl system the

(a) Angiosperms are placed before gymnospenns
(b) Dicots are placed before monocots
(c) Monocots are placed before dicots
(d) Archichlamydeae is placed before dicots

BHU PMT (Mains)-2011

Ans. (c) : According to engler and prantl system the monocots are placed before dicots. From various groups of gymnosperms, Angiosperms are evolved monocots and then dicots. From angiosperms 1st evolved monocots and then dicots. It means that dicots are advanced whereas monocots are primitive.

712. Figs belong to

(a) critical link species, as they form connecting link between trees and herbs
(b) critical link species, as they establish essential link in the absorbance of nutrients from soil and organic residues.
(c) keystone species, as they produce large quantity of fruits; and their protection leads to conservation of animals dependent on them
(d) keystone species, as they have high degree of animal-dependent pollination

DUMET-2010

Ans. (c) : Figs represent keystone species because they produce large quantity of fruits; and their protection leads to conservation of animals dependent on them.

713. Vegetative fertilization is also called

(a) triple fusion
(b) true fertilization
(c) syngamy
(d) generative fertilization

J&K CET-2009

Ans. (a) : Vegetative fertilization is also called triple fusion. It involves the fusion of second male gamete with two polar nuclei or their fusion product. As a consequence, a triploid primary endosperm nucleus develops, splits and produces triploid endosperm.

714. During the process of sexual reproduction in flowering plants, double fertilization involves

(a) fertilization of egg cell by two male gametes
(b) fertilization of egg cell and a central cell by two male gametes brought by same pollen tube
(c) fertilization of egg cell and a central cell by two male gametes brought by different-pollen tube
(d) fertilization of two egg cells by two male gametes brought by same pollen tube

J&K CET-2014

Ans. (b) : During the process of sexual reproduction in flowering plants, double fertilization involves fertilization of egg cell and a central cell by two male gametes brought by same pollen tube. Triploid endosperm nuclei are created when two polar nuclei fuse with haploid sperm.

715. Consider the following statements with respect to angiosperms

(A) The male sex organ in a flower is the stamen
(B) The anthers following mitosis produce pollen grains
(C) In an embryo sac, the primary endosperm nucleus (PEN) is diploid
(D) After double fertilization the ovules develop into seeds and ovaries develop into fruit

Of the above statement

(a) C and D are correct (b) A and B are correct
(c) A and C are correct (d) A and D are correct
(e) B and C are correct

Kerala PMT-2015

Ans. (d) : The male sex organ in a flower is called stamen and after double fertilization the ovules develop into seeds and ovaries develop into fruit. The PEN is triploid and is formed by the process of triple fusion. The pollens are produced by meiosis. Hence, statement A & D are correct with respect to angiosperms.

716. The fleshy receptacle of syconous of fig encloses a number of

(a) achenes (b) samaras
(c) berries (d) mericarps

BHU PMT (Screening)-2010

Ans. (a) : The fleshy receptacle of syconous of fig encloses a number achenes. A syconium is the type of inflorescence borne by figs (genus ficus) formed by an enlarged, fleshy, hollow receptacle with multiple ovaries on the inside surface. A multitude of achenes which are produced by the development of female flowers into achenes inside the inflorescence's closed receptacle, are produced.

717. Grafting is successful in dicots but not in monocots because the dicots have

(a) vascular bundles arranged in a ring
(b) cambium for secondary growth
(c) vessels with elements arranged end to end
(d) cork cambium

Rajasthan PMT-2010

Ans. (b) : Grafting is successful in dicots but not in monocots because the dicots have cambium for secondary growth. Cambium have the capacity to form secondary xylem and pholem. It is present in dicots and absent in monocots.

@apna_pdf

718. In CAM plants, CO_2 acceptor is
(a) RuBP (b) PEP
(c) OAA (d) PGA
MGIMS Wardha-2008

Ans. (b) : In CAM plants, CO_2 acceptor is phosphoenol pyruvic acid (PEP) during night while ribulose bisphosphate is CO_2 acceptor during day time.

719. In Gloriosa, the tendrillar part is formed by
(a) stipule (b) leaf apex
(c) leaf petiole (d) axillary bud
AMU-2011

Ans. (b) : In Gloriosa, the tendrillar part is formed by leaf apex. Leaf apex in the tip of the leaf which can vary in shapes and sizes in different plants.

720. The wood used for making musical instruments as xylophone is
(a) Dalbergia (b) Tactona
(c) Plywood (d) Santalum
AMU-2011

Ans. (a) : The wood used for making musical instruments as xylophone is the Dalbergia. It is Indian rose wood. It consists of a frame of wood pitched bars which rests on a metal stand which has wheels for ease transport. These bars are made of Rose wood.

721. The component of cell wall of the vessel of an angiospenn is a complex compound of
(a) glucose (b) galacmronic acid
(c) coniferyl alcohol (d) chitin
AMU-2011

Ans. (c) : The component of cell wall of the vessel of an angiospenn is a complex compound of coniferyl alcohol. The component of cell wall of the vessel of an angiosperm is a complex compound of coniferyl alcohol.

722. Which one of the following is matched incorrectly?
(a) Pinus Coralloid roots
(b) Sequoia Tap roots
(c) Cycos Unbranched stem
(d) Cedrus Branched stem
AMU-2010

Ans. (a) : The coralloid roots are found in cycadophytes. The caralloid roots contain symbiotic cyanobacteria (blue-green algae), which fix nitrogen and in association with root tissues and form beneficial amino acids, for example:- asparagine.

723. If an angiospermic plant produces unisexual and bisexual flowers on the same plant, the condition would be termed as
(a) Dioecious (b) Trioecious
(c) Polygamous (d) Andro-gynoecious
AMU -2000

Ans. (c) : If an angiospermic plant producs unisexual and bisexual flowers on the same plant, the condition is termed as polygamous. For example, Mango.

724. Which of the following plant yields oil and fibre both ?
(a) *Cocos nucifera* (b) *Eucalyptus*
(c) *Brassica campestris* (d) *Euphorbia hirta*
MGIMS Wardha-2004

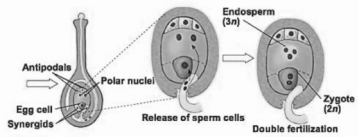
Ans. (a) : The *Cosos nucifera* or the coconut tree is a member of the palm family (Arecaceae family). The coconut term can refer to the entire coconut palm, the seed, the fruit which is botanically a drupe, not a nut. It yields both oil and fibre. The coconut oil is used as cooking oil as well as hair oil.

725. Cuscuta which climbs up the support with help of loop formation around the support. This type of movement is called:
(a) nutation
(b) nastic movement
(c) hygroscopic movement
(d) none of the above
VMMC-2006

Ans. (a) : Nutation, often called circumnutation, is a particular class of nastic movements, in which the plant organ successively bends in different directions, resulting in an apparent oscillatory swinging motion. Cuscuta plant is called a parasite.

726. Double fertilisation occurs among
(a) algae (b) bryophytes
(c) angiosperms (d) gymnosperms
UP CPMT-2008
BCECE-2007

Ans. (c) : Double Fertilisation is a process unique to angiosperm. The double fertilization is exhibited by angiosperms. Double fertilization is a process in which one of the male gamete fuses with the female egg and the other male gamete fuses with the two polar nuclei. Double fertilization includes both syngamy and triple fusion.



727. The endosperm found in angiospermic seed is different from that of gymnosperm in the sense that in the former
(a) it is formed before fertilisation while latter is formed after fertilization
(b) it is formed after fertilisation while letter is formed before fertilization
(c) it is cellular while latter is nuclear
(d) it is nutritive while latter is protective
Manipal-2015
Rajasthan PMT-2001

Ans. (b) : The gymnosperms are non-flowering plants that have naked seeds on the surface of scales or leaves whereas angiosperms are the flowering plants which have seeds that are encased inside an ovary. The endosperm found in the angiosperm seed is formed after fertilization or during triploid fusion while the endosperm is formed before fertilization in case of the gymnosperm. The endosperm is gymnosperms in pre fertilization tissue and haploid in nature but in angiosperms it is post fertilisation tissue and generally triploid in nature.

728. If the diploid number of an angiospermic plant is 24, the number of chromosomes in pollen grain, endosperm and integument will be
(a) 12, 36, 12 (b) 12, 24, 36
(c) 12, 12, 36 (d) 12, 36, 24
Manipal-2015

@apna_pdf

Ans. (d) : • The pollen grains are haploid in nature, so, No. of chromosome in pollen grain is-

$2n = 24$

$n = \frac{24}{2} = 12$

Endosperm is polyploidy, so it's going to have 3n chromosomes.

$n = 12$

$3n = 3 \times 12 = 36$

Integoment is diploid in nature, therefore, it is going to have 2n chromosomes,

$n = 12$

$2n = 2 \times 12 = 24$

Hence, Pollen grain, endosperm and integument will be 12, 36 and 24 respectively.

729. Female gametophyte of angiosperm consist of egg cell, synergids antipodal cell and central cell. Out of them egg apparatus consist

(a) two synergids and one egg cell
(b) three synergids cells
(c) antipodal cells and egg cell
(d) a nucleus and two antipodal cells

VMMC-2014

Ans. (a) : The egg apparatus of female gametophyte of angiosperm is three celled structures. It consists of one egg cell and two synergids on either side of egg cell. Three antipodal cells are present on chalazal side. The central cell (secondary nucleus) is binucleate and is present in centre of embryo sac (female gametophyte).

730. Eustele is present in :

(a) algae (b) dicots
(c) bryophytes (d) pteridophytes

JIPMER-2000

Ans. (b) : Eustele is a type of dissected siphonostele in which vascular cylinder appears in a ring of collateral or bicollateral vascular bundles separated by medullary rays e.g., Dicot stem, which referes to the typical features of the group, namely that the seed has two embryonic leaves or cotyledons.

731. Number of meiotic divisions necessary to produce 100 seeds in cyperus is

(a) 100 (b) 200
(c) 300 (d) 100

Manipal-2013

Ans. (b) : One microspore mother cell in the cyperaceae family generates just one pollen grain (Microspore), since the other 3 microspores degenerate. For the formation of 100 seeds, 100 egg cells and 100 pollen grains are required.

Therefore, the total number of meiotic division required to produce 100 seeds in Cyperus = No. of divisions required for egg cell + No. of divisions required for pollen grains = 100 + 100 = 200.

732. Consider the following statements associated with the germination of an angiospermous seed

(1) as the seed gets hydrated and germinates, enzymatic activity is increased

(2) the respiration rate of the germinal-seeds increases along with the increased enzymatic activity

(3) the increase in the respiratory rate continues till senescence

(4) rate of enzymatic activity decreases

(a) 1, 2 and 3 are correct.
(b) 1 and 2 are correct.
(c) 2 and 4 are correct.
(d) 1 and 3 are correct.

BHU PMT (Mains)-2008, 2006

Ans. (b) : The germination of an angiospermous seeds are associated with the following statements, as the seeds get hydrated and germinates, enzymatic activity is increased. The respiration rate of the germinating seed increases along with the increased enzymatic activity.

733. Triple fusion in angiosperm is the fusion of second sperm with

(a) Antipodal cell and one synergid cell
(b) Two antipodal cells
(c) Two synergid cells
(d) Two polar nuclei

AMU-2009

Ans. (d) : In Angiosperm, fertilization involves two important events- Syngamy and triple fusion. The triple fusion is a characteristic feature in angiosperms where the sperm nucleus fuses with the secondary polar nuclei in the embryo sac. After pollination the pollen tube in formed carrying male gametes that move toward the egg cell one of them fuses with it by completing syngany.

734. Tallest angiosperm is:

(a) Eucalyptus (b) red wood tree
(c) oak tree (d) Pinus

AFMC-2004

Ans. (a) : *Eucalyptus regnans* (375 ft.) is the tallest angiosperm. It is the tallest blooming plant and perhaps the tallest tree on the planet. The vast majority of these trees are quick cultivators,arriving at statutes of around 30 to 180 feet or more.

735. A normal angiosperm embyo sac at the final stage of development has

(a) 4 nuclei (b) 8 nuclei
(c) 3 nuclei (d) 7 nuclei

CG PMT-2006

Ans. (b) : In angiosperms, the ovule contains an embryo sac (female gametophyte) which is formed from a megaspore. The mature embryo sac has three cells called antipodals at the chalazal end and three cells at micropylar and constituting the egg apparatus. Each of these cells consists nuclei. The egg apparatus consists of two synegids and one egg cell. There is large central cell Present which consists of two polar nuclei. Hence, embryo sac has 7 cells and eight nuclei.

The poolen tube ultimatly enters an ovule throught the micropyle and penetrates one of the sterile cells on either side of the egg.

736. Angiosperms differs from gymnosperms because

(a) embryo is present in it
(b) tissue is present in it
(c) vessel is present in its xylem
(d) None of the above

CG PMT-2006

@apna_pdf

Ans. (c) : Angiosperms differ from gymnosperms in having specialized structures to cover seeds and have cells in the xylem. In angiosperm, there is presence of xylem vessels while xylem tracheids are present in gymnosperm.

737. An example of a parasitic plant which is strictly epiphytic is
(a) Cuscuta (b) Viscum
(c) Orobanche (d) Rafflesia

BHU PMT (Screening)-2011

Ans. (b) : Parasitic plants are the one which cannot prepare their own food, so the depend on the other plants for the food, to derive it plants, so for that they invade their stem or roots of the plants, they obtain nutrition and water both. Viscum is a common example of partial stem parasites, which grow as parasitic epiphytes on host plants. But it can carry out photosynthesis and manufacture their own food.

738. Which of the following is a rootless aquatic plant, in which a portion of the leaf forms a tiny sac for trapping insects?
(a) Nepenthes (b) Drosera
(c) Utricularia (d) Dionaea

DUMET-2009

Ans. (c) : The rootless aquatic plant named Utricularia that belongs to the genus bladderworts is a carnivorous aquatic plant. Utricularia or bladderwort is an insectivorous submerged aquatic plant in which the rootless floating stem bears highly dissected leaves. Some of the segmented leaves are modified to form bladders. Small insects flow into the bladder with water, but cannot come out due to the valve.

739. If Gnetum is not in flowering it may be mistaken for a
(a) tree fern (b) monocot plant
(c) dicot plant (d) None of these

CG PMT-2011

Ans. (c) : Flowers are the reproductive structures of plants that bear male and female gamets. The Gnetum is easily mistaken for a dicot plant unless it is in flowering or fruiting stage. The plant body is differentiated into root, stem and leaves. Ephedra and welwitschia of gnetales group are does not belongs to dicot angiosperm.

740. In embryo, cleavage brings about
(a) increased size
(b) increased DNA content
(c) change in shape and size
(d) increased mass of protoplasm

CG PMT-2011

Ans. (b) : During cleavage, there is no growth. However, repeated divisions result in an increase in DNA content. It is the process of division of a unicellular zygote into a multicellular embryo. It brings about the distribution of the cytoplasm of the zygote, amongst the blastomeres.

741. Monocots and dicots are the two main classes to
(a) fungi (b) angiosperm
(c) gymnosperm (d) protest

CMC Ludhiana -2013

Ans. (b) : In the late 1990 the most plant taxonomist divide angiosperm into two main clases- monocots and dicots. The monocots have one cotyledons while dicots have two cotyledons.

742. In which of the following features, Cycas resembles with angiosperms?
(a) Presence of vessels
(b) Circinate vernation
(c) Dichotomously branched leaves
(d) Pollen tube is the carrier of male gametes

BCECE-2008

Ans. (d) : Due to the existence of siphonogamy, in which male gametes are transferred to female gametes via a pollen tube, cycas, mimics angiosperms. Vessels are present in xylem of angiosperm while absent in Cycas (gymnosperm). The young leaves of Cycas are circinately folded as the those of fern but the angiospermic leaves are not circinately folded.

743. Water translocation in angiosperms is done by
(a) Sieve cells (b) Sieve tube elements
(c) Xylem vessel system (d) Xylem and phloem

AIPMT-1990

Ans. (c) : Water translocation is done in angiosperm (vascular plant) by xylem vessels and trachied from the root to the leaf. Continuous transpiration is cause of movement of water in xylem vessels upward side. It is raw material of plant for photosynthesis.

744. Which of the following is the result of double fertilization ?
(a) Cotyledon (b) Nucellus
(c) Endosperm (d) None of these

Punjab MET-2006

Ans. (c) : Double fertilization present in flowering plant is a result of sexual reproduction in which two male gametophyte i.e. generative nucleus and vegetative nucleus are fused with egg cells and polar nuclei. Fertilization of one male gamete with polar body (nuclei) endosperm is formed which is triploid in nature.

745. Respiratory roots in halophytes are positively
(a) Phototropic (b) Aerotropic
(c) Rheotropic (d) Geotropic

BVP-2014

Ans. (b) : The growth movement in response to air is called aerotropism. In halophytes, such as mangrove tress, there are respiratory roots called pneumatophores. These roots facilitate geseous exchange in marshy land.

746. A example of CAM plant is
(a) black night shade (Solanum nigrum)
(b) lemon grass (Cymbopagon flexuosus)
(c) sugarbeet (Beta vulgaris)
(d) snake plant (Sansevieria trifasciata)

AMU-2015

Ans. (d) : Snake plant is as example of CAM plant. In day time, they close their stomata to save water and at night they open up and store CO_2 in the form of an organic acid. Snake plant use the CAM process of photosynthesis.

@apna_pdf

747. Number of chromosomes in an angiospermic plant is 14, then the number of chromosomes in synergid cells will be

(a) 14 (b) 7
(c) 28 (d) 21

JIPMER-2008

Ans. (b) : Angiospermic plants are diploid in nature. Synergids are part of female gametophyte and are haploid in nature. Thus, if the angiosperms plant cell has 2n = 14, synergies will have n = 7. because it develops by reductional division.

748. Pair the species with the type of wood:

Species		Type of wood	
(A)	**Tectona grandis**	**(1)**	**Soft wood**
(B)	**Cedrus deodara**	**(2)**	**Hard wood**
(C)	**Shorea robusta**		
(D)	**Dalbergia sisso**		

The correct pairing is:

(a) A-1 B-2 C-2 D-1
(b) A-1 B-1 C- 2 D-2
(c) A-2 B-1 C-2 D-2
(d) A-2 B-1 C-1 D-2

J&K CET-2003

Ans. (c) : Tectona grandis is a tropical hardwood tree species in the family lamiaceae.

- Cedrus deodara has softwood belongs to family Pinaceae.
- In Shorea robusta hardwood present. It is a species of tree in the family Dipterocarpaceae.
- In Dalbergia sisso hardwood present. It is a fast-growing, hardy, deciduoues rosewood tree native to Indian subcontinent & southern Iran.

749. Muehlenbeckia belongs to this category:

(a) xerophyte
(b) epiphyte
(c) mesophyte
(d) hydrophyte

AP EAMCET-2000

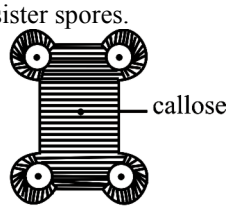
Ans. (a) : Muchlenbeckia is a xerophyte. These xerophytic plants can survive in Physiologically dry conditions. They need very little water. Such plants have adaptations to survive in an environment with little water.

750. In Angiosperm all the four microspores of tetrad are covered by a layer which is formed by : -

(a) Pectocellulose
(b) Callose
(c) Cellulose
(d) Sporopollenin

AIPMT-2002

Ans. (b) : Callose is involved at multiple stages of pollen developments as a structural component. Callose wall surrounds the sporocytes during the meiotic stage. It provides an isolation barrier sealing off one meiotic cell (megaspore mother cell) from another. Hence, it acts as a molecular filter isolating the developing microspores form the influence of the surrounding diploid tissue or sister spores.



Microspore tetrad
(mein 4 microspore)

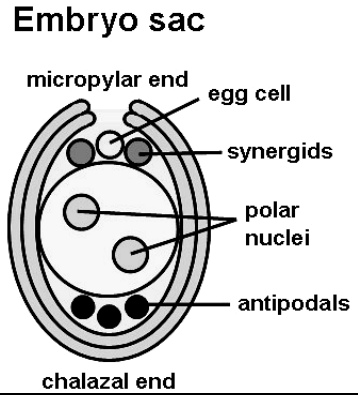
751. In Angiosperms pollen tube liberate their male gametes into the :-

(a) Central cell
(b) Antipodal cells
(c) Egg cell
(d) Synergids

AIPMT-2002

Ans. (d) : In Angiosperms pollen tube enter into synergids through filiform apperatus.

- The pollen tube discharged two male gametes.
- 1st fused with egg cell and fused with polar nuclei, they fused simultaneously called **double fertilization**.



752. How many nuclei take part in double fertilization of flowering plants?

(a) 3 (b) 2
(c) 5 (d) 8

GUJCET-2011

Ans. (c) : • Double fertilization is an event unique to angiosperms in involves fusion of one male gamete (hoplaid) with egg (hoplaid) to form zygote (diploid) that gives rise to embryo accompained with fusion of other male gamete (haploid) with two polar nuclei (Secondary nucleus) to form primary endosperm nucleus (PEN) that gives rise to a nutrivite tissue called endosperm.

- Hence total of 5 haploid nuclei are involved in double fertilization process.

753. A piece of wood having no vessels belongs to

(a) teak (b) mango
(c) Pine (d) palm

Assam CEE-2014

Ans. (c) : A piece of wood naring no vessels belong to pine because pine is Gymnosperm (Non flowering plant), and Gymnosperms are devoid of vessels instead tracheids are present in them in place of vessels.

@apna_pdf

754. In angiosperms, how many microspore mother cells are required to produced 100 pollen grains:?
(a) 100 (b) 50
(c) 25 (d) 10

BVP-2001

Ans. (c) : Pollen grain formed from microspore mother cell by meiosis. In meiosis cell division 4 haploid (n) cells are formed from a single diploid (2n) cells.
All 4-microspore are active so all microspore taken part in formation Pollen grain.
Formation of 100 microspore 25 microspore mother cells (MMC) required.
• 4 pollen grains are formed from 1 MMC so 100 pollen grains are formed from 100/4 = 25 MMC

755. The shade tolerant plants are known as
(a) Psammophytes (b) Heliophytes
(c) Halophytes (d) Sciophytes
(e) Hydrophytes

Kerala PMT-2009

Ans. (d) : • Shade loving trees or plants are also known as sciophytes. They usually grow on the forest floor and under the canoppes of trees with thick falioge.
Sciophytes are also known as photohoborus plants. Example - Orchids.

756. Which one of the following series includes the orders Ranales, Parietales and Malvales ?
(a) Bicarpellatae (b) Thalamiflorae
(c) Calyciflorae (d) Disciflorae
(e) Inferae

Kerala PMT-2009

Ans. (b) : Thalamiflorae series includes the order Ranales, Parietales and malvales,. Thalamiflorae is an artificial group of classification by Augustin de candelle. It is a group under dicetyledeneus plants. All the three orders show thalamiflorae series. It includes plants which as conical thalamus and ovary is superior.

757. The plant of arid regions that modifies its stem into a flattened structure with chlorophyll pigments to carry out photosynthesis is
(a) Euphorbia (b) Opuntia
(c) Citrus (d) Bougainvillea
(e) Colocasia

Kerala PMT-2012

Ans. (b) : Euphorbia, colocasia and Bougainvillea grow in well drained soil but opuntia grows in arid regions which have little or no rain, like in xerophytic conditions. In these circumstance, the leaves are changed to resemble spines in order to minimize water loss through transpiration. On the other hand, the stem chang and undergo photosynthesis, becoming green and flattened. Phylloclade is a term for such stem alteration.

758. Which one of the following event takes place after double fertilization?
(a) The pollen grain germinates on the stigma
(b) The pollen tubes enter the embryosac
(c) Two male gametes are discharged into the embryosac
(d) The PEN (Primary Endosperm Nucleus) develops into endosperm
(e) The male gamete fuses with egg to form a zygote

Kerala PMT-2012

Ans. (d) : After double fertilization, the zygot develops into on embryo (with one or two cotyledons) and the PEN develops in to endosperm which provides nourishment to the developing emberyo. The synergids and antipodal degenerate after fertilisation during these events the ovules develop in to seed and the ovaries develop in to fruit.

759. A taxon is observed Himgiri variety which is resistant to hill bunt disease belongs to this taxon. In this taxon, pollen grains lose viability within 30 minutes of their release from anthers. The taxon belongs to the order
(a) Poales (b) Sapindales
(c) Polemoniales (d) Rosales

AP EAMCET-2014

Ans. (a) : Wheat variety Resistant to hill bunt disease is 'HImgiri'. Himgiri is a wheat hybrid that was developed by hybridization and selection for disease resistance and leaf and stripe rust pathogens. It is a disease resistance variety to stripe rust or yellow rust and also hill blunt. Wheat belongs to order 'Poales'.

760. Which of the following pairs in angiosperms are diploid and triploid respectively?
(a) Secondary nucleus and endosperm
(b) Microspore mother cell and egg cell
(c) Polar nucleus and secondary nucleus
(d) Endosperm and antipodal cells

JCECE-2010
AP EAMCET-2007

Ans. (a) : In an angiosperm the embryo sac is haploid, zygote is diploid and endosperm is triploid (3n) whereas, Nucellus, secondary nucleus and megaspore mother cell (MMC) are diploid (2n).

761. Triple fusion in angiosperms is the fusion of second sperm with
(a) antipodal cell and one synergid cell
(b) two antipodal cells
(c) two synergid cells
(d) two polar nuclei

JCECE-2010

Ans. (d) : Triple fusion in angiosperms is the fusion of second sperm with two polar nuclei. Fusion of second sperm cell with two polar nuclei results in the formation of a diploid zygote.

762. In angiosperms, lateral roots arise from –
(a) endodermis (b) cortex
(c) pericycle (d) epiblema

BVP-2000

Ans. (c) : The pericycle cells surround the xylem and phloem in the stem. Lateral roots is an extension of primary root which starts to develop in the pericycle, which is the outermost cell layer in the vascular cylinder. It facilitates a stronger connection between the plant and the soil and improves water absorption.

763. Acacia arabica is a :
(a) hydrophyte (b) mesophyte
(c) halophyte (d) xerophytes

BVP-2000

@apna_pdf

Ans. (d) : Plants grow in dry habitat called xerophytic plant. In these plants, leaves are small and vestigial (while petiole enlarges) to cut transpiration. Lamina is vestigial, while petiole enlarges to form phyllode in Australian speices of Acacia. Phyllode refers to flattened petiole which is green and photosynthetic.
→ Acacia arabica is xerophyte because it is seen in desert places.

764. In angiosperm, triple fusion is necessary for the formation of:
(a) Embryo
(b) Pollen
(c) Endosperm
(d) Leaf

BHU PMT (Mains)-2006

Ans. (c) : In angiosperms, triple fusion is required for the formation of endosperm. It is the fusion of the male gamete with two polar nuclei inside the embryo sac of the angiosperm. In that process the fusion of three haploid nuclei occurs so it is known as triple fusion. Triple fusion is required for the formation of endosperm.

765. Which among the following is a rootless plant?
(a) Nymphaea (b) Sagittaria
(c) Ceratophyllum (d) Vallisneria

AIIMS-2007

Ans. (c) : Ceratophyllum is submerged floating hydrophytes.
- It remains completely under water but is not rooted in mud.

The flowering plant genus ceratophyllum is widespread and may be found in temperate and tropical areas in ponds, marshes and peaceful streams.

766. Which one shows the correct descending sequence with reference to the number of cohorts ?
(a) Thalamiflorae, Calyciflorae, Disciflorae, Inferae
(b) Heteromerae, Inferae, Disciflorae, Calyciflorae
(c) Bicarpellatae, Disciflorae, Heteromerae, Calyciflorae
(d) Disciflorae, Thalamiflorae, Calyciflorae, Heteromerae

AP EAMCET-2008

Ans. (a) : Thalamiflorae (6) - Calyciflorae (5) - Disciflorae (4) - Inferae (2)

767. Vessels and companion cells are found in
(a) angiosperm (b) pteridophytes
(c) bryophytes (d) thallophytes

JIPMER-2008

Ans. (a) : In Angiosperm (flowering plant), xylem contains vessels and phloem possesses sieve tubes and companion cells.
Vessels are abscent in pteridophytes except some species of selaginella, Adiantum, pteris, pteridium and equisetum. Also abscent in Gymnosperm except Gnetum welwistchia and Ephedra.
Companion cells abscent in pteridophytes and Gymnosperms.

768. A plant bears fruit, has a column of vascular tissue and a tap root system. The plant is a
(a) angiosperm and dicot
(b) gymnosperm and dicot
(c) angiosperm and monocot
(d) gymnosperm and monocot.

AIPMT-1994

Ans. (a) : A plant having column of vascular tissues bearing fruits and having a tap root system the plant is angiosperm and dicot. Dicotyledoneal is a group of angiosperms that are characterized by vascular tissue present in columns, seed are covered by fruits possess xylem vessels, tap root system.

G. Life process of plants and Alternation of Generation.

769. Match the plant with the kind of life cycle it exhibits:

	List-I		List-II
(A)	**Spirogyra**	**(i)**	**Dominant diploid sporophyte vascular plant, with highly reduced male or female gametophyte**
(B)	**Fern**	**(ii)**	**Dominant haploid free-living gametophyte**
(C)	**Funaria**	**(iii)**	**Dominant diploid sporophyte alternating with reduced gametophyte called prothallus**
(D)	**Cycas**	**(iv)**	**Dominant haploid leafy gametophyte alternating with partially dependent multicellular sporophyte**

Choose the correct answer from the options given below:
(a) (A)-(ii), (B)-(iv), (C)-(i), (D)-(iii)
(b) (A)-(iv), (B)-(i), (C)-(ii), (D)-(iii)
(c) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(d) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)

NEET-2022

Ans. (c) :	
Spirogyra	Dominant haploid free living gametophyte
Fern	Dominant diploid sporophyte alternating with reduced gametophyte called prothallus.
Funaria	Dominant haploid leafy gametophyte alternating with partially dependent multicellular sporophyte
Cycas	Dominant diploid sporophyte vascular plant with highly reduced male of female gametophyte.

@apna_pdf

770. In which organisms the following structures are developed respectively?
Conidia; Non motile spores; Buds; Zoospores
(A) Chlamydomonas (B) Yeast
(C) Rhizopus (D) Pencillium
(E) Wolffia
(a) A, C, D, B (b) D, C, B, A
(c) B, C ,D, E (d) D, A, B, C

TS EAMCET-09.08.2021 Shift-II

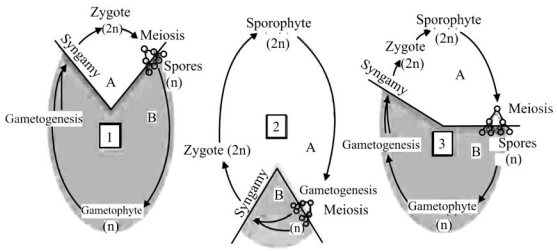
Ans. (b) : Conidia- Conidium, is a type of asexual reproductive spore of fungi (Kingdom fungi) usually produced at the tip or side of hyphae (Filaments that make up the body of a typical fungus) or on special spore-producing structure called conidiophores. The spores detach when mature.
Non motile spores- Rhizopus produce non motile spores called aplanospores, while others produce zoospores.
Buds- Budding is a type of asexual reproduction which is most commonly associated in both multicellular and unicellular organism. Bacteria, yeast, corals, flatworms, jellyfish and sea anemones are some animal species which reproduce through budding.
Zoospore- A zoospore is a motile asexual spore that uses a flagellum for locomotion. Also called a swarm spore, these spores are created by chlamydomonas.

771. Assertion (A) : In haplontic life cycle zygote acts as meiocyte.
Reason (R) : In spirogyra, non flagellated gametes will fuse to form zygote.
The correct option among the following is :
(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-II

Ans. (b) : In zygotic meiosis, the zygote acts as the meiocyte and meiosis occurs in diploid zygotes. Zygote and sporophyte will be diploid and gametophyte and gametes will be haploid. The gametophyte is the free-living, dominant phase in organisms with a **haplontic life cycle.**
Both gametes fuse to form diploid cells which form new individuals later. A spirogyra is a green algae also known as water silk or blanket weed. It is filamentous and possess helical chloroplast. These algae show Isogamy and Non-flagellated gametes and can reproduce both sexually and asexually.

772. Which of the following correctly represents the type of lifecycle patterns from the given options?



(a) 1–Haplontic, 2–Diplontic, 3–Haplo-diplontic
(b) 1–Diplontic, 2–Haplontic, 3–Haplo-diplontic
(c) 1–Haplo-diplontic, 2–Diplontic, 3–Haplontic
(d) 1–Diplontic, 2–Haplo-diplontic, 3–Haplontic

AP EAPCET-07.09.2021 Shift-I
Kerala PMT-2008

Ans. (b) : 1-Haplontic, 2-diplontic, 3- Haplo-diplontic
Diplontic life cycle:- sporophytic phase (2n) is dominant photosynthetic and independent. The gametophytic phase is represented by the single to few celled gametophyte. The gametes fuse to form zygote. Which develops into sporophyte. Example:- Fucus, gymnosperms & angiosperms.
Haplontic life cycle:- Gametophytic phase is dominant photosynthetic and independent, whereas sporophytic phase is represented by the zygote. Zygote undergoes meiosis to restore haploid condition.
e.g. volvox, spirogyra.
Haplodiplontic life cycle : - This type of life cycle is found in bryophytes and pteridophytes which is intermediate between haplontic and diplontic phase. Both the phases are multicellular.

773. Based on the following characteristics of life cycles identify and arrange the plants respectively.
(A) Haplontic (B) Diplo-haplontic
(C) Haplo-diplontic (D) Diplobiontic
(E) Diplontic
(i) Laminaria
(ii) Volvox
(ii) Polysiphonia
(iv) Salvinia
(v) Fucus
Options:

	A	B	C	D	E
(a)	i	iii	iv	v	ii
(b)	ii	iv	i	iii	v
(c)	ii	i	iv	iii	v
(d)	v	i	iii	ii	iv

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Haplontic — Volvox
Diplo–haplontic — Salvinia
Haplo–diplontic — Laminaria
Diplobiontic —Polysiphonia
Diplontic — Fucus

774. In Bryophytes & Pteridophytes the number of male gametes produced is several thousand times the number of female gametes produced.
Reason : Large number of male gametes fail to reach the female gametes during transport.
(a) Assertion is correct but reason in incorrect
(b) Both Assertion and reason are correct
(c) Both Assertion and reason are incorrect
(d) Assertion is incorrect but reason is correct

Karnataka CET-2021

Ans. (b) : Male gametes need to be transported to female gamete for fertilization. A large number of male gametes are destroyed or lose during transport. Hence, the male gametes are produced in large number.
Both Bryophtes and Pteridophytes use water for the transfer of male gametes to the female gametes.

@apna_pdf

775. Which of the following statements is correct ?
(a) Some of the organisms can fix atmospheric nitrogen in specialized cells called sheath cells
(b) Fusion of two cells is called Karyogamy
(c) Fusion of protoplasms between two motile or non-motile gametes is called plasmogamy
(d) Organisms that depend on living plants are called saprophytes

NEET-2021

Ans. (c) : Fusion of protoplast of two cells is called plasmogamy. A significant stage - plasmogamy shown in sexual reproduction of fungi.
• In this stage, the cytoplasm of two motile or non-motile parent cells (usually from the mycelia) fuses together. In brings two haploid nuclei to close together in the same cell.

776. Male and female gametophytes do not have an independent free living existence in:
(a) Bryophytes
(b) Pteridophytes
(c) Algae
(d) Angiosperms

NEET-2020 Phase-II

Ans. (d) : Male and female gametophytes do not have free living existence in angiosperms.
• In gymnosperms and angiosperms, the gametophyte are dependent upon the sporophyte. In gymnosperms and angiosperms, the male & female gametophytes do not have a separate, free living life.

777. Choose the correct statements.
(A) Pseudoelaters, archegonia on archegoniophore are seen in Marchantia.
(B) Wolffia and Salvinia are the smallest plants belonging to pteridophytes.
(C) Embryophytic, archegoniate, tracheophytes with underground rhizome is seen in Dryopteris.
(D) Algae are primary producers of energy rich compounds for the aquatic animals.
(E) The reduced male gametophyte develops within the microspore.
(a) A, B, D only (b) A, B, C only
(c) C, D, E only (d) B, C, E only

TS EAMCET-29.09.2020 Shift-II

Ans. (c) : Algae are primary producers of energy which produces organic compounds such as Carbohydrates, proteins & lipids through photosynthesis. These compounds are utilized by other organisms such as herbivorous animals.
•The reduced male gametophyte develops within the microspore. Microspores are small haploid in structure which provides rise to the male gametophyte. The pollen grain represent the reduces male gametophyte as they contain the male gametes.
• Dryopteris is commonly known as wood fern, male ferns or sometimes also called as buckler fern. In belongs to the family of dryopteridaceae.
Therefore, embryophytic, archegoniate and tracheophytes with underground rhizome is seen in dryopteris.

778. A,B and C are heterotrophic plants, 'A' has no sex organs but produces sexual spores exogenously, 'B' produces sexual spores endogenously and 'C' has no sexual stage but reproduces asexually. Based on these characters, identify A, B and C respectively.
(a) Rhizopus, Aspergillus, Alternaria
(b) Colletotrichum, Albugo, Penicillium
(c) Ustilago, Neurospora, Trichoderma
(d) Aspergillus, Agaricus, Alternaria

AP EAMCET-24.04.2019 Shift-II

Ans. (c) : Ustilago, Neurospora, Trichoderma
Ustilago- is autoecious i.e. it completes its life cycle on a single host. Sex organ are completely absent. It produced two kinds of spore during its life cycle Teliospores or teleutospores and basidiospores.
• **Neurospora** the spores are endogenously formed in a sac like structure called ascus. sac spore forming structure in ascomycetes and basidium is a spore forming structure in basidiomycetes.
• Most **Trichoderma** strains have no sexual stage but instead produce only sexual spore. However for a few strains the sexual stage is known but not among strains that have usually been considered for bicontrol process is within the accomycetes in the genus Hypocrea.

779. Choose the correct pair of taxa showing following sets of characters in sequence
(I) Trachaeophytic heterosporous plants with siphonogamous oogamy
(II) Trachaeophytic heterosporous plants with archegonia
(III) Archegoniates with zooidogamous oogamy
(A) Marchantia and selaginella
(B) Salvinia and pinus
(C) Polytrichum and Eucalyptus
(D) Cycas and Eucalyptus
Options:
(a) D, B, A (b) C, D, B
(c) B, D, A (d) D, A, C

AP EAMCET-24.04.2019 Shift-II

Ans. (a) : Trachaeophytes also called vascular plant possess lignified water- conducting tissue. Trachaeophytes have transport vessels, xylem and phloem. Ex. Eucalyptus, Cycas.
•**Heterosporous plants:-** Megaspores and microspores are produced in the megasporangia and microsporangia respectively. The sporangia are borne on spirally arranged megasporophyll and microsporophyl. ex. Pinus cycus, Selaginella, salvia.
• Zooidogamy is a type of plant reproduction in which male gametes (antherozoids) swim in a path of water to the female gamete (archegonium). Zooidogamy is found in algae, bryophytes, pteridophytes, and some gymnosperms. Ex. Marchantia, cycas, selaginella.

780. Assertion (A): Gametophyte is represented by few celled or many celled stage called diplo-haplontic life cycle.
Reason (R): Pteridophytes and all seed bearing plants follow diplo-haplontic life cycle pattern.
The correct answer is:

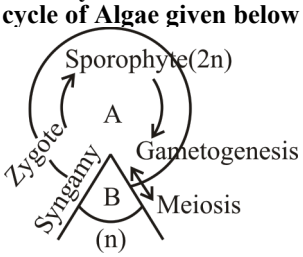
@apna_pdf

(a) Both (A) and (R) are true. (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false.
(d) (A) is false but (R) is true.

TS EAMCET-09.05.2019 Shift-I

Ans. (b) : The gametophyte represents the sexual phase of the life cycle, as gametes are produced in this phase. Plant sporophyte represent the asexual phase of the cycle and produce spores.
In the diplontic life cycle, the diploid sporophyte is the dominant photosynthetic independent phase of the plant body. The haploid phase is represented by gametes only.

781. Identify correct answer with reference to life cycle of Algae given below



(a) It is haplo–diplontic life cycle of Laminaria
(b) Sporophyte is dependent on Gametophyte
(c) Sporophyte and Gametophyte are independent
(d) It represents life cycle of Fucus

AP EAMCET-25.04.2018 Shift-II

Ans. (d) : The given figure in the question represents the life cycle of Fucus. Fucus has a diplontic life cycle. Generally, most of the algae are haplontic where as few other are diplontic. Fucus is one such algal that exhibits diplontic behavior i.e. sporophyte is the dominant phase in case of fucus.

782. Match of the following lists

List -I	List - II
(A) Ascocarp	**(I) A spore produced by an ascus**
(B) Haplontic	**(II) An asexual spore produced by certain algae and some fungi, capable of moving about by means of flagella**
(C) Zoospore	**(III) A life cycle in which the haploid phase predominates and the diploid stage is limited to the zygote**
(D) Ascospore	**(IV) A non-motile, thin-walled spore**
	(V) It is the fruiting body of ascomycetous fungi

The correct match is:

	A	B	C	D
(a)	III	IV	V	II
(b)	IV	II	III	I
(c)	II	I	IV	III
(d)	V	III	II	I

TS EAMCET-12.05.2017

Ans. (d) : Ascocarp is fruiting body (sporocarp) of an ascomycetes, phylum fungus. It consist of very tightly interwoven hyphae and millions of embedded asci each of which typically contains four to eight ascospores.
• Haplontic life cycle is the free - living independent, haploid stage that divide to give rise to a new organism for example green algae.
• Zoospores are motile asexual spores that are found in bacteria fungi and protists. These spores are flagellated and posses different ultrastructural properties in different organisms. Some of the common properties are
(i) they are naked.
(ii) they do not possess any wall.
• Ascospores are generally found in clusters of four or eight spores with a single mother cell, as in the ascus. These spores are formed as a means of packaging post meiotic nuclei.

783. In plant 'A', sporophyte is not free living, 'B' zygote represents short lived sporophyte, 'C' independent gametophyte and sporophytic generations. The organisms A, B and C are respectively

(a) Volvox, Lycopodium, Marchantia
(b) Lycopodium, Volvox, Marchantia
(c) Marchantia, Volvox, Lycopodium
(d) Marchantia, Lycopodium, Volvox

AP EAMCET-28.04.2017 Shift-II

Ans. (c) : • Marchantia ;- Marchanitia is bryophytes in which the sporophyte is dependent an gametophyte that is why sporophyte is not free living.
• The life cycle of volvox is haplontic i.e. the dominant stage in free living haploid (n) gamatophyte and sporophyte is represents only by the diploid zygote (n) In valvox sporophytic generation is represented only by the one called zygote. There are no-free living sporophytes.
• Lycopodium :- Lycopodium is a sparophyte (2n) with distinct sporophytic (2n) and gametophytic (n) generations which alternate with each other.

784. Choose the correct statement from the following.

(A) In pheophyceae members the cell wall is covered by gelatinous coating called algin.
(B) Mosses, along with lichens are the first organisms in the Xerarch succession.
(C) All bryophytes are not homosporous but show heteromorphic alternation of generations.
(D) Some chlorophyll bearing thalloid organisms grow in association with sloth bear.

Options:

(a) A, B, C (b) B, C, D
(c) A, B, D (d) A, C, D

AP EAMCET-28.04.2017 Shift-II

Ans. (c) : A Xerarch succession is a form of plant succession starting in the bare ground that is very dry or is limited by the availability of water and eventually culminating in a mature forest.
Such communities usually originate from extremely dry environments - such as rock deserts and sand dynes. Lichens produce rocks in Xerarch succussion and exude acide chemicals mosses like lichens have evolved to

@apna_pdf

with sand severe drought. Algae are chlorophyll-bearing, simple, thaloid, autotrophic and largely aquatic organisms. They occur in a variety of other habitats. Moist stones, soil and wood. Some of them also occur in association with fungi and animal exa - on sloth bear.

785. In Cycas
(a) ovule and microsporangia are present in same sporophyll
(b) micro and megasporophyllus are present in same cone
(c) male cone and megasporophylls are borne on the same plant
(d) male cone and megasporophylls are borne on separate individual plants

AIIMS-2017

Ans. (d) : Cycas plants are dioecious. These plants have male and female reproductive structures on different plants.
The male sporophyte will have minute **microsporangia** in the abaxial surface of the **microsporophyll.** The female cone will have loosely arranged **megasporophylls**. There **megasporophylls** will have ovules.

Male Cone Female Cone

786. Read the following statements regarding bryophytes and choose the incorrect option.
(a) Gametophytic phase is dominant in life cycle
(b) Fertilisation takes place in presence of water
(c) Zygote undergoes meiosis to produce sporophyte
(d) Sporophyte is physiologically dependent on gametophyte

AIIMS-2017

Ans. (c) : A diploid zygote is formed after the process of fertilisation which undergoes many rounds of mitosis and give rise to a diploid multicellular sporophyte. The specialized cells of the sporophyte further undergoes meiosis form haploid spores. These spores develop into gametophytes.
• The haploid stage, in which a multicellular haploid gametophyte develops from a spore and produces haploid gametes, is the dominant stage in the bryophyte life cycle.

787. Life cycle of Ectocarpus and Fucus respectively are
(a) Haplontic, Diplontic
(b) Diplontic, Haplodiplontic
(c) Haplodiplontic, Diplontic
(d) Haplodiplontic, Haplontic

NEET-2017

Ans. (c) : Life cycle of Ectocarpus is Haplodiplontic. Ectocarpus has a haploid-diploid life cycle that involves alternation between two multicellular generation, the sporophyte and the gametophyte.
In this, the free-living, multicellular haplontic and diplontic are both present. the major component of the diplontic life cycle is the diploid sporophyte.
Both the haplodiplontic and diplontic life cycle are seen in the algae ectocarpus and fucus.

788. Which of the following statement is true?
(a) Spores are gametes
(b) Spores and gametes are diploid
(c) Gametes are always haploid
(d) Spores are always diploid

AIIMS-2000

Ans. (c) : Gametes - gametes are formed through meiosis (reductional division) in which a germ cell undergoes two fissions, resulting in the production of 4 gametes. During fertilization, male and female gamete fuse, producing a diploid (i.e. containing paired chromosomes) zygote.

789. Read the following statements (A – E) and answer the question which follows them.
(A) In liverworts, mosses and ferns gametophytes are free living
(B) Gymnosperms and some ferns are heterosporous
(C) Sexual reproduction in Fucus, Volvox and Albugo is oogamous
(D) The sporophyte in liverworts in more elaborate than that in mosses
(E) Both, Pinus and Marchantia are dioecious
How many of the above statements are correct ?
(a) Four (b) One
(c) Two (d) Three

NEET-2013

Ans. (d) : In the given statement, D is wrong because the sporophyte found in mosses is more elaborate than the sporophyte found in liverworts.
In dioecious condition, the plant body bear a single spore either male or female, though the Marchantia is dioecious, Pinus is not. Pinus show the monoecious condition i.e. both male and female parts present on the same plant. Hence both pinus and marchantia are dioecious. This statement is wrong. In liverworts mosses and ferns gametophytes are free living. This statement is true. Oogamous type of sexual reproduction is found in Fucus, Volvox and Albugo. Gymnosperm and some ferns are heterosporous. This statement is also true.

790. Select the wrong statement :
(a) Chlamydomonas exhibits both isogamy and anisogamy and Fucus shows oogamy
(b) Isogametes are similar in structure, function and behaviour
(c) Anisogametes differ either in structure, function or behaviour
(d) In Oomycetes female gamete is smaller and motile, while male gamete is larger and non-motile

NEET-2013

Ans. (d) : Oomycetes are fungus-like eukaryotic microbes. They reproduce both sexually and asexually. They include many pathogenic species of plants. Two distinct spore types are produced by oomycetes. The female gametes in sexual spores are big and non-motile. The male spore or gamete, in contrast, is tiny and motile.

@apna_pdf

791. Isogamous condition with non-flagellated gametes is found in :
(a) Fucus (b) Chlamydomonas
(c) Spirogyra (d) Volvox

NEET-2013

Ans. (c) : Isogamous (similar in size) condition with non-flagellated gametes is found in Spirogyra in which both gametes are non-motile.
In Fucus and Volvox, motile male gametes and non motile female gametes are produced.
In Chlamydomonas, flagellated gametes are seen which are dissimilar or similar in size.

792. Gametophyte is the dominant phase in the lifecycle of .....
(a) Hibiscus (b) Nephrolepis
(c) Cycas (d) Riccia

Karnataka CET-2011

Ans. (d) : Sporophyte is the diploid stage and the gametophyte is the haploid stage. Gametophyte is the dominant phase in the lifecycle of bryophytes, which are the non-vascular plants. Riccia is a liverwort, belongs to bryophyte and hence it exhibit the dominant gametophytic stage.

793. Gametophyte and sporophyte are independent of each other in which of the following groups?
(a) Pteridophytes (b) Angiosperms
(c) Gymnosperms (d) Bryophytes

AIIMS-2010

Ans. (a) : Gametophyte and sporophyte are independent of each other in pteridophyte, because gametophyte is small or inconspicuous and sporophyte is differentiated into true root, stem and leaves.
Bryophytes are non-vasculor terrestrial plant of moist habitats in which multicellular diploid sporphyte live as parasite. Gymnosperms and angiosperms do not produce spores.

794. Elater mechanism for seed dispersal is exhibited by
(a) Riccia (b) Marchantia
(c) Dryopteris (d) Funaria

AIIMS-2014

Ans. (b) Elaters are the long spindle shaped hygroscopic structures with spiral thickening inside them. They are mostly found in liverworts like Marchantia. The resulting twisting movement helps in dispersal of spores.

795. Match items in Column I with those in Column II.

Column-I	Column-II
A. Peritrichous Flagellation	**1. Ginkgo**
B. Living fossil	**2. Selaginella**
C. Smallest flowering Plant	**3. E. coli**
D. Largest perennial alga	**4. Wolffia**
E. Rhizophore	**5. Macrocystis**

(a) A-3, B-1, C-4, D-5, E-2
(b) A-2, B-3, C-4, D-1, E-5
(c) A-4, B-2, C-1, D-5, E-3
(d) A-2, B-4, C-3, D-5, E-1

AIIMS-2014

Ans. (a)

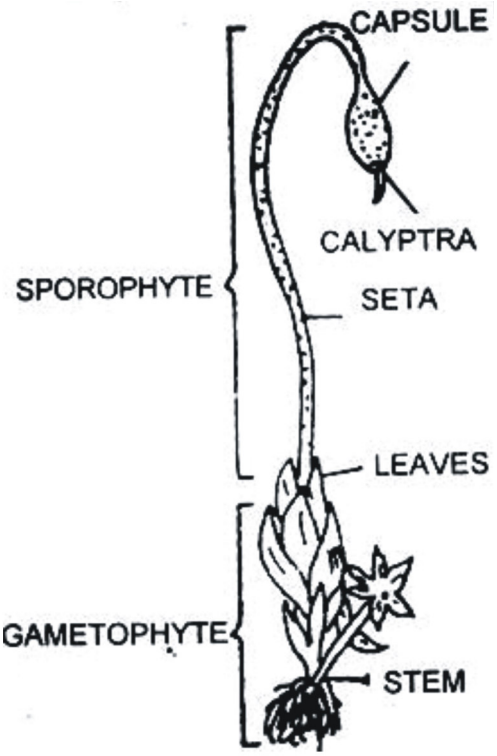
A. Peritrichous Flagellation	–	E. coli
B. Living fossil	–	Ginkgo
C. Smallest flowering Plant	–	Wolffia
D. Largest perennial alga	–	Macrocystis
E. Rhizophore	–	Selaginella

796. The plant body of moss *(Funaria)* is
(a) Completely sporophyte
(b) Predominantly sporophyte with gametophyte
(c) Completely gametophyte
(d) Predominantly gametophyte with sporophyte.

AIIMS-2002

Ans. (d) : In the life cycle of bryophytes, the gametophytic generation is the major stage. Gametophyte activity determines the sporophyte phase. That is why, the plant body of funaria moss is predominantly gametophytic with dependent sporophyte.

- Zygote develops into sporophyte and produces haploid meiospores which on germination form gametophyte. Sporophyte in mosses is differentiated into foot, seta and capsule.



797. Mosses and ferns are found in moist and shady places because both
(a) Require presence of water for fertilization
(b) Do not need sunlight for photosynthesis
(c) Depend for their nutrition on microorganisms which can survive only at low temperature
(d) Cannot compete with sun-loving plants.

AIIMS-2004

@apna_pdf

Ans. (a) : Mosses and ferns can only reproduce in the presence of water, via motile antherozoids that swim to reach the archegonium, hence they can only be found in damp environments.
Mosses lack vascular tissue, also both mosses and ferns require water to carry out sexual reproduction.

798. In *Ulothrix* meiosis takes place in
(a) Cells of the filament
(b) Holdfast
(c) Zygote
(d) Zoospores.

AIIMS-2004

Ans. (c) : The ulothrix plant are heterothallic and is sexualIy reproduced also by biflagellate gametes. Ulothrix meiosis (reduction division) occurs in zygote. Zygote (2n) undergoes meiosis to form four haploid quadriflagellate zoospores, each zoospore then develops into a new ulothrix thallus. Mitosis is followed by meosis to form 8 or 16 haploid nuclei.

799. Physiological heterospory is seen in :
(a) chlamydomonas (b) rhizopus
(c) selaginella (d) lycopodium

DUMET-2004

Ans. (c) : Selaginella Heterospory is important with respect to the evolutionary perspective. Heterospory is found in some pteridophytes and all seed plants i.e. gymnosperms and angiosperms. In selaginella, all the microsporocytes or microspore mother cells undergo meiosis to produce a large number of microspore whereas only one megasporocyte is functional and produces four large megaspores after meiosis.
• Heterospory become evident before meiosis as in selaginella.
• Microspore are present in microsporangia, whereas megaspore are present in magasporangia.

800. In prothallus of a vascular cryptogamic, the antherozoids and eggs mature at different times. As a result of
(a) self-fertillisation is prevented
(b) it can be concluded that plant is apomictic
(c) there is a low degree of fertility
(d) no change in success rate of fertilization

Manipal-2014

Ans. (a) : Vascular cryptogams usually multiply through sexual reproduction. They adopt various methods in order to prevent self-fertilization. When an antherozoid and an egg from the same plant develop at different time they are unable to fertilize one another, avoiding self-fertilization. If the antherozoid matures before egg it is termed as protandry. If the egg matures before antherozoid it is termed protogyny
• The difference in maturation period of antherozoid and egg has no relation with fertility rate in the plant. Its nothing more than a plant's way of preventing self-fertilization.
• The success rate of self-fertilization decreases while that of cross fertilization increases

801. Prothallus of the fern produces
(a) spores (b) gametes
(c) Both (a) and (b) (d) cones

VMMC-2009

Ans. (b) : Prothallus of the fern produces gametes. Prothallus in the fern produces male and female gametes which after fertilization give rise to diploid which sporophyte which produces spore. The underside of the prothallus is where the gametes are produced from the male and female sex organs. Prothallus of the fern is gametophyte. It is green photosynthetic structure that is one cell thick usually heart or kidney shaped, 3-10 mm long and 2-8 mm broad.

802. Calyptra develops from
(a) venter wall of archegonium
(b) outgrowth of gametophyte
(c) neck wall of archegonium
(d) paraphysis of the archegonial branch

VMMC-2009

Ans. (a) : Calyptra develops from venter wall of archaegonium. The protective covering around the eggs/sporophyte present inside the archegonium is known as calyptra. Cells in the enlarged portion of the archegonium, a structure resembling a flask, will produce calyptra as long as the egg is present there. Calyptra is often refered to as a hood, acover or a lid. It is a maternal gametophytic structure which is small and covers the capsule which contain the eggs/embryonic sporophyte. As the sporophytes are released from the capsule that is present in the center of the archegonium calypter disappears. It is considered to be a haploid tissue that grows in close association with the sporophytes in case of bryophtes and gymnosperms.

803. Match the organism in column A with the Contents in Column B.

Column A	Column A
(A) Gracilaria	(I) Biflagellate zoospores
(B) Ectocarpus	(II) Elaters
(C) Marchantia	(III) Biflagellate antherozoids
(D) Cycas	(IV) Carpogonium
	(V) Multiciliated male gametes

	A	B	C	D
(a)	(I)	(IV)	(III)	(V)
(b)	(IV)	(I)	(II)	(V)
(c)	(IV)	(II)	(III)	(I)
(d)	(IV)	(V)	(II)	(I)

AP EAMCET-2015

Ans. (b) : The carpogonium in Gracilaria has been observed by Bornet and thuret he reported that fertilized female nuclease remind in carpogonium which fused with the bottom cell of a vegetative filament arising from the supporting cell.
• Asexual reproduction in Ectocarpus take place by biflagellated zoospores that are produced in both unilocular and plurilocular sporangia.
• In marchantia some of the sporophytes (spore mother cells) that are diploid will remain diploid and undergo a change to form elaters.
• Male gametes of cycas are multicilliated top shaped equal and the largest in plant kindgom.

804. Development of gametophyte from sporophyte without formation of spores is called:
(a) apogamy (b) apospory
(c) autogamy (d) hologamy

J&K CET-2003

@apna_pdf

Ans. (b) : Apospory:- Apospory is the development of diploid (2n) gametophytes without meiosis and spores, formation from vegetative or non reproductive cells of the sporophyte.

805. The gametophyte generation is dominant in:
(a) Gymnosperm (b) Bryophyte
(c) Angiosperm (d) Pteridophyta

Rajasthan PMT-1995

Ans. (b) : Gametophyte generation is dominant in Bryophyte & life cycle is haplo -diplontic.
Sporophytic generation is dominant in pteridophyta & life cycle is haplo-diplontic.
Gymnosperm - sporophytic phase is dominant- life cycle is Diplontic

806. In gametophyte of fern :
(a) prothallus is independent from sporophyte
(b) prothallus is attached with sporophyte
(c) it is main plant body
(d) a structure attached with rhizome

Rajasthan PMT-2001

Ans. (a) : The prothallus represents the haploid gametophytic generation. It is multicellular, independent, photosynthetic form that lives for a short duration. The prothallus needs a cool, damp and shady place to grow.

807. Which of the following is/are grouped under phanerogams?
(a) Angiosperms (b) Gymnosperms
(c) Pteridophytes (d) Both (a) and (b)

Manipal-2008

Ans. (d) : Phanerogams- German botanist A.W. Eichler divided the whole plant kingdom into phanerogams and cryptogams. Phanerogams are the most advanced plants on our planet and their plant body is divided into roots stems and leaves. They have particular reproductive organs that produce seeds also known as seed-producing plants. The pine trees, grasses, crops flowers, bamboo trees etc which we see around us all belongs to phanerogams it is the largest subkingdom. Which is divided into two parts gymnosperm and angiosperm.

808. An immature male gametophyte differs from a mature male gametophyte in that it
(a) has not yet left the pollen sac
(b) has not yet germinated and its generative cell has not divided into two male gamete
(c) is a microspore that has not yet divided by mitosis
(d) still consist of microsporocyte

AMU-2014

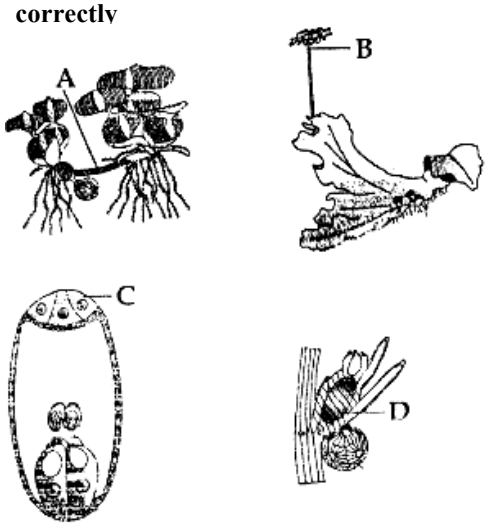
Ans. (b) : The pollen is immature or partially developed male gametophyte similarly, the unicellular microspore produce male gametes and develops into mature microgametophyte by the process of mitotic cell division. Hence the pollen grains are immature male gametophyte and partially developed male gametophyte. An immature male gametophyte differs from a mature male gametophyte in that it has not got germinated. At the maturity the male gametophyte consists of three cells, vegetative cell and two sperm cell.

809. Which of the following statement is correct?
(a) In Cycas, megasporophyll produce pollen grains
(b) In Agaricus gills produce basidiospores
(c) In Aspergillus, fruiting body is perithecium
(d) In Funaria capsule represents gametophytic generation

Rajasthan PMT-2002

Ans. (b) : Agaricus completes its sexual cycle by producing basidiospores on the margins of the gills of the mushroom. Like almost all fungi in the Basidiomycete group, the organism exists primarly in a dikaryon state where each cell has two nuclei one from each parent produced after two haploid hyphae fuse.
Short lived primary mycelium originates from homokaryotic basidiospores.

810. Examine the figures (A-D) given below and select the right option out of 1-4, in which all the four structures A, B, C and D are identified correctly



Options :

	A	B	C	D
(a)	Sucker	Seta	Megaspore mother cell	Gemma cup
(b)	Rhizome	Sporangiophore	Polar cell	Globule
(c)	Runner	Archegoniophore	Synergid	Antheridium
(d)	Offset	Antheridiophore	Antipodals	Oogonium

AIPMT (Mains)-2010

Ans. (d) : A- Offset of water hyacinth (Eichhornia).
B- Antheridiophore of marchantia
C- Antipodals of the mature embryo sac.
D- Oogonium of Chara

811. Which one of the following is considered important in the development of seed habit ?
(a) Free-living gametophyte
(b) Dependent sporophyte
(c) Heterospory
(d) Haplontic life cycle

AIPMT-2009

@apna_pdf

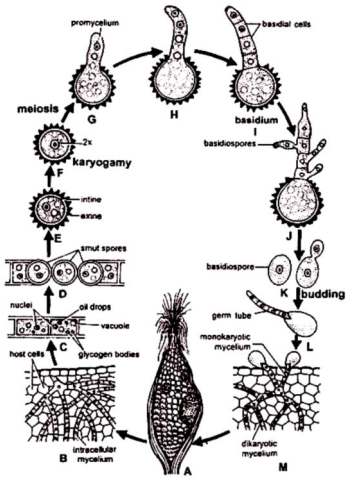
Ans. (c) : Heterospory is thus considered an important step in evolunton as it is a precursor to the seed habit. Heterospory evolved first in pteridophytes such as Selaginella and Salvinia. The seed habit is the most complex and evolutionary method of sexual reproduction.

812. Which one of the following has haplontic life cycle ?

(a) Wheat (b) Funaria
(c) Polytrichum (d) Ustilago

AIPMT-2009

Ans. (d) : Ustilago shows haplontic life cycle. Where the haploid stage is multicellular and the diploid stage is unicellular. When a plant has been haploid for the life cycle, it is referred to as the haplontic life cycle. Lifecycles can be haploid, diploid or alternating between the two and may either be haplontic, diplontic or haplo-diplontic.



Diagrammatic life cycle of Ustilago

813. Heterospory is the production of

(a) sexual and asexual spores
(b) large and small spores
(c) haploid and diploid spores
(d) diploid and tetraploid spores

JIPMER-2004

Ans. (b) : Heterospory is the production of spores of two different size and sexes by the sporophytes of land plant. In some pteridophytes two type of spores are formed which differ significantly in their size and also in function. This phenomenon is called heterospory example- Selaginella and Marsilea etc.

814. Study the following lists.

List I	List II
(A) Neck of archegonium In *Funaria*	**(i) Two-nucleated**
(B) Neck of archegonium in *Pteris*	**(ii) Two - celled**
(C) Neck canal cells in *Pteris*	**(iii) Zero**
(D) Neck canal cell in Cycas	**(iv) Six vertical rows of cells**
	(v) Four vertical rows of cells

The correct match is :

	A	B	C	D
(a)	3	4	2	5
(b)	4	5	1	3
(c)	3	4	2	1
(d)	4	3	5	1

AP EAMCET-2010

Ans. (b) : Neck of Archegonium in Funaria :- Mature archegonium has a long columnar stalk, a swollen venter and an elongated neck. The wall of venter is two layered, but that of neck is single layered, consisting of cell arranged in six spirally twisted rows of cell. Neck consist of 6 or more neck canal cell (6-11).

Neck of Archegonium pteris :- Archegonium is the female reproductive organ in fern and mosses. Neck-canal cell is located above the egg. It has four ventrical row of cell.

Neck canal cell in Pteris :- Neck canal cell in Pteris is single & binucleated because the neck of Dryopteris is made up of four vertical rows of cells.

Neck canal cell in Cycas :- Neck canal cell are absent in cycas.

List-I	List-II
(a) Neck of archegonium in Funaria	Six vertical rows of cell
(b)Neck of archegonium Pteris	Four ventrical row of cell
(c) Neck canal cell in Pteris	Two Nucleated
(d) Neck canal cell in Cycas	Zero

815. Study the following lists:

List-I	List-II
A. Pteris—Spermatozoids	**1. Zooidogamy**
B. Cycas—Male gametes	**2. Malic acid**
C. Funaria—Antherozoids	**3. Oogamy**
D. Spirogyra—Aplanogametes	**4. Sucrose**
	5. Physiological anisogamy

The correct match is:

	A	B	C	D
(a)	1	5	4	3
(b)	3	2	4	5
(c)	2	5	4	1
(d)	2	4	3	5

AP EAMCET-2005

Ans. (d) :

List-I	List-II
A. Pteris- Spermatozoids	Malic acid
B. Cycas- Male gametes	Sucrose
C. Funaria- Antherozoids	Oogamy
D. Spirogyra- Aplanogametes	Physiological anisogamy

During fertilization, the spermatozoids are attracted by the malic acid released by the archegonia of the pteris. In order to attract the male gametes during fertilization, the cycas archegonia exude dissolved sucrose.

@apna_pdf

• Oogamy occurs in Funaria and in Spirogyra the aplanogametes are of + Strain i.e. male and- Strain i.e. female and thus they show physiological an-isogamy.

• Physiological anisogamy is risible at the time of conjugation when one of two isogametes show motility and is considered as the male gamete. This phenomenon is referred to as physiological anisogamy, as they show dissimilar physiological function.

816. Flagellated male gametes are present in all the three of which one of the following sets ?

(a) Riccia, Dryopteris and Cycas
(b) Anthoceros, Funaria and Spirogyra
(c) Zygnema, Saprolegnia and Hydrilla
(d) Fucus, Marsilea and Calotropis

AIPMT-2007

Ans. (a) : There are two types of gametes male and female gametes that when fused produce offspring. A genus of liver worts called Riccia is a bryophytes male gametes on it are biflagellated.
Dryopteris is a pteridophyte and have a multiflagellate male gametophyte. The gymnosperm group of plants includes cycas which have muciliated male gametes. The male gametes in cycas are top shaped, equal and spirally coiled.

817. In the prothallus of a vascular cryptogam, the antherozoids and eggs mature at different times. As a result:

(a) Self fertilization is prevented
(b) There is no change in success rate of fertilization
(c) There is high degree of sterility
(d) One can conclude that the plant is apomictic

AIPMT-2007

Ans. (a) : In prothallus of vascular cryptogams, the antherozoids and egg mature at different times and is called as an outbreeding divce. The antherozoids are biflagellated or multiflagellated. As a result, of which self-fertilization is prevented and cross fertilization occurs.

818. Gametophyte is dominant stage in the life cycle of

(a) bryophyta (b) pteridophyta
(c) angiosperms (d) gymnosperms

UP CPMT-2011

Ans. (a): The life cycle of a bryophyte includes the gametophytic and sporophytic phases, both of which are morphologically distinct. The gametophytic phase differe from one another morphologically. The gametophytic phase is more conspicuous independent and dominant while saprophyte depend on gametophyte.

819. Match the plant structures given in the column-I with their plants given in the column–II.

Column-I	Column-II
A. Prothallus	**p. Bryophytes**
B. Microsporophyll	**q. Pteridophytes**
C. Protonema	**r. Angiosperms**
D. PEN	**s. Gymnosperms**

(a) A-r, B-p, C-s, D-q (b) A-s, B-r, C-p, D-q
(c) A-q, B-s, C-r, D-p (d) A-q, B-s, C-p, D-r

Karnataka CET-2016

Ans. (d) :

Column–I	Column–II
(A) Prothallus	Pteridophytes
(B) Microsporophyll	Gymnosperms
(C) Protonema	Bryophytes
(D) PEN	Angiosperms.

820. Which of the following taxa shows zooidogamous oogamy?

(i) Spirogyra (ii) Funaria
(iii) Pteris (iv) Cycas
The correct sequence is :

(a) (i), (ii), (iii) (b) (i), (iii), (iv)
(c) (i), (ii) , (iv) (d) (ii), (iii), (iv)

AP EAMCET-2009

Ans. (d) : Zooidogamy is a type of fertilization which is seen in certain plants, in which male gametes swim in the water to reach the female gametes, thus male gametes are motile and flagellated, which helps them to swim in water. For example, bryophytes, pteridophytes and some gymnosperms exhibit zooidogamy during sexual reproduction.

• **In Funaria,** a liberated antherozoid swim towards the female archegonium in the presence of water.

• Pteris reproduces vegetatively by the older rhizome segments eventually dying and decomposing. They therefore fall under the category of pteridophytes.

• **In Cycas,** they are oogamous where the male gamete is significantly larger than the male. The male gamete being motile reaches up the female gamete in order to take in for fertilization.

821. A plant completing its life cycle before the onset of dry condition is said to be :

(a) short day plant (b) long day plant
(c) drought escaping (d) all of the above

AFMC-2000

Ans. (c) : A plant completing its life cycle before the onset of dry condition is said to be drought escaping.
It is the ability of a plant to complete the life cycle before serious soil and plant water deficits develop.
Drought escaping plant species are annuals which germinate and grow only when there is sufficient moisture available to complete their life cycle.

@apna_pdf

822. The branch of biology, which deals with the study of processes and functions of an organism, is called:
(a) histology (b) anatomy
(c) physiology (d) entomology
BHU PMT-2004

Ans. (c) : The branch of biology, which deals with the study of processes and functions of an organism is called physiology. It also helps us to determine what goes wrong in disease, facilitating the development of new treatments and guidelines for maintaing human and animal health. This branch of biology tells us how organisms organ systems, organs, cells and bio-molecules function in living organisms.

823. A typical foliage leaf comprises
(a) hypopodium (b) mesopodium
(c) epipodium (d) all of these
AMU-1996

Ans. (d) : Foliage leaves are the leaves found on the main stem and branches. These are green in colour and perform the function of photosynthesis. A foliage leaf consist of three parts.
1. Leaf base is called Hypopodium.
2. Petiole is also called as Mesopodium.
3. Lamina is called as Epipodium.

824. Sporangia bearing leaf is called
(a) cataphyll (b) sporophyll
(c) leaflet (d) cladophyll
AMU-2002

Ans. (b) : Sporangia bearing leaf is called sporophyll. Several sporangia grouped together are called as sorus. Sporangia can produce spores by mitosis but in nearly all land plants and many fungi, sporangia are the site of meiosis and produce genetically distinct haploid spores.

825. Match the following column I with column II.

	Column-I		Column-II
A.	**Phototaxis**	**1.**	**Circular movement of protoplasm with response to warm condition**
B.	**Chemotaxis**	**2.**	**Downward movement of floral organs (closing flower)**
C.	**Seismonasty**	**3.**	**Movement of chla-mydomonas**
D.	**Hyponasty**	**4.**	**Movement of antherozoids towards archegonia**

(a) A - 3 B - 4 C - 1 D - 2
(b) A - 1 B - 2 C - 3 D - 4
(c) A - 4 B - 2 C - 3 D - 1
(d) A - 3 B - 1 C - 4 D - 2
CMC Ludhiana-2015

Ans. (a) :

	Column-I	Column-II
A.	Phototaxis	Movement of chlamydomonas
B.	Chemotaxis	Movement of autherozoids towards archegonia
C.	Seismonasty	Circular movement of protoplasm with response to warm condition Drooping of leaf
D.	Hyponasty	Downward movement of floral organs (Closing flower)

A. Phototaxis- Phototaxis is a type of locomotary movement that occurs when a whole organism moves towards or away from a stimulus of light.
B. Chemotaxis- Response to the chemical stimulus.
C. Seismonasty- It is due to change in turgidity.
D. Hyponasty- More growth occurs on lower surface. Flowers closed and folding of leaves occurs.

826. Which of the following pairs are correctly matched? (1) Fertile spike? Ophioglossum (2) Sporangiophore? Equisetum (3) Synangium? Psilotum (4) Apophysis? Spirogyra
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 1, 2 and 4 are correct
(d) 1 and 3 are correct
BHU PMT (Mains)-2006

Ans. (a) :
Fertile spike - ophioglossum
Sporangiophore - equisetum
Synangium - psilotum

827. Cotton belonges to family :
(a) Solanaceae (b) Cucurbitaceae
(c) Leguminoseae (d) Malvaceae
MGIMS Wardha-2003

Ans. (d) : The cotton belongs to family Malvaceae. The surface fibres are obtained from cotton seed hairs which are used in textile industries for making clothes. Cotton fibre is mainly made up of cellulose.

828. Masses of pollen grains, i.e., pollinia is found in
(a) Gramineae (b) Solanaceae
(c) Orchidaceae (d) Malvaceae
JIPMER-2013

Ans. (c) : Pollinia is a coherent mass of pollen grains. The orchidoideae have a single terminal stamen and the anthers produce one or more waxy masses of pollen called as pollinia. The stigma is proximal to the single terminal stamen. It is found in calotropis and orchids.

@apna_pdf

829. Lady finger belongs to family

(a) Malvaceae (b) Cucurbitaceae
(c) Brassicaceae (d) Liliaceae

JIPMER-2013

Ans. (a) : Lady finger or Okra belongs to the family Malvaceae, which contains plants with gamosepalous calyx, polysepalous petals, monothecos anthers, syncarpous gynoecium. The scientific name of lady's finer is Abelmoschus esculentus.

830. Match the following with correct combination.

Column I	Column II
A. Cuscuta	1. Saprophyte
B. Eichhornia	2. Pneumatophare
C. Monotropa	3.Insectivorous plant
D. Rhizophora	4. Parasite
E. Utricularia	5. Root pocket

Codes

	A	B	C	D	E
(a)	3	1	5	4	2
(b)	2	3	1	5	4
(c)	4	3	1	5	2
(d)	4	5	1	2	3

JIPMER-2013

Ans. (d) : Cuscuta is genus which includes nearly 100-170 species of yellow, orange, or red parasitic plant.

- Eichhornia is a aquatic flowering plants with develop root pockets.
- Monotropa is a Saprophytic plant. *Monotrapa uniflora* also known as Indian pipe.
- Rhizophora is a mangrove trees with pneumatophores.
- Utricularia is a genus of insectivorous plants.

831. The largest ovules in the plant world are found in:

(a) Tsuja (b) Pinus
(c) Banyan (d) Cycas

AFMC-2002

Ans. (d) : The Cycas belongs to gymnospermic group of plants. It contains largest ovules, which are orthotropous (upright) type ovule. It contains a thick integument which can be divided into three layers, namely, outer fleshy, middle stony and inner fleshy layers.

832. Insectivorous plant usually survive in:

(a) water rich soil
(b) N_2 deficient soil
(c) N_2 rich soil
(d) sugar deficient medium

JCECE-2005

Ans. (b) : The insectivorous plants like Nepenthes, Drosera, etc, are autotrophic plants which behave as heterotrophic organisms as they trap N_2 from the insects which they catched. These plants usually survive in water logged or boggy habitats, which are deficient in nitrogen. These plants supplement their nitrogen supply through catching and digesting small animals like insects.

833. In which of the following the sporophyte is indeterminate in growth?

(a) Riccia (b) Marchantia
(c) Anthoceros (d) Funaria

VMMC-2006

Ans. (c) : In Anthoceros sporophyte is represented by foot, merismatic zone and capsule. The sporophte produces the spores in the capsule. The spores on germination produce the gametophyte. The sporophyte of Anthoceros shows indetermine growth and also cylindrical capsule with short foot.

834. Clear cut alternation of generations in present in:

(a) Rhizopus (b) Aspidium
(c) E. coli (d) Spirogyra

JIPMER-1995

Ans. (b) : Alternation of generations is present in Aspidium. The alternation of generations means that plants alternate between two different life stages, or generations, in their life cycle, a haploid stage called gametophyte and a diploid stage called sporophyte.

835. In plants, glycolate metabolism takes place in

(a) low concentration of CO_2
(b) high concentration of CO_2
(c) low concentration of oxygen
(d) absence of oxygen

VMMC-2005
AMU-2004

Ans. (a) : In low CO_2 concentration glycolic acid or glycolate is formed which forms the substrate for photorespiration or glycolate metabolism. It is energetically wasteful. Photo respiration is related with high O_2 and low CO_2 concentration.

836. Which of the following have gametuphytic plant body and sporophyte remains as a parasite on it?

(a) Funaria (b) Pteris
(c) Cycas (d) Neem

Rajasthan PMT-2000

Ans. (a) : In mosses, Funaria main plant body is gametophytic and sporophyte remains a parasite on gametophyte for nutrition.

- The sporophyte is the dominant generation, but multicellular male and female gametophytes are produced within the flowers of the sporophyte.

@apna_pdf

04 ANIMAL KINGDOM

A. Basis of Classification

1. Study the following pick up the correct combinations

	Phylum	Salient feature	Example
I.	Porifera	Cnidoblasts	Sycon
II.	Cnidaria	Tissue level organisation	Adamsia
III.	Annelida	Malpighian tubules	Nereis
IV.	Echinodermata	Water vascular system	Antedon

(a) I, II (b) III, IV
(c) I, III (d) II, IV

TS EAMCET-10.05.2023, Shift-II

Ans. (d) :
Porifera → cnidoblast e.g. sycon
Echinodermata → water vascular system Antedon

Cnidaria is also called coelentrates.
Tissue lable body organisition and this is diploblostic
• The number of cnedaria is adomsia is also called sea anemon

2. Among triplolastic animals, these are asymmetrical
(a) Larvae of echinoderms
(b) Crustaceans
(c) Adult gastropods
(d) Ctenophores

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : Adult gastropods are triplolastic animals and asymmetrical- The medium celled species of gastropods as abalone, periwinkles, whelks and numerous sea snails.
Torsion of body mass is present in gastropods and Radula is present and mostly median
• Ctenophore are diploblostic and bidadialy symmetrical

3. The cleavage pattern in Deuterostomia is
(a) Spiral and determinate
(b) Spiral and indeterminate
(c) Radial and indeterminate
(d) Radial and determinate

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : Clevage a series of mitotic divisions where by the enormous volume of egg cytoplasm is divided into numerous smaller nucleated cells. These cleavage stage cells are called- blastomeres.
Several types of cleavage symmetry seen in nature radial (echinoderms, amphibians), spiral (mollusks, annelids), bilateral (ascidians, tunicates), rotational (mammals).
In deuterostomes cleavage pattern is radial & indeterminate.
Radial– The cells divide such that seen cell in the top four cell plane is directly over one other cell in the bottom plane.
Indeterminate– Early embryonic cells retain capacity to develop into a complete embryo if isolated from other cells. Cleavage produces blastomeres which are qualitatively equipotential or totipotent. When they are isolated, they develop into complete embryos. This is because the fates of blastomeres are not predetermined in the early embryonic period. Vertebrates and certain invertebrates such as echinoderms which produce regulative type of eggs exhibit indeterminate cleavage.

4. Slowest and most primitive type of locomotion in Protozoan is
(a) Flagellar movement
(b) Amoeboid locomotion
(c) Ciliary locomotion
(d) Undular movements

AP EAPCET-22.05.2023, Shift-I

Ans. (b) : Amoeboid locomotion– Movement of the animals is made by the throwing of pseudopodium, called amoeboid movement.
In the direction of movement of amoeba a new pseudopodium is formed and the pseudopodium at the opposite side gradually disappears.

5. Number of vertebrae that from the sacrum
(a) 5 (b) 12
(c) 7 (d) 1

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : Vertebrae are the 33 individual bones that interlock with each other to form the spinal column. The vertebrae are numbered and divided into regions- cervical, thoracic, lumber, sacrum, and coccyx.
The sacrum is made up of five fused vertebrae (S_1 to S_5). The sacrum and coccyx are weight-bearing spinal structures. Sacrum is a shield-shaped bony structure that is located at the base of the lumber vertebrae.

6. Among vertebrates, renal portal system is absent in
(a) Myxine, Macropus, Felis
(b) Columba, Hemidactylus, Panthera
(c) Pteropus, Elephas, Labeo
(d) Scoliodon, Rana, Antelopa

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : Renal portal system is absent in myxine, macropus, felis. Found in most vertebrates its function is to supply blood to renal tubules when glomular filtration is absent.

@apna_pdf

7. Match the following

Larva		Phylum	
A.	Parrenchymula	**I.**	Ctenopohora
B.	Cydippid	**II.**	Annelida
C.	Miracidium	**III.**	Porifera
D.	Trochophore	**IV.**	Echinodermata
		V.	Platyhelminthes

(a) A-III, B-IV, C-V, D-I
(b) A-IV, B-I, C-V, D-II
(c) A-II, B-V, C-I, D-III
(d) A-III, B-I, C-V, D-II

TS EAMCET-11.05.2023, Shift-II

Ans. (d) :

A.	Parrenchymula	III.	Porifera
B.	Cydippid	I.	Ctenopohora
C.	Miracidium	V.	Platyhelminthes
D.	Trochophore	II.	Annelida

8. Assertion (A) : Radial symmetry is an advantage to sessile animals.
Reason (R) : They live water and respond equally to stimuli that arrive from all directions.
The correction option among the following is
(a) A and R are true, R is correct explanation for A
(b) A and R are true, but R is not correct explanation for A
(c) A is true. But R is false.
(d) A is false. But R is true.

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : When any plane passing through the central axis of the body divides the organism into two identical halves, it is called radial symmetry- e.g., coelenterates, ctenophores and echinoderms.
Radial symmetry is an advantage to sessile animals e.g.- coelenterates, sponges ctenophorans & echinoderms.
They live water and respond equally to stimuli that arrive from all directions.

9. All protostomes show
(a) Holoblastic, spiral, indeterminate cleavage
(b) Holoblastic, radial, determinate cleavage
(c) Holoblastic, spiral, determinate cleavage
(d) Holoblastic, radial, indeterminate cleavage

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : All protostomes shows holoblastic, spiral and determinate cleavage.
Holoblastic Cleavage– When the cleavage furrows divide to entire egg. It may be–
Equal– When the cleavage furrow cuts the egg into equal cells. It may be radially symmetrical, bilaterally symmetrical, spirally symmetrical or irregular.
Unequal– When the resultant blastomeres becomes unequal in size.
Spiral Cleavage– The cells divide at slight angles to one another; so that the none of the four cells in one plane of the eight cell stage is directly over a cell in the other plane.
Determinate– The developmental fate of each embryonic cell is established very early. If a cells isolated from the 4-cell stage the embryo will not fully develop. This is because the fate of each blastomere is predetermined in the early embryonic stage itself. Annelids, mollusks and ascidians which produce mosaic type of eggs exhibit determinate cleavage.

10. Hemozoin is
(a) Insoluble, crystalline substance released during malarial parasite infection
(b) Soluble, amorphous and released during pneumonia attack
(c) Antigen released by plasmodium
(d) Antibody released by malaria patient

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : Hemozoin is a waste product of blood feeding parasite such as malaria. It is insoluble, crystalline substance released during infection.

11. Select the set of characters equally shared by reptiles and aves among the following
(a) Pneumatic bones and powerful breast musculature
(b) Interclavicle, uricotelism and megalecithal eggs
(c) Urinary bladder and Furcula
(d) Furcula and keel

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : The made of fertilization in both reptiles and birds is internal. Both reptiles and birds lay eggs. Interclavicle bone, uricotelism and megalecithal eggs are equally spread characters of reptiles and aves.

12. Choose the common characters shown by the animals of classes Scyphozoa and Anthozoa
A. Mesoglea is non cellular with amoebocytes
B. Cnidocytes occur in ectoderm and endoderm
C. Germ cells are derived from endoderm
D. Coelenteron is undivided
(a) A, C (b) B, D
(c) B, C (d) C, D

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : Common features of class scyphozoa and Anthozoa are– Cnidoblast occurs both in ectoderm and endoderm germ cells derived from endoderms. Both are exclusively marine.
Differences between class scyphozoa and anthozoa– In scyphozoans coeletron is divided into four chambers and some canals and mesoglea contains amoebocytes.
In anthozoans coelentron is divided into eight or more septa or mesenteries, and mesoglea contain connective tissue.

13. Match the following

	List-I		List-II
A	**Gorgonia**	**i**	**Marine leech**
B	**Pontobdella**	**ii**	**Sea Urchin**
C	**Balanus**	**iii**	**Sea Fan**
D	**Echinus**	**iv**	**Rock barnacle**

@apna_pdf

(a) A – iii, B – i, C – iv, D – ii
(b) A – iii, B – iv, C – ii, D – i
(c) A – iv, B – i, C – ii, D – iii
(d) A – ii, B – iv, C – i, D – iii

AP EAPCET-23.05.2023, Shift-I

Ans. (d) :

A	Gorgonia	ii	Sea Urchin
B	Pontobdella	iv	Rock barnacle
C	Balanus	i	Marine leech
D	Echinus	iii	Sea Fan

14. Bilateral symmetry is observed in
A. Aterias
B. Bipinnaria
C. Adult gastropods
D. Auricularia larva
E. Brachiolaria larva
(a) B, C, E (b) A, C, D
(c) A, B, E (d) B, D, E

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : Bilateral symmetry is observed in Bipinnaria larva, Auricularia larva and Brachiolaria larva.
Bipinnaria is larva of starfish, Auricularia is the larval stage of sea cucumber and Barchiolaria larva is second stage larva of starfish.

15. Match the following

	List-I		List-II
A.	**Red panda**	**i**	**Grus leucogeranus**
B.	**Siberian crane**	**ii**	**Antelope cervicapra**
C.	**The black buck**	**iii**	**Sus salvanius**
D.	**Pygmy hog**	**iv**	**Ailurus ochraceus**

(a) A. iv B. i C. ii D. iii
(b) A. iii B. iv C. i D. ii
(c) A. ii B. i C. iv D. iii
(d) A. iii B. iv C. ii D. i

AP EAPCET-23.05.2023, Shift-I

Ans. (a) :

A.	Red panda	iv	Ailurus ochraceus
B.	Siberian crane	i	Grus leucogeranus
C.	The black buck	ii	Antelope cervicapra
D.	Pygmy hog	iii	Sus salvanius

16. Match the following:

	Excretory organs		Examples
(A)	**Protonephridium**	**(I)**	**Terrestrial arthropods**
(B)	**Malpighian tubules**	**(II)**	**Crustaceans**
(C)	**Pericardial glands**	**(III)**	**Amphibians**
(D)	**Antennary glands**	**(IV)**	**Rotifers**
		(V)	**Adult molluscs**

The correct match is
Options:

	A	B	C	D
(a)	IV	I	V	III
(b)	IV	I	V	II
(c)	III	I	IV	V
(d)	II	V	I	IV

TS EAMCET-30.07.2022 Shift-I

Ans. (b) :

Excretory organs		Example	
A	Protonephridium	IV	Rotifers
B	Malpighian tubules	I	Terrestrial Arthropods
C	Pericardial glands	V	Adult molluscs
D	Antennary glands	II	Crustaceans
		V	Amphibians

17. The lowest level of organization among eumetazoans is
(a) Cellular level (b) Tissue level
(c) Organ level (d) Organ–system level

TS EAMCET-30.07.2022 Shift-I

Ans. (b) : The lowest level of organization among eumetazoans is tissue level. These are found in coelente rates and ctenophores.
• Organ system level of organisation is seen in annelids, Arthropoda, Echinoderms, molluscs and chordates
• The celluar level of organization is found in the porifera phylum.

18. Match the following:

	List-I		List-II
(A)	**Choanocytes**	**(I)**	**Cnidaria**
(B)	**Lasso cells**	**(II)**	**Porifera**
(C)	**Stinging cells**	**(III)**	**Nematoda**
(D)	**Renette cells**	**(IV)**	**Ctenophora**
(E)	**Periostracum**	**(V)**	**Mollusca**

The correct match is:

	A	B	C	D	E
(a)	V	I	IV	II	III
(b)	II	IV	I	V	III
(c)	IV	III	II	I	V
(d)	II	IV	I	III	V

TS EAMCET-31.07.2022 Shift-II

Ans. (d) :

	List – I	List - II
A	Choanocytes	Porifera
B	Lasso cell	Ctenophora
C	Stinging cells	Cnidaria
D	Renette cell	Nematoda
E	Periostracum	Mollusca

19. The animals which are active during day time
(a) Vesporal (b) Diurnal
(c) Cresporal (d) Auroral

Karnataka CET-2022

Ans. (b) : Diurnal : Diurnal animal are animal that are active during the day and then sleep at night.
Example - Diurnal animal include Human, Deer, Dog, etc
Vesporal : Animal which remain active during dusk (late hour of day).
Example : Bat and Owls.
Cresporal : A Cresporal organism is one that is adapted specifically to run. An animal can be considered Cresporal if it has the ability to run fast.
Example : Cheetah.
Auroral : an auroral animal are those who remain active at dawn (early hours of the day).
Example: Bubalcus.

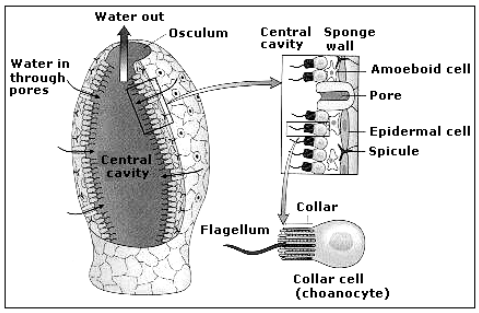
@apna_pdf

20. Multicellular animals that exhibit cellular level organisation are

(a) Protozoans (b) Metazoans
(c) Eumetazoans (d) Parazoans

TS EAMCET-30.07.2022 Shift-II

Ans. (d) : Parazoans are multicellular animals that exhibit cellular-level organization. The cellular level is the most basic level of organization. Sponges are the most common parazoa in the world.
An organism is organized into four level : cells, tissues, organs and organ systems.

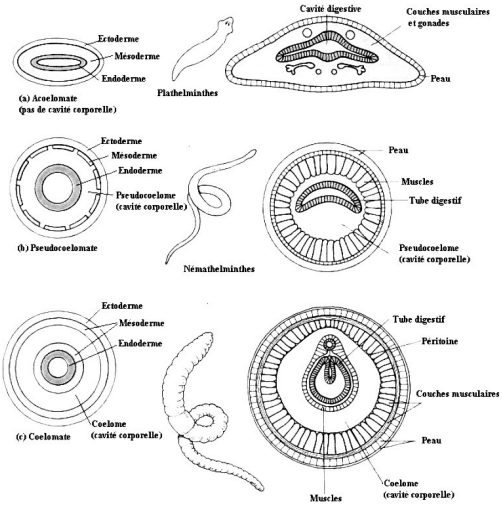


21. Which of the following groups constitutes eucoelomates?

(a) Acoelomates & Pseudocoelomates
(b) Schizocoelomates & Pseudocoelomates
(c) Schizocoelomates & enterocoelomates
(d) Enterocoelomates & Pseudocoelomates

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Animal that have a true coelom is known as Eucoelemate. Schizocoelomates and enterocoelomates are type of two categories of true coelom.



- Schizocoelomates is a coelom that originates from the splitting of the mesoderm creating the pocket-like cavity. e.g.- Annelids, Arthropods, and Molluscs.
- Enterocoelomates is a coelom formed from the wall of the embryonic gut or archenteron as hollow outgrowths. e.g.- Echinoderms, Hemichordates and Chordates.

22. The Scientific name of Rhesus monkey

(a) Macaca fascicularis (b) Macaca radiata
(c) Macaca mulatta (d) Macaca fuscata

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : The scientific name of Rhesus monkey is *Macaca mulatta*. It is a species of Old World monkey they live in groups of 20 to 200 animals and lives on the ground or in trees.
-*Macaca fascicularis* commonly called long tailed macaque or crab eating macaques
-*Macaca radiata* commonly called bonnet macaque also known as zati.
-*Macaca fuscata* commonly called Japanese macagues also known as the snow monkey.

23. Which scientist is regarded as the pioneer in the field of systematic of invertebrates?

(a) Libbie Henrietta Hyman (b) Heackle
(c) Leeuwenhoek (d) Robert E. Grant

AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Libbie Henrietta Hyman born on Dec 6, 1888,, U.S and died Aug. 3,1969 New York city U.S zoologist and writer particularly noted for her widely used texts and reference work on invertebrate and vertebrate zoology. Libbie Henrietta Hyman is regarded as the pioneer in the field of systematic of invertebrates.

24. Read the following and find out the correct combinations

	Coelom/ Symmetry	Phylum	Example
(a)	Pseudocoelom	Platyhelminthes	Ascaris
(b)	Bilateral	Cnidaria	Hydra
(c)	Eucoelom	Annelida	Pheretima
(d)	Radial	Ctenophora	Obelia

TS EAMCET-30.07.2022 Shift-II

Ans. (c) : A coelom or the body cavity is important for the formation of complex organs. The organism without a body cavity cannot develop proper organs. The entire organism belonging to phylum annelida (Pheretima) posses coelom.

- True coelom or Eucoelom is a fluid-filled cavity. It is lined by mesodermal epithelium and develops within the mesoderm. It develops between alimentary canal and gut wall.
- Phylum Annelida is a very broad phylum belonging to the kingdom Animalia.

25. Match the following

Sub Division	Character	Example
A) Acoelomata	**i) Coelom is formed by archenteron**	**p) Mollusca**
B) Pseudocoelomata	**ii) Without a body cavity**	**q) Hemichordata**
C) Schizocoelomata	**iii) Body cavity should not lined by mesodermal layers**	**r) Nematoda**
D) Enterocoelomate	**iv) Coelom is formed by splitting of mesoderm**	**s) Platy helminthes**

(a) (A – ii – r), (B – iv– s), (C – iii – p), (D – i – q)
(b) (A – ii – s), (B – ii – r), (C – i – p), (D – iv – q)
(c) (A – ii – s), (B – iii – r), (C– iv – p), (D – i – q)
(d) (A – iii – s), (B –ii – r), (C – iv – p), (D – i – q)

AP EAMCET-06.09.2021 Shift-I

@apna_pdf

Ans. (c):
Acoelomata – Animals in which body cavity is absent **e.g. - Platyhelminthes**.
Pseudocoelomata – The body cavity is not lined by mesoderm, instead, the mesoderm is present as scattered pouches in between the ectoderm and endoderm.
e.g. - Nematodes (Aschelminthes).
Schizocoelomata – Coelom is formed by splitting of mesoderm **e.g.- Mollusca**.
Enterocoelomate – Coelom is formed by archenteron **e.g. - Hemichordata**.

26. Principal type of symmetry in triploblastic animals
(a) Asymmetry (b) Radial
(c) Bilateral (d) Biradial

TS EAMCET-09.08.2021 Shift-II

Ans. (c) : Triploblastic animals have three germs layers are ectoderm, endoderm and mesoderm and have a large diversity of body plans compared with diploblastic organisms because of the additional mesoderm layer. The majority of them are bilaterally symmetrical.

27. Match List I with List II and select the correct option from the codes given below?

	List I		List II
i	Nephridia	A	Coelenterata
ii	Comb plates	B	Platyhelminthes
iii	Choanocytes	C	Annelida
iv	Flame cells	D	Porifera
v	Cnidoblasts	E	Ctenophora

Options:
(a) (i-C), (ii-E), (iii-A), (iv-B), (v-D)
(b) (i-C), (ii-E), (iii-D), (iv-B), (v-A)
(c) (i-C), (ii-A), (iii-E), (iv-B), (v-D)
(d) (i-E), (ii-A), (iii-D), (iv-B), (v-C)

AP EAMCET-05.10.2021 Shift-I

Ans. (b) : Match List I with List II–

Nephridia	–	Annelida
Comb plates	–	Ctenophora
Choanocytes	–	Porifera
Flame cells	–	Platyhelminthes
Cnidoblasts	–	Coelenterata

28. Cold blooded animals fall under the category of _____
(a) Endotherms (b) Thermophiles
(c) Ectotherms (d) Psychrotherms

AP EAPCET-07.09.2021 Shift-I
DUMET-2010

Ans. (c) : Cold blooded animals fall under the category of ectotherms. e.g. Fishes, Amphibians and Replies.
- An ectotherm relies primarily on its external environment to regulate the temperature of its body.
- Birds and mammals are called endotherm.
  Endotherm is an animal that can control its internal body temperature endotherm body temperature usually much warmer than the temperature of environment. Endotherm are called warm blooded animals.
- Psychrotherms are Animals that lives in the cold.
- Thermophiles are animals that live in hot springs.

29. Identify the correct statements with reference to 'Enterocoelomates'.
A.) Body cavity is formed from endodermal pouches
B) They display determinate type of cleavage
C) Enterocoelomates are deuterostomes
D) Hemichordates are enterocoelomates
(a) A & B (b) B & C
(c) C & D (d) A & C

TS EAMCET-09.08.2021 Shift-I
TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Enterocoelomates are deutrostomes.
- Hemichordates are enterocoelomates.
- Body cavity is formed from mesoderm lined.
- They display radial and in determinate cleavage.

30. Coelomate animal in which blastopore develops into anus is called
(a) proterostomia (b) deuterostomia
(c) blastostomia (d) diastomia
(e) None of these

CMC Vellore-2010, 2015
AP EAPCET-07.09.2021 Shift-I

Ans. (b) : Deuterostomia : Based on the embryonic development metazoans are divided into protostomes and deuterostomes.
- Deuterostome include chordate and echinodermata the blastopore in deuterostome is develop into an anal opening.

Protostomia : protostome are primitive invertebrates blastopore in protostome are developed into a mouth.
Example : Arthropods, molluscs, annelids, flatworms and nematodes.

31. Read the following statements
(A) Metagenesis is observed in Helminths.
(B) Echinoderms are triploblastic and coelomate animals.
(C) Round worms have organ-system level of body organization.
(D) Comb plates present in ctenophores help in digestion.
(E) Water vascular system is characteristic of Echinoderms.
Choose the correct answer from the options given below.
(a) (B), (C) and (E) are correct
(b) (C), (D) and (E) are correct
(c) (A), (B) and (C) are correct
(d) (A), (D) and (E) are correct

NEET-2021

Ans. (a) : Echinoderms are triploblastic and coelomate animals as true coelom is observed in them.
- **Roundworms** (Aschelminths) have organ system level of organization.
- **Water vascular system** is seen in echinoderms. It helps in locomotion, capture and transport of food and respiration.
- **Comb plates** present in ctenophores help in locomotion.
- Alternation of generation is also known as metagenesis. It is observed in members of phylum coelenterata (cnidaria).

@apna_pdf

32. Match List - I with List - II

List - I		List - II	
(A)	**Metamerism**	**(i)**	**Coelenterata**
(B)	**Canal system**	**(ii)**	**Ctenophora**
(C)	**Comb plates**	**(iii)**	**Annelida**
(D)	**Cnidoblasts**	**(iv)**	**Porifera**

Choose the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(iv)	(i)	(ii)	(iii)
(b)	(iv)	(iii)	(i)	(ii)
(c)	(iii)	(iv)	(i)	(ii)
(d)	(iii)	(iv)	(ii)	(i)

NEET-2021

Ans . (d) :

	List-I		List-II
(A)	Metamerism	(iii)	Annelida
(B)	Canal system	(iv)	Porifera
(C)	Comb plates	(ii)	Ctenophora
(D)	Cnidoblasts	(i)	Coelenterata

Metamerism– It is the repetition of homologous body segments.
Canal System– It also called aquiferous system. It is characterstics feature of phylum porifera.
Comb Plates– It is large ciliary structure found in phylum ctenophora.
Cnidoblasts– It is secretory organs occurs in phylum coelenterate. They play important role in offens and defens and attachment of substratum.

33. Within the kingdom animalia, which one of the following features is primarily used for classification of the organisms?

(a) Body symmetry (b) Habitat
(c) Mode of nutrition (d) Locomotory organs

KVPY (SA)-2021

Ans. (a) : Within the kingdom animalia, Body symmetry is primary used for classification of the organism. Generally animals show two types of symmetry-
(A) Radial symmetry:- When any plane passing through the central axis divides the body into two equal halves is called radial symmetry.
eg:- Coelentrates, Ctenophores and Echinoderms
(B) Bilateral symmetry:- When only a single plane divides the body into equal halves is called Bilateral symmetry.
eg:- Annelida, Arthropoda, mollusca etc.
Phylum protozoa classified on the basis of locomotion.

34. Which one of the following is the correct structural organization of any animal?

(a) Tissues → Organs → Systems → Cells
(b) Cells → Tissues → Organs → Systems
(c) Cells → Organs → systems → Tissues
(d) Systems → Organs → Cells → Tissues

MHT CET 5.10.2020 Shift-I

Ans. (b) : Cells → Tissues → Organs → Systems is the correct structural organization of any animal. In animal is starts from the smallest fundamental unit is called cell.
Cell :- It is the smallest fundamental unit.
Tissue:- A group of similar cells called tissue.
Organ:- A collection of tissue known as organ.
System:- A group of organs that perform a function.

35. Match the following columns and select the correct option :

Column – I		Column–II	
A.	**Aptenodytes**	**i**	**Flying fox**
B.	**Pteropus**	**ii**	**Angel fish**
C.	**Pterophyllum**	**iii**	**Lamprey**
D.	**Petromyzon**	**iv**	**Penguin**

(a) (A)-(ii), (B)-(i), (C)-(iv), (D)-(iii)
(b) (A)-(iii), (B)-(iv), (C)-(ii), (D)-(i)
(c) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)
(d) (A)-(iv), (B)-(i), (C)-(ii), (D)-(iii)

NEET-2020 Phase-II

Ans. (d) :

(A)	Aptenodytes	(iv)	Penguin
(B)	Pteropus	(i)	Flying fox
(C)	Pterophyllum	(ii)	Angel fish
(D)	Petromyzon	(iii)	Lamprey

36. Match the following columns and select the correct option.

Column-I		Column-II	
(A)	**Gregarious, polyphagous pest**	**(i)**	**Asterias**
(B)	**Adult with radial symmetry and larva with bilateral symmetry**	**(ii)**	**Scorpion**
(C)	**Book lungs**	**(iii)**	**Ctenoplana**
(D)	**Bioluminescence**	**(iv)**	**Locusta**

	(A)	(B)	(C)	(D)
(a)	(iv)	(i)	(ii)	(iii)
(b)	(iii)	(ii)	(i)	(iv)
(c)	(ii)	(i)	(iii)	(iv)
(d)	(i)	(iii)	(ii)	(iv)

NEET-2020 Phase-I

Ans. (a) :

(A)	Gregarious, Polyphagous Pest	Locusta
(B)	Adult with radial symmetry and larva with bilateral symmetry	Asterias
(C)	Book lungs	Scorpion
(D)	Bioluminescence	Ctenoplana

37. Identify the incorrect statement (s) from the following:

(a) Labrum is called lower lip
(b) Hind wings (mesothoracic) called tegmina.
(c) Gizzard in alimentary canal is also called proventriculus.
(d) Exchange of gases take place at the tracheoles by active process.
(e) The opening of the spiracles is regulated by the sphincters

(a) (a), (b), (c) and (d)
(b) only (a), (b), (d)
(c) only (a)
(d) only (b), (c)

AP EAMCET-25.09.2020 Shift-I

@apna_pdf

Ans. (b) :
(a) Labrum : The labrum is also known as the upper lip. It consist of a flattened cuticle and help to hold the food in the correct position when the cockroach feed.
(b) Metathoracic : Hind wing called metathoracic wing which are delicate thin transparent and membranous wing with broad terminal end. They are used for flight.
(d) Exchange of the gases in cockroach take place in tracheoles by the process of diffusion.

38. Study the following statements :
I. Sponges are considered as an evolutionary blind offshoot.
II. In anthozoans, germ cells are derived from ectoderm
III. Primary function of flame cells of flatworms is osmoregulation.
IV. Body cavity of nematodes contain botryoidal tissue.
Among the above, the correct statements are:
(a) I,II (b) I, III
(c) III, IV (d) II, IV

TS EAMCET-28.09.2020 Shift-II

Ans. (b) : Sponges are not considered as an evolutionary to higher phyta.
Germ cell : Embryonic germ cell are pleuripotent stem cell derived from primordial germ cell.
Botryoidal tissue : In leeches the botryoidal tissue is composed of two different cell types granular botryoidal cell and flattened endothelial like cell.

39. Statement I : Sternum appeared for the first time in amphibians.
Statement II : Snakes have 10 pairs of cranial nerves.
The correct option among the following is
Options:
(a) Statements I and II are true.
(b) Statements I and II are false.
(c) Statement I is true. But II is false.
(d) Statement I is false. But II is true.

TS EAMCET-28.09.2020 Shift-I

Ans. (a) : The sternum also known as the breast bone, is a flat bone located in the middle of the rib cage and chest areas. Amphibians are first tetrapods and leud a dual mode of life on land and fresh water.
Sternum appeared for the first time in the amphibians.
- Cranial nerves are 12 pairs in reptiles, except in snakes (10 pairs).

40. Study the following and pick up the correct statements:
(I) Aristotle's lantern is found in echinoids
(II) Glochidium is the larva of cephalopods
(III) Scorpions respire with book lungs.
(IV) Parapodia are found in oligochaetes
Options:
(a) I, III (b) I, II
(c) III, IV (d) II, IV

TS EAMCET-28.09.2020 Shift-I

Ans. (a) : According to the question correct statement is
(1) Aristotles lantern is found in echinoids
(2) Glochidium is the larva of freshwater mussels (unio)
(3) Scorpions respire with book lungs.
(4) Parapodia are found in Annelids but some annelids such as earthworms belonging to the subclass Oligochaeta lack parapodia.

41. Follow the statements given below
I. Haemocoel in arthopods is around gonads and excretory organs.
II. Haemocoel in molluscs is around kidneys, visceral organs and gonads.
III. Coelom in echinoderms is modifed into an ambulacral system.
IV. Functional body cavity in annelids is the secondary body cavity.
Find out the correct statements from the above
(a) Only I and II are correct
(b) Only III and IV are correct
(c) Only I, II and IV are correct
(d) I, II, III and IV are correct

TS EAMCET-29.09.2020 Shift-I

Ans. (b) : The correct statement is –
(III) Coelom in echinoderms is modified into an ambulacral systems.
(IV) Functional body cavity in annelids is the secondary body cavity.

42. Identify wrongly matched Scientific name and common name:

	Scientific name	Common name
a.	**Bungarus**	**Krait**
b.	**Exocoetus**	**Flying fish**
c.	**Trygon**	**Electric ray**
d.	**Carcharodon**	**Dog fish**
e.	**Myxine**	**Hagfish**

(a) Only (c), (d) (b) (a),(b),(c) and (e)
(c) Only (c) (d) Only (d)

AP EAMCET-24.09.2020 Shift-I

Ans. (d) :

Scientific Name		Common Name
Bungarus	-	Krait
Exocoetus	-	Flying fish
Myxine	-	Hagfish
Trygon	-	Electric ray
Carcharodon Carcharias	-	Great white shark
Squalus acanthias	-	Dog fish

43. The 'Coelom' was coined by _____
(a) Bentham (b) Haeckel
(c) Robert Brown (d) Robert Hooke

AP EAMCET-25.09.2020 Shift-I

Ans. (b) : Term coelom was coined by Haeckel.
- The term was coined in 1872, between the alimentary canal and the body wall lined on all sides by mesoderm.
- The nucleus of the cell was discovered by Robert Brown
- The cell was first discovered and named by Robert Hooke in 1665 (In dead cell wall of plant cells (cork))
- Bentham is known as father of Jurisprudence.

44. Identify the common features of Saccoglossus, Cucumaria, Chaetopleura
(1) Bilaterally symmetrical. They are triploblasitc and coelomate animals
(2) Development is indirect

@apna_pdf

(3) Presence of water vascular system which helps in locomotion
(4) Excretory system is absent. Sexes are separate
(a) 1 and 2 (b) 1
(c) 2 and 4 (d) 1, 2, 3 and 4

AP EAMCET-24.09.2020 Shift-II

Ans. (a) : The common features of saccoglossus, cucumaria, chaetopleura are bilaterally symmetrical, they are triploblastic and coelomate animals, development is indirect.
- Presence of water vascular system which helps in locomotion found in echinodermata.
- In Echinodermata excretory system is absent and sexes are separate.

45. Match the species in Column I with their respective feature of body organization in Column II.

Column-I	Column-II
P. Mollusca	i. Pseudocoelom
Q. Annelida	ii. Radula
R. Nematoda	iii. Radial symmetry
S. Echinodermata	iv. Segmentation

Choose the correct combination.
(a) P-ii, Q-i, R-iv, S-iii (b) P-ii, Q-iv, R-i, S-iii
(c) P-iii, Q-iv, R-i, S-ii (d) P-iv, Q-iii, R-ii, S-i

KVPY (SA)-2020

Ans. (b) :

Column -I	Column-II
P) Mollusca	(ii) Radula
Q) Annelida	(iv) segmentation
R) Nematoda	(i) Pseudocoelom
S) Echinodermata	(iii) Radial symmetry

46. Bilaterally symmetrical and acoelomate animals are exemplified by
(a) Platyhelminthes (b) Aschelminthes
(c) Annelida (d) Ctenophora

NEET-2020 Phase-I

Ans. (a) : Flatworms or platyhelminthes are bilaterally symmetrical and acoelomate animals.
- Annelida is triploblastic, bilaterally symmetrical and coelomates.
- Aschelminthes are pseudocoelomate animals.
- Ctenophora are radially symmetrical with no coelom.

47. Which one of the following phyla is a pseudocoelomate?
(a) Cnidaria (b) Nematoda
(c) Mollusca (d) Chordata

KVPY SB & SX-2019

Ans. (b) : Pseudocoelomate is also known as false coelom. It is occurs in Nematodes organs are less organized inside the pseudocoelom. Pseudocoelomate body cavity present but incompletely lined with mesoderm.

48. Match the following genera with their respective phylum :
(A) Ophiura (i) Mollusca
(B) Physalia (ii) Platyhelminthes
(C) Pinctada (iii) Echinodermata
(D) Planaria (iv) Coelenterata
Select the correct option :
(a) (A)-(iii), (B)-(iv), (C)-(ii), (D)-(i)
(b) (A)-(iv), (B)-(i), (C)-(iii), (D)-(ii)
(c) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)
(d) (A)-(i), (B)-(iii), (C)-(iv), (D)-(ii)

NEET (Odisha)-2019

Ans. (c) : Ophiura ophiura or the serpent star is a species of brittle star in the order Ophiurida- related to phylum
- **Echinodermata**. It is typically found on coastal seabeds around northwestern Europe.
- **The physalia** also known as the man-of-war, belongs to the phylum **coelenterata**, is a marine hydrozoan found in the Atlantic Ocean and the Indian Ocean .
- **Pinctada** is a genus of saltwater Oysters, marine bivalve mollusca in the family pteridae, belongs to phylum **Mollusca**. There pearl oysters have a strong inner shell layer composed of nacre, also known as "mother of pearl".
- **Planarian**, (class turbellaria), any of a group of widely distributed mostly free living flatworms of the class turbellaria (phylum **platyhelminthes**).

49. Match the following organisms with their respective characteristics :

A.	**Pila**	**i.**	**Flame cells**
B.	**Bombyx**	**ii.**	**Comb plates**
C.	**Pleurobrachia**	**iii.**	**Radula**
D.	**Taenia**	**iv.**	**Malpighian tubules**

Select the correct option from the following :

	A	B	C	D
(a)	(iii)	(iv)	(ii)	(i)
(b)	(ii)	(iv)	(iii)	(i)
(c)	(iii)	(ii)	(iv)	(i)
(d)	(iii)	(ii)	(i)	(iv)

NEET-2019

Ans. (a) : Pila → Radula
Bombyx → Malpighian tubules
Pleurobrachia → Comb plate
Taenia → Flame cell
- Pila or apple snail contain file like rasping organ called radula.
- Bombyx or silkworm is an arthropod in which excretion occur through malpighian tubules.
- The body of ctenophore pleurobranchia bears eight row of ciliated comb plate which help in locomotion.
- In Taenia, excretion occur through specialised cells called flame cells, which contain a protonephridia.
- These are mostly endoparasite found in animal including human.

50. Statement (S): Bilaterally symmetrical animals are less efficient than the other animals in seeking food and locating mates because of cephalization.
Reason (R) : Cephalization is developed in bilaterally symmetrical animals.
The correct answer is
(a) Both (S) and (R) are correct and (R) is the correct explanation to (S).

@apna_pdf

(b) Both (S) and (R) are correct but (R) is not the correct explanation to (S).
(c) (S) is correct but (R) is not correct
(d) (S) is not correct but (R) is correct

TS EAMCET-09.05.2019 Shift-I

Ans. (d) : Advance cephalized animals have a head and brain, while less cephalized animals display one or more regions of nervous tissue. Cephalization is associated with bilateral symmetry and movement with the head facing forward. Bilaterally symmetrical animals can seek food, locate mate, escape from predators, and move more efficiently.
Thus statement (S) is not correct but reason (R) is correct.

51. Consider following features
(A) Organ system level of organisation
(B) Bilateral symmetry
(C) True coelomates with segmentation of body
Select the correct option of animal groups which possess all the above characteristics
(a) Annelida, Arthropoda and Mollusca
(b) Arthropoda, Mollusca and Chordata
(c) Annelida, Mollusca and Chordata
(d) Annelida, Arthropoda and Chordata

NEET-2019

Ans. (d) : Annelida, Arthopoda and chordata posses following characteristics-
- They have organ system level of body organization, bilateral symmetry and true coelom.
- Coelom is fluid filled cavity between alimentary canal and bodywall
- It is lined on all sides by mesoderm.

52. Match the following :

	Set-I		Set-II
A.	**Acoelomate**	**I.**	**Earth worm**
B.	**Pseudocoelomate**	**II.**	**Acorn worm**
C.	**Schizocoelomate**	**III.**	**Tape worm**
D.	**Enterocoelomate**	**IV.**	**Round worm**

The correct match is

	A	B	C	D
(a)	II	I	III	IV
(b)	III	IV	I	II
(c)	I	II	IV	III
(d)	II	III	IV	I

TS EAMCET-08.05.2019 Shift-I

Ans. (b) :

	Set-I		Set-II
A	Acoelomate	III	Tape worm
B	Pseudocoelomate	IV	Round worm
C	Schizocoelomate	I	Earth worm
D	Enterocoelomate	II	Acorn worm

53. Statement (S) : Symmetry of an organism is determined based on the symmetry of the early developmental stages and not that of the adults.
Reason (R) : Bilaterally symmetrical animals are more efficient in seeking food, locating mates and avoiding predators.
Which of the following is true?
(a) Both (S) and (R) are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : An organism starts as a single cell and has to organize itself and its genetic material in a symmetrical way to ensure that each daughter cell has a copy of each gene before it splits.
The bilaterally symmetrical animal can seek food and locate mates, escape from predators, and move more efficiently.

54. Match the following :

List-I	List-II
(A) Chordata	**(i) Acoelomate**
(B) Nematoda	**(ii) Schizocoelomate**
(C) Mollusca	**(iii) Enterocoelomate**
(D) Platyhelminthes	**(iv) Pseudo coelomate**

The correct answer is

	A	B	C	D
(a)	(i)	(iii)	(ii)	(iv)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(iv)	(iii)	(i)	(ii)
(d)	(ii)	(iv)	(iii)	(i)

TS EAMCET-02.05.2018 Shift-II

Ans (b):

	List – I	List - II
a.	Choradata	Enterocoelomate
b.	Nematoda	Pseudocoelomate
c.	Mollusca	Schizocoelomate
d.	Platyhelminthes	Acoelomate

55. Match the following

	List-I		List-II
(A)	**Trichimella**	**(I)**	**Platyhelminthes**
(B)	**Redia**	**(II)**	**Mollusca**
(C)	**Trochophore**	**(III)**	**Echinodermata**
(D)	**Glochidium**	**(IV)**	**Porifera**
		(V)	**Annelida**

	A	B	C	D
(a)	IV	III	V	II
(b)	II	V	I	IV
(c)	IV	I	V	II
(d)	III	II	I	V

AP EAMCET-25.04.2018 Shift-I

Ans. (c) :
Trichimella - Porifera.
Redia - Platyhelminthes
Trochophore - Annelida
Glochidium - Mollusca

56. Animals living in air-water interface
(a) Nekton (b) Periphyton
(c) Plankton (d) Neuston

AP EAMCET-25.04.2018 Shift-I

Ans. (d) : Neuston (or swimmers) are living organism that are able to swim and move independently of currents. Neuston are group of organism found on top of underside of the surface of film of water
Example : floating plant

@apna_pdf

Plankton : Zooplankton include microscopic animals (krill, sea snails, pelagic worm, etc.) some example of plankton include - diatoms, jelly-fish dinoflagellates. This is also includes microscopic plants like algae called phytoplankton.

57. Match the following

List-I	List-II
(p) Crab	(i) Green glands
(q) Dugesia	(ii) Malpighian tubules
(r) Wuchereria	(iii) Renette glands
(s) Scolopendra	(iv) Flame cells

The correct answer is

	(p)	(q)	(r)	(s)
(a)	(ii)	(iii)	(iv)	(i)
(b)	(i)	(iii)	(iv)	(ii)
(c)	(i)	(iv)	(iii)	(ii)
(d)	(i)	(ii)	(iii)	(iv)

TS EAMCET-02.05.2018 Shift-I

Ans. (c) :

Crab	–	Green gland
Dugesia	–	Flame cell
Wuchereria	–	Renette gland
Scolopendra	–	Malpighian tubules

58. Statement (S) : Symmetry of an organism is determined based on the symmetry of the early developmental stages and not that of the adults.
Reason (R) : Bilaterally symmetrical animals are more efficient in seeking food, locating mates and avoiding predators.
Which of the following is true?

(a) Both (S) and (R) are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Symmetry of an organism is determined based on the symmetry of the early developmental stages and not that of the adults because radial symmetry is not found in adult of the phylum hemichordate.

Bilaterally symmetry: the bilaterally symmetrical animals can seek feed, ldcate mates, escape from predaters and move more efficiently. These animals have dersal ventral sides and anterior, posterior ends, right and left sides.

Example of animal that possess bilateral symmetry : Flatworms, common worm (ribbon worm) clams snails, octopus, crustacean insects, spiders, sea stars, sea urchins and vertebrates.

59. Which of the following animals does not undergo metamorphosis?

(a) Earthworm (b) Tunicate
(c) Starfish (d) Moth

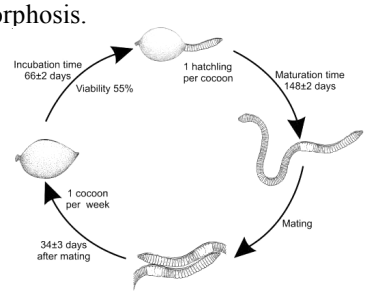
NEET-2018

Ans. (a) : Earthworm do not have larval stage it exhibit direct development.

• Grasshopper does not go under metamorphosis.

Metamorphosis refers to transformation of larva into adult, animal, that perform metamorphosis are said to have indirect development.

• Some insect, fish, amphibians, mollusca, crustaceans, cnidarians, echinoderms and tunicate undergo metamorphosis.



60. Match the following

	List- I		List-II
(p)	Asymmetry	(i)	Cnidaria
(q)	Radial symmetry	(ii)	Platyhelmenthes
(r)	Bilateral symmetry and Enterocoelom	(iii)	Porifera
(s)	Bilateral symmetry without body cavity	(iv)	Hemichordata

The correct answer is

	(p)	(q)	(r)	(s)
(a)	(i)	(iii)	(iv)	(ii)
(b)	(ii)	(i)	(iii)	(iv)
(c)	(iv)	(iii)	(ii)	(i)
(d)	(iii)	(i)	(iv)	(ii)

TS EAMCET-02.05.2018 Shift-I

Ans. (d) :

	List-I	List-II
p	Asymmetry	Porifera
q	Radial symmetry	Cnidaria
r	Bilateral symmetry and enterocoelom	Hemichordata
s	Bilateral symmetry without body cavity	Platyhelmenthes

61. Match the following

List-I		List-II	
A.	Chordata	(i)	Acoelomate
B.	Nematoda	(ii)	Schizocoelomate
C.	Mollusca	(iii)	Enterocoelomate
D.	Platyhelminthes	(iv)	Pseudo coelomate

@apna_pdf

The correct answer is

	A	B	C	D
(a)	(i)	(iii)	(ii)	(iv)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(iv)	(iii)	(i)	(ii)
(d)	(ii)	(iv)	(iii)	(i)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) :

	List-I	List-II
A	Chordata	Enterocoelomate
B	Nematoda	Pseudocoelomate
C	Mollusca	Schizocoelomate
D	Platyhelminthes	Acoelomate

62. Which of the following is an acoelomate

(a) Ascaris lumbricoides (b) Taenia solium
(c) Enterobius (d) Nereis

TS EAMCET-03.05.2018 Shift-I

Ans. (b) : Taenia solium is acoelomate.

- Taenia solium belongs to the phylum platyhelminthes.
- It is commonly known as the Pork tapeworm.
- It live inside the human body.
- Ascaris lumbricoides is pseudocoelomates .
- Enterobius (pinworm) is pseudocoelomate.
- Nereis is coelomate.

63. Match the following

Cells of fat body		Function
(A) Trophocytes	(I)	Store uric acid
(B) Mycetocytes	(II)	Synthesis and storage of lipids
(C) Oenocytes	(III)	Storage of urea
(D) Urate cells	(IV)	Storage of food
	(V)	Store symbiotic bacteria

The correct answer is

Options :

	A	B	C	D
(a)	III	IV	V	I
(b)	IV	V	III	II
(c)	IV	III	V	I
(d)	IV	V	II	I

AP EAMCET-28.04.2017 Shift-I

Ans. (d) :

Cell of fat body Function

Trophocytes – Storage of food
Mycetocytes – Store symbiotic bacteria
Oenocytes – Synthesis of and storage of lipids
Urate cells – Store uric acid

- Tropocytes (adipocytes) are major cell of a storage organ the fat body from which stored glycogen and lipids are mobilized under starvation.
- Insect have special cells called mycetocytes that harbour symbiotic microorganism.
- Oenocytes are a cell type of ectodermal origin that displayed marked evolutionary variations in size, number and anatomical location across insecta.

64. Match the following

List–I		List–II	
A.	Enterocoelom	I.	Cnidaria
B.	Coelenteron	II.	Echinodermata
C.	Haemocoelom	III.	Nematoda
D.	Pseudocoelom	IV.	Arthropoda
		V.	Annelida

The correct answer is

Options:

	(A)	(B)	(C)	(D)
(a)	II	IV	III	V
(b)	II	I	IV	III
(c)	II	III	V	IV
(d)	III	II	I	IV

AP EAMCET-28.04.2017 Shift-II

Ans. (b) :

	List-I	List-II
A	Enterocoelom	Echinodermata
B	Coelenteron	Cnidaria
C	Haemocoelom	Arthropoda
D	Pseudocoelom	Nematoda

65. Match the following

Set - I	Set - II
(A) Flame cells	(I) Arthropods
(B) Coiled tubules	(II) Platyhelminthes
(C) Malpighian tubules	(III) Crustcean
(D) Green glands	(IV) Annelids

Identify the correct match between Set I and Set II

	A	B	C	D
(a)	II	IV	I	III
(b)	I	II	IV	III
(c)	III	IV	I	II
(d)	IV	III	II	I

TS EAMCET-12.05.2017

Ans. (a) :

	Set – I	Set – II
A	Flame cells	Platyhelminthes
B	Coiled tubules	Annelids
C	Malpighian tubules	Arthropods
D	Green glands	Crustcean

66. Match the following

Pseudopodium	Examples
(A) Lobopodia	(I) Elphidium
(B) Reticulopodia	(II) Actinophrys
(C) Filopodia	(III) Polytoma
(D) Heliopodia	(IV) Entamoeba
	(V) Euglypha

The correct answer is

Options :

	A	B	C	D
(a)	IV	I	V	II
(b)	II	V	I	IV
(c)	IV	I	V	III
(d)	IV	II	V	I

AP EAMCET-28.04.2017 Shift-I

@apna_pdf

Ans. (a) :

Pseudopodium	Examples
A) Lobopodia	(IV) Entamoeba
B) Reticulopodia	(I) Elphidium
C) Filopodia	(V) Euglypha
D) Heliopodia	(II) Actinophrys

67. Among the following edible fishes, which one is a marine fish having rich source of omega-3 fatty acids?

(a) Mystus (b) Mangur
(c) Mrigala (d) Mackerel

NEET-2016 Phase-II

Ans. (d) : Mackerel is marine fish rich in omega -3 fatty acids. Indian Mackerel is a species of Mackerel in the scombrid-family of order-perciformes. It is also known as Bangada, Kembung, and Aiyla is categorised in pelagic fishes. Generally used as sea food.

- Mystus native to Asia, popular due to its good taste.
- Mangur also known as walking catfish. Since it is carcinogenic fish doctors suggest avoid eating it.
- Mrigala carp also known as white carp.

68. A coelom (body cavity) derived from blastocoel is known as

(a) Schizocoel (b) Enterocoelom
(c) Haemocoel (d) Pseudocoelom

UP CPMT-2013
Uttarakhand PMT-2010

Ans. (d) : Pseudocoelom is a body cavity lying inside the body wall of certain organisms like the nematodes. It helps in circulation of nutrients and maintains a hydrostatic pressure.

69. Match List I with List II and select the correct option

List-I	List-II
A. Protozoa	**1. Pennatula**
B. Aschelminthes	**2. Beroe**
C. Porifera	**3. Monocystis**
D. Ctenophora	**4. Wuchereria**
E. Cnidaria	**5. Cliona**

(a) A-3, B-5, C-4, D-1, E-2
(b) A-4, B-3, C-5, D-2, E-1
(c) A-3, B-4, C-5, D-2, E-1
(d) A-2, B-4, C-5, D-3, E-1
(e) A-3, B-4, C-5, D-1, E-2

Kerala PMT-2008

Ans. (c) :

List-I	List-II
A) Protozoa	Monocystis
B) Aschelminthes	Wuchereria
C) Porifera	Cliona
D) Ctenophora	Beroe
E) Cnidaria	Pennatula

70. Body cavity lined by mesoderm is:

(a) coelom (b) coelenterons
(c) blastocoel (d) all of these

J&K CET- 2005, 2002

Ans. (a) : Body cavity lined by mesoderm is coelom. In the embryonic stage, three germs layers are found. these three germ layers are-
(1) ectoderm
(2) Endoderm
(3) Mesoderm.
Those animal in which all 3 layers are present are called triploblastic animal eg- chordata.
In most animal body cavity forms from these 3 layers which is lined by mesoderm epithelial cells. This body cavity is called coelom. On the basis of coelom animals are divides in 3 categories.
(1) Acoelomates (No coelom)
(2) Coelomates (true coelomates)
(3) Pseudocoelomates (false coelomates)

71. Which one of the following features is common to leech, cockroach and scorpion?

(a) Nephridia (b) Ventral nerve cord
(c) Cephalization (d) Antennae

Assam CEE-2014

Ans. (b) : Ventral nerve cord is common to leech, Cockroach and Scorpion. It is the functional equivalent of the vertebrae spinal cord. It consists of the subesophageal ganglion in the head & connected to the brain by circumesophageal connectives.

72. The lower Jaw of a mammal is made up of:

(a) dentary (b) maxilla
(c) Premaxilla (d) Post maxilla

BVP-2001

Ans. (a) : The lower Jaw of a mammal is made up of to dentary in ancestral animal.
In mammals the dentary consist of only one bone while in Reptiles it consists of several bones.
In mammals the upper Jaw is made up of the maxillary while the lower Jaw is known as the mandible.
• It helps in chewing.

73. Match List I with List II and choose the correct option

List-I (Organism)	List-II (Excretory Structure)
1. Cockroach	**A. nephridia**
2. Clarias	**B. malpighian tubules**
3. Earthworm	**C. kidneys**
4. Balanoglossus	**D. flame cells**
5. Flatworm	**E. proboscis gland**

(a) 1 - A, 2 - C, 3 - B, 4 - D, 5 - E
(b) 1 - C, 2 - A, 3 - B, 4 - E, 5 - D
(c) 1 - B, 2 - A, 3 - C 4 - E, 5 - D
(d) 1 - B, 2 - A, 3 - E, 4 - C, 5 - D
(e) 1 - B, 2 - C, 3 - A, 4 - E, 5 - D

Kerala PMT-2009

Ans. (e) :

	List-I corganism		List-II (Excretory structure)
1	Cockroach	B	Malpighian tubules
2	Catfish	C	Kidneys
3	Earth worm	A	Nephridia
4	Balanoglossus	E	Proboscis gland
5	flat worm	D	Flame cell

@apna_pdf

Malpighian Tubules– Main excretory organ in insects.
Kidneys– It filter urea & other waste products from the blood.
Nephridia– It remove metabolic waste from the body.
Proboscis Gland– Excretory organ of Hemichordata.
Flame Cell– Occurs in platyhelminthes. It is also known as solenocytes.

74. Read the following statements and select the not correct option
(i) Circulatory system in arthropods is of closed type
(ii) Parapodia in annelids help in swimming
(iii) Phylum Molluscs is the second largest animal phylum
(iv) Aschelminthes are dioecious
(a) i and iii alone are wrong
(b) i alone is wrong
(c) iii alone is wrong
(d) iii and iv alone are wrong
(e) ii alone is wrong

Kerala PMT-2012

Ans. (b) :
(I) Circulatory system in Arthropoda is of Open type
(II) Parapodia in annelida help in crawing and swimming
(III) Phylum mollusca is the second largest animal phylum (phylum Arthropoda is largest animal phylum)
(IV) Aschelminthes are dioecious, pseudocoelomate.

75. Which of the following characteristics is mainly responsible for diversification of insects on land?
(a) Bilateral symmetry (b) Exoskeleton
(c) Eyes (d) Segmentation

AIPMT-2015

Ans. (b) : Insects belong to the largest phylum of Arthopoda. Insects have three parts of the body head, thorax, and abdomen. The most important adaptation is the exoskeleton. Insect exoskeleton is made up of chitin which help to prevent their skin from drying and also helps to maintain the moisture of insects skin.

76. Which of the following diseases is caused by a protozoan?
(a) Blastomycosis (b) Syphilis
(c) Influenza (d) Babesiosis

AIPMT (Re-Exam)-2015

Ans. (d) : Babesiosis is caused by microscopic parasites that infect red blood cells and are spread by certain ticks. Babesiosis is caused by apicomplexan parasites of the genus, Babesia. The symptoms of babeiosis are fever, chills, sweats, fatigue etc. It causes flu-like symptoms and can lead to severe illness.

77. Biradial symmetry and lack of cnidoblasts are the characteristics of-
(a) Starfish and sea anemone.
(b) Ctenoplana and Beroe.
(c) Aurelia and Paramecium.
(d) Hydra and starfish

AIPMT-2006
CMC Vellore-2012
JCECE-2013

Ans. (b) : Biradial symmetry and lack of cnidoblasts are the characteristics of Ctenoplana and Beroe.
- Biradial symmetry is a combination of radial and bilateral symmetry.
- Biradial symmetry is found in organism which shows morphological features of both bilateral and radial symmetry.
- Biradial organisms can only be cut along the two planes (longitudinal and transverse plane) equally.
- Ctenoplana is a marine solitary planktonic ctenophore. The ctenoplanidae family has only one genus, ctenoplana.
- Beroe cucumis has a transparent, sac like body, often somewhat compressed and reaches a maximum length of about 15 cm.

78. Which one of the following has an open circulatory system?
(a) Pheretima (b) Periplaneta
(c) Hirudinaria (d) Octopus

AIPMT-2006

Ans. (b) : *Periplaneta* has an open circulatory system cockroach has 13 chambered tubular heart which is filled with oxygenated blood.
- The American cockroach, periplaneta americana, is the largest of the common peridomestic cockroaches measuring an average 4 cm in length. It comes under phylum arthropoda.

79. Metameric segmentation is the characteristic of
(a) Platyhelminthes and Arthropoda.
(b) Echinodermata and Annelida.
(c) Annelida and Arthropoda.
(d) Mollusca and Chordata.

AIPMT-2006

Ans. (c) : The term metamerism refers to a linear repetition of parts in an animal body.
- It occurs in three highly organized phylum Annelid, Arthropoda and Chordata. Each segment is called a metamere, or somite. Segmentation often affects both external and internal structures. Such a condition is called metameric Segmentation.

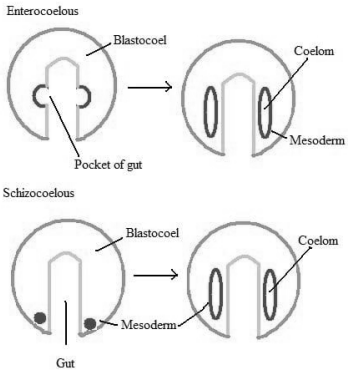
80. Schizocoelomates and enterocoelomates are:
(a) Acoelomates (b) Invertebrates
(c) True coelomates (d) Echinoderms only

AIIMS-2015 / JIPMER-2011 / JCECE-2007

Ans. (c) : Presence or absence of body cavity between the body wall and the gut wall is very important in classification. The body cavity which lined by mesoderm called coelome. Animals possessing coelome are called coelomates, e.g., annelids, mollusks, arthropods echinoderms, hemichordates and chordates.
Schizocoelomates are invertebrate animal that possesses a schizocoel, a coelom, which is formed by the splitting of the mesodermal cell.
Enterocoelomates are animals in which coelom is lined by mesoderm which arise in the embryonic stage as an outpocketing of the developing gut. Hence, Schizocoelomates and Enterocoelomates are true coelomates.

@apna_pdf

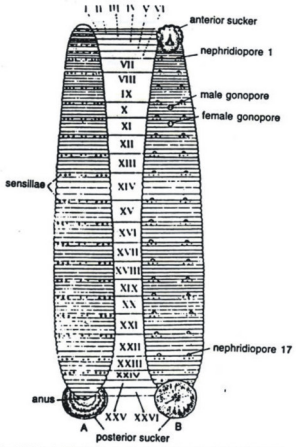
Flatworm are acoelomate animal.



81. Which one assists in locomotion?
(a) Trichocysts in Paramecium
(b) Pedicellariae of starfish
(c) Clitellum in Pheretima
(d) Posterior sucker in Hirudinaria

AIPMT-1993

Ans. (d) : Hirudinaria has a sucker. The anterior sucker is smallest and is perforated by the mouth, posterior sucker is bigger. It is essential for locomotion.



Leech (Hirudinaria). A. Dorsal, View, B. Ventral View

82. Radial symmetry is, usually, exhibited in animals which
(a) are attached to the substratum
(b) have one opening of alimentary canal
(c) live in water
(d) have ciliary mode of feeding.

AIPMT-1995, 1994
AIIMS-1996

Ans. (a) : The organisms are attached to the substratum possess radial symmetry in all vertical planes. When any plane passing through the central of axis of the body divides the organism into two identical haves, it is called radial symmetry.

83. Vivipary is found in :
(a) Coelenterata (b) Protozoa
(c) Rabbit (d) Pisces

Punjab MET-2006

Ans. (c) : Vivipary means giving birth to young ones .Viviparous animals produce young ones instead of laying eggs through sexual mode of reproduction.
Vivipary is found in Rabbit, Dolphin, Whales, Humans, Lion, Elephants, Dogs.Viviparity is development of the embryo inside the body of the mother.

84. Pseudocoel is present in :
(a) Periplaneta (b) Ascaris
(c) Pheretima (d) Hydra

Punjab MET-2006

Ans. (b) : Ascaris is a member of phylum Aschelminthes, which shows the presence of pseudo-coelom. Which derived from embryonic blastocoel.
It is covered externally by muscles but internally by the lining of the intestine (endoderm).

85. Radial symmetry is found in :
(a) frog (b) starfish
(c) humans (d) Pheretima

Punjab MET-2006

Ans. (b) : Radial symmetry is the regular arrangement of body parts around a central axis.
Adult echinodermata (starfish) are Radially symmetrical but larva of echinodermata are bilaterally symmetrical.

86. Match the locomotory organs given under column I with the phylum in which they are seen, listed under column II; choose the answer which gives the correct combination of the alphabets of the two columns:

Column–I (Locomotory organs)	Column –II (Phylum)
A. Pseudopdia	p. Mollusca
B. Parapodia	q. Chondriehthyes (Pisces)
C. Muscular foot	r. Protozoa
D. Fins	s. Annelida

(a) A = r, B = p, C = s, D = q
(b) A = p, B = r, C = s, D = q
(c) A = s, B = r, C = q, D = p
(d) A = r, B = s, C = p, D = q

Karnataka CET-2001

Ans. (d) :

Column-I		Column-II
Locomotany organs		Phyllum
A	Pseudopodia	Protozoa e.g. – Amoeba
B	Parapodia	Annelida. e.g. - Earthworm
C	Muscular foot	Mollusca e.g. – Pila
D	Fins	Chondrichthyes (Pisces) e.g. - Sark

87. Which of the following is not found in vertebrates?
(a) Bilateral symmetry (b) Gill opening
(c) Body scales (d) Cnidoblasts

CG PMT-2005

Ans. (d) : Cnidoblasts are not found in vertebrates cnidoblasts are specialized and modified interstitial cells which are found in coelenterate animals. The presence of cnidocytes (cnidoblast) the phylum coelentreata also know as cnideria. Cnidocytes help not only in defense but also in locomotion, adhesion and capture of prey.

88. Match the following list of animals with their level of organization and choose the correct sequence:

@apna_pdf

Column–I	Column–II
(A) Organ level	(P) Pheritima
(B) Cellular aggregate level	(Q) Fasciola
(C) Tissue level	(R) Spongilla
(D) Organ system level	(S) Obelia

	(A)	(B)	(C)	(D)
(a)	(S)	(R)	(P)	(Q)
(b)	(S)	(Q)	(R)	(P)
(c)	(Q)	(S)	(R)	(P)
(d)	(Q)	(R)	(S)	(P)

Karnataka CET-2013

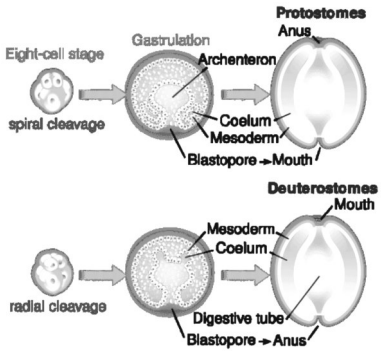
Ans. (d) :

	Column-I	Column-II
A	Organ level	Fasciola
B	Cellular aggregate level	Spongilla
C	Tissue level	Obelia
D	Organ system level	Pheritima

89. Which of the following are the characteristics of deuterosome?
(a) Spiral cleavage, blastopore becoming anus
(b) Spiral cleavage, blastopore becoming mouth
(c) Radial cleavage, blastopore becoming anus
(d) Radial cleavage, blastopore becoming mouth

DUMET-2002

Ans. (c) : The main characteristics of Deuterostomes include:-



- The anus is formed before the mouth

Radial, cleavage and the blastopore becoming anus.

- Mesoderm is formed from pockets of the gut

The main characteristics of Protostomes-

- A mouth that develops before the anus in embryos
- True tissue and are bilaterally symmetric
- Spiral determinate cleavage.

90. The general body plan and body symmetry are similar in
(a) frog and locusts
(b) sea horse and star fish
(c) annelids and sponge
(d) Pigeon and liver fluke

Punjab MET-2011

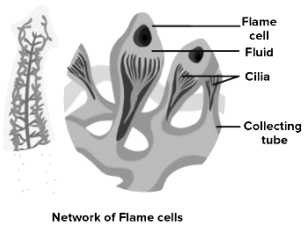
Ans. (a) : The general body plan and body symmetry are similar in frog and locust.

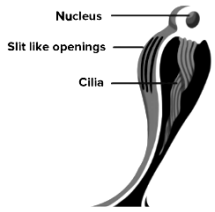
- Both frog and locusts are coelomates having bilateral body symmetry while the others have either different body plans or different body symmetry.
- Starfish is a radially symmetrical animal and seahorse is bilaterally symmetrical.
- Sponges are not true coelomates. They show cellular level of body organization. Body surface is also with skeleton in the form of spicules and spongin fibers.
- Annelida are coelomates. They show organ system level of body organization and bilateral symmetry.
- Pigeon is true coelomates and liver fluk is pseudocoelomate.

91. Solenocytes and nephridia are respectively found in :
(a) Platyhelminth and Annelids
(b) Annelids and Nematoda
(c) Cnidaria and Mollusca
(d) Mollusca and Echinodermata

JCECE-2003
Rajasthan PMT-2002

Ans. (a) : Solenocytes or flame cell are the excretory structrue in platyhelminthes. Solenocytes are a type of long, narrow flagellated cells that functions in excretion of nitrogenous wastes.





Solenocytes are primarily concerned with ionic and fluid volume regulation. Nephridia are the tubular excretory structure of earthworm and other annelids. Closed circulatory system is present in annelids, and they shows organ system level of body organization.

92. The body of the animal can be divided into identical halves in only one plane is
(a) asymmetry (b) bilateral symmetry
(c) radial symmetry (d) biradial symmetry

J&K CET-2010

Ans. (b) : Animals can be categorized on the basis of their symmetry. Sponges are mostly **asymmetrical** i.e. any plane that passes through the center does not divide them into equal halves.

When any plane passing through the central axis of the body divides the organism into two equal halves, it is called **radial symmetry** e.g., coelenterates, ctenophores and echinoderms.

Bilateral symmetry : The body is divided into two equal halves by only one plane.

e.g : Annelids

93. Which one of the following is a matching set of a phylum and its three examples ?
(a) Cnidaria-Bonellia, Physalia, Aurelia
(b) Platyhelminthes-Planaria/Schistosoma, Enterobuis
(c) Mollusca-Loligo, Teredo, Octopus
(d) Porifera-Spongilla, Euplectella, Pennatula

JCECE-2013

Ans. (c) : The matching set of a phylum–

1. Mollusca – Body is covered by Calcareous shell. Ex.- Loligo, Teredo, Octopus
2. Annelida – Body is divided into segments that are separated by septa. Ex.- Bonellia
3. Cridaria or coelenterate–They are also known as cnidarians due to presence of cnidoblasts. Ex.- Physalia, Aurelia, Pennatula

@apna_pdf

4. Platyhelminthes–They are mostly parasitic with a few free-living. Ex.- Planaria, Schistosoma
5. Nematoda–Their body has a cavity or pseudocoelom. Ex.- Enterobuis
6. Porifera–They have spongy appearance and attached to the substratum and do not move. Ex.- Spongilla, Euplectella

94. Changes that allow the conversion of larva into adult, is called
(a) metagenesis (b) alternation
(c) metamorphosis (d) metastasis
CG PMT-2008

Ans. (c) : Metamorphosis is the transformation of larva into an adult through drastic changes.
Hormones called molting and juvenile hormones, which are not species specific, apparently regulate the changes.
Ex. Butterflies, moths, ants, beetles and bees.

95. Which of the following is the correct pairing of the classification group and common example ?
(a) Porifera - sea fan
(b) Crustacea - cattle fish
(c) Plathyhelminthes - Neries
(d) Mastigophora - Volvox
BVP-2006

Ans. (d) : The correct pairing of the classification group and common example is mastigophora volvox.
- Leeuwenhoek was the first scientist to observe volvox in 1700.
- Volvox is also known as globe algae.

96. Microlecithal eggs are present in
(a) Insects (b) Aves
(c) Fishes (d) Mammals
MGIMS Wardha-2012

Ans. (d) : Microlecithal egg is the one in which the amount of yolk is very less. The eggs of amphioxus, Marsupians and Eutharian mammals are of its type
- In insects centrolecithal eggs are found
- In Aves have Macrolecithal eggs.
- Dipnoi fishes have mesolecithal eggs and sharks, bony fishes have Macrolecithal eggs.

97. Animals which have well-marked digestive cavity are put under
(a) Metazoa (b) Bryozoa
(c) Parazoa (d) Enterozoa
CMC Vellore-2011
BVP-2011

Ans. (d) : Enterozoans are organisms which have distinct functional digestive tract.
- Enterozoa includes animals such as tape worm that is parasitic in the intestine.
- Bryozoa are aquatic invertebrate.
- Parazoa the sub – kingdom in which multi – cellular organism have less specialized cell than in the metazoan.
- Metazoans are eukaryotic multicellular organism.

98. The most recently discovered animal phylum is
(a) Concentricycloidea (b) Pogonophora
(c) Loricifera (d) Ctenophora
J&K CET-2011

Ans. (c) : The most recently discovered animal phylum is Loricifera.
- It was first discovered in 1983 by R.M. Kristensen.
- The loricifera is a microscopic, sediment dwelling marine invertebrate.
  Loriciferans have a hard, corset shaped shell called a Lorica, inside which is a head with an introvert surrounded by rings of elongated spines called scalids.
- Loricifera typically inhabit the space between sand and mud particles in the ocean. They are found in shallow waters. Many of them are acoelomate with some adults are pseudocoelomate.

99. The aquatic organism that can actively swim at will against the water current is
(a) Neuston (b) Plankton
(c) Nekton (d) Benthos
J&K CET-2011

Ans. (c) : Nekton are aquatic organism that are able to swim and move independently of currents.
- Plankton, Nekton and benthos are the three major classes of aquatic organism. These organism vary in the way they move and the place they live

(A) Benthos : Benthos are aquatic organism that crawl in sediments at water floor. They are decomposers eg : sponge, clams & Angle fish
(B) Phytoplankton : These are incapable of moving on their own. They are unable to swim against currents. Algae and bacteria that use sunlight to make food are known phytoplankton.
(C) Zooplankton : They are incapable to moving on their own. It is microscopic organism that eat phytoplankton
(D) Nekton : It travel by swimming in the sea on their non plankton and Nekton are main source of food. Fish and shrimp are example of nekton.

100. Match Column I with Column II and choose the correct answer.

	Column I		Column II
(i)	Incomplete digestive system	(A)	Sponges
(ii)	Cellular level of organization	(B)	Coelenterates
(iii)	Radial symmetry	(C)	Annelids
(iv)	Pseudocoelomate	(D)	Platyhelminthes
(v)	Metamerism	(E)	Aschelminthes

(a) i - C, ii - D, iii - A, iv - B, v - E
(b) i - D, ii - E, iii - B, iv - C, v - A
(c) i - D, ii - A, iii - B, iv - E, v - C
(d) i - A, ii - B, iii - C, iv - D, v - E
(e) i - B, ii - C, iii - D, iv - A, v - E
Kerala PMT-2014

Ans. (c) :

Column – I		Column – II	
I	Incomplete digestive system	D	Platyhelminthes
II	Cellular level of organization	A	Sponges
III	Radial symmetry	B	Coelenterates
IV	Pseudocoelomate	E	Aschelminthes
V	Metamerism	C	Annelids

@apna_pdf

101. Study of behavior of animals called

(a) Ethology (b) Parapsychology
(c) Euphenics (d) Etiology

AMU-2009

Ans. (a) : Ethology - Ethology is the scientific study of animal behavior including animal communication predation, defence, aggression, imprinting fixed action pattern and releasers and migration most often in their natural condition.

Parapsychology - The study of special mental abilities which cannot be explained scientifically such as telepathy or knowing the future.

Euphenics - Euphenics is a symptomatic treatment of genetic disease of human beings.

- It deals with the control of several inherited human disease especially in born errors of metabolism in which the missing or defective enzyme has been identified.
- It can be done by various genetic techniques such as genetic engineering etc.

102. Match the various classes of animals given under Column-I with the examples listed in Column-II. Choose the answer which gives the correct combination of alphabets of the two columns.

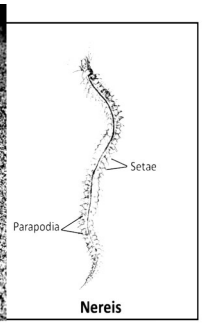
	Column - I (Classes)		Column - II (Examples)
A	Polychaeta	p.	scorpion
B	Trematoda	q.	pila
C	Arachnida	r.	liver fluke
D	Gastropoda	s.	nereis
		t.	star fish

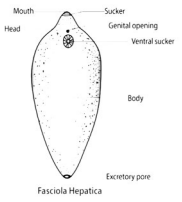
(a) A = s, B = r, C = p, D = q
(b) A = r, B = s, C = p, D = t
(c) A = q, B = s, C = t, D = p
(d) A = t, B = q, C = s, D = r

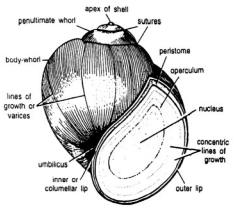
Karnataka CET-2003

Ans. (a) :

A. Polychaeta **s.** Nereis
B. Tremotoda **r.** Liver fluke
C. Arachnida **p.** Scorpion
D. Gastropoda **q.** Pila







Polychaeta - Polychaetes are mainly found in marines environment, from shallow waters down to the depths of deep-sea trenches.
Example :- Lugworm (Arenicola marina)
Sandworm or clamworm alitta
Nereis virens (the clamworm)

Trematoda - Trematoda are flatworm classified in the phylum platyhelminthes. Trematodes are dorso-ventrally flattened and leaf like in shape.
Example :- Schistosoma, Clonorchis, Fasciola (liver fluke).

Arachnida - Class arachnida of Arthropods comprising chiefly terrestrial invertebrates. Including the spiders, scorpion, mites, and ticks and having a segmented body divided in two region of which the anterior bears four pair of leg but no antenna.

Gastropoda - Gastropods can be recognised by their large foot, tentacles, coiled, shell (although this is sometime small or absent) and the presence of Torsion which is where the body is twisted round so that the anus reproductive organs, mantle cavity and gills all point forwards.
Example :- Pila

103. Match the branches of Biology listed in Column-I with the areas of study listed in Column-II. Choose the answer which gives the correct combination of alphabets of the columns.

	Column - I (Branches of biology)		Column - II (Area of study)
A	Helminthology	p.	study of insects
B	Entomology	q.	study of fungi
C	Ornithology	r.	study of algae
D	Phycology	s.	study of birds
		t.	study of worms

(a) A = p, B = s, C = q, D = t
(b) A = t, B = p, C = s, D = r
(c) A = s, B = t, C = r, D = p
(d) A = r, B = p, C = s, D = q

Karnataka CET-2003

Ans. (b) : Helminthology : Helminthology is the study of parasitic worm (helminthous). This field studies the taxonomy of helminthous and their effect on their hosts.
Helminth example : - Hookworm, Ascaris whipworm
Entomology : Entomology is the study of insect and their relationship to human, the environment and other organism.
Ornithology : The word ornithology comes from the late 16th century latin ornithologia meaning 'Bird science'.
Thus study of bird is known as ornithology.
Phycology : Phycology also called algology the study of algae is a large heterogeneous group of chiefly aquatic plant ranging in size from microscopic form of species all large as shrub or trees.

104. Animals like cockroach, lizards and mice share buildings to human dwelling such animals are

(a) transgenic (b) transplants
(c) inquilines (d) cultigens

AMU-2011

@apna_pdf

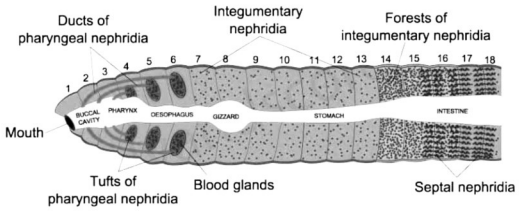
Ans. (c) : Inquilines : An animal that live commensally in the nest, burrow, or dwelling place of an animal of another species.
Example : Some organism such as insect may live in the homes of gophers or the garages of humans and feed on detritus, fungi, roots, etc.

105. Which one of the following pair of items correctly belongs to the category of organs mentioned against it?
(a) Thorns of Bougainvillea and tendrils of Cucurbita - Analogous organs
(b) Nictitating membrane and blind spot in human eye - Vestigial organs
(c) Nephridia of earthworm and Malpighian tubules of cockroach - Excretory organs
(d) Wings of honeybee and wings of crow - Homologous organs

Rajasthan PMT-2010

Ans. (c) : Nephridia : The nephridia are paired osmoregulatory – Excretory organ on the internal body wall of each segment of a worm.
• In earthworm, Nephridia are responsible for maintaining osmoregulation.
Malpighian tubules : The malpighian tubule (MTs) are the main excretory organ in most insects.
• They play a key role in the production of primary urine and osmoregulation selectively reabsorbing water, ions and solutes.

Excretory or Nephridial System of Earthworm



106. Which of the following is not a case of epimorphosis?
(a) Formation of sperms from small clumps of cells
(b) Regeneration of tall in a lizard
(c) Replacement of severed arm in starfish
(d) Replacement of limb is salamander

CMC Vellore-2013
Rajasthan PMT-2009
UP CPMT-2004

Ans. (a) : Epimorphosis : Epimorphosis is defined as the regeneration of a specific part of an organisms in a way that involve extensive cell proliferation of somatic stem cells differentiation and reformation as well as blastema formation, so formation of sperms from small clumps of cell is not a case of epimorphosis.

107. In which of the following class polymorphism is very distinct ?
(a) Class-Euccstoda (b) Class-Hydrozoa
(c) Class-Crinoidea (d) Class-Gastropoda

Rajasthan PMT-2000

Ans. (b) : The phenomenon of polymorphism is mainly seen in the class-hydrozoa.
Polymorphism : Polymorphism is the ability of an object to take an different forms.
Class-hydrozoa : The Hydrozoa is a class of Cnidarians they are characterized by having a life-cycle involving sexual and asexual reproduction.
Example : Fresh Water Jelly, Fresh water polyps (Hydra) obelia, Portuguese man of war (Physalia), Pink-hearted Hydroids (tubularia).

108. Root cap is absent in:
(a) Mesophyics (b) Hydrophytes
(c) Epiphytes (d) Xerophyies

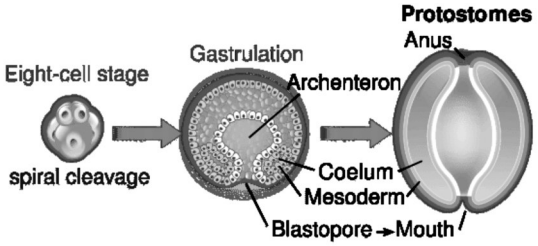
Rajasthan PMT-2006

Ans. (b) : Hydrophytes plants : Plants that live in water are known as hydrophytes.
Example : Hydrilla, Valisneria and other remaining completely submerged in the water.
• Root cap is absent in hydrophytes. In these type of plants root pocket is present instead of root cap. Root pocket act as balancing organs.

109. Spiral cleavage is found in
(a) nemertines (b) annelids
(c) mollusca (d) All of these

Haryana PMT-2011

Ans. (d) : Spiral cleavage : Spiral cleavage is a characteristic feature of protostome especially include spiralia here the resulting daughter cell are not located exactly on top of each other.



• Instead the blastomere are organized spirally around the embryo's pole to pole axis.
Phylum have spiral cleavage : Molluscs, Annelids Platyhelminth and Nemerteans.

110. Animals active at night are :
OR
An animal, which comes out at night and hides during the day is
(a) diurnal (b) nocturnal
(c) parasites (d) nocto-diurnal

BCECE-2004, 2009

Ans. (b) : Nocturnal animal : Animal active at night called nocturnal animal. Nocturnal animal tend to have elevated senses due to their activity in the dark.
• Good vision of nocturnal at night poor vision of prey species avoiding heat of the day.
Example :- Bat, Rat, Badger, Raccoon

111. Match the following column I with column II.

	Column-I		Column-II
A.	Vampire bat	1.	Osmotroph
B.	Cockroach	2.	Frugivorous
C.	Tiger	3.	Carnivorous
D.	Taenia	4.	Omnivorous
		5.	Sanguivorous

@apna_pdf

(a) A - 2 B - 4 C - 3 D - 5
(b) A - 5 B - 3 C - 4 D - 1
(c) A - 1 B - 4 C - 2 D - 5
(d) A - 5 B - 4 C - 3 D - 1

CMC Ludhiana-2015

Ans. (d) :

Column-I		Column-II
Vampire bat	–	Sanguivorous
Cockroach	–	Omnivorous
Tiger	–	Carnivorous
Taenia	–	Osmotroph

112. Which one is not correctly matched?
(a) Mollusca - Pseudocoel
(b) Cnidaria - Nematocyst
(c) Annelida – Chloragogen cells
(d) Echinodermata – Water vascular system

Manipal-2010

Ans. (a) : Pseudocoel : Roundworm of phylum nematoda are characterized as pseudocoelomates.
- Phylum mollusca animals are bilaterally symmetrical, triploblastic and coelomate.
  Nematocyst : The nematocyst present in coelentrates are exclusive stinging apparatus of the cnidocytes/cnidoblasts and is a distinguishing feature of the phylum coelenterata.
- **Chloragogene cells :** Chloragogene cell also known as the yellow cells. Cell supposed to be excretory in nature which is analogous to human liver.

Water vascular system : The water vascular system or ambulacral system is a unique system of echinoderm that helps mainly in locomotion.
Example :- Star fish

113. Column I contains larval stages and column II contains the group to which it belongs. Match them correctly and choose the right answer.

	Colume I		Colume II
A	Planula	p	Annelida
B	Tornaria	q	Mollusca
C	Trochophore	r	Arthropoda
D	Bipinnarria	s	Chordata
E	Glochidium	t	Echinodermata
		u	Coelenterata

(a) A = u, B = s, C = p, D = t, E = q
(b) A = q, B = t, C = p, D = s, E = u
(c) A = t, B = s, C = r, D = q, E = p
(d) A = s, B = r, C = q, D = p, E = t

Karnataka CET-2011

Ans. (a) :

Group		Larval stage
Coelentrata	–	Planula
Chordata	–	Tornaria
Annelida	–	Trochophore
Echinodermata	–	Bipinnarria
Mollusca	–	Glochidium

114. Animals which possess cleidoic eggs exhibit.
(a) External fertilization and internal development
(b) Internal fertilization and internal development
(c) Internal fertilization and external development
(d) External fertilization and external development

Karnataka CET-2011

Ans. (c) : Cleidoic : Cleidoic egg is often referred to as an amniotic egg because it is characteristic of amniotes which have a thick and hard outermost shell. This hard shell is permeable for gases. Cleidoic eggs exhibit internal fertilization and external development.
Cleidoic egg is terrestrial adaptation. e.g. Birds and reptiles, prototheria mammal and insects.
- Cleidoic eggs have a protective shell and are laid out of water. The shell is porous to air and may be flexible or calcareous (hard). The egg contain all the food that embryo need to develop into a hatching.

115. Match List-I with List-II

List-I	List-II
A. Stomochord	**i. Hirudinaria**
B. Botryoidal tissue	**ii. Dentalium**
C. Captacula	**iii. Balanoglossus**
D. Rhabdites	**iv. Dugesia**
	v. Pinctada

The correct answer is:

	A	B	C	D
(a)	iii	ii	v	i
(b)	i	ii	iv	iii
(c)	iii	i	ii	iv
(d)	i	iii	ii	v

AP EAMCET-2016

Ans. (c) :

Stomochord	–	Balanoglossus
Botryoidal tissue	–	Hirudinaria
Captacula	–	Dentalium
Rhabdites	–	Dugesia

- Hemichordates have a rudimentary structure in the collar region called stomochord. e.g. Balanoglossus. Botryoidal tissues found in Hirudinaria.
- Captacula is present in the organisms in which there is no developed head. This is used as sensory organs. They are also helpful in digging and obtaining the food. This is present in the dentalium.
- Rhabdites are rod shaped that found in Dugesia or planaria.

116. Mark the right combination.
(a) Sycon system - Water vascular system
(b) Sea-urchin - canal system
(c) Hook worm - Pseudocoel
(d) Cray fish - Skeletal system
(e) None of the above

CMC Vellore-2015

Ans. (c) : Round worm or Ascaris lumbricoid are example of pseudocoelom.
Pseudocoelom is a body cavity filled with the separating of the gut of organism from the body wall, but without the line of mesoderm.

117. Read the following statements and choose the sets of correct ones.
(I) Neopillina galatheae is the most primitive mollusc having metamerism like annelids.
(II) Peripatus resembles and arthropod in having haemocoel dorsal heart with ostia, tracheal respiration and the pattern of development.

@apna_pdf

(III) Latimeria chalumnae is a surviving member of crossopterygii the probable anscetor of the first amphibians.
(IV) The theory of natural selection was proposed by Darwin and Wallace.
(a) I and II (b) III and IV
(c) I, II and III (d) All of the above
(e) None of the above

CMC Vellore-2015

Ans. (d) : Neopilina is a very primitive mollusc and connecting link between annelids and molluscs.
- **Peripatus** is a connecting link between arthropods and annelids.
- **Latimeria** is a genus of living coelacanth fishes that is the type of family Latimeriidae. It is sometime considered to be a living fossil, not a reptile but a fish.
- **Darwin and Wallace** The theory of evolution is a shortened form of the term 'Theory of evolution by natural selection', which was proposed by 'Darwin' and 'Alfred Russel Wallace' in 19th century.

118. Which of these statements are wrong ?
(i). Parapodia are lateral appendages in arthropods used for swimming
(ii). Radula in molluscs are structures involved in excretion
(iii). Aschelminthes are dioecious
(iv). Echinoderm adults show radial symmetry
(v). Ctenophorans are diploblastic
(a) i and ii (b) i and iii
(c) i, iv and v (d) iii and v
(e) ii, iii and iv

Kerala PMT-2011

Ans. (a) : Parapodia are lateral appendages in annelids, not arthropods. They are used for swimming respiration, and gas exchange.
• Radula is a rasping tounge like organ in molluses. It is used for scraping food from surfaces. If is not involved in exeretion.

119. Read the following statements and choose the correct option.
I. The pelvic fins of female sharks bear claspers.
II. In Obelia, polyps produce medusae sexually and medusae form the polyps a sexually.
III. Flame cells in Platyhelminthes help in osmoregulation and excretion.
IV. In non-chordates, central nervous system is ventral, solid and double.
V. Pinnae are present in mammals
(a) II, IV and V only are correct
(b) I, III and V only are correct
(c) III, IV and V only are correct
(d) I, II and III only are correct
(e) II and III only are correct

Kerala PMT-2013

Ans. (c) :
1. Male shark have a pair of external reproductive organ called clasper that are located between their pelvic fins. Claspers are use for reproduction.
• Female shark have a cloaca instead of claspers.
• Polyps produce medusas asexually and medusas produce polyp sexually.

120. Match the animals list with names under Column I with the amimals listed with regular zoological name given Column II; choose the answer which given the correct combination of the alphabets of the two columns:

	Column-I (Animals with common name)		Column-II (Animals with zoological name)
A	Starfish	p	Sepia
B	Jellyfish	q	Asteroidea
C	Devilfish	r	Aurelia
D	Cuttlefish	s	Octopus

(a) A = q, B = p, C = s, D = r
(b) A = q, B = r, C = s, D = p
(c) A = t, B = p, C = s, D = q
(d) A = t, B = s, C = p, D = r

Karnataka CET-2000

Ans. (b) :
Star-fish – Asteroidea
Jelly-fish – Aurelia
Devil-fish – Octopus
Cuttle-fish – Sepia

121. Match the names of branches of science listed under Column I with the field of study given under Column II ; choose the choice which gives the correct combination of the alphabets:

Column-I (Branch of science)		Column-II (Field of study)	
A	Mycology	p	Study of birds
B	Ornithology	q	Study of worms
C	Herpetology	r	Study of fishes
D	Ichthyology	s	Study of fungi
		t	Study of snakes

(a) A = s, B = t, C = p, D = r
(b) A = s, B = p, C = t, D = r
(c) A = p, B = s, C = r, D = t
(d) A = q, B = s, C = r, D = t

Karnataka CET-2000

Ans. (b) :
Mycology – Study of fungi
Ornithology – Study of birds
Herpetology – Study of snakes
Ichthyology – Study of fishes

122. Study the following lists

	List-I		List-II
(A)	Tuberculosis	(I)	Polyhedral
(B)	Pneumonia	(II)	Filamentous Branched
(C)	Cholera	(III)	Round cells
(D)	Polio	(IV)	Comma shaped
		(V)	Helical form

The correct match is
(A) (B) (C) (D)
(a) (II) (IV) (III) (I)
(b) (II) (III) (IV) (I)
(c) (V) (IV) (III) (II)
(d) (I) (II) (V) (IV)

TS EAMCET-15.05.2016

@apna_pdf

Ans. (b) :
Tuberculosis – Filamentous branched
Pneumonia – Round cells
Cholera – Comma shaped
Polio – Polyhedral

123. Match the following with reference to larval forms

	List-I		List-II
(A)	Cydippid	(I)	Schistosoma
(B)	Muller's larva	(II)	Balanoglossus
(C)	Trilobite larva	(III)	Hormiphora
(D)	Miracidium larva	(IV)	Dugesia
		(V)	Limulus

(A) (B) (C) (D)
(a) (III) (IV) (V) (I)
(b) (III) (IV) (II) (V)
(c) (II) (I) (V) (III)
(d) (II) (III) (I) (IV)

TS EAMCET-15.05.2016

Ans. (a) :
Cydippid – Hormiphora
Muller's larva – Dugesia
Trilobite larva – Limulus
Miracidium larva – Schistosoma

Cydippid larva is found in some marine forms of hormiphora which does not reproduce asexually.

- In dugesia, muller's larva is formed. Muller's larva or mulleria is a larval form of some polycladida. It has 8-fold symmetry and is somewhat like a Ctenophore muller's larva is ciliated and has several pairs and unpaired lobes.
- Trilobites larva is found in limulus. It is a Juvenile of larva found in living fossil animals like limulus.
- Miracidium larva is found in schistosoma. The miracidium along with the cercaria both of which are water borne and free living are the only two stages in the life cycle of schistosoma.

124. Match the following:

List-I	List-II
A. Ductus botalli	1. Oikopleura
B. Ductus carotians	2. Lepidosiren
C. Neotany	3. Lamprey
D. Anadromous	4. Lacertillia
E. Amazon	5. Uraeotyphlus

	A	B	C	D	E
(a)	5	4	1	3	2
(b)	5	1	4	3	2
(c)	5	1	4	2	3
(d)	4	1	5	2	3

AP EAMCET-2006

Ans. (a) : A. Ductus botalli - Uraeotyphlus
B. Ductus carotians - Lacertillia
C. Neotany - Oikopleura
D. Anadromous - Lamprey
E. Amazon - Lepidosiren

125. Which of the following animals have scattered cells with cell – tissue grade organisation:
(a) Sponge (b) Hydra
(c) Liver fluke (d) Ascaris

AIPMT-2000

Ans. (b) : Hydra belongs to the most primitive class of hydrozoa in the phylum Coelenterata. It has a simple form and structure. In Hydra tissue grade level of body organization found. They are solitary, sessile, freshwater animals that are cosmopolitan in distribution.

- Sponge, has cellular grade level of organization.
- Liver fluke, has organ grade level of organization.
- Ascaris, has organ system grade level of organization.

126. The figure shows four animals (a), (b), (c) and (d). Select the correct answer with respect to a common characetrsitcs of two of these animals

(a) (b)
(c)
(d)

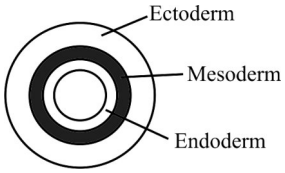
(a) (c) and (d) have a true coelom
(b) (a) and (d) respire mainly through body wal
(c) (b) and (c) show radial symmetry
(d) (a) and (b) have cnidoblasts for self defence

AIPMT (Mains)-2011

Ans. (a) : True coelom, which refers to a body cavity that is completely lined by mesoderm is found in the mollusca, annelids, arthropods, echinoderms & chordates.

- In all advance invertebrate phyla have a true coelom.
- The formation of coelom splitting of mesoderm.
- This kind of coelom called **shizocoelomates**.

Octopus- Belong from phylum mollusca and order Octopoda.



Scorpion- It is predatory organism (Arthropod) class Arachnid.

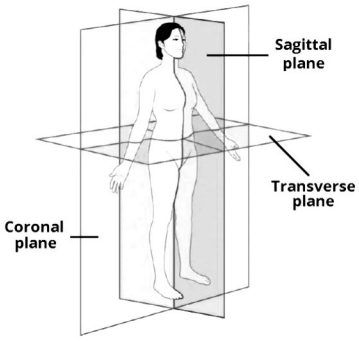
- The coelom forms by out pocketing of the primitive gut.
- It is thus called **enterocoelomates**.

127. The plane that divides the body into right and left halves.
(a) Transverse (b) Frontal
(c) Sagittal (d) Radial

AP EAMCET-2010

Ans. (c) : Sagittal – Sagittal is a section through an organism that is bisected in the longitudinal plane and divides the body into right and left halves.
Transverse section also called cross sectional is a cut or slice taken perpendicular to the long axis of a structures or organism.

@apna_pdf



Frontal section – Frontal section is a section through the body passing at right angles to the median plane dividing the body into dorsal and ventral part.
Radial section – Radial section is the vertical plane from the pith at the center of the tree heading out towards the bark.

128. Which one of the following groups of three animals each is correctly matched with their one characteristic morphological feature?

	Animals		Morphological feature
(a)	Scorpion, Spider, Cockroach	–	Ventral solid central nervous system
(b)	Cockroach, Locust, Taenia	–	Metameric Segmentation
(c)	Liver fluke, Sea anemone, Sea cucumber	–	Bilateral symmetry
(d)	Centipede, Prawn, Sea urchin	–	Jointed appendages

AIPMT-2008

Ans. (a) : Scorpion, spider and cockroaches belong to the phylum Arthropoda and have a ventral solid nerve cord. They have jointed appendages.
Non chordate have Double ventral solid, Nerve cord
Chordate have Single, dorsal hollow, Nerve cord
- Metameric segmentation in this condition, inter segmental septa are present, which provides internal as well as external segmentation, also called true segmentation. Ex- Earthworm, Cockroach, Locust.
- Bilateral symmetry body is divide into identical left and right halves in only one plane. Example– Liver fluke is a flatworm. Sea Anemone and sea cucumber are Echinoderms, so they have radially sysmmetry.
- Jointed appendages:- Phylum Arthropoda have jointed appendages. Example- Centipede, Prawn etc.

129. In coelomates the problem of diffusion of food from gut to tissues is solved by
(a) The presence of coelomic fluid
(b) Churning the food within the cavity
(c) Developing a circulatory system
(d) Developing gut associated glands

AP EAMCET-2009

Ans. (c) : In Coelomate, the developing circulatory system is the solution of the problem of diffusion to food from gut to tissue. After digestion and absorption, most of the absorbed food materials are passed into paracellular space (in between the enterocytes), from where they enter blood capillaries and then transported to tissue.
- Coelomic fluid present in coelom and act as protective cushion for internal organ.
- Churning of food helps in digestion of food.
- Gut associated glands like liver, pancrease etc help in the digestion.

130. As per classification which of the following is correct?
(a) Ascaris, Pheretima, Grasshopper
(b) Hydra, Pterido, Leucosolenia
(c) Starfish, Grasshopper, Solen
(d) Pila, Dentalium, Octopus

MGIMS Wardha-2003

Ans. (d) : Pila (Apple snail), Dentalium (Tusk shell)and Octopus (Devil fish) are Molluscus. All organisms belonging to the same phylum-Mollusca.
- Ascaris belongs to phylum Aschelminthes, Pheretima is an annelid while the Grasshopper belongs to phylum Arthropod.
- Hydra belongs to phylum – Cnidaria, Pteridophyte is a plant phylum while Leucosolenia belongs to phylum porifiera.
- Starfish beongs to phylum Echinodermata, grasshopper is an arthropod while salmon is belongs to phylum chordate.

131. Cleidoic eggs are found in :
(a) fishes (b) amphibians
(c) few reptiles (d) None of these

AFMC-2011

Ans. (c) : Cleidoic eggs are defined as having a thick, rigid outer shell, made of calcium carbonate.
The elements like yolk, water and salt are present in the egg shell and these are known as cleidoic eggs. Ex: Few reptiles.
• Non - cleidoic eggs are found in fishes.

132. In sharks, one of the following is absent
(a) Claspers
(b) Placoid scales
(c) Cartilaginous endoskeleton
(d) Air bladder

J&K CET-2008

Ans. (d) : Air bladder is distinctive characteristic of bony fishes while sharks belong to cartilagenous fishes that do not contain air bladders and hence have to swim continuously or else they may sink.
• Male sharks have claspers that help in mating during sexual reproduction.

133. An acoelomate animal with bilateral symmetry is
(a) Hydra (b) Liver fluke
(c) Physalia (d) Obelia

DUMET-2008

Ans. (b) : An acoelomate animal with bilateral symmetry is Liver fluke it belong to phylum Platyhelminthes. This symmetry is also known as plane symmetry. In this symmetry body is divided into two equal haves in one plane.

@apna_pdf

134. What is the similarity between fly, mosquitoes and cockroach?
(a) All have 13 chamber heart
(b) All have 4 pairs of legs
(c) All have open excretory system
(d) All belong to class Insecta

AFMC-2002

Ans. (d) : The fly, mosquitoes and cockroach all are belongs to class insect and phylum Arthropoda.
osquitoes- order-Diptera
Cockroach- order- Blattadea

135. Heart lacks sinus venosus in:
(a) fishes (b) mammals
(c) amphibians (d) echinoderms

AFMC-2002

Ans. (b) : The sinus venosus, or systemic venous sinus, is the cardiac chamber with myocardial walls located upstream of the right atrium in tetrapods and the single atrium of fish.
• Certain adult birds and mammals lack the presence of sinus venosus, precaval and postcaval veins in their heart. Thus the hearts of mammals lack sinus venosus.

136. The movement seen in the trichoid joint is:
(a) decrease in angle
(b) restricted in different planes
(c) free in more than one plane
(d) rotator around a central axis

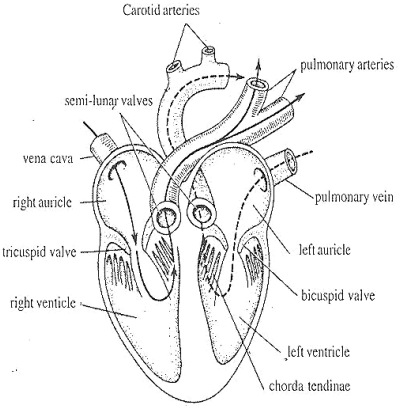
AP EAMCET-2004

Ans. (d) : Pivot joint are also called rotatory joint or trochoid joint, in vertebrate anatomy. It is a freely moveable Joint (diarthrosis) that allows only rotatory movement around a single axis.
• The moving bone rotates within a ring that is formed from a second bone and adjoining ligament.
• Pivot joints also provide for the twisting movement of the bones of the forearm (radius and ulna) against the upper arm.

137. Myogeneic heart is characteristic feature of
(a) chordates
(b) chordates including fishes
(c) non-chordates like annelids and arthropods, and vertebrates
(d) mollusca and other vertebrates like man

VMMC-2014

Ans. (d) : A heart that does not require neural input to beat is called a myogenic heart. Myogenic heart is found in molluscs and vertebrates.



138. The group amniota includes
(a) birds and reptiles
(b) birds and mammals
(c) reptiles and mammals
(d) reptiles, birds and mammals

Manipal-2013

Ans. (d) : Amniota is a group of vertebrates, it included all living reptiles, birds, mammals and their extinct relatives and ancestors.
• The amniotes are the evolutionary branch (clade) of the tetrapods in which the embryo develop within a set of protective extra - embryonic membranes -the Amnion, chorion and allantois.

139. Which one pair/set exhibit uricotelism?
(a) Bird, land reptiles and insect
(b) Fish, birds and amphibians
(c) Mammals, birds, and reptiles
(d) Amphibians, mammal and reptiles

Manipal-2013

Ans. (a) : Uricolelism is a metabolic process found in some animal including reptiles, birds, and insects, where uric acid is the primary west product excreted.
Uric acid is relatively in soluble compound which allows it to be excreted as a semi-solid allows it to be excreted as a semi-solid parts or power conserving water in these animals.

140. Coelom is lined on all sides by
(a) Ectoderm (b) Mesoderm
(c) Endoderm (d) Both (a) and (b)

J&K CET-2015

Ans. (b) : True coelom is the body covity which is completely lined with mesoderm and the animal are called coelomates. The coelom is a fluid -filled cavity located between the outer wall of the body and the digestive tract.
• The outer layer is called the ectoderm, the middle layer mesoderm, and the inner layer endoderm.
• The mesoderm lying in between the outer 2 layer encloses the coelom.

141. All flatworms differ from all round worms in having
(a) triploblastic body
(b) solid mesoderm
(c) bilateral symmetry
(d) metamorphosis in the life history

DUMET-2009

Ans. (b) : Flatworms are acoelomate i.e. they have solid mesoderm. Flatworms, platyhelminthes are a phylum of relatively simple bilaterian, unsegmented, soft-bodied invertebrate. On the other hand, Roundworms are pseudocoelomate.

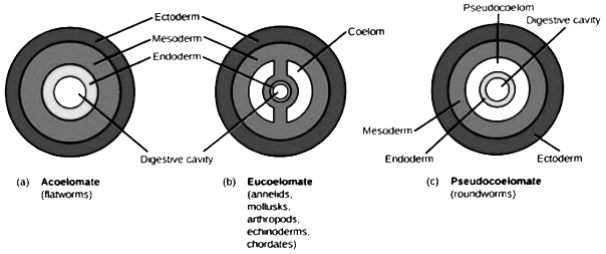
142. Coelom derived from blastocoel is known as :
(a) haemocoel (b) enterocoelom
(c) pseudocoelom (d) schizocoel

DUMET-2001

Ans. (c) : A pseudocoelomate is also known as a blastocoelomate.
Some animal, the body cavity is not lined by mesoderm, instead, the mesoderm is present as scattered pouches in between the ectoderm and endoderm. Such a body cavity is called pseudocoelom and the animal possessing them are called pseudocoelomates.

@apna_pdf

• A pseudocoelomate is often a small animal, which relies mostly on diffusion to distribute oxygen and nutrients to its cells.



143. Sinus venosus is present in :
(a) birds only
(b) birds and mammals
(c) reptiles and birds
(d) fishes, amphibians and reptiles

DUMET-2001

Ans. (d) : The first chamber to receive returned blood is the sinus venosus. The sinus venosus, which is found in fishes, amphibians and reptiles, allow for the mixing of pure and impure blood in the same chamber.
• The heart of aves and mammals is 4 chambered i.e. two auricles and two ventricles. The right auricle receives deoxygenated blood from the superior vena cava (precaval) and inferior vena cava (post caval), after that sends it into the right ventricle which pumps the deoxygenated blood to the lungs for oxygenation.

144. Which of the following animals has a true coelom?
(a) Ascaris (b) Pheretima
(c) Sycon (d) Taenia solium

J&K CET-2007

Ans. (b) : The body cavity lined by mesoderm is called coelom. Animal having coelom are called coelomates e.g. Annelids, Echinoderms and Chordates.
Pheretima belongs to phylum Annelida.
These are nocturnal in habit and live in damp, moist, humus rich soil of lawns, gardens etc. Body is long, narrow and cylindrical and colour in brown. Body is divided into 100-140 segments called metameres.
• Pheretima has true coelom (schizocoel). The coelom is filled with milky white alkaline coelomic fluid.

145. Which of the following organisms is pseudocoelomate?
(a) Hookworm (b) Liver fluke
(c) Jellyfish (d) Leech

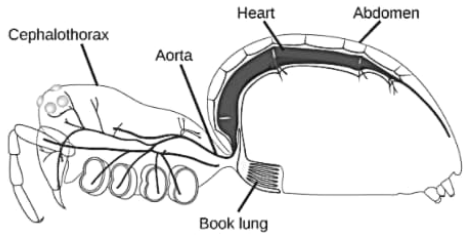
Rajasthan PMT-2011
DUMET -2002

Ans. (a) : Pseudocoelomate are the organisms that have false body cavities.
- They have a fluid - filled body cavity separating the gut of the organism from the body wall but it is not lined by mesoderm, unlike true coelemates.
- All the organisms belonging to Aschelminthes are pseudocoelomates.
- Hook worm is an example of pseudocoelomate.

146. Book lungs are the respiratory organs in:
(a) Protozoans (b) Cnidarians
(c) Arthropods (d) Amphibians

Rajasthan PMT-2006,2004

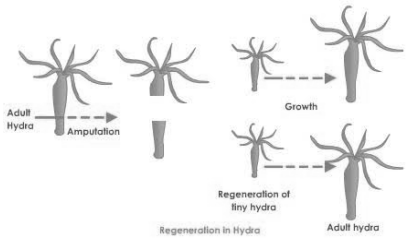
Ans. (c) : Book lungs are a type of respiratory organ in arachnids such as spiders, and scorpions.
- They are known as book lungs because of their stacked-plate appearance resembling closed pages of a book.
- 4 pairs of book lungs are found in scorpions and two pairs are found in spiders.
- The book lungs are located inside the animals of class arachnid Arthropoda.
- It is filled with haemolymph that carries oxygen.



147. Morphallaxis (morphallactic regeneration) occurs in
I. Hydra **II. Planaria**
III. Salamander **IV. Lizard**
(a) I and III (b) I and II
(c) II and IV (d) IV and I

CMC Ludhiana -2013

Ans. (b) : Regeneration is the natural process of replacing or restoring damaged or missing cells, tissues, organs, and even entire body parts of full function in plants and animals.



• In morphallaxis , every cut section of the organism regenerates into the whole organism. For example Planaria and Hydra can regenerate into whole organisms from a split section.

148. Torsion and detorsion are exceptional to
(a) Mollusca (b) Echinodermata
(c) Annelida (d) All of these

CMC Ludhiana-2011

Ans. (a) : Torsion and detorsion are exceptional to mollusca. Phylum mollusca divided into seven classes:- Aplacophora, Monoplacophora, Polyplacophora, Bivalvia, **Gastropoda**, Cephalopoda and Scaphopoda.
The gastropods have an asymmetrical body. Torsion is the rotation of the visceral mass, mantle and shell 180 degree with respect to the head and foot of the gastropod. This leads to the mantle cavity and anus to an anterior position above the head, thereby causing asymmetry in gastropod. Detorsion is brought about by the reversal of the torsion phases and it occurs in same groups of gastropods.

@apna_pdf

B. Porifera

149. Which of the following cell type is capable of giving rise to other cell types in sponges?

(a) Thesocytes (b) Pinacocytes
(c) Cnidocytes (d) Archaeocytes

VMMC-2012 / JIMPER-2009
MGIMS Wardha-2008 / UP CPMT-2012, 2008
Rajasthan PMT-2008 / CG PMT-2008
Punjab MET-2004 / DUMET-2001
Manipal-2000 / AIIMS-1994

Ans. (d) : Archaeocytes cell type is capable of giving rise to other cell types in sponges.
Archaeocytes area totipotent and can change into all other types of sponge cell. It is present in the gemmule and its helps in asexual reproduction.

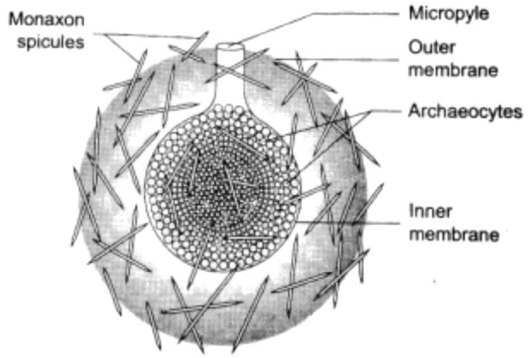
150. During unfavourable conditions, the sponges form

(a) cyst (b) encyst
(c) spicule (d) gemmule

AP EAMCET-2011
MGIMS Wardha-2010
JIPMER-2010 / BVP-2008
Uttarakhand PMT-2007

Ans. (d) : During unfavourable conditions, the sponges form gemmule and are involved in asexual reproduction.
Gemmules are internal buds, that are capable of developing into a new organism or adult sponge.

- Gemmule help to survive during unfavorable condition and germinate to produce new sponges.
- A fully formed gemmule is a small hard ball having a mass of food laden archaeocytes enclosed in a double layered tough envelope with amphidisc spicules.



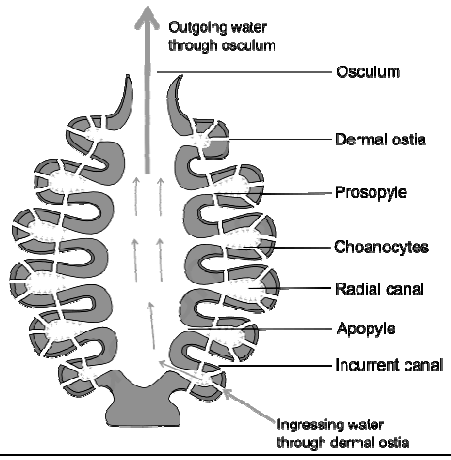
Gemmule in sponges

151. Canal system is present in phylum:

(a) Annelida (b) Porifera
(c) Acanthocephala (d) Echinodermata

HP CET-2018
Rajasthan PMT-2011, 2004
BCECE-2009, 2007

Ans. (b) : Canal system is the characteristic feature of the phylum porifera. They are primitive multicellular, non-motile aquatic organisms, commonly called as sponges. Body is perforated with many pores called ostia. Water enters into the body through ostia and leads to canal system. It circulates water throughout the body and carries food and oxygen.



152. The excretory material of bony fish is :

(a) urea (b) protein
(c) ammonia (d) amino acid

VMMC-2012 / Uttarakhand PMT-2008
CG PMT-2008 / MGIMS Wardha-2006
DUMET-2001

Ans. (c) : The excretory material of bony fish is ammonia. It is a excretory product which is very toxic substance to tissue and extremely soluble in water. The process of excretion of ammonia is known as Ammonotelic. It is observed in aquatic animals.

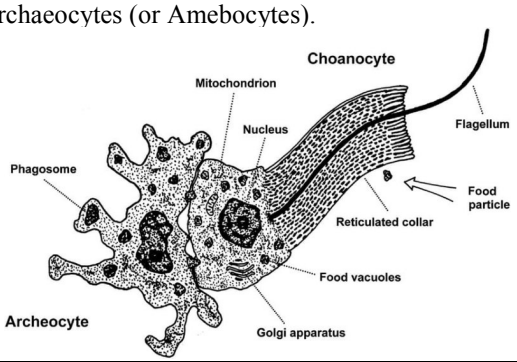
153. In case of poriferans the spongocoel is lined with flagellated cells called :

(a) Ostia (b) Oscula
(c) Choanocytes (d) Mesenchymal cells

NEET-2017 / AMU-2005
Manipal-2004 / Uttarakhand PMT-2004

Ans. (c) : In case of poriferans the spongocoel is lined with flagellated cells called choanocytes.
Choanoderm is the inner cellular layer, lining the Spongocoel in porifera consisting of flagellated cell, called Choanocytes.

- **Ostia** are small pores with connect the outer environment to spongocoel.
- **Oscula** is the large aperture in a sponge through which water is expelled.
- **Mesenchyme** also known as methyl in sponges, is a gelatinous matrix that contains skeletal elements and archaeocytes (or Amebocytes).



@apna_pdf

154. Identify the correct statements in relation to Wucheraria

(a) Pineal spicules are unequal and chitinous.
(b) Pineal spicules are equal in size and chitinous.
(c) Sausage shaped larva is formed in labrum of mosquito
(d) Mamillated eggs are found in the life cycle.

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : • Wuchereria bancrofti is a filarial nematode that, as an adult, is a thread-like worm. The female nematodes are 10 cm long while the males are only about 4 cm long. It is digentic parasite requiring two hosts to complete its life cycle. Two hosts are man and female culex mosquito.

• A pair of uneuqal chitinous penial setae or copulatory spicules is present in cloacal or curued region. Many copulatory papillae are present in the posterior region.

155. Study the following table and pick up the incorrect combination (s).

S. No.	Group	Salient feature	Example
I)	Cyclostomata	Absence of renal portal system	Lamprey
II)	Gnathostomata	Internal ears with three semi circular canals each	Lanselet
III)	Chondrichthyes	Heterocercal caudal fin	Torpedo
IV)	Osteichthyes	Absence of air bladder	Catla

(a) I, II (b) II, IV
(c) II, III (d) I, IV

TS EAMCET-30.07.2022 Shift-II

Ans. (b) :

	Group	Salient Feature	Example
1.	Cyclostomata	Absence of renal portal system	Lamprey
2.	Gnathostomata	Internal ears with three semi circular canals each	Placodermii
3.	Chondrichthyes	Heterocercal caudal fin	Torpedo
4.	Osteichthyes	Presence of air-bladder	Catla

156. Match the following:

Classes	Examples
A) Demospongiae	I) Corallium
B) Anthozoa	II) Beroe
C) Hydrozoa	III) Euplectella
D) Nuda	IV) Obelia
	V) Chalina

The correct match is

	A	B	C	D
(a)	V	I	IV	III
(b)	II	IV	I	V
(c)	V	I	IV	II
(d)	III	V	IV	I

TS EAMCET-30.07.2022 Shift-II

Ans. (c) :

	Classes		Examples
(A)	Desmospongiae	(V)	Chalina
(B)	Anthozoa	(I)	Corallium
(C)	Hydrozoa	(IV)	Obelia
(D)	Nuda	(II)	Beroe

157. Sponges that contain calcareous spicules and live in shallow marine waters are included under the class

(a) Calcarea (b) Demospongia
(c) Hexactinellida (d) Scyphozoa

AP EAMCET-12.07.2022 Shift-II

Ans. (a) : Calcareous sponges belongs to the class calcarea under phylum Porifera. The members of this class characterized by spicules made of calcium carbonate.
Sponge divided into 3 classes
(i) Calcarea- Calcareous skeleton
(ii) Hexactinellida- siliceous skeleton
(iii) Desmospongia-Silicious or spongin fiber

158. Which of the following is not a characteristic feature of sponges?

(a) Cellular level of organization
(b) Body supported by chitin
(c) Intracellular digestion
(d) Presence of ostia

AP EAPCET-07.09.2021 Shift-I

Ans. (b) : Sponges are primitive multicellular animal they have only cellular level of body organization.
Body supported by chitin is not a characteristic feature of sponges because sponges body is supported by spicules that made of calcium or silica or proteinaceous spongin fibers.
Ostia are the inhalant pores in sponges through which water enters the body.
Nutrition in sponges is intracellular.
Development in sponges is indirect through larval stages known as parenchymula and Amphiblastula.
• Chitin is present in the cell wall of fungi.

159. A sponge harmful to oyster industry is_____

(a) Cliona (b) Euspongia
(c) Sponailla (d) Hyalonema

AP EAMCET-24.09.2020 Shift-I
MGIMS Wardha-2008

Ans. (a) : Cliona (boring sponges) is a genus of Demospongiae in the family clionaidae. It is found worldwide. These sponges mostly live on reefs and lagoons. They are harmful to the oyster industry because they create round holes on the shells of oysters.

160. The outer chitinous layer of the gemmule of a sponge is secreted by____

(a) choanocytes (b) interstitial cells
(c) amoebocytes (d) archaeocytes

MHT CET-08.10.2020 Shift-I

Ans. (c) : The outer chitinous layer of the gemmule of a sponge is secreted by amoebocytes.
• An amoebocyte is a cell with motility, it move and surround the central mass of archaeocytes and it secrete thick hard chitinuous inner layer and an outer membranous layer around archaeocytes that forms layer around it.

@apna_pdf

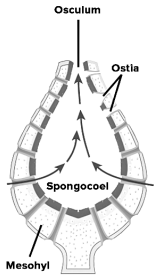
Amoebocytes have a variety of functions delivering nutrients from choancytes to other cells within the sponge, giving rise to eggs for sexual reproduction.

161. In most simple type of canal system of porifera, water flows through which one of the following ways?

(a) Ostia→ Spongocoel→ Osculum→Exterior
(b) Spongocoel→ Ostia→ Osculum→ Exterior
(c) Osculum→ Spongocoel→ Ostia→ Exterior
(d) Osculum→ Ostia → Spongocoel → Exterior

WB JEE-2012

Ans. (a) : In most simple type of canal system of Porifera, water flows through the following ways - Ostia→ Spongocoel→ Osculum→Exterior.
Water canal system is a characteristic feature of phylum porifera. The body of the poriferans have pores called ostia. The body has only one opening called the osculum. There is a continuous water movement from the exterior to the interior of the body of the poriferans. Water flows through the ostia into the spongocoel and goes out through the osculum. This helps in food gathering, exchange of gases and removed of waste.



Basic sponge body plan

162. Muscles in sponges are

(a) striated (b) smooth
(c) Both [a] and [b] (d) None of these

Uttarakhand PMT-2011

Ans. (d) : Sponges do not have muscular tissue; myocytes form fusiform contractile cells. They are able to contract without muscles.

- They are animals of the phylum porifera.
- They lack muscles, nerves and other internal organs.
- Tubular cells (porocytes) makeup the pores into the sponge body through the mesophyl.
- They have ascon, sycon and leucon type body.

163. The phenomenon of regeneration in sponges was observed and explained by :

(a) H.W. Wilson (b) Aristotle
(c) Robert Grant (d) Ellis

Uttarakhand PMT-2006

Ans. (a) : The phenomenon of regeneration in sponges was observed and explained by H.W. Wilson.

- Regeneration morphogenesis i.e. the ability to restore the lost parts by regeneration in sponges.
- Sclerocyte cells are responsible for forming the skeleton of porifera. Thus the power of regeneration in sponges is due to Archaeocytes or Amoebocytes.
- Aristotle gave the theory of spontaneous generation.
- Robert E. Grant was the one who coined the term porifera in 1836.
- John Ellis, recognize the animal nature of sponges.

164. Power of regeneration of sponges is due to:

(a) theocytes (b) archaeocytes
(c) amoebocytes (d) sclerocytes

AIIMS-2000

Ans. (b) : Power of regeneration of sponges is due to archaeocytes.

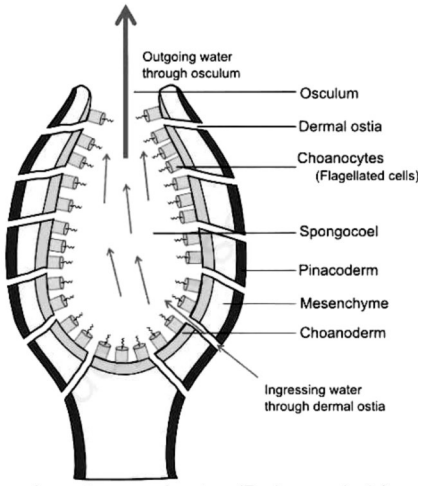
- Regeneration morphogenesis i.e. the ability to restore the lost parts by regeneration in sponges.
- Archaeocytes are type of amoebocytes cells found in sponges. They are totipotent cell which can transforms into sclerocytes, spongocytes or collencytes.

165. Body having meshwork of cells, internal cavities lined with food filtering flagellated cells and indirect development are the characteristics of phylum

(a) Protozoa (b) Coelenterata
(c) Porifera (d) Mollusca

AIPMT (Re-Exam)-2015

Ans. (c) : Body having meshwork of cells, internal cavities lined with food filtering flagellated cells and indirect development are the characteristics of the phylum Porifera.
Phylum porifera comprises sponges which are aquatic, marine, sessile, radically symmetrical or asymmetrical animals.
This phylum has characteristics of canal system.
Sponges have a central body cavity known as spongocoel which is lined by specialized flagellated cells called choanocytes or collar cells.



Ascon type canal system (Ex: Leucosolenia)

166. Collar cells are characteristic of

(a) earthworm (b) roundworms
(c) coelenterata (d) sponges

UP CPMT-2009

Ans. (d) : Collar cells are seen in the body wall of sponges. Collar cell/choanocytes are specialized cell consist of a flagellum, a collar and a nucleus. The collar of choanocytes contain various microvilli.
Collar cell are chacteristic feature of the sponges.

167. Which of the following have porous body and are diploblastic?

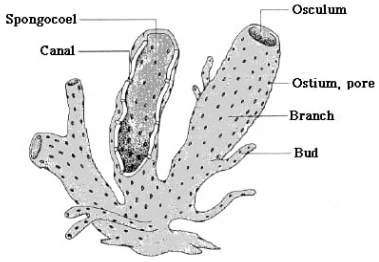
(a) Aurelia and Obelia
(b) Adamsia and Euplectella

@apna_pdf

(c) Leucosolenia and Spongilla
(d) Sycon and Hydra

AIIMS-2010

Ans. (c) : Leucosolenia and spongilla have porous body and are diploblastic. Both are belonging to phylum porifera means pore bearing. So they have pore throughout their body.



168. What is the range of length of sponges?
(a) 1 mm - 10 mm
(b) 1 cm - 1 metre
(c) 1 mm - 100 mm
(d) 1 metre - 10 metre

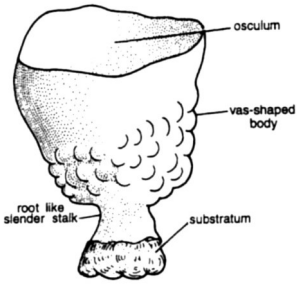
BCECE-2015

Ans. (b) : Some sponges are about a centimeter long and may be even less than a centimetre. Some sponges which are vase like or cylindrical are up to 1 or 2 metre long.
- Sponges have a high efficiency and capacity for particle retention preferably small particle (<10μm) such as bacteria, phytoplankton viruses and dissolved organic matter.
- The range of length of sponges is 1cm - 1 metre.

169. Proterion is an example of
(a) Protozoa (b) Porifera
(c) Cnidaria (d) Ctenophora

BCECE-2015

Ans. (b) : Proterion is an example of phylum porifera. Proterion which is now known as cliona patera, is commonly called as Neptune's cup.
It includes multicellular animals that are commonly called sponges.



170. Which of the following features is universally present in all sponges?
(a) marine habitat
(b) presence of spicules
(c) presence of spongin fibres
(d) presence of spongocoel

MP PMT-2013

Ans. (d) : All sponges have a central body cavity known as spongocoel which is lined by choanocytes or collar cells. Hence, the thing which is common for all sponges is spongocoel.
- Sponges may be marine (eg-sycon) or fresh water (eg – spongilla)

171. One animal that does not perform locomotion is
(a) Sycon (b) Nereis
(c) Sepia (d) Euglena

JIPMER-2011

Ans. (a) : Sycon is a sponges that belong to phylum porifera. Sponges are sessile as they are attached to a substratum. Hence, Sycon does not perform locomotion
- In Nereis locomotary organ is parapodia.
- In Sepia (cuttlefish) locomotary organ is fins.
- In Euglena locomotary organ is flagella.

172. The canal system is a characteristic feature of
(a) echinoderms (b) helminthes
(c) coelenterates (d) sponges

JIPMER-2011 / Punjab MET-2010
BCECE-2012

Ans. (d) : The canal system is a characteristic feature of sponges, belong to phylum porifera. It is also called an aquiferous system. The canal system of sponges acts as a water circulatory system. It helps in food acquisition, respiration and excretion. In porifera canal system is of three types e.g. Asconoid, syconoid and leuconoid.

173. Members of phylum Porifera are
(a) exclusively marine animals
(b) exclusively fresh water animals
(c) mostly fresh water animals but few are marine animals
(d) mostly marine animals but few are fresh water animals

HP CET-2012 / VMMC-2004

Ans. (d) : Sponges are the members of phylum porifera. They are generally marine and asymmetrical animals but few are freshwater animals. They show cellular level of body organization. Spicules or sponging fibres make up the skeleton of sponges. It provides them structural support.

174. Larva of Sycon is:
(a) parenchymula (b) amphiblastula
(c) redia (d) trochophore

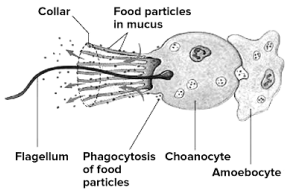
Rajasthan PMT-2005 / AFMC-2001

Ans. (b) : In Sycon, development indirect i.e., development occur through larval form.
Amphiblastula is the larval stage of Sycon.
(a) Parenchymula is the larva of Leucosolenia
(c) Redia is the larval stage of *Fasciola hepatica* (liver fluke) but not sponge.
(d) Trochophore larva is found in annelids and molluscs.

175. Choanocyte is the characteristic feature of:
(a) sponges (b) arthropods
(c) annelida (d) none of these

UP CPMT-2011/ Rajasthan PMT-2005
UP CPMT-2002

Ans. (a) : Choanocyte is also called as collar cells, most important specialized cells of sponges having following structural specialities.



@apna_pdf

- Protoplasmic partition are microvilli or collar towards spongocoel through which flagellum comes out.
- Cytoplasm with a nucleus and cellular organelles, shows presence of vacuole called contractile vacuole but function is unknown.
- Choanocytes form inner surface of sponge body its flagellum which creates water current and helps in feeding and also takes part in intracellular digestion.

176. Which one of the following statements about all the four of Spongilla, Leech, Dolphin and Penguin is correct –

(a) Penguin is homoeothermic while the remaining three are poikilothermic
(b) Leech is fresh water form while all othersare
(c) Spongilla has special collared cells called choanocytes, not found in the remaining three
(d) All are bilaterally symmetrical

AIPMT (Screening)-2010

Ans. (c) : Spongilla belongs to phylum porifera, in which the characteristic cells are choanocytes, these are absent in leech, dolphin and penguin. These collared cells called choanocytes, are not found in remaining three species. These collared cells which have flagellated structures aid in food capture and movement.

- Dolphin and Penguin are a homeothermic while other two are poikilothermic. Spongilla and leech are the freshwater and penguin and dolphin are marine water animal.
- Spongilla is asymmetrical while other three are bilaterally symmetrical.

177. Which one of the following statements is incorrect?

(a) Insects have one pair of antenna
(b) Millipedes possess two pairs of appendages in each segment of the body
(c) Prawns have two pairs of antenna
(d) Animals belonging to the phylum-Porifera have nematocyst

WB JEE-2015

Ans. (d) : Nematocyst : The nematocyst present in coelenterate are exclusive stinging apparatus of the cnidocytes. It is a distinguishing feature of the phylum coelenterate.

- It helps to capture the prey and serve for adhesion, offence and defense. It also helps in locomotion and food capture.

178. Which of the following characteristic features always holds true for the corresponding group of animals

	Animal	Feature
(a)	**Reptilia**	**3-chambered heart with one incompletely divided ventricle**
(b)	**Chondrichthyes**	**Cartilaginous endoskeleton**
(c)	**Mammalia**	**Viviparous**
(d)	**Chordata**	**Possess a mouth with an upper and a lower jaw**

NEET-2016 Phase-I

Ans. (b) : Chondrichthyes contains the cartilaginous fishes which have endoskeletons composed of cartilage.

- Reptilia have 3-chambered heart, except crocodiles, which have three and half chambered heart.
- All mammalia are viviparous except monotremes, viviparous give birth to young ones and the development of offspring is inside the mother body.
- Chordata possess a mouth with an upper and a lower jaw, but jawless fish don't have any jaw.

179. What is left when bath sponges dries up?

(a) Spicules (b) Spongin fibres
(c) Tentacles (d) Holdfast

JIPMER-2004

Ans. (b) : Euspongia is also known as bath sponge. Sponges are classified on the basis of their skeleton, which is made up of sponging fibres. Only the skeleton is left after the sponge dries.

- Calcareous spicules are made of calcium carbonate.
- Siliceous spicules are made of silica.

180. Spicule, made up of silica are found in

(a) Grantia (b) Sycon
(c) Hyalonema (d) Leucosolenia

UP CPMT-2014
VMMC-2014
AP EAMCET-2001

Ans. (c): Spicule, made up of silica are found in Hyalonema.
Hyalonema is a member of class-hexactinellida of the phylum porifera. It is a marine found in deep sea, has oval body with a spirally twisted root tuft.

181. Which of the following animal can successfully reproduce without utilizing the process of mitosis?

(a) Amoeba (b) Hydra
(c) Tapeworm (d) Sycon

Karnataka CET-2006

Ans. (d) : Sycon can successfully reproduce without utilizing the process of mitosis. Sycon belongs to the phylum porifera.

- In Amoeba reproduction is asexual. It takes place by binary fission, multiple fissions and sporulation. Sycon belongs to porifera.
- Tapeworm can reproduce sexually or asexually. Asexual reproduction by breaking off proglottid segments at the end of the trunk.
- Hydra reproduces asexually by budding and sexually by gemetes formation.

182. Which types of cells absent in sponges?

(a) Trophocytes (b) Myocytes
(c) Archeocytes (d) Cnidocytes

JIPMER-2014
UP CPMT-2006
AMU-2006

Ans. (d) : Cnidocytes are specialized cells that are found in the phylum cnidaria **(sea anemones, jellyfish, corals and hydras)**. They contain an "explosive" organelle called **cnidocyst** that acts as a 600 million-years-old microscopic injection system and is important for prey capture and anti-predator defense.
(a) Trophocytes – In sponges, these cells involved in the digestion and distribution of food.

@apna_pdf

(b) Myocytes–Myoytes are elongated, contractile cells, which surround canal openings and pores can contract to regulate flow through the sponge.
(c) Archaeocytes–These cells are totipotent, they have ability to change into all of the other types of sponge cells.

183. Locomotion does not occur in
(a) Amoeba (b) Pheretima
(c) Leucosolenia (d) Maggot of Musca
CG PMT-2011

Ans. (c) : Leucosolenia is calcareous sponge, belong to calcispongiae family and phylum porifera. Locomotion does not occur in Leucosolenia. Except for changes in the porocytes, no mature sponge is capable of locomotion. Some are completely devoid of contractile powers.

184. Which one of the following animal phyla possesses spicule?
(a) Annelida (b) Mollusca
(c) Porifera (d) Platyhelminthes
WB JEE-2012

Ans. (c) : Members of phylum Porifera are commonly known as sponges.
They have cellular level of organization.
They have water transport or canal system.
The body of these animals are supported by a skeleton made up of spicules or sponging fibers. Spicules are composed of either calcium or silica.

185. Canal system in Porifera is not concerned with
(a) respiration (b) nutrition
(c) sexual reproduction (d) none of the above
AFMC-2005

Ans. (d) : Sponges belong to the phylum porifera. Body wall is diploblastic, middle layer is called mesenchyme, which has various kinds of wandering amoebocytes. Body wall contains numerous pores called ostia through which water enters into the body and leads to canal system.
- Having no digestive system, Sponges are holozoic creatures. The choanocytes found in the flagellated chamber of the canal system which assist the food particles to be immediately absorbed.
- In sponges, sexual reproduction takes place through the participation of sperm and ovum.
- Since there is a continuous flow of water because of the canal system, the gaseous exchange takes place between cells of sponges and the flowing water.

186. Which of the following cells are useful for feeding in sponges?
(a) Thesocytes (b) Collar cells
(c) Pinacocytes (d) Sclearocytes
Manipal-2012 / AFMC-2002 AP / EAMCET-1997

Ans. (b) : Sponges are marine primitive organism that belongs to the phylum porifera. Choanocytes are another name of collar cells that line interior of sponges. They help to get water to flow through the sponge. They first whip its flagella back and forth. The water removes the wastes while bringing in nutrients and oxygen.
- The collar cells have sticky collars to attract food particles that are carried in with water.

187. Which is not a larva of sponge?
(a) Tornaria (b) Parenchymula
(c) Stereogastrula (d) Amphiblastula
Manipal-2011

Ans. (a) : Tornaria Larva is found in Hemichordates.
- Animals of this phylum are worm-like, brittle and soft.
- The body is divided into 3-parts
  (i) Proboscis
  (ii) Collar
  (iii) Trunk
- The animals have tornaria larva just like bipinnaria larva of Echinodermata in their developmental stage.
- Stereogastrula or Parenchymula larva is found is Leucosolenia.
- Amphiblastula larva is found in Scypha.

188. Which of the following are also known as collar cells?
(a) Choanocytes (b) Pinocytes
(c) Thesocytes (d) Cnidoblast
Manipal-2004 / AMU-2005
Uttarakhand PMT-2004

Ans. (a) : The interior body wall of sponges is lined with distinct cell called choanocytes also referred to as collar cells. These cells contain a collar of microvilli around the central flagellum. In Sponges, they create a sort of cell layer called choanderm.

189. Air bladder is present in
(a) chondrichthyes (b) star fishes
(c) actinopterygii (d) flying fishes
DUMET-2010

Ans. (c) : Air bladder is found only in bony fishes. It is a sac-like outgrowth form the dorsal wall of the oesophagus. It is hydrostatic in function and in some cases help in respiration as well it provides bounce to the fishes and helps them in swimming.
- The actinopterygians, or Ray-finned fish, are one of the 2 major classes of bony fish (osteichthyes), the other being the lobe-finned fish, or sarcopterygians.

190. Fresh water bony fish survives by
(a) get rid of H_2O and gain salt
(b) get rid of salt and gain H_2O
(c) Both [a] and [b]
(d) None of the above
DUMET-2008

Ans. (a) : Marine bony fish typically lose salt and pick up water because their internal osmotic concentration is lower than the surrounding water. Marine fishes lose a lot of water through osmosis to their surroundings. To compensate they have to drink a lot of water and secrete excessive salt form their gills to the surrounding sea water.

191. Which type of scales are found in Chondrichthyes ?
(a) Gonoid (b) Cycloid
(c) Placoid (d) Ctenoid
UP CPMT-2012

Ans. (c) : Placoid scales are found in chondrichthyes. Placoid scales are also called denticles. The placoid scales are structurally homologous to the vertebrate teeth" denticle" with a central pulp cavity supplied with

@apna_pdf

blood vessels, that is surrounded by a conical layer of dentine, all of which sits on top of a rectangular basal plate that rests on the dermis.

• These scales are found in cartilaginous fishes as such sharks, rays and chimeras.

192. The commercial bath sponges belongs to :

(a) Protozoa (b) Porifera
(c) Coelenterata (d) Echinodermata

JIPMER-1999

Ans. (b) : The commercial bath sponges belongs to Porifera. They are multicellular organism, sessile and sedentary in nature. Euspongia is a commercial used sponge, commonly known as bathe sponge. It is found across the mediterranean sea. It belongs to the class 'Desmospongiae' under the phylum 'Porifera' of animal kingdom'.

193. Which fish selectively feeds on the larva at mosquito?

(a) Gambusia (b) Rohu
(c) Clarias (d) Exocoetus

BHU PMT (Screening)-2010
BVP-2008

Ans. (a) : Gambusia affinis and poecilia reticulata are the two most important larvivorous fish which have been used extensively in the country for the control of mosquito breeding in urban area. Both these fish though exotic but have acclimatized very well in different types of climatic conditions prevailing in the country.

194. The pH of the avian blood is maintained by

(a) HCO_3^- (b) $H_2PO_4^-$
(c) CH_3COO^- (d) Cl^-

KVPY SA-2016

Ans. (a) : Bicarbonate (HCO_3^-) ions keep the pH of avian blood constant. The body of avian contains a number of buffering system that serve to regulate the pH between 7.33 & 7.45.Since bicarbonate ion is a base, it helps neutralise the acid in the blood and increase the pH above 7.

195. Food storage in Leucosolenia occur by :

(a) ostia (b) osculum
(c) thesocyte (d) spongocoel

MGIMS Wardha-2005

Ans. (c) : Food storage in Leucosolenia occur by thesocyte. The thesocytes of sponges are usually binucleate and are packed with yolk platelets. They store food in the form of basic proteins and glycoproteins.

196. Sponges are :

(a) pelagic (b) free-swimming
(c) planktonic (d) sessile

VMMC-2005
AMU-2004
BCECE-2006

Ans. (d) : All the sponges are sessile, meaning they cannot move around. Adult sponges are sessile and they are not able to walk from place to place. They are generally found in freshwater but survive in a marine environment. They do not have well developed locomotary organs.

197. Which of the following groups is a side line in the process of evolution?

(a) Porifera (b) Annelids
(c) Echinodermata (d) None of these

AMU-2011

Ans. (a) : Phylum porifera is a group of simple aquatic animals that lack true tissues, organs and symmetry. They are regarded as side line to the major trends of evolution. Porifera possess cellular level organisation and their individual cells functioning independently, they lack in the coordinated patterns of cell functions found in more specialized tissues or organs of other animal phyla.

198. Branch of zoology dealing with the study of fishes is called

(a) Arthrology (b) Ichthyology
(c) Saurology (d) Herpetology

Uttarakhand PMT-2009

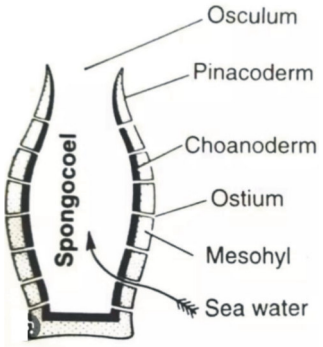
Ans. (b) : Ichthyology is the scientific study of fishes which is concerned with a large group of organism and a number of specialized sub disciplines for example taxonomy, anatomy, ecology physiology and behavioral science.

199. The type of canal system found in Leucosolenia is

(a) ascon type (b) sycon type
(c) leucon type (d) aphodal type

UP CPMT-2001

Ans. (a) : The type of canal system found in Leucosolenia is 'Ascon type'. The colony consists of few simple vase-like, cylindrical individuals each terminating in an osculum and united at their bases by irregular horizontal tubes. Leucosolenia reproduces both asexually and sexually.



200. A metazoa without tissue organisation is called:

(a) parazoa (b) protozoa
(c) eumetazoa (d) dermatozoa

Manipal-2000

Ans. (a) : A metazoa without tissue organization is called parazoa. Parazoa include multicellular sponges and lack true tissues. They do not show tissue-level organization, although they do have specialized cells that perform specific functions.

201. The following are the statements about Parazoa:

1. Includes red algae, fungi and sponges
2. Multicellular animals
3. Tissues and organ systems are absent
The correct combination is:

@apna_pdf

(a) 1 and 3 only are correct
(b) 1 and 2 only are correct
(c) All are correct
(d) 2 and 3 only are correct

AP EAMCET-2004

Ans. (d) : Parazoa is a group of invertebrates that contain sponges. They are multicellular organism with a loose cellular organization. They are asymmetrical organisms.
Tissue and organs system are absent. These animals have pores in their entire body which help them in the movement of water.

202. Which cells are found only in sponges?
(a) Amoeboid cells (b) Choanocytes
(c) Pigment cells (d) Gland cells

Haryana PMT-2005

Ans. (b) : Choanocytes cells are found only in sponges. They are the cells that line the inner surface of spongocoel and canals of porifera. They possess flagella and the cooperative movement of flagella filters help in creating a flow channel for water.

203. Water vascular system is characteristic of
(a) Protozoa (b) Porifera
(c) Annelida (d) Echinodermata

CG PMT-2009

Ans. (d) : The water vascular system is a hydraulic system utilized by echinoderms, such as Sea stars and Sea urchins, for locomotion, food and waste transportation, and respiration. The system is made up of canals connecting numerous tube feet.
Water vascular system is characteristic of the phylum Echinodermata, water flow through this system enabling gaseous exchange, nutrition, predation and locomotion.

204. A sponge differs from all other matazoans in having :
(a) nerve cells
(b) absence of blood
(c) numerous mouthlets and one exit
(d) none of these

JIPMER-2000

Ans. (c) : A sponge differs from all other metazoans in having numerous mouthlets and one exit. Metazoans are multicellular and belong to the kingdom Animalia. Examples of metazoans are flatworms, arthropods, birds reptiles and mammals.

205. Which one of the following is a fresh water sponge?
(a) Euplectella (b) Spongilla
(c) Euspongia (d) Sycon

JIPMER-2000

Ans. (b) : Spongilla is a fresh water sponge. They come under the genus of freshwater sponges with over 200 different species. Spongilla was first publicly recognized in 1696 by Leonard plukenet and are found in lakes, ponds and slow streams.

206. Sponges have evolved from
(a) ciliates (b) flagellates
(c) protozoans (d) choanoflagellates

Manipal-2013

Ans. (d) : Sponges have evolved from choanoflagellates. In choanoflagellate colonies, every cell can feed. To become a sponge, the majority must abandon feeding as collar cells, lowering feeding potential dramatically.

207. Heterocercal tail is found in:
(a) cartilaginous fishes (b) bony fishes
(c) whale (d) amphibians

VMMC-2011, 2007 / UP CPMT-2010
J&K CET-2006

Ans. (a) : Heterocercal tail is found in the cartilaginous fish. They are cold-blooded animals and belong to chondrichthyes class, for example - Sharks, Scoliodon.

208. Which of the following is different?
(a) Rodent (b) Lamprey
(c) Bat (d) Fish

JIPMER-1995

Ans. (b) : A lamprey belongs to cyclostomata class. These are primitive vertebrates that lack jaws and do not have paired fins.

209. Swim bladder is present in
(a) star fishes (b) bony fishes
(c) carp fishes (d) All of these

AMU-2005
Manipal-2003

Ans. (b) : Swim bladder is also called air bladder, is a buoyancy organ that are found in bony fishes and is acquired from an outpocketing of the digestive tube.

210. Torpedo is commonly known as
(a) sucker fish (b) electric ray
(c) globe fish (d) sea horse

VMMC-2005
AMU-2004

Ans. (b) : Torpedo is generally known as electric ray due to the presence of a pair of electric organs, one either side of the body between head and the pectoral fins.

211. Which is the only phylum in the animal kingdom without any nerve cell ?
(a) Porifera (b) Coelenterata
(c) Annelida (d) Nematoda

AMU-2012

Ans. (a) : Porifera is the only phylum in the animal kingdom without any nerve cell. They relying on water flow through their canal system for their food and oxygen. They do not have any nerve cells or sensory cells. However, touch or pressure to the outside of a sponge can cause a local concentration of its body.

212. Digestion in Leucosolenia and other sponges is
(a) Only extracellular
(b) Only intracellular
(c) First extracellular, then intracellular
(d) First intracellular, then extracellular

MGIMS Wardha-2011

Ans. (b) : Lecucosolenia is a group of Calcareous sponges. They are small-bodies, soft branching and colonial marine sponges.
- Sponges have a cellular level of organization and therefore, they do not have any organ system.
- Due to the absence of an organ, the digestion is intracellular, digestion occurs in food vascuoles only.

@apna_pdf

213. Sponges have originated from
(a) ciliate protozoans
(b) sporozoan protozoans
(c) sarcodine protozoans
(d) choanoflagellate protozoans

BHU PMT (Screening)-2011

Ans. (d) : Sponges may have originated from flagellated protozoans. The choanocytes of sponges are similar to the choanoflagellate protozoans. The primitive structures of the porifera shows affinities with certain types of protozoans.
- Choanoflagellida have a transparent food gathering collar of cytoplasm around the base of the flagellum.
- They are solitary and sessile with or without a stalk.

214. Hydra can paralyse prey by
(a) nematocysts (b) tentacles
(c) mouth (d) None of these

BHU PMT (Screening)-2011

Ans. (a) : Nematocyst is the specialized cell present in the tentacles of hydra which also known as cnidocyte. It contains neurotoxin that protects in self-defense and to catch preys. Hydra have four types of nematocysts on their tentacles and ectoderm.

215. Which of the following is a viviparous fish?
(a) Exocoetus (b) Gambusia
(c) Clarias (d) Labeo

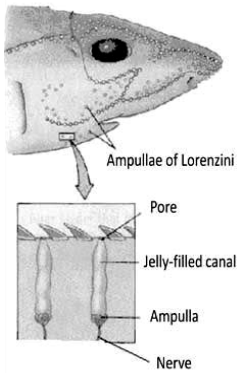
DUMET-2009

Ans. (b) : Gambusia is a genus that belong to poeciliidae family of viviparous fish. They are viviparous, which means after the gestation of a brood, the female will have a live birth. It is a fresh water fish and are quite smaller than fresh water fishes.
Gambusia is also known as mosquito fish because the fish eats mosquito larvae for the biological control of mosquitoes.

216. Ampullae of Lorenzini are present in
(a) fish (b) lizard
(c) frog (d) rabbit

DUMET-2009

Ans. (a) : Ampullae of Lorenzini are electroreceptor, sense organs that have potential to detect electric field. They form a network of mucus- filled pores in the skin of cartilaginous fish (sharks, rays) and of basal bony fishes such as reedfish, sturgeon and lungfish.



217. An example of Scyphozoa is:
(a) jelly fish (b) cuttle fish
(c) silver fish (d) cat fish

AP EAMCET-2011, 2000

Ans. (a) : Scyphozoa is an example of jellyfish. They comes under the marine class of the phylum Cnidaria which is generally known as true jellyfish.

218. An example for the group which is considered as blind alley in animal kingdom is:
(a) Chalina (b) Chelone
(c) Chamaeleon (d) Chiroptera

AP EAMCET-2000

Ans. (a) : Chalina belongs to demosponsgiae class of phylum porifera. Chalina sponge is closed at one end and no higher forms are derived from it. It is also known as 'mermaids or dead man's fingers' because it looks like the fingers of human. Therefore, It is considered as the blind alley of animal Kingdom.

219. Animals devoid of respiratory, excretory and circulatory organs are
(a) sponges (b) threadworms
(c) tapeworms (d) liver fluke

CMC Ludhiana-2010

Ans. (a) : Animals devoid of respiratory, excretory and circulatory organs are sponges. They are the simplest multicellular animals. They have no organ system like respiratory, Excretory and circulatory and are characterized by numerous canals and chambers.

220. Bath sponges are formed from
(a) Euplectella
(b) dried spongin fibre skeleton
(c) skeleton of Spongilla
(d) dry Leucosolenia

Haryana PMT-2011

Ans. (b) : Dead and dried skeleton of spongin fibres are utilized as bath sponges. Euspongia is commonly known as bath sponges. It is because of its texture, which is made up of fuzzy, sponge-like fibres.
They are found in mediteranean sea, red sea etc.

221. Flying fish is
(a) Scoliodon (b) Hippocampus
(c) Exocoetus (d) Torpedo

AMU-2002

Ans. (c) : Exocoetus is a bony fish which is also known as flying fish. The body is covered with cycloid scales. The mouth is wide, and the jaws bear teeth. It is a marine fish. The tail has hypobatic fins like the ventral lobe which help them to glide in the air.

222. Salmon fishes are also known as
(a) cod fish (b) trout
(c) cartilaginous fish (d) bony fish

AMU-2002

Ans. (b) : Salmon fishes are also known as trout. It is general name for a number of carnivorus freshwater. They belong to the genera oncorhynchus, salmo and salvelivus.
- Cod is the common name for Gadus fish.

223. Hydra does not perform locomotion by:
(a) looping (b) somersaulting
(c) jet propulsion (d) walking

VMMC-2003

Ans. (c) : Hydra are generally sedentary but move during hunting. They move by two distinct methods, looping and somersaulting. By this process a Hydra can move to several inches in a day. Hydra is a genus of small freshwater organism belonging to phylum cnidaria and closs hydroza.

@apna_pdf

C. Coelenterata (Cnidaria)

224. Which of the following animals is called 'Portuguese man-of-war' ?
(a) Physalia sp. (b) Periplaneta sp.
(c) Hirudinaria sp. (d) Plasmodium sp.
Tripura JEE-2017 / BVP-2008
Uttarakhand PMT-2007 / BVP-2005
Haryana PMT-2004

Ans. (a) : Physalia is known as the Portuguese man of war. It is a marine hydrozoan of the family physaliidae found in the Atlantic, Indian and pacific oceans. It has numerous venomous microscopic nematocytes which deliver a painful sting powerful enough to kill fish and has been known to occasionally kill humans.

225. Polyp phase is absent in
(a) Hydra (b) Aurelia
(c) Physalia (d) Obelia
VMMC-2012 / JIPMER-2009
UP CPMT-2008 / Rajasthan PMT-2008
CG PMT-2008

Ans. (b) : Cnidarians exhibits two basic body forms called polyp and medusa.
Polyp is a sessile and cylindrical form like Hydra Adamsia etc.
Where medusa is umbrella-shaped and free-swimming like Aurelia or Jelly-fish.
Aurelia belong to class scyphozoa that contains the jelly fishes. They are mainly marine and free floating through they can "swim". In this class the polyp stage in either reduced or absent.

226. In sea anemone, the symmetry is
(a) radial (b) bilateral
(c) spherical (d) absent
Manipal-2010 / AMU-2009
JIPMER-2008 / J&K CET-2007
CMC Ludhiana-2007 / UP CPMT-2004
MGIMS Wardha-2004

Ans. (a) : All cnidarians (e.g. sea anemone) and echinoderms (e.g. star fish) are radially symmetrical and typically sessile in adult form. Radial symmetry, separates the body into two halves along any control axis. Radial symmetry is the arrangement of body parts around a central axis. Radially symmetrical animals posses top and bottom surfaces, but no left and right side. The two halves of a radially symmetrical animals are called the oral side and aboral side.

227. In Hydra, which substance of nematocyst worked as hypnotizing substance ?
(a) Glutatheone (b) Heparin
(c) Histamin (d) Hypnotoxine
CMC Ludhiana-2008 / AMU- 2006
Uttarakhand-2005 / Manipal-2000
Rajasthan PMT-1999

Ans. (d) : Largest Cnidoblast (nematocyst) is penetrant type which inject Hypnotoxin in the prey. Hypnotoxin can't kill the prey, only paralyses.

228. Which of the following is colourless Hydra?
(a) Hydra jusca (b) Hydra viridis
(c) Hydra oligactis (d) Hydra vulgaris
(e) All of the above
CMC Vellore-2015 / Uttarakhand-2005
Punjab MET-2003 / DUMET-2001

Ans. (d) : The commonly occurring colourless Indian species is Hydra vulgaris belong to phylum coelenterata. The Hydra is solitary fresh water animals and cosmopolitan in distribution.
Tubular body respresenting polystage body differentiated in three parts-pedal disc, hypostome and trunk.

229. Characterisitc of coelenterata is occurrence of:
(a) Nematocysts (b) Polymorphism
(c) Flame cells (d) Choanocytes
VMMC-2010 / AMU-2008
AP EAMCET-2005 / UP CPMT-2001

Ans. (a): Coelenterates have nematocyst Nematocysts are stinging cell. Nematocysts are mainly concerned with food capture, defense and attachment.
They have the special types of cells called **nematocysts**, are present in coelenterata only. These cells are used for food catching defensive and offensive purposes.
• Coelenterates are acoelomate. They have a single opening which acts as mouth and anus.
(b) Polymorphism is the ability of an object to take on many forms.
(c) A flame cell is specialized excretory cell found in the simplest freshwater invertebrates, including flatworms, rotifers and nemerteans. Flame cell functions like a kidney, removing waste materials.
(d) Choanocytes, are grouped within chambers. They are the main 'pumping station' for sponge survival.

230. The characteristic larva of phylum-'Coelenterate' is
(a) Planula (b) Cysticercus
(c) Rhabdiform (d) Wriggler
VMMC-2012 / JIPMER-2009
MGIMS Wardha-2008 / UP CPMT- 2008

Ans. (a) : The characteristic larva of phylum coelenterate is planula. Planula, plural planulae, free-swimming or crawling larval type found in many species of the phylum cnidaria.
Example : – Jelly fish, corals, and sea anemones.
• Wriggler is a larvae of mosquitoes.
• Rhabdiform larvae nematodes is a feature of (roundworm).

231. Hydra recognises its prey by:
(a) nematocyst (b) chemical stimulus
(c) Smell (d) sensitivity
BVP-2001 / AIIMS-1996
Manipal-2001 /VMMC-2004

Ans. (a) : Hydra recognizes its prey by nematocyst. Nematocyst are stinging cells of hydra. Nematoblasts of cnidoblasts produced nematocyst used for capturing and paralyzing the prey. The nematocyst consists of coiled and hollow thread consists of barbs or spines and also contains poisons. Hydra is carnivorous and feed on small insect larva. They are solitary in habit and reproduce sexually as well as asexually.

232. Stinging capsules (nematocysts) are found in
(a) wasp and honeybee
(b) scorpion and cobra
(c) sea pen and sea fan
(d) cactus and Venus flytrap.
AIIMS-2013/ JIPMER-2006
UP CPMT-2005, 2003

@apna_pdf

Ans. (c) : Stinging capsule (Nematocysts) are the organs of offence and defence, present in the phylum Coelenterata. **Sea pen and Sea fan** are members of this phylum.

- Nematocysts have specific capsules known as cnidoblasts cell. They have most common intracellular secretion products. Nematocysts belong to the phylum Coelenterata. In coelentrates, a cavity called coelentron or gastrovascular cavity is present with single opening called-mouth, this cavity help in digestion and circulation.

233. Digestion is both extracellular and intracellular in

(a) Cnidaria (b) Platyhelminthes
(c) Nemathelminthes (d) Mollusca

AP EAPCET-12.07.2022 Shift-I

Ans. (a) : Digestion is both intracellular and extracellular in Cnidaria and Ctenophora. Cnidaria have an incomplete type of digestive system. The gastro-vascular cavity has only one opening both for intake of food and removal of wastes. Intracellular digestion occurs only in Protozoa and Porifera.

234. The symmetry of Aurelia is

(a) Spherical (b) Radial
(c) Biradial (d) Bilateral

TS EAMCET-31.07.2022 Shift-I

Ans. (b) : The symmetry of Aurelia is radial symmetry. The Aurelia has a distinct tetramerous (4 part) radial symmetry arranged around the oral aboral axis.
There are four oral arms, four gonads, four subgenital pits, four gastic pouches and four or eight of each type of radial canal.
The mouth has four corners and there are eight sense organs.

235. The most primitive and the slowest type of locomotion in protozoans

(a) Gliding locomotion
(b) Amoeboid locomotion
(c) Ciliary locomotion
(d) Euglenoid locomotion

AP EAMCET-12.07.2022 Shift-II

Ans. (b) : The most primitive kind of movement in protozoa is called amoeboid movement. It is caused by contractility and is also the characteristic of sarcadina and many sporozoa. Amoeboid movement is made by the throwing of pseudopodium.

236. Nocturnal periodicity is exhibited by

(a) Trophozoites of plasmodium
(b) Sheathed microfilaria larvae of Wucheraria
(c) Sausage shaped larvae of Wuchereria
(d) Sporozoites of plasmodium

TS EAMCET-09.05.2019 Shift-I
TS EAMCET-30.07.2022 Shift-II

Ans. (b) : Nocturnal periodicity is a circadian rhythm with the periodicity expressed during night time. Mycrofilariae show nocturnal periodicity i.e day and night moment. When organism movement occur in night called nocturnal moment, at night or during sleep they came into superficial or peripheral vessels in skin to be sucked by nocturnal mosquitoes (Culex or Aedes) which serve as intermediate host.

237. 'Lasso' is a structure found in _____

(a) Nutritive muscular cell
(b) Epithelial muscular cell
(c) Nematoblasts
(d) Nerve cell

AP EAPCET-07.09.2021 Shift-I

Ans. (c) : Modern carnivorous fungi capture and kill tiny nematode worms that come to feed on them. Some produce sticky structure that the nematodes gets stuck in, other grow small loops that act like a lasso when the nematodes go through when the nematode dies, the fungus penetrates the worm and digest it.
Lasso is defence mechanism is an nematoblast. It is a coiled structure which is stored in a state on relicol tension (spring tension) on affroching danger the lasso is ejected at a high tension.

238. Which of the following statements regarding coelenterates are correct?

(i) Cnidoblasts present mostly on the tentacles and the body
(ii) Digestion is both extra and intracellular
(iii) Polypoid forms are free swimming
(iv) Some exhibits metagenesis
(v) Development includes a free-swimming ciliated larva the planula

Options:

(a) Except (iii), all are correct
(b) Except (iii) & (v) all are correct
(c) Except (i) & (iii), all are correct
(d) Except (ii) & (v), all are correct

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : Cnidoblasts present mostly on the tentacles and the body, have a poison filled capsule.

- Digestion is both extra and intracellular in coelenterates.
- Some exhibits metagenesis.
- Development includes a free-swimming ciliated larva the planula.
- Polypoid forms are sessile and medusa form are free swimming.

239. Select the incorrectly matched pair from following :

(a) Osteocytes – Bone cells
(b) Chondrocytes – Smooth muscle cells
(c) Neurons – Nerve cells
(d) Fibroblast – Areolar tissue

NEET-2020 Phase-II

Ans. (b) : Chondrocytes are cartilage cells. The intercellular material is solid, pliable and resists compression. They produce to maintain the cartilaginous matrix, which consists of collagen and proteoglycan.

- Neurons (or) nerve cells are the structural and functional unit of nervous system.
- Fibroblasts are resident cell in the adipose tissues. They synthesize the extracellular matrix and collagen, produces the structural framework (stroma) for animal tissues, and plays a critical role in wound healing.
- Osteocytes derive from osteoblasts or bone-forming cells, and are essentially osteoblasts. Surrounded by the products they secreted.

@apna_pdf

240. Find out the correct option about Coelenterata:
(a) Cnidoblast and bilateral symmetry
(b) Cnidoblast and radial symmetry
(c) Choanocytes and water canal system
(d) All marine and only sexual reproduction

AIIMS-26.05.2018 Shift-I

Ans. (b) : Cnidobasts are unique stinging cell found in Coelenterata. These are used for anchorage, defense and for the capture of prey. Coelenterata shows radial symmetry.
- Choanocytes are specialised cells of sponges. Coelenterates are mostly marine but also have some fresh water forms. Reproduction may be either sexual or asexual.

241. What is the symmetry of medusa?
(a) Bilateral (b) Radial
(c) Asymmetrical (d) Biradial

JIPMER-2018

Ans. (b) : Most coelenterates shows radial symmetry. They shows two life forms (diamorphism), tubular polyp and circular medusa.
Medusa is shaped like an umbrella shows radial symmetry. The outer convex surface is known as exumbrella, while the inner concave surface is called subumbrella.
The subumbrellar surface shows four radial canals and circular canal of the gastrovascular system.

242. 'Comb-plate' is the characteristic feature of
(a) Ctenophora (b) Echinodermata
(c) Mollusca (d) Annelida

Tripura JEE-2017

Ans. (a) : Comb-plate is the characteristic features of Ctenophora. Ctenophora are commonly known as sea whales or comb Jellies, radially symmetry, diploblastic organisms with tissue level of organization. Ctenophores lack nematocyst, they possess colloblasts cells that produce a sticky secretion which captures prey.

243. In which animal nerve cell is present but brain is absent : -
(a) Sponge (b) Earthworm
(c) Cockroach (d) Hydra

Rajasthan PMT-2007
AIPMT-2002
BVP-2002

Ans. (d) : In Hydra nerve cells are present but brain is absent. It is a member of the phylum coelenterata. Its nervous system is made up of nerve cells and their process.
- Sponges do not have the nervous system. They are the only multicellular animals without a nervous system.
- Both earthworm and cockroaches have a brain.

244. Which of these is not a cnidarian?
(a) Jellyfish (b) Silverfish
(c) Sea anemone (d) Physalia

Uttarakhand PMT-2011

Ans. (b) : Silverfish is not a cnidarian. The scientific name of the silver fish is *Lepisma saccharina*. They belong to the phylum Arthropoda and class insecta.
- Scyphozoa are commonly called true Jellyfish.
- Sea anemone is that the scientific name of the creature is also Actiniaria.
- Physalia is commonly called Portuguese man of war.

245. The true statement regarding corals is:
(a) form branch colonies
(b) solitary or colonial
(c) grow as massive bodies
(d) all of the above

AIIMS-1999

Ans. (d) : Corals are marine invertebrates within the class anthozoa of the phylum coelenterata.
Coral are polypoid coelenterates. They may be solitary e.g.- Fungi or colonial e.g.- Madrepora.
- The colonial corals grow continuosly into massive bodies and form coral reefs.
- Corals are found mainly in the tropical oceans and seas.
- Corals form branch colonies of individual polyps.

246. Penetrant, valvent and glutinant are type of
(a) nematocyst of Hydra
(b) tentacles of Hydra
(c) zooids of Obelia
(d) tentacles of Obelia

CMC Vellore-2013

Ans. (a) : Penetrant, valent and glutinant are the types of nematocysts of Hydra and not the types of tentacles of Hydra. Tentacles of Hydra are the extension of the body layer that encircles the opening of the mouth.
Penetrant is also known as stenotele. It paralyzes the prey by releasing poisonous fluid. Glutinant is a sticky surface used to stick to prey. Valvent is also known as desmosome. It is smallest nematocyst.

247. The type of asexual reproduction found in Hydra is
(a) Multiple fission (b) Budding
(c) Sporulation (d) Binary fission
(e) Gemmule formation

Kerala PMT-2009

Ans. (b) : Budding, a type of asexual reproduction is found in hydra. A bud develops from an outgrowth. These buds develop externally and when fully mature, detach from the parent body as a new individuals.
- Binary fission is a type of asexual reproduction in which a cell divide to form two daughter cells.
- Gemmules are internal buds in sponges and help in asexual reproduction.
- Sporulation is an asexual reproduction in which spores are formed from the vegetative cells during unfavourable conditions.

248. Choose the correct pair
(a) Radial symmetry – Coelenterates
(b) Coelomates – Aschelminthes
(c) Metamerism – Molluscs
(d) Triploblastic – Sponges
(e) Metagenesis – Echinoderms

Kerala PMT-2012

Ans. (a) :
(A) Radial symmetry – Coelenterates
(B) Coelomates – Annelida to chordata
(C) Metamerism – Annelids
(D)Triploblastic–Platyhelminthes, molluscs, Anthropods, chordates
(E) Metagenesis – Obelia

@apna_pdf

249. Coral reef formation is mainly related to
(a) sponges (b) anthozoans
(c) molluscs (d) hydrozoans.
AMU-1995

Ans. (b) : Coral reef formation is mainly related to Anthozoans. Coral refers to a particular class of animal belonging to phylum coelenterata. It is a soft-bodied radially symmetrical marine invertebrate which secretes a calcareous skeleton. Coral reefs form as live polyps build not only on each other, but also on the skeleton remains of previous coral. As a result they are able to create massive structure like the Great Barrier Reef.

250. The poisonous fluid present in nematocysts of Hydra is:
(a) toxin (b) venom
(c) hematin (d) hypnotoxin
AMU-2006
AIIMS-2000

Ans. (d) : Nematocysts are venom-containing stinging organelles located in cnidocytes in cnidarians. The poisonous fluid present in nematocysts of Hydra is hypnotoxin.
Hypnotoxin is a mixture of protein and phenol. This fluid is injected in the body of prey with the help of pointed needle shaped structure called barb & spicules. Hypnotoxin can't kill the prey, it only paralyzes.
The nematocyst is used for defence response of Hydra.
Any poisonous substance is called toxin. Venom is a toxin which is present in some animals such as snakes, bees, scorpion, etc.

251. Metagenesis refers to :
(a) Presence of a segmented body and parthenogenetic mode of reproduction
(b) Presence of different morphic forms
(c) Alternation of generation between asexual and sexual phases of an organism
(d) Occurrence of a drastic change in form during post-embryonic development
AIPMT (Re-Exam)-2015

Ans. (c) : Metagenesis refers to the alternation of generation between sexual and asexual phases of an organism during its life cycle.
- In coelenterates, metagenesis is alternation of generation between polyp and medusa phase. Polyp reproduces asexually by budding to form medusa and medusa reproduces sexually to form polyp.
- Metagenesis and metamorphosis both term are different in mutagenesis. Metagenesis is alternation of generation but in metamorphosis organism produce distinct stages during its life cycle like egg, larva, pupa and adult.

252. Select the Taxon mentioned that represents both marine and fresh water species.
(a) Echinoderms (b) Ctenophora
(c) Cephalochordata (d) Cnidaria
AIPMT-2014

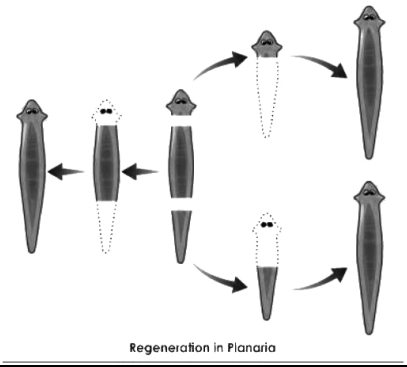
Ans. (d) : Cnidaria phylum is notable in the animal kingdom for exhibiting polymorphism. Most of them are marine and other are fresh water. Example- fresh water cnidarian Hydra and marine cnidarians - Jellyfish, sea anemones, sea fans etc. While members of ctenophora, cephalochordata, echinodermata are found exclusively in the marine environment.

253. Which one of the following living organisms completely lacks a cell wall?
(a) Cyanobacteria (b) Sea- fan (Gorgonia)
(c) Saccharmyces (d) Blue-green algae
AIPMT-2014
MGIMS Wardha-2003

Ans. (b) : Sea - fan (Gorgonia) belongs to cnidaria class-Anthozoa. They are also known as sea whips or sea fans and are similar to the sea pen, a soft coral. These marine invertebrates are multi-cellular, have no cell walls.
- BGA belong to monera & their cell wall is made up of peptidoglycan.
- Saccharomyces fungi cell wall is made up of chitin.

254. Planaria posses high capacity of.
(a) Metamorphosis
(b) Regeneration
(c) Alternation of generation
(d) Bioluminescence
AIPMT-2014

Ans. (b) : Planaria, belongs to the phylum platyhelminthes and class turbellaria. The body is dorsoventrally flattened.
Planaria possesses a high capacity of regeneration. It can be cut into pieces and each piece can regenerate into a complete organism. Cells at the location of wound site proliferate to form a blastema that will differentiate into new tissues and regenerate the missing parts of the piece of the cut Planaria.
• Bioluminescence is the property of living organism to emit light is well-marked in ctenophores.



Regeneration in Planaria

255. Absence of circulatory system in Hydra is compensated by
(a) pseudocoelomic fluid
(b) gastrovascular cavity
(c) presence of tentacles
(d) none of the above
UP CPMT-2007

Ans. (b) : Absence of circulatory system in Hydra is compensated by gastrovascular cavity, it is the primary digestive organ in mojar animal phyla.
Hydra have a fluid filled cavity called gastrovascular cavity that absorbed nutrients. The Hydra gets oxygen from the water that entered the cavity and gets rid of carbon dioxide through this cavity. They do not have a complete circulatory system i.e. contain only one opening.

@apna_pdf

256. Regeneration in Hydra will be faster if it is cut off from
(a) tentacles (b) hypostome
(c) base (d) all of these
UP CPMT-2007

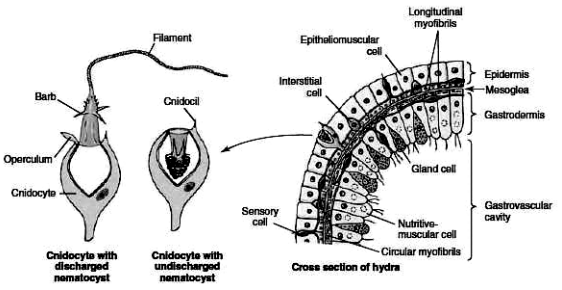
Ans. (a) : Regeneration in Hydra will be faster if it is cut off from tentacles compared with other organs like hypostome, base polyp etc. Regeneration is the ability of an organism to replace its lost or damaged body parts. Hydra has great power of regeneration.

257. Which of the following is not applicable to coelenterate?
(a) choanocytes (b) coelenteron
(c) radial symmetry (d) nematoblasts.
AIIMS-1996

Ans. (a) : Choanocytes is not applicable to coelenterates. Coelenterates have the following characteristic-
The presence of choanocytes is a characteristic feature of the phylum porifera. They contain a flagellum surrounded at its base by a thin cytoplasmic collar cell that maintain the flow of food bearing water.

258. Hydra receives impulses and stimuli through
(a) Nerve net (b) Nematocytes
(c) Sensory cells (d) Neuron cells.
AIIMS-2002

Ans. (c) : In hydra, sensory cells are found in the gastrodermis. They are supposed to be stimulated by the entry of the prey into the gastrovascular cavity.



259. Which of the following is correct about nematocyst in Hydra?
(a) It can be re-used
(b) Its ejection is conditioned reflex
(c) It is ejected on contact and pierce the prey
(d) Due to which other Hydra doesn't come in contact with it.
AIIMS-2001

Ans. (c) : Nematocysts are the stinging cells and are the organs of offence and defense of coelenterates.
- Nematocysts contains a poisonous proteinaceous fluid, called hypnotoxin along tube which injects the fluid into the victim. Hypnotoxin can't kill the prey only paralyzes.
- Nematocysts are activated in response to chemicals secreted by prey. They explode after coming in contact with the prey.

260. Jelly fish belongs to Class
(a) Hydrozoa (b) scyphozoa
(c) Anthozoa (d) none of these
AIPMT-1989

Ans. (b) : Jellyfish or Aurelia belongs to any planktonic marine member of the class scyphozoa (phylum Cnidaria). Jellyfish are not real fish.
Their stings may cause skin rashes, muscles cramps, or even death.

261. Which one of the following animals possesses nerve cells but no nerves?
(a) Hydra (b) Tapeworm
(c) Earthworm (d) Frog's tadpole
AIPMT-1993

Ans. (a) : Hydra possesses nerve cells but no nerve because it lacks a brain. It is a member of the phylum coelenterata.

262. One of the special characters of coelenterata only is the occurrence of
(a) polymorphism (b) flame cells
(c) hermaphroditism (d) nematocysts
AIPMT-1994

Ans. (d) : Special type of cells called nematocytes are present in only coelenterata, these cells are used for anchorage, defence and for the capture of pray.

263. Symmetry in Cnidaria is
(a) radial (b) bilateral
(c) pentamerous (d) spherical
Punjab MET-2008
JCECE-2012

Ans. (a) : Symmetry in Cnidaria is radial. Coelenterata (cnidaria) are aquatic, sessile or free swimming radial symmetrical animal.
They are diploblastic and acoelomate organism that do not have a true body cavity and mesoglea is present instead of mesoderm.

264. Portuguese man of war is:
(a) Portuguese soldier
(b) A sponge
(c) A coelenterate
(d) Soldiers of first world war
JIPMER-1996

Ans. (c) : Portuguese man of war is a coelenterate commonly called physalia.
It is also known as a blue bottle or floating terror this is a hydrozoan with many tentacles that have venomous stinging cells and cause harm to other organism.

265. It employs both intracellular and extracellular digestion:
(a) Hydra (b) Aurelia
(c) Amoeba (d) Planaria
BCECE-2015

Ans. (a) : Hydra is a member of phylum coelenterata (cnidaria). Cnidarian exhibit tissu level of organisation and are diploblastic. They have a central gastro-vasicular cavity with a single opening, mouth on hypostome. It employs both extracellular and intracellular digestion.

266. This is not a Cnidarian:
(a) Obelia (b) Jelly fish
(c) Sea anemone (d) Beroe
BCECE-2015

Ans. (d) : Obelia, Jellyfish and sea anemone belong to phylum Cnidarian.
Beroe belong to phylum Ctenophora also known as comb Jellies or sea walnuts, order Beroida.

@apna_pdf

267. The typhlosole in earthworm is related with
(a) excretion (b) absorption
(c) respiration (d) reproduction
WB JEE-2007

Ans. (b) : Earthworm belong to phylum annelida. Typhlosole is an internal fold of the dorsal wall in earthworm. In earthwarm, Typhlosole is present between the 26th to last segment except the 23rd - 25th segments from the last folded portion increases the surface area for the absorption of food in the intestine of earthworm. It has a tubular digestive system which includes the pharynx, oesophagus, crop intestine and gizzard that is used for crushing the food.

268. Blind sac body plan is shown by
(a) roundworms (b) annelids
(c) coelenterates (d) arthropods
WB JEE-2007

Ans. (c) : Blind sac body plan is shown by coelenterates and flatworms. In this type of body plan animals have single opening that acts as both mouth and anus eg-Hydra.

269. One of the characteristic of Hydra is :
(a) predation (b) metamerism
(c) hibernation (d) mimicry
Punjab MET-2006
Rajasthan PMT-2002
JCECE-2003

Ans. (a) : One of the characteristic of Hydra is predation because, it is exclusively carnivorous.
- Hydra obtained food as a predator.
- Prey are mostly aquatic animal like insects and egg of small fish etc.

270. Female reproductive organ of Ascaris are :
(a) protandrous (b) polydelphic
(c) didelphic (d) monodelphic
Rajasthan PMT-1999

Ans. (c) : Female reproductive organ in Ascaris is didelphic because it has two ovaries. It is tube-like structure long, thin and coiled.
Oogonia is produced by budding from a single large germinal cell that forms each ovarys' proximal germinal zone.

271. Hydra is :
(a) triploblastic, radial symmetrical and acoelomate
(b) triploblastic, radial symmetrical and coelomate
(c) diplobalstic, radial symmetrical and acoelomate
(d) diploblastic, radial symmetrical and coelomate
Rajasthan PMT-1999, 1995

Ans. (c) : Hydra belong to class Hydrozoa of Cnidarians. Cnidarians have radial symmetry and diploblastic body plan. They are acoelomate and have a central digestive cavity (gastrovasclar cavity). In Hydra, tubular body shows polyp stage, 1/3 part of body wall is made by ectodermal cells and 2/3 part by endodermal cells. In between endoplasm and ectoplasm non cellular jelly like mesoglea is present for attachment of two layers.
It has a single opening to serve as both mouth and anus.

272. How many ovum are developed in ovary of Hydra ?
(a) Two (b) Many
(c) One (d) Three
MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (c) : Hydra can reproduce both asexually and sexually. It produces asexually by budding and sexually by the formation of gametes. A bud from the tubular body of an adult develops a mouth and tentacles. The male reproductive organ produces sperms and the females reproductive organ produces a single egg, a fusion of which result in the formation of zygote, no larval stage found, development is direct.

273. Hydra does not perform locomotion by :
(a) looping (b) somer saulting
(c) jet propulsion (d) walking
Haryana PMT-2001

Ans. (c) : Hydra is generally sessile or sedentary, but they move for hunting. Hydra perform locomotion by looping, walking and somer saulting but does not perform jet propulsion.
Jet propulsion is that they contract their hollow saucer shaped bodies to force water out which propels them forward.

274. Hydra can paralyse prey-toy:
(a) nematocysts (b) tentacles
(c) mouth (d) none of these
J&K CET-2001

Ans. (a) : Nematocyst is the specialized cell in the tentacles of Hydra, called as Cnidocyte which carries neurotoxin and projects in self-defence to catch preys.
When neurotoxin comes in contact with prey it paralyzes them by suppressing the activity of the nervous system.
Hydra capture their food by paralyzing and killing the food organism by means of nematocysts, which are discharged into the prey. The prey is brought to the mouth (proctostome) by the tentacles, a response that in induced glutathione.

275. Sperms of Hydra formed from:
(a) Interstitial cells
(b) Epithelial muscular layer
(c) Nerve cells
(d) All of the above
Rajasthan PMT-1995

Ans. (a) : In Hydra testis releases sperm cells that swim in the water with the help of tail. Interstitial cells of Hydra form a multipotent stem cell system, producing terminally differentiated nerve cells and nematocytes during asexual growth under well-feed condition the interstitial cell population double in size every 4 days.

276. Polyp stage is not present in:
(a) Hydrozoa (b) Scyphozoa
(c) Anthozoa (d) Calcarea
Rajasthan PMT-1995

Ans. (d) : Hydrozoa, Scyphozoa and Anthozoa are classes of the Cnidarians or coelenterate that all have similar body morphology with a polyp and medusa.
The class calcarea consists of sponges from the phylum porifera whose body is covered with a calcareous shell and spicules but no polyp.
Calcareous sponge, any of a class (calcarea) of sponges characterised by skeletons composed entirely of calcium carbonate spicules (needle like structures).

@apna_pdf

277. You are examining a water sample from a pond which is full of water plants. You find an animal which is cylindrical and shows a long filamentous structure at one end. It is not stationary and shows variety of movements. It could :

(a) Paramecium (b) Tadpole
(c) Hydra (d) Amoeba

Rajasthan PMT-2001

Ans. (c) : Hydra is a fresh water animal its body is hollow and cylindrical.
To its one end (Hypastome) are attached 4, 6, or 8 contractile projection (Filamentous) known as tentacles. Hydra shows a variety of movement.

- **Paramecium -** Paramecium genus of microscopic single - called and free-living protozoans.
- **Tadpole -** A Tadpole is the larval stage in the biological life cycle of an amphibian.
- **Amoeba -** Amoeba is unicellular organism that has the ability to change its shape.

278. Which of the following is a Coelenterate ?

(a) Sea urchin (b) Sea horse
(c) Sea pen (d) Sea cucumber

Rajasthan PMT-2001

Ans. (c) : Sea pen (Pennatula) are soft corals that are under the class Anthozoa and under the phylum-coeleneterata or Cnidaria. Sea urchin, Brittle star and Sea cucumber are echinoderms.
Characteristics of coelenterate -
These are sac-like animals having a radially symmetrical body, A gastrovascular cavity is present having the same inlet and outlet in these organism reproduction mode is asexual e.g. Hydra and sea anemone, corals, Jellyfish.

279. Ctenophora shows affinities with:

(a) Cnidaria (b) Aschelminthes
(c) Cephalopoda (d) Turbelaria

JCECE-2003

Ans. (a) : Ctenophora shows several affinities with Cnidaria, some of them are :-

- The radial and tetramerous symmetry of the body like the medusa of the Hydrozoans.
- Arrangement of parts along oral-aboral axis.
- Presence of branching gastrovascular canal and absence of coelom.
- Presence of tentacles and statocyst.
- Endodermal nature of gonads etc.
- Cnidarians live in both fresh water and marine habitates while cterophores only live in the sea.
- Both cnidarians and ctenophores are diploblastic animals.

280. Coral reefs are formed by

(a) molluscs (b) coelenterates
(c) protozoans (d) echinoderms

BVP-2011

Ans. (b) : Corals are marine invertebrates belongs to the class anthozoa and the phylum coelenterate. They live in compact colonies of many identical individual polyps form they possess a hard calcium carbonate exoskeleton

281. Which shows polymorphism?

(a) Physalia (b) Trypanosoma
(c) Termite (d) All of these

BVP-2009

Ans. (d) : Polymorphism is a condition in which one animal in its life cycle may have more than one morphology or appearance coelenterate members like obelia, physalia show polymorphism. There are two morphological forms one sessile and other free-swimming many insects like termites have polymorphism as the larvae look different. Some protozoa member also show polymorphism like Trypanosoma.

282. What is the diameter of stenotypes ?

(a) 16 microns (b) 25 microns
(c) 10 microns (d) 5 microns

Rajasthan PMT-2000

Ans. (a) : The diameter of stenotypes is 16 microns.

283. Which one of the followig scientist coined the name Hydra ?

(a) Rudulphi (b) Hyman
(c) Linnaeus (d) Grobben

Rajasthan PMT-2000

Ans. (c) : Hydra name coined by Linnaeus.
Biologists are especially interested in hydra due to their regenerative ability.

284. Which of the following possess a hard exoskeleton formed by calcium carbonate?

(a) Physalia (b) Aurelia
(c) Corallium (d) Halistemma

AP EAMCET-2007

Ans. (c) : Corallium is a scientific name for precious coral or red coral that belongs to a genus of marine corals. They are found on rocky sea bottoms with low sedimentation and dark environment due to their skeletons made up of calcium carbonate.
Thus, coralium possess a hard exoskeleton formed by calcium carbonate.

285. Which of the following is not found in Hydra?

(a) Epithelio-muscular cells
(b) Cnidocyte
(c) Choanocyte
(d) Nerve cells

MGIMS Wardha-2004
UP CPMT-2004

Ans. (c) : Cnidocytes (cnidoblasts), nerve cells and epithelio – muscular cells are the characterstics feature of Hydra.
Cnidocytes, which are the stinging cells are used for anchorage, defense and for capture of prey.
Choanocytes is the main feature of phylum Porifera (sponges).

286. 'Ephyra' is the stage in the life cycle of :

(a) Physalia (b) Obelia
(c) Aurelia (d) Sea anemone

AFMC-2000

Ans. (c) : Ephyra is a free swimming larval stage in the life cycle of Aurelia or jelly fish.
In Aurelia the fertilized egg develops in to a Planula larva. The ephyra stage is a transient stage in the life cycle of Aurelia.

@apna_pdf

287. Sea anemone belong to phylum :
(a) Protozoa (b) Porifera
(c) Coelenterata (d) Echinodermata
BCECE-2005

Ans. (c) : Corals, anemones and jellies are related and all belong to the phylum Cnidaria (Coelenterata). The animals in this group are aquatic, possess stinging cells within their tissue and have a body plan characterized by radial symmetry.

288. The relation between Zoochlorella and Hydra is known as:
(a) Endozoic (b) Parasitism
(c) Heterotroph (d) None of these
Rajasthan PMT-1996

Ans. (a) : Mutualism is a type of symbiotic relationship between a coloured hydra an zoochlorellae.
- Endozoic is a type of symbiosis is which one organism lives inside the body of another organism.
- Parasitism a type of symbiosis in which one organism benefits at the expense of the other organism.

289. Mesoglea of Hydra is chemically:
(a) Mucoprotein (b) Lipid
(c) Protein (d) Mucopolysaccharide
Rajasthan PMT-1996

Ans. (d) : Mesoglea lies between the Epidermis and gastrodermis and is a jelly-like substance that are composed of small dense granules of glycogen which is a polysaccharide and mucoprotein.
- Mesoglea serves as a skeleton to support the organisms and substratum for the cell attachment.

290. Main characteristics of Cnidaria is:
(a) Diploblastic,radial symmetry and cnidoblast cells
(b) Triploblastic, radial symmetry and cnidoblast cells
(c) Diploblastic, bilateral symmetry and cnidoblast cells
(d) Triploblastic, bilaterally symmetrical and cnidoblast cells
Rajasthan PMT-1996

Ans. (a) : Cnidarians appear to have diverse morphologies, but all members of this phylum universally possess stinging cells called Cnidoblasts.
- These are multicellular, diploblastic animals with tissue level of organization.
- There body is radially symmetrical.

291. Bud develops in an adult Hydra in
(a) 1-2 hrs (b) 3-4 hrs
(c) 12days (d) 2-4 days
Rajasthan PMT-1996

Ans. (d) : The bud enlarges, develops a mouth and circlet of tentacles at its free end. Once the bud is fully developed, it constricts as the base and finally separates the parent body to become individual organism. This process takes about 3 days to start and end.

292. Study the following cells of Hydra?
(1) nerve cells
(2) sensory cells
(3) nematocyst
(4) gastro dermal cells
(a) Only 2 (b) Only 1
(c) 1 and 2 (d) 3 and 4
Rajasthan PMT-1996

Ans. (d) : Hydra nematocysts are unique in storing energy for discharge in the capsule wall, which is elastically stretched by an extreme osmotic pressure.
- The gastrodermins lines the gastrovascular cavity in Hydra and is associated with the digestion.

293. Which of the following is known for its regeneration power?
(a) Hydra (b) Obelia
(c) Physalia (d) Aurelia
UP CPMT-2010

Ans. (a) : Regeneration can be referred to as the natural potential of some organisms to repair and regrow damaged or lost body parts. Some organisms may have the ability to grow into a complete organism even from a small fragment of the body, e.g. - Hydra and planaria.

294. Highest degree of polymorphism is found in
(a) Protozoa (b) Cnidaria
(c) Platyhelminthes (d) Arthropoda
Uttarakhand PMT-2009
J&K CET-2008

Ans. (b) : Polymorphism is a discontinuous genetic variation resulting in the occurrence of several different forms or types of individual among the members of a single species. It is the characteristic feature of cnidarians, particularly the polyp and medusa forms, or of zooids within colonial organisms. For ex- physalia.

295. Characteristic cells of Hydra are
(a) archaeocytes (b) thesocytes
(c) cnidoblasts (d) trophocytes
DUMET-2008

Ans. (c) : In Cnidaria, marine animals mainly contains cnidoblasts cells.
Example- Hydra, Jelly fish etc.
Cnidarians have cnidoblast cells on their tentacles and bodies. It is used for anchorage, defense, offense and capture of the prey.

296. Which of the following are totipotent cells in Hydra?
(a) Gi and cells (b) Nutrit epithelial
(c) Interstitial cells (d) Musculo epithelial
AFMC-2002

Ans. (c) : In hydra, the totipotent cells responsible for asexual reproduction (Budding) and tissue regeneration are known as interstitial cells. These cells have the remarkable ability to differentiate into any type of cells required for these process.

297. Siphonophora is the order in
(a) Protozoa (b) Cnidaria
(c) Porifera (d) Annelida
J&K CET-2009

Ans. (b) : Siphonophora is an order of cephalopods within class Hydrozoa, which is a class of marine organisms within the phylum Cnidaria.
- Siphonophores are highly polymorphic and complex organisms.
- Like other hydrozoans, some siphonophores emit light to attract and attack prey.

@apna_pdf

298. In Hydra, waste material of food digestion and nitrogenous waste material are removed from
(a) mouth
(b) body wall
(c) mouth and body wall
(d) mouth and tentacles

BHU PMT (Screening)-2010

Ans. (c) : Hydra does not have any special excretory organ, they excrete via the general body surface by the process of diffusion. In hydra, undigested residues are effected from coelenteron through the mouth while nitrogenous excretory product (ammonia) is removed from the general body surface.
• Some nitrogenous waste products are also expelled out along with indigestible matter through the mouth.

299. Which of the following animals has a tetramorphic colony?
(a) Velella (b) Physalia
(c) Obelia (d) Porpita

MGIMS Wardha-2013

Ans. (b) : Physalia is tetramorphic in nature. A tetramorphic colony is a coloniat organism that consists of four types of zooids.
Physalia is a type of jellyfish. The four types of zooids in a physalia colony are–
• Gastrozooid – This is the feeding zooid.
• Dactylozooid – This is the defensive zooid.
• Gonozooid – This is the reproductive zooid.
• Gonopalpon – This is a non-reproductive zooid .

300. Gonads of Obelia occur in
(a) on blastocyst
(b) hydrula stage
(c) radial canals of medusa
(d) bases of tentacles of medusa

CMC Ludhiana-2008
AMU-2007

Ans. (c) : Gonads of Obelia occurs in radial canals of medusa which is type sexual reproduction of responsible for dispersion of sperm and ova in water.
• These gonads are responsible for dispersion of sperms and ova in water.

301. Which of the following belongs to Anthozoa?
(a) Dugesia (b) ster culiaceae
(c) Fungia (d) Aurelia

JIPMER-2001

Ans. (c) : The organism fungia are belong to Anthozoa. It is a class of cnidarians that included corals, sea pens and anemones.
The seabead, while their larvae can disperse as part of the planktoon.

302. If Hydra is cut transversely in three equal parts then :
(a) all three parts will die
(b) regeneration will occur in all the three parts
(c) regeneration will occur only in anterior
(d) regeneration occurs only in middle part

J&K CET-2006

Ans. (b) : Hydra has a high potential of regeneration. This was first established by Abraham Trembloy in 1744. If a living hydra is cut into two or three or more very small pieces, every piece develops into a new individual.

303. Which of the following has no skeleton?
(a) Star fish (b) Sponge
(c) Butterfly (d) jelly fish

JIPMER-1995

Ans. (d) : Jellyfish are the free-swimming marine members of the phylum Cnidaria. They live in marine waters. They do not have eyes, brains or skeletons.
• They have no hard bony parts but they do have the mesogloea.

304. Number of tentacles in Hydra is:
(a) two to four (b) six to ten
(c) ten to fourty (d) fourty of fifty

Haryana PMT-1999

Ans. (b) : Hydra belongs to the group Cnidaria.
• The animals have a sac-like and translucent body with one open end acting as mouth. The mouth is surrounded by arm-like structures called tentacles.
• The number of tentacles in hydra varies from 3 to 9.

305. Mesogloea is found in:
(a) Amoeba (b) Sponges
(c) Hydra (d) Earthworm

Haryana PMT-1999

Ans. (c) : Hydras are some of the simplest multicellular animals to have muscle.
• The body wall consist of two layers of cells with a middle gelatinous layer called mesoglea.
• In hydras and other two layered animals, one kind of cell serves as both muscle and epithelial cells.

306. The cnidoblasts used during looping movement of Hydra are:
(a) stenoteles (b) volvents
(c) desmosomes (d) atrichous isorrhiza

AP EAMCET-2000

Ans. (d) : Atrichous isorrhiza is a type of nematocyst present on the tentacles and helps hydra to locomote also known as inchmovement or somersaulting.
• In this method of locomotion of hydra usually the body first extends and then bends over, so that the tentacles attach to the substratum with the help of adhesive atrichous isorhiza.

307. Nematoblast of hydra are:
(a) Sensory
(b) Complicated
(c) With nematocyst apparatus
(d) All of the above

Rajasthan PMT-2006

Ans. (a) : Nematoblasts of cnidoblasts are sensory in nature. Cnidarian Animals are characterized with Cnidoblasts or cnidocytes present on the tentacles and the body. Cnidoblasts are used for anchorage, defense and for the capture of prey.

@apna_pdf

• Cnidaria is classified in the kingdom animalia. They are mostly found in both marine and fresh water environment
Examle- Corals, sea anemones, Jellyfish, hydra etc.

308. Which type of reproduction is found in Hydra?
(a) Polyembryony (b) Sexual and asexual
(c) Parthenogenesis (d) Encystment
Rajasthan PMT-2000

Ans. (b) : Mainly Hydra reproduces asexually by the method of budding.
• During unfavorable conditions, hydra can also reproduce sexually.
A bud develops on hydra's body which further matures into a testicle or an ovary.

309. Hydra belongs to which of the following ?
(a) Bi radially symmetrical
(b) Radially symmetrical and coelomate
(c) Coelomate and bilaterally symmetrical
(d) Radially symmetrical and acoelomate
Rajasthan PMT-2000

Ans. (d) : Hydra is an aquatic animal belonging to phylum Cnidaria and class Hydrozoa. They are tubular, radially symmetrical with their mouth surrounded by tentacles present at the distal end. They are triploblastic and generally acoelomate.

310. Silver fish is a :
(a) fish (b) crustacean
(c) cnidarians (d) insect
BCECE-2002

Ans. (d) : Silverfish is an insect. It belongs to the hexapod invertebrates. They have a skeleton structure called "Chitinous Exoskeleton." It is a shiny silver insect.

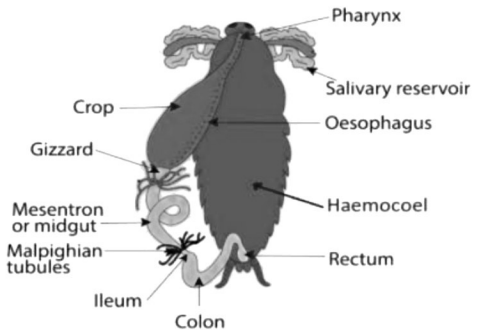
311. Corals are
(a) most rich fauna
(b) most poor fauna
(c) also found in fresh water
(d) free living ctenophorans
Haryana PMT-2011

Ans. (a) : Coral reefs are believed by many to have the highest biodiversity of any ecosystem on the planet- Even more than a tropical rainforest occupying less than one percent of ocean floor, coral reefs are home of more 25% of all marine life.

D. Ctenophora

312. Haemocoel is found in
(a) Hydra and Aurelia
(b) Taenia and Ascaris
(c) Cockroach and Pila
(d) Balanoglossus and Herdmania
BCECE-2014 / UP CPMT-2011
BVP-2007 / MGIMS Wardha-2006

Ans. (c): Haemocoel is the body cavity which is filled with blood or (haemolymph). It is generally found in arthropods and molluscs e.g. Periplaneta and Pila. These do not posses an arrangement of blood vesseles like those in mammals. Haemocoel develop from part of the blood system.



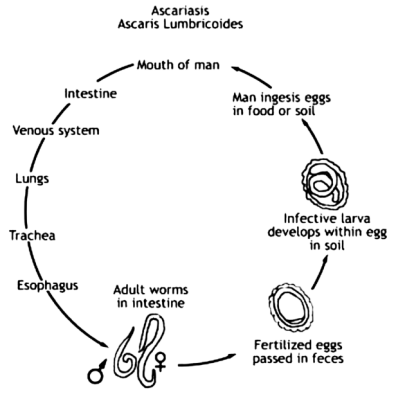
Structure of haemocoel in cockroach

313. Heart in fishes is described as
(a) Nurogenic and bronchial heart
(b) Myogenic, bronchial and venous heart
(c) Neurogenic and venous heart
(d) Neurogenic and alternate heart
AP EAPCET-12.07.2022 Shift-I

Ans. (b) : The fish heart, like other vertebrates, is myogenic, possessing a pacemaker tissue that triggers action potentials slowly and spontaneously.
The heart in fishes is described as bronchial heart because its main function is to pump venous blood to ventral aorta into gills and to somatic vasculature.
• Fish heart is two chambered, consisting of an auricle and a ventricle. Fishes have venous type of heart.

314. Larvae of Ascaris undergo second moulting in
(a) Inside the egg
(b) Alveoli of lungs of man
(c) Intestine of man
(d) Inside the uterus of parent
TS EAMCET-31.07.2022 Shift-I

Ans. (b) : The larvae of Ascaris undergo second and third moulting occurs in the lungs.



• The larvae undergo first moulting in the soil.
• The second stage larva goes from soil to lungs.
• Larvae hatch from the eggs in your small intestine which is the first moult.

315. Function of comb plates of Ctenophores is
(a) Excretion (b) Locomotion
(c) Food collection (d) Respiration
TS EAMCET-09.08.2021 Shift-II

@apna_pdf

Ans. (b) : Locomotion- In Ctenophore, there are special comb-like, eight ciliary plate which are found on their body, serve the purpose of locomotion.
In ctenophores- excretory and respiratory system are absent.
Food collection - A pair of long solid tentacles on which a special type of cell present called Lasso cells which helps in the catching of prey

316. Which of the following vertebrates are jawless
(a) Chondrichthyes (b) Osteichthyes
(c) Cyclostomata (d) Amphibia
TS EAMCET-12.05.2017

Ans. (c) : The jawless fish means the fish species which lack true jaw or defined jaw structure. These are lampreys and hagfish.
Cyclostomata which means round mouth fishes are a group of agnathans. They comprise jawless fishes that have tiorny epidermal structure resembling the function of teeth, unlike jawed fishes. These have bramenial gills positioned internally.
Chondrichthyes– Chondrichthyes are cartilaginous vertebrate fishes having defined jaw.
Osteienthyes– Osteienthyes is also known as bony fish
• Amphibia are also jawed.

317. Comb jelly is member of phylum
(a) Mollusca (b) Echinodermata
(c) Coelenterata (d) Ctenophora
MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (d) : The comb jelly, also known as ctenophore, is a member of the phylum Ctenophora. Ctenophores are marine invertebrates that are characterized by their comb-like rows of cilia, which they use for locomotion.

318. Which one of the following groups of animals reproduces only by sexual means?
(a) Ctenophora (b) Cnidaria
(c) Porifera (d) Protozoa
NEET (Karnataka)-2013

Ans. (a) : In Ctenophora asexual reproduction is absent. They are monoecious and fertilization is generally external.
• In Cnidaria asexual reproduction (budding) is found in the polyps and sexual reproduction is found in the medusa form.

319. 'Treponema pallidum' pathogen is a cause of
(a) leprosy (b) plague
(c) syphilis (d) pertussis
JIPMER-2016

Ans. (c) : Treponema pallidum, is the bacteria that cause syphilis.
leprosy- also caused by bacteria mycobacterium leprae
plague- also caused by bacteria yersinia pestis
pertussis- also caused by bacteria bordetella pertussis

320. Nematoblasts are formed by:
(a) interstitial cells
(b) gland cells
(c) myoepithelial cells
(d) nerve cells
Rajasthan PMT-2004

Ans. (a) : Nematoblasts are stinging cells found in cnidaria or coelenterata. The purpose is to ward off enemies or to capture prey.
Example– Hydra. The cells that produce nematocysts are called nematoblasts.

321. Comb plates are found in
(a) Adamsia (b) Aurelia
(c) Nereis (d) pleurobrachia
J&K CET-2008

Ans. (d) : Pleurobranchia belongs to sub phylum Ctenophora, in which comb plate are found. Ctenophora is exclusively marine group of animals, solitary free swimming.
Body is circular similar to medusa of coelentrates showing modified radial symmetry called biradial symmetry.

322. Which one shows bio-luminescence?
(a) Noctiluca (b) Polystomella
(c) Entamoeba (d) Suctoria
Haryana PMT-2005

Ans. (a) : Noctiluca shows bio– luminescence. These bioluminescent marine species include fish, bacteria, and jellies.
Noctiluca scintillans is a bioluminescent, dinoflagellate, which means it is a type of plankton that produces light.

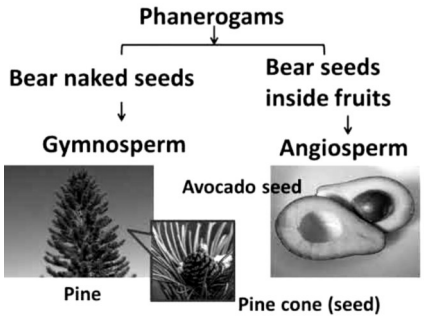
323. In which type of egg, total cleavage is possible?
(a) Telolecithal
(b) Oligolecithal
(c) Centrolecithal
(d) Macrolecithal
BCECE-2011

Ans. (b) : Very little yolk in oligolecithal egg facilitates total holobastic cleavage.
• Complete furrowing (blastomeres completely separate from each other)- holoblastic eggs.
• Example - eggs of mammals, except for birds and lancetfish eggs.

324. Which of the following is/are grouped under phanerogams?
(a) Angiosperms
(b) Gymnosperms
(c) Pteridophytes
(d) Both (a) and (b)
UP CPMT-2008

Ans. (d) : Phanerogams are plant that bear seeds as well as flower compared to other plants. Spermatophytes are another term for these individuals. The plants body is divided into three parts - The root, the stem and leaves.

@apna_pdf



- Gymnosperms and angiosperms are categorized under phanerogams.
- They have well developed vascular system.
- The seeds are present without a seed coat in the gymnosperms (cycas, pinus) while the fully developed seed is present in angiosperm (Mango, pear etc).

325. The group of Anamniota includes
(a) reptiles and birds
(b) birds and mammals
(c) fishes and amphibians
(d) reptiles and mammals

UP CPMT-2008
Uttarakhand PMT-2008

Ans. (c) : Fishes and amphibians is known as anamniota because its lacks amnion which is the innermost layer of extraembryonic membrane that forms fluid filled sac around the foetus.

326. Animals having a built in thermostate to maintain constant body temperature are known as
(a) biothermic (b) poikilothermic
(c) oligothermic (d) homeothermic

UP CPMT-2008

Ans. (d) : Animals that have properties to maintain a constant environment inside the body is called homeothermic animals .
- Poikilothermic animals cannot maintain internal environment inside the body and changes according to its surrounding.
- Oligothermic - The ability to tolerate relatively low temperature.

327. When an animal has both sexes (male and female), it is called
(a) Intersex (b) Super male
(c) Gynandromorph (d) Super female

BCECE-2007

Ans. (c) : If an organism is half male and half female it is called gynandromorph.
Gynandromorphs are individuals that have both male and female characteristics. This phenomenon occurs in mitosis during early development. While the organism contains only a few cells, one of the dividing cells does not split its sex chromosome typically.
Gynandromorphs occurs in many organisms i.e. insects, spiders crustaceans, arthropods and also in birds.

328. Coelom in cockroach is:
(a) a spacious cavity
(b) absent
(c) enterocoelic
(d) restricted to gonads

AP EAMCET-2001

Ans. (d) : Coelom in cockroach is restricted to gonads. In Cockroach, the viscera and alimentary canal are present in haemocoel - a cavity filled with blood. The true coelom in Cockroaches is found in a much reduced state. It is formed by the splitting of mesodermal layer. It is exclusively present in the cavities of the gonad.
An cockroach, schizocoel coelom is presented which helps in the food digestion.

329. Eusthenopteron connects
(a) reptiles and birds
(b) birds and mammals
(c) fishes and amphibians
(d) amphibians and reptiles

CMC Vellore-2013

Ans. (c) : Eusthenopteron is connecting link between fishes and Amphibians.
Eusthenopteron was first discovered in miguasha, Quebec and was described by 'J.F. Whiteaves'.
- Eusthenopteron was a 'Devonian fossil' fish on the direct line towards the early amphibian
- It was an elongated, carnivorous fish characterized by advanced nature of vertebrate and strong notochord.

330. Body cavity of Hydra is called:
(a) haemocoel (b) coelenterons
(c) enterocoel (d) pseudocoel

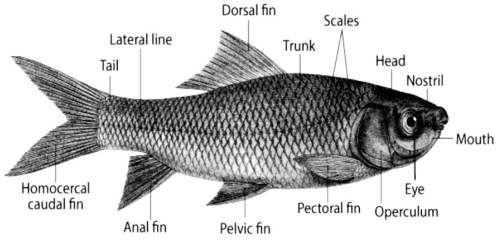
J&K CET-2003

Ans. (b) : Body cavity of hydra is called coelenterons, it is also known as gastrovascular cavity which takes the food and excretes the waste from the same opening.

331. The body of Rohu fish is covered by
(a) Cycloid scale, but the tail of homocercal
(b) Placoid scale, but the tail of heterocercal
(c) Cycloid scale, but the tail of heterocercal
(d) Ptecoid scale, but the tail is homocercal

WB JEE-2014

Ans. (a) : Rohu is a teleost fish and has a body covered with cycloid scale but the tail of homocercal. These scales have smooth outer margin and are uniform with the smooth texture. Grooves appear in the tail which are called homocercal.



Scales provide protection to the fish from predators and also helps in locomotion.

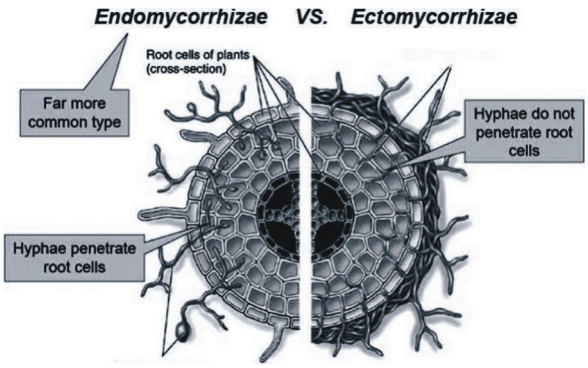
@apna_pdf

332. An example of endomycorrhiza is

(a) Rhizobium
(b) Nostoc
(c) Glomus
(d) Agaricus

AIPMT (Mains)-2010

Ans. (c) : The genus glomus form endomycorrhiza, a symbiotic associations with plants. The fungal symbiont in these associations absorbs phosphorus from soil and passes it to the plant. Plants having such associations show other benefits also, such as resistance to root-borne pathogens, tolerance to salinity and drought, and an overall increase in plant growth and development.



333. Choose the cat fish from the following:

(a) Labeo rohita
(b) Catla catla
(c) Cirrhina mrigala
(d) Wallago attu

Karnataka CET-2004

Ans. (d) : Wallago attu is a species of catfish that belongs to the family Siluridae. It is native to south and Southeast Asia. It is commonly known as helicopter catfish. It is found in Chilika Lake, Tonle Sap and also in large rivers.

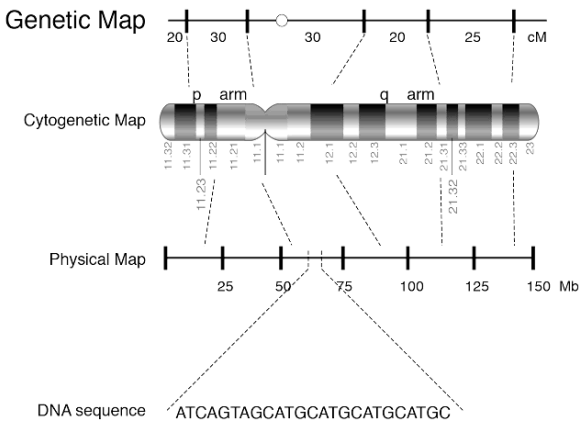
334. Genetic map is one that

(a) Shows the stages during the cell division
(b) Shows the distribution of various species in a region
(c) Establishes sites of the genes on a chromosome
(d) Establishes the various stages in gene evolution

MGIMS Wardha-2010

Ans. (c) : A genetic map (linkage map)shows the relative location of genetic markers (reflecting sites of genomic variants) on a chromosome.

- A genetic map is based on the concept of genetic linkage



- The closer two markers are to each other on a chromosome, the higher the probability that they will be inherited together.
- By studying inherited patterns, the relative order and location of genetic markers along a chromosome can be established.

Concluded, genetic map is one that stablishes sites of the genes on a chromosome.

335. Sea horse belongs to

(a) Mammals (b) Amphibia
(c) Aves (d) Pisces

UP CPMT-2003

Ans. (d) : Sea horse belongs to Division Gnathostomata and super class Pisces and class osteichthyes. Sea horse is also known as Hippocampus. Sea horse also possess a segmented bone shield, an erect stance, and a curly prehensile tail.

336. Which fish has an electric organ?

(a) Torpedo (b) Rhinoceros
(c) Scoliodon (d) Cat fish

Uttarakhand PMT-2007

Ans. (a) : Electric cell (genus Electrophorus), any of 3 species of elongated south American knife fishes that produce powerful electric shocks to stun prey, usually other fish.

- Torpedo is a marine cartilaginous fish which produces 8-220 volt electric charge (current) depending on species.
- Their electric organs are modified lateral muscle plate innervated by cranial nerves.

337. Isinglass is prepared from :

(a) lchthyophis (b) lungs
(c) fishes (d) lizards

AFMC -2011

Ans. (c) : Isinglass is a gelatinous substance produced from the high-grade collagen. This collagen protein is obtained from the air-bladder or swim bladder of certain fishes.

Example- perch, Indian salmon, catfishes, and carps etc. Isinglass is used in the preparation of special cement, in the clarification of wine and beer etc.

@apna_pdf

E. Platyhelminthes

338. In which triploblastic animal, coelom is absent?
(a) Platyhelminthes (b) Aschelminthes
(c) Annelids (d) Arthropoda
APEAMCET-2021 / VMMC-2011
WB JEE-2011, 2008 / Uttarakhand-2005

Ans. (a) : The members of phylum Platyhelminthes are acoelomate and triploblastic i.e. lacking a body cavity. The special mesodermal tissue called mesenchyma fills the gaps between the organs.

339. Flame cells are present in:
(a) Aschelminthes (b) Platyhelminthes
(c) Annelida (d) Cephalochordata
JIPMER-2019/ AIIMS-2019
AMU-2008 /AIPMT-1991

Ans. (b) : The phylum Platyhelminthes contains flame cells. It is a specialized excretory cells that assist Playtehelminthes in excretion. Flame cells are also known as **solenocytes.**

340. Secondary host of Schistosoma is :
(a) Hydra (b) Euglena
(c) Snail (d) Pheretima
UP- CPMT -2012, 2008, 2003 / VMMC-2012
Punjab MET-2011 / BCECE-2010
DUMET-2005

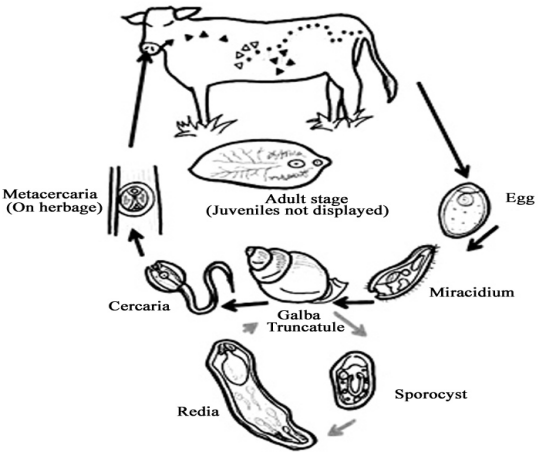
Ans. (c) : *Schistosoma* are parasitic flatworms. It is commonly as blood flukes. It is a digenetic parasite, and the life cycle of *Schistosoma* includes two hosts: the definitive host, which is human, and the secondary host, a snail.

341. Turbellarians are free living:
(a) Nematodes (b) Cestodes
(c) Planarians (d) Trematodes
UP CPMT-2012 / VMMC-2012
JIPMER-2009 / UP CPMT-2012, 2008
Rajasthan PMT-2008

Ans. (c) : One of the several flatworms in the Turbellaria traditional class is called **Planarias**. It mainly refers to free-living flatworms of the genus Tricladida (triclads), though a large variety of free-living Platyhelminthes are also known by this widely used name.

342. During the life-cycle, *Fasciola hepatica* (liver fluke) infects its intermediate host and primary host at the following larval stages respectively:
(a) redia and miracidium
(b) cercaria and redia
(c) metacercaria and cercaria
(d) miracidium and metacercaria
CMC Vellore-2014 / MGIMS Wardha-2010
AIIMS-2008 / AI PMT-2003

Ans. (d) : *Fasciola hepatica* is a digenetic endoparasite. It completes its life cycle with sheep and fresh water snail. Sheep serves as a primary host, and snails serve as an intermediate host. The shell of the snail is invaded by sporocyst formed when the egg capsule of the non-feeding larval miracidium comes into touch with water. As the sporocyst matures, redia emerges from the snail in the form of cercaria. They encyst and produce metacercaria.



343. What is true about Taenia saginata?
(a) Life history has pig as intermediate host
(b) There are two large suckers on scolex
(c) Rostellar hooks are absent
(d) Rostellum has double circle of hooks
AMU-2005 / UKPMT-2004
Manipal-2004 / AIPMT-1993

Ans. (c): *Taenia saginata* is a flatworm that is a member of the phylum Platyhelminthes. It is a parasite that lives in the human intestine and causes taeniasis and cysticercosis in cattle. The body consist of scolex, neck, and strobilia, while the scolex has four suckers, there are no hooks. An identifying feature of *Taenia saginata* is the absence of these rostellar hooks.

344. The alternate host of Taenia saginata is:
(a) cow (b) pig
(c) dog (d) none of these
BVP-2005 / AMU-2005
Haryana PMT-2004 / Manipal-2003

Ans. (a) : The alternate host of *Taenia saginata* is cow. *Taenia saginata,* also known as the beef tapeworm, is transmitted to humans in the form of infectious larva cysts found in the meat of cattle, which serve as the parasite's usual intermediate host. The other secondary host of *T. Saginata* are buffaloes, sheep and goats.

345. Flame cells present in the members of platyhelminthes are specialized to perform,
(a) Respiration and Osmoregulation
(b) Osmoregulation and Circulation
(c) Osmoregulation and Excretion
(d) Respiration and Excretion
Karnataka CET-20.05.2023

Ans. (c) : In platyhelminthes the main unit of excretion is flame cells. Which is scattered parenchymatous tissue if has numerous pseudopodial process. Its cytoplasm has a nucleus and other cytoplasmic organelles. The function of these cells is to regulate the osmotic pressure of the worm and maintain its ionic balance.

346. Identify the larval stages in the development of liver fluke
(a) Veliger, Trochophore, Sporocyst, Planula
(b) Sporocyst, Planula, Trochophore, Redia
(c) Miracidium, Sporocyst, Redia, Cercaria
(d) Planula, Sporocyst, Muller, Trochophore
AP EAPCET-23.05.2023, Shift-II

@apna_pdf

Ans. (c) : Larval stages in the development of liver fluke–

Miracidium Larva– Its outer surface has 21 chitinous plate arranged in 5 rows. Outer surface is ciliated excluding anterior most apical end.

- A large number of germ cells are present which develops next larval form-sporocyst larva.
- Miracidium larva is more advanced than its adults due to the presence of locomotary cilia and sensory brain and eye.

Sprocyst Larva– It is inside the snail body. It is simplest larval form of fasciola. First larva in snail alimentary canal which comes out by breaking of outer wall of miracidium larva.

Redia Larva– Redia larva develop next larval stage. Cercarial form germ balls present inside their body.

Cercaria Larva– About 10-42 carcavia larva develops from single redia larva. Alimentary canal or gut becomes inverted U-shaped with mouth opening and muscular pharynx.

347. The larval stages of the parasite that causes gigantism in snail is

(a) Ascaris (b) Taenia solium
(c) Monocystis (d) Fasciola hepatica

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : Sporocyst larva of fasiciola cause gigantism in snails.

It is digenetic parasite, primary host is sheep and secondary host is snails. It is simplest larval form of fasciola.

348. Select the correct statements :

(A)Platyhelminthes are triploblastic pseudocoelomate and bilaterally symmetrical organisms

(B) Ctenophores reproduce only sexually and fertilization is external

(C) In tapeworm, fertilization is internal but sexes are not separate.

(D) Ctenophores are exclusively marine, diploblastic and bioluminescent organisms.

(E) In sponges, fertilization is external and development is direct.

Choose the correct answer from the options given below :

(a) (A) and (E) only
(b) (B) and (D) only
(c) (A), (C) and (D) only
(d) (B), (C) and (D) only

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) :

- Ctenophores are free living marine organisms, and reproduce only sexually and fertilization is external.
- The tapeworms are flatworms that can live in a person's digestive tract. In tapeworm, fertilization is internal but sexes are not separate.
- Ctenophores are exclusively marine, diploblastic and bioluminescent organisms.

349. Which of the following are found in Platyhelminthes?

(a) Colloblasts and comb plates
(b) Pseudocoelom and Renette cell
(c) Green glands and statocysts
(d) Ladder-like nervous system and flame cells

AP EAPCET-11.07.2022 Shift-I

Ans. (d) : The nervous system of Platyhelminthes is a complex even scattered system. It is longitudinal, meaning that there are two main nerve cords that run the length of the body. These nerve cords are interconnected by transverse nerves, which form a ladder-like pattern. The nerve cords are concentrated at the head region, they form a brain like structure called the **cerebral ganglia** that controls the sensory organ and motor responses. The flame cells are excretory organs that are found in all flatworms.

350. Assertion (A): Protonephridia are found in lancelet.

Reason (R): Protonephridia are primarily concerned with excretion.

The correct option among the following is:

(a) (A) is true. (R) is true and (R) is the correct explanation for (A)
(b) (A) is true. (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-31.07.2022 Shift-II

Ans. (c) : Protonephridia are found in the phylum Platyhelminthes.

Bundle of flame cells are called protonephridia.

It is a network of dead-end tubules connected to an external opening. These tubules excrete dilute fluids and function in osmoregulation.

351. Match the following

	List-I		List-II
(i)	Larvae of Fasciola	(a)	Filariasis
(ii)	*Sacculina*	(b)	Female Anopheles Mosquito
(iii)	Plasmodium	(c)	Snail
(iv)	Wuchereria	(d)	Carcinus maenas

(a) (i – b), (ii – c), (iii – a), (iv – d)
(b) (i – a), (ii – c), (iii – d), (iv – b)
(c) (i – c), (ii – d), (iii – b), (iv – a)
(d) (i – d), (ii – c), (iii – a), (iv – b)

AP EAMCET-11.07.2022 Shift-II

Ans. (c) :

	List-I	List-II
(i)	Larvae of Fasciola	Snail
(ii)	Sacculina	Carcinus maenas
(iii)	Plasmodium	Female anopheles Mosquito
(iv)	Wuchereria	Filariasis

352. Alimentary canal is absent in _____

(a) Planaria (b) Liver fluke
(c) Blood fluke (d) Tapeworm

AP EAMCET-25.09.2020 Shift-I
Rajasthan PMT-1998

@apna_pdf

Ans. (d) : Tapeworms belongs to the phylum Platyhelimthes. They can be either ectoparasites or endoparasites and very few of them are free living. Tapeworms have an incomplete alimentary canal and only one opening for ingestion and egestion as they absorb the host's digested food material.

353. Ascaris belongs to nematode and Taenia belongs to Platyhelminthis, but they exhibit which of the following as a common character?

(a) Sexes are separate (dioecious), i.e., males and females are distinct.
(b) Fertilization is internal and development is direct
(c) Bilaterally symmetrical and triploblastic
(d) Hooks and suckers are present

AP EAMCET-25.09.2020 Shift-I

Ans. (c) : Ascaris belongs to Aschelminthes, and Taenia belongs to Platyhelmenthes, but they exhibit bilaterally symmetrical and triplobalstic common characters.

354. Which of the following animal group are triploblastic, bilaterally symmetrical acoelomates?

(a) Arthropods, Molluscs and Poriferans
(b) Ctenophore, Nematodes and Echinodermats
(c) Chordata, Annelids and Platyhelminthes
(d) Only Platyhelminthes

AP EAMCET-24.09.2020 Shift-II

Ans. (d) : Flatworms (Platyhelminthes) are triploblastic, acoelomate, bilaterally symmetrical creatures with organ-level body organization. They may reproduce sexually and asexually, have a dorso-ventrally flattened body, and display a variety of parasitic morphologies.

355. Match the type of ring worm with the organ affected :

Column-I		Column -II	
A.	**Tinea corporis**	**p.**	**The groin**
B.	**Tinea capitis**	**q.**	**The scalp**
C.	**Tinea pedis**	**r.**	**The feet**
D.	**Tinea cruris**	**s.**	**Skin on the body**

(a) (A – s), (B – r), (C – q), (D – p)
(b) (A – p), (B – q), (C – r), (D – s)
(c) (A – s), (B – q), (C – r), (D – p)
(d) (A – q), (B – s), (C – r), (D – p)

AP EAMCET-25.09.2020 Shift-II

Ans. (c) :

Tinea corporis	–	Skin on the body
Tinea capitis	–	The scalp
Tinea pedis	–	The feet
Tinea cruris	–	The groin

356. Identify the correct statement with reference to platyhelminthes:

A. These are the first bilaterally symmetrical triploblastic animals.
B. They have pseudocoelom which acts like a hydrostatic skeleton
C. Hooks and suckers are present for attachment in parasitic forms
D. Fertilisation is internal, development is indirect with many larval stages

(a) A, B & C (b) A, B & D
(c) A, C & D (d) B, C & D

TS EAMCET-09.05.2019 Shift-I

Ans. (c) : Animals are divided into two categories based on their body plans' symmetry and the number of germ layers they include, named triploblastic and diploblastic, respectively.

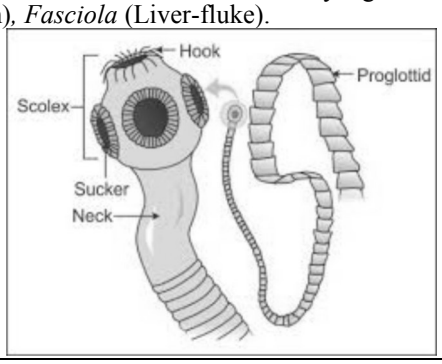
- The parasitic types of hooks and suckers include ones that take nutrients directly from the host via the surface of their bodies.
- The organization of the larva, also known as the nymph, is similar to that of the adult or imago.

357. Animal of which phylum have hooks and suckers and are endoparasite on other animals

(a) Platyhelminthes (b) Annelida
(c) Aschleminthes (d) Arthropoda

AIIMS-25.05.2019 Shift-I

Ans. (a) : Platyhelminthes or flatworm are mostly endoparasites found in animals. They contain hooks and sucker that allow them to directly receive nutrients from the host via the surface of their body. eg:- *Taenia* (Tape worm), *Fasciola* (Liver-fluke).



358. The following are found in Taenia solium, which one is the correct sequence?

(a) Oncosphere, hexacanth, cysticercus, matured proglottid, gravid.
(b) Matured proglottid, cysticercus, gravid, oncosphere, hexacanth.
(c) Hexacanth, cysticercus, gravid, oncosphere, mature proglottid.
(d) Gravid, oncosphere, cysticercus, hexacanth, mature proglottid.

AIIMS-2017

Ans. (a) : *Taenia solium* is a tapeworm. The life cycle of tapeworm having many larval stages are oncosphere, hexacanth, cysticercus, matured proglottid, and gravid. The infection of *Taenia* causes cysticercosis which is a disease of the intestine. It is caused by eating undercooked pork.

359. Which parasite shows alternation of generation and alternations of hosts in its life cycle?

(a) Fasciola (b) Ascaris
(c) Taenia (d) Wuchereria

AMU -2006 / BVP-2001

Ans. (a) : In *Fasciola* germ cells reproduce asexulally before the adult stage transitions to sexual reproduction. *Fasciola* completes its life cycle in two alternate hosts in a process known as "alternation of generation". The primary definitive host is sheep, and a freshwater snail serves as the secondary host.

@apna_pdf

360. Bladder worm/cysticercus is the larval stage of
(a) tapeworm (b) roundworm
(c) pinworm (d) liver fluke
AIPMT-1991

Ans. (a) : The tapeworm larvae of the genus *Taenia* are scientifically known as Cysticercus. It is a tiny, sac-like vesicle with a bladder-like appearance. The consumption of food or water that has been contaminated with tapeworm larvae or eggs results in tapeworm infection.

361. The scientific name of lung fluke of man is
(a) Hymenolepis nana
(b) Schistosoma haematobium
(c) Paragonimus westermani
(d) Echinococcus granulosus
Uttarakhand PMT-2010
APEAMCET-2002

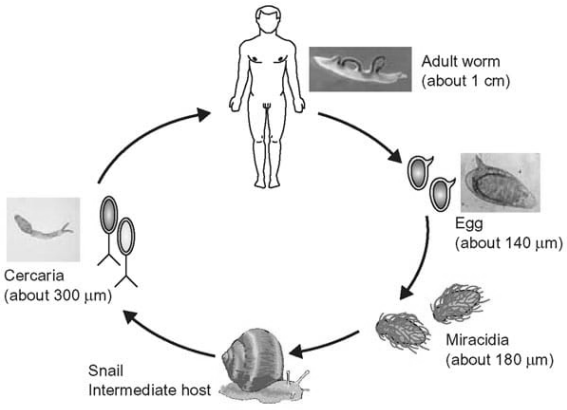
Ans. (c) : *Paragonimus westermani* which is the major species of lung flukes, infect the lungs of humans and causes **paragonimiasis**.
This infection comes from eating raw or lightly cooked crab, which carries immature flukes larvae.

362. Solenocytes are associated with:
(a) nutrition (b) respiration
(c) reproduction (d) excretion
MP PMT-2013

Ans. (d) : Solenocytes, commonly referred to as *flame cells*, are excretory organs found in Platyhelminthes. They are responsible for osmoregulation and excretion. Platyhelminthes are parasitic, commensal, or free-living organisms. They are a triploblastic worm that is bilaterally symmetrical and dorsoventrally flattened.

363. The larval from of Schistosoma that enters the snail:
(a) redia (b) cercaira
(c) miracidium (d) sporocyst
AP EAMCET-1998

Ans. (c) : The miracidium is the second stage in the life cycle of *Schistosoma*. When the eggs are laid and come into contact with fresh water, they hatch and release miracidiun. In this phase, miracidia are ciliated and free swimming.



364. Vitelline glands are found in :
(a) Fasciola (b) Taenia
(c) Pheretima (d) Ascaris
Manipal-2001

Ans. (a) : Vitelline glands are found in the fasciola. These cells are the major contributors to the formation of the eggshell. The vitelline cells are developed in the vitelline follicles which is located in the posterior third of an adult parasite body in the areas lateral to the uterus and testis.

365. Which one is not the larval stage of Fasciola ?
(a) Cercaria (b) Miracidium
(c) Cysticercus (d) Redia
Haryana PMT-2001

Ans. (c) : Cysticercus is not the larval stage of Fasciola. Cysticercosis is an infection caused by the larvae of the Parasite *Taenia solium*.
This infection occurs after a person swallows tapeworm eggs.
The larvae get into tissue such as muscle and the brain and form cysts (these are called cysticerci). Larval cysts in the brain cause a form of cysticercosis called neurocysticercosis, which can lead to seizures.

366. Tapeworm occurs as a parasite in:
(a) liver (b) stomach
(c) intestine (d) all of these
J&K CET-2001

Ans. (c) : *Taenia solium* (Tapeworm) is a digenetic parasite. The man is the primary host, and the pigs are secondary. The species of *Taenia* inhabit the gut (intestine) of man and domestic animals. It commonly infects many different animals, including humans, livestock, and domestic cats and dogs (usually meat-eating mammals).

367. What is common amongst Tapeworm, Liver fluke, and Planaria ?
(a) They are all segmented
(b) They are all found in gut
(c) They all have a coelom
(d) They are all have flattened bodies
Rajasthan PMT-2001

Ans. (d) : Tapeworm, liver fluke, and planaria belong to the phylum Platyheliminthes.
Dorso-ventrally flattened bodies are the most significant and common feature of all animals in this phylum Platyheliminthes. These organisms are acoelomates because their bodies are flat and lack a body cavity and their bodies are also not segmented.

368. The excretory cells, that are found in platy helminthes are:
(a) Protonephridia (b) Flame cells
(c) Solenocytes (d) All of the above
BCECE-2012
J&K CET-2007

Ans. (d) : The excretory cells, that are found in platy helminthes are Protonephridia, flame cells and Solenocytes. They are elongated, flagellated cells that aid in the removal of nitrogenous wastes in most lower invertebrates.
- They are responsible for excretion and osmoregulation in Platyhelminthes.
- Protonephridia is an excretory tube that lacks an internal opening. It is found in Platyhelminthes, Rotifers, and some Chordates.

@apna_pdf

369. Find the wrongly matched pair

(a) Cnidoblast – Anchorage
(b) Flame cells – Defense
(c) Parapodia – Swimming
(d) Radula – Rasping organ
(e) Air bladder – Buoyancy

Kerala PMT-2013

Ans. (b) : Flame cells is a specialized excretory cells that assist Platyhelminthes in excretion and are not involved in defense.

370. Anus is absent in

(a) Unio (b) Pheretima
(c) Periplaneta (d) Fasciola

HP CET-2012

Ans. (d) : Anus is absent in *Fasciola.* The loose mesoderm known as parenchyma, which makes up the main tissue layer of flatworms, never separates into a cavity (coelom) in which internal organs are suspended.

371. Which one of the following animal has rhabdites ?

(a) Syllis (b) May fly
(c) tse-tse fly (d) Dugesia

Rajasthan PMT-2000

Ans. (d) : Many flukes, including *Dugesia*, have extracellular structures and specialized epidermal cells called rhabdites that help in locomotion.

• Rhabdites is a characteristic of turbellaria but also found in nemertea, gastrotricha and annelids.

372. Choose the correct combinations

	List-I	List-I	List-I
	Class	**Character**	**Example**
(I)	**Turbellaria**	**Mostly free living flat worms with mucus forming rhabdites in body wall**	**Convoluta**
(II)	**Trematoda**	**Commonly called flukes which bear two suckers**	**Bilharzia**
(III)	**Cestoda**	**Ecto and endoparasites body unsegmented**	**Echinococcus**
(IV)	**Phasmidia**	**Amphids performing chemo receptor function**	**Trichuris**

(a) (II) and (III) (b) (I) and (II)
(c) (I), (III) and (IV) (d) (I), (II) and (IV)

TS EAMCET-2015

Ans. (b) : Cestoda : They are long, flat, ribbon-like organism commonly known as **tapeworms**. The head, or scolex, has one or more hooked sucker, for attachment to the host.

• The body consists of segments called proglottids e.g. *Taenia*.

Phasmidia : They are one of two subgroups of nematodes used in some classification systems.
They are unicellular sensilla in the lateral tail region of certain species of nematodes.

373. The pair that exhibits hyperplasia and hypertrophy is:

(a) Fasciola hepatica — Plasmodium vivax
(b) Sacculina — Carcinus maenas
(c) Leishmania tropica — Wuchereria bancrofti
(d) Nosema notabilis—Sphaerospora polymorpha

TS EAMCET-15.05.2016

Ans. (a) :

- A parasitic trematode called ***Fasciola hepatica*** is sometimes referred to as the common **liver fluke or the sheep liver fluke**. The livers of many mammals, including humans, are affected by it. The epithelium of adult flukes in the bile ducts becomes inflamed and undergoes hyperplasia (an increase in cell number).
- A protozoan parasite called ***Plasmodium vivax*** is a human pathogen that causes malaria. Infections with ***P. vivax*** malaria can cause severe illness and mortality, frequently as a result of splenomegaly (hypertrophy) i.e. a increase in the spleen's size.

374. Which one of the following kinds of animals are triploblastic?

(a) Flatworms (b) Sponges
(c) Ctenophores (d) Corals

AIPMT (Screening)-2010

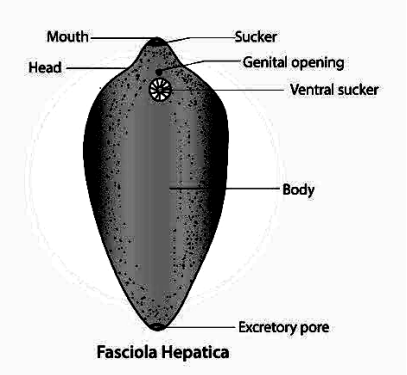
Ans. (a) : Flatworms belongs to phylum Platyhelminthes. It is an acoelomate animal.
Mesoderm, ectoderm, and endoderm are the three primary germinal cell layers that make up the whole body of the flatworms, they are referred to as triploblastic.

375. One example of animals having a single opening to the outside that serves both as mouth as well as anus is:

(a) Octopus (b) Asterias
(c) Ascidia (d) Fasciola

AIPMT (Screening)-2010

Ans. (d) :*Fasciola* belongs to phylum Platyhelminthes and have an incomplete alimentary canal, there is a single opening for ingestion and egestion both, as they absorb the host's digested food material.
This is also called as **blind sac body plan.**



Fasciola Hepatica

@apna_pdf

376. In which of the following organisms, self fertilization is seen?
(a) Earth worm (b) Liver fluke
(c) Fish (d) Round worm

Karnataka CET-2007

Ans. (b) : In liver fluke, self fertilization is occur in which male and female gametes are produced in the same individuals.

377. In contrast to annelids the platyhelminthes show
(a) radial symmetry
(b) presence of pseudocoel
(c) bilateral symmetry
(d) absence of body cavity

JIPMER-2007

Ans. (d) : Platyhelminthes does not have a coelomic or pseudocoelomic cavity for digestion of food as found in higher organisms. These groups of organisms are known to obtain their digested food directly.

378. The animal in which the space between the gut and the body wall is filled with mesenchyme is:
(a) Echinodiscus (b) Enterobius
(c) Eunice (d) Echinococcus

AP EAMCET-2008

Ans. (d) : *Echinococcus granulosus* parasitizes the intestines of dogs, wolves, foxes, cats, etc. The body wall consists of the tegument base membrane, integumentary muscle, and mesenchymal cells. Hence, mesenchymal tissue is present between the gut and body wall.

379. Which of the following requires an invertebrate intermediate host?
1. Dugesia
2. Schistosoma
3. Echinococcus
4. Ancylostoma
5. Wuchereria
(a) 3 and 4 (b) 2 and 5
(c) 3 and 5 (d) 1 and 4

AP EAMCET-2005

Ans. (b) : Schistosoma is a blood fluke of the class Trematoda of the phylum Platyhelminthes. It has a single intermediate host, a snail. It causes the disease schistosomiasis in humans. *Wuchereria bancrofti* is a nematode. It has mosquitoes like Ades, Culex, Anopheles, as the intermediate host, causes the disease, filariasis, or wucherireasis, in humans.

380. Match the following with reference to Taenia solium.

List I	List II
(A) Mehlis glands	(I) Tegument formation
(B) Vitelline gland	(II) Osmoregulation and excretion
(C) Mesenchyma cells	(III) Lubricate passage of capsules into uterus
(D) Flame cells	(IV) Secretion of embryophore
	(V) Capsule formation around zygote

The correct match

	(A)	(B)	(C)	(D)
(a)	(III)	(V)	(I)	(II)
(b)	(III)	(V)	(II)	(IV)
(c)	(V)	(I)	(II)	(IV)
(d)	(IV)	(III)	(I)	(II)

AP EAMCET-2013

Ans. (a) :

List I	List II
(A) Mehlis glands	(III) Lubricate passage of capsules into uterus
(B) Vitelline gland	(V) Capsule formation around zygote
(C) Mesenchyma cells	(I) Tegument formation
(D) Flame cells	(II) Osmoregulation and excretion

381. Mehlis gland in tapeworm is associated with
(a) respiration (b) reproduction
(c) excretion (d) circulation

VMMC-2014 / MGIMS Wardha-2013
APEAMCET-1999

Ans. (b) : The Mehlis gland is a part of the female reproductive organ and has an important role in guiding the ova out towards the passage ending in the uterus of flatworms. Thus, its secretion lubricates the passage of the uterus, through which the ova move. It may play a part in eggshell formation. Excretion in Platyhelminthes occurs through flame cells.

382. Cysticercus stage is formed in
(a) Taenia (b) Plasmodium
(c) Leishmania (d) Wuchereria

WB JEE-2010

Ans. (a) : A parasitic tissue illness known as cysticercosis is carried on by the larval cysts of the tapeworm *Taenia solium.* In most low-income nations, these larval cysts are a major contributor to adult-onset seizures by infecting the brain, muscles, or other tissues by ingesting eggs found in the feces of a person who has an intestinal tapeworm, one develops cysticercosis.

383. Which one of the following is an avtively swimming free-living and non – feeding stage of the liver – fluke?
(a) Sporocyst (b) Redia
(c) Cercaria (d) Metacercaria

AMU-2015

Ans. (c) : Cercaria larvae are present in the life cycle of liver fluke, which is a member of the Platyhelminthes. Cercaria is a free-swimming larva and has a long tail. It then leaves the snail and moves on to aquatic vegetation, where it forms a cyst called metacercariae.

384. Taenia solium derives its energy from the breakdown of
(a) nucleic acids (b) amino acids
(c) glycogen (d) glycerol

BVP-2008 / Uttarakhand PMT-2007
AP EAMCET-1998

@apna_pdf

Ans. (c) : The body of *Taenia solium* is divided into three parts: head (scolex), neck, and body. The anterior part of the scolex has 4 suckers and 28–32 hooks. The suckers are lateral in position, which helps in attachment to the intestinal wall. *Taenia solium* store energy mainly in the form of glycogen.

385. Flatworms excrete through:
(a) kidney (b) nephridia
(c) protonephridia (d) Malpighian tubules

Manipal-2012
AFMC-2002

Ans. (c) : Flatworms have a specialized excretory system called **protonephridia**, which helps them eliminate waste products from their bodies. Unlike more complex organisms with kidneys, flatworms use protonephridia to regulate their internal environment. These structures consists of tubules and flame cells that filter excess water and waste materials from the body fluids.

386. Taenia solium is associated with :
(a) Apolysis (b) strobilisation
(c) Premonition (d) All of these

Uttarakhand PMT-2004

Ans. (d) : *Taenia solium*, commonly called **pork tapeworm**, belongs to the family Taeniidae. It is transmitted to pigs through human feces, which have parasite eggs and contaminate their fodder. Apolysis in *Taenia solium* occurs at the posterior end of the strobila (proglottids). *Taenia solium* shows strobilation, which means adults in *Taenia solium* have a longer number of hermaphroditic sexual organs. Premonition means the host gets either complete or partial immunity when infected by *Taenia solium.*

387. Taenia solium belongs to class:
(a) Nematoda (b) Trematoda
(c) Cestoda (d) Turbellaria

VMMC-2010
JIPMER-1997

Ans. (c) : ***Taenia solium*** belongs to phylum Platyhelminthes and class Cestoda, order Cyclophyllidea and family Taeniidae.

388. Flame cells of flatworms help in
(i) Osmoregulation (ii) Digestion
(iii) Reproduction (iv) Excretion
(v) Bioluminescence
(a) ii only is correct (b) i and iv are correct
(c) iii only is correct (d) i and v are correct
(e) iv and v are correct

Kerala PMT-2015

Ans. (b) : The flame cell is a specialized excretory cell of the flatworm. The flame cell is structurally similar to the flame cells of the *Fasciola*. Bundles of flame cells are called *protonephridia*; these cells regulate osmotic pressure.

389. The trematode parasite infecting human lungs with two intermediate hosts in its life-cycle is:
(a) Schistosoma haematobium
(b) Paragonimus westermani
(c) Loa loa
(d) Mycobacterium tuberculosis

AP EAMCET-2003

Ans. (b) : The trematode parasite Paragonimas uses *Mycobacterium tuberculosis* as one of its intermediary hosts before infecting human lungs. The crab and snail serve as intermediate hosts. Trematodes are endoparasites and ectoparasites, and they are members of the phylum Platyhelminthes.

390. Infective stage to man of the parasite that causes haematuria is:
(a) miracidium (b) redia
(c) microfilaria (d) cercaria

AP EAMCET-2004

Ans. (d) : The parasite that causes hematuria in males, cercaria, is in its infectious stage. It is the parasitic trematode larva. From a single redia larva, cercaria larvae develop into the larval stage, with germ walls present inside their bodies in numbers between 10 and 12.

391. A statement of Assertion (A) is given followed by a corresponding statement of Reason (R) just below it. Of these statements, mark the correct answer as:
Assertion : Tapeworm, roundworm and pinworm are endoparasites of human intestine.
Reason : Improperly cooked food is the source in intestinal infections.
(a) If both Assertion and Reason are true and Reason is correct explanation of Assertion
(b) If both Assertion and Reason are true but Reason is not the correct explanation of Assertion
(c) If Assertion is true but Reason is false
(d) If both Assertion and Reason are false

Haryana PMT-2004

Ans. (b) : Roundworms and pinworms are members of the phylum Nematoda, class Cestoda, and tapeworm is a member of the phylum Plathyhelminthes. Endoparasites include roundworms, pinworms, and tapeworms. Inadequately prepared food is the primary cause of intestinal illness. However, eating incorrectly cooked food can cause tapeworm infection, contaminated food and water can spread roundworm, and insufficient sanitation can spread pinworm or ringworm.

392. Laurer's canal is characteristic feature of:
(a) Taenia (b) Fasciola
(c) Periplaneta (d) Ascaris

VMMC-2014

Ans. (b) : Laurer's canal is a characteristic feature of Fasciola. It is a part of the reproductive system of Trematodes, analogous to the vagina. These arise from the oviduct during the breeding season and act as fertilization tubes.

393. Which of the following does not have any alimentary canal ?
(a) Ascaris (b) Taenia
(c) Frog (d) Earthworm

JIPMER-2001

Ans. (b) : *Taenia solium* (Tapeworm) and *Echinococcus* (Dog Tapeworm) are endoparasites. They obtain their food from the host through the body's surface therefore, it lacks an alimentary canal. The alimentary canal is altogether absent in *Taenia solium.* Therefore, its mode of nutrition is saprozoic, i.e., it absorbs digested liquid food.

@apna_pdf

394. Hymenolepis nana is commonly known as:
(a) Pork tapeworm
(b) Dead man's finger
(c) Dog tapeworm
(d) Dwarf tapeworm

VMMC-2014 / AP EAMCET-2001

Ans. (d) : *Hymenolepis nana* is commonly called as **dwarf taperworm**. Its infection is most common in children, in persons living in institutional setting, and in people who live in areas where sanitation and personal hygiene is inadequate.

395. Schistosoma is a parasite found in:
(a) testes of frog (b) liver
(c) intestine (d) blood

BCECE-2006 / VMMC-2005 /AMU-2004

Ans. (d) : *Schistosoma* is a blood fluke that causes the parasitic disease Schistosomiasis in humans. It lives in the hepatic portal system and mesenteric blood vessels of human beings. The symptoms of Schistosomiasis are diarrhea, anemia, spleen, pain, and fever. *Taenia solium* is a parasite in the small intestine of humans that causes taeniasis.

396. Gynaecophoric canal is found in :
(a) Taenia saginata (male)
(b) Schistosoma haematobium (male)
(c) Wuchereria. bancrofti (male)
(d) E.granulosus (female)

DUMET-2001

Ans. (b) : A gynaecophoric canal is found in *Schistosoma haematobium*, which helps in lodging the female. The gynaecophore is a ventral groove or canal that fits the female worm and from where the latter resides. throughout adult life.

397. Respiratory, blood vascular and skeletal systems are absent in the members of phylum.
(a) Annelida (b) Porifera
(c) Platyhelminthes (d) Echinodermata

BVP-2015

Ans. (c) : Simple, bilaterally symmetrical flatworms make up the phylum Platyhelminthes. Unsegmented, triploblastic invertebrates. They lack specific circulatory and respiratory systems, they are forced to have flattened forms. They do have a digestive cavity, but it only has one aperture that can be used for ingestion and egestion.

398. Which one is not a larval stage of flatworm ?
(a) Redia (b) Cercaria
(c) Bipinnaria (d) Miracidium

VMMC-2008 / AMU-2008

Ans. (c) : The majority of starfish evolve into bipinnaria as their first stage of larval development. The bipinnaria is a free-living, aquatic zooplankton species. The bands of cilia are used for locomotion and eating.

399. An acoelomate with Protandrous condition is:
(a) Taenia (b) Schistosoma
(c) Megascolex (d) Ascaris

AP EAMCET-2000

Ans. (a) : Platyhelminthes, commonly known as flatworms, are invertebrate animals that are unsegmented and bilaterally symmetrical. Most flatworms are free-living and commonly found in freshwater. *Taenia* is a genus of tapeworms that belongs to the phylum Platyhelminthes. They are diagnosed with the protandrous condition. They are parasites.

400. In which of the following mosaic cleavage occurs ?
(a) Echinococcus granulosus (b) camel
(c) Whale (d) Dog fish

Rajasthan PMT-2000

Ans. (a) : *Echinococcus granulosus* is a protostome animals belonging to the phylum Platyhelminthes.
• Mosaic cleavage is also known as **determinate cleavage**. This is generally seen in the protostomes. The cells of blastocyst have a pre-decided fate, which means any cell of the blastocyst cannot develop into an individual animals.
• Each blastomere produced by early embryonic cleavage does not have the capacity to develop into a complete embryo.

401. Which of the following is not the character of Taenia solium?
(a) Apolysis (b) Proglottid
(c) Metamerism (d) Strobila

BCECE-2008

Ans. (c) : *Taenia solium* is a flatworm with proglottids, which are the several segments that make up its body. The scolex, the unsegmented neck, and the segmented posterior portion, often known as the *strobila*, are the three body regions.

F. Aschelminthes

402. Body cavity of adult ascaris is:
(a) haemocoel (b) amphicoel
(c) pseudocoelom (d) schizocoel

Rajasthan PMT-2009 / CMC Vellore-2009
Punjab MET-2009/ MGIMS Wardha-2004
UP CPMT-2004 / JIPMER-1995

Ans. (c) : A pseudocoelom is a fluid-filled body cavity that is not fully lined by mesoderm, unlike a true coelom. It is found in certain invertebrates like roundworms (nematodes) and rotifers. The pseudocoelom serves as a space for internal organ to provide nutrient, gases and waste products such as roundworm or nematodes.

403. Filariasis is caused by
(a) Wuchereria (b) Culex
(c) Trichinella (d) Schistosoma

MGIMS Wardha-2011 / BHU PMT Screening- 2011
AMU-2008 / Manipal-2005

Ans. (a) : Elephantiasis, also referred to as **lymphatic filariasis**, is a neglected tropical disease. When Culex mosquitoes transmit filarial parasites to people, infection results. Infection tends to come up in youth, where it does the lymphatic system covert harm. These thread-like filarial worms come in three different varieties. 90% of cases are caused by one *Wuchereria bancrofti*.

@apna_pdf

404. Read the following statements regarding Wuchereria bancrofti and find the correct ones

(A) Wuchereria exhibit sexual dimorphism
(B) It belongs to the class Phasmidia
(C) It is commonly called hook worm
(D) It is very common in tropical countries

(a) A & C (b) B & C
(c) A, B & D (d) B, C & D

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : Wuchereria bancrofti is commonly known as filarial worm. This worm causes filariasis in humans. It is pseudocoelomate, it shows sexual diamorphism, female is longer than male posterior end of the female is straight and bears anus. It is digenetic parasite requiring two host to complete its life cycle. The two host are man and female culex mosquito.

405. Assertion (A): - Female Wuchereria is ovoviviparous
Reason (R): - Larva of Wuchereria exhibits nocturnal periodicity

(a) A is correct but R is wrong
(b) A is wrong but R is correct
(c) Both A and R are correct and R is the correct explanation of A
(d) Both A and R are correct and R is not correct explanation of A

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : Female *Wuchereria* is ovoviviparous, and larvae exhibit nocturnal periodicity.
Nocturnal periodicity is circadian rhythm with an expression of periodicity, and at night parasite come to peripheral blood.
Wuchereria is a filarial nematode that is a major cause of lymphatic filariasis. It infect the lymphatic system and causes lymphatic filariasis.

406. Which of the following statements are correct in relation to Wuchereria?

(i) It is ovoviviparous
(ii) It completes its lifecycle in man and female Anopheles mosquito
(iii) Both male and female worms are found coiled together in the blood of man
(iv) Microfilaria larva is surrounded by a loose cuticular sheath
(v) Microfilaria larva moves to the peripheral blood circulation of man during the night time

(a) Only (i), (ii) and (iii) are correct
(b) Only (i), (iv) and (v) are correct
(c) Only (iii) and (v) are correct
(d) Except (i), all are correct

AP EAPCET-11.07.2022 Shift-I

Ans. (b) : Correct statement in relation to Wucheraria.
(i) It is ovoviviparous.
(iv) Microfilaria larva is surrounded by a loose cuticular sheath.
(v) Microfilaria larva moves to the peripheral blood circulation of man during the night time.

407. Which of the following is not correct related to Wuchereria?

(a) Its secondary host is female Anopheles mosquito
(b) It is commonly called filarial worm
(c) It is a digenetic parasite
(d) Pseudocoelmate

AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Humans serves as a definitive host (sexual reproduction occurs), and mosquitoes (female Culex not female Anopheles), which serves as intermediate host.
It is commonly known as filarial worm. It is pseudo coelomate animal. It is a digenetic parasite, they complete their life cycle with two organism. The primary host is human and the intermidiate host is Culex mosquito. So, option (a) is not correct related to *Wuchereria*.

408. Assertion (A): Sexual dimorphism is distinct in Ascaris.
Reason (R): The post anal tail in male Ascaris is curved.
The correct option among the following is:

(a) (A) is true. (R) is true and (R) is the correct explanation for (A)
(b) (A) is true. (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-31.07.2022 Shift-II

Ans. (a) : *Ascaris* belongs to the phylum Aschelminthes. It is also known as a **roundworm.** *Ascaris* is dioecious, i.e., male and female are distinct, and often female are longer than male.
It shows sexual dimorphism. The post anal tail in male *Ascaris* is curved.

409. Which one of the following is wrongly matched?

(a) Adamsia – Sea anemone
(b) Pennatula – Sea pen
(c) Gorgonia – Sea fan
(d) Ascaris – Hookworm

AP EAMCET-11.07.2022 Shift-II

Ans. (d) :
Adamsia – Sea anemone
Pennatula – Sea pen
Gorgonia – Sea fan
Ascaris – Roundworm
Ancylostoma – Hookworm

410. Larva of ascaris perform extra intestinal migration through the following organs in the body of man _____xc

1.	**Heart**	**6.**	**Pulmonary arteries**	**11.**	**Small intestine**
2.	**Liver**	**7.**	**Trachea**	**12.**	**Alveoli**
3.	**Lungs**	**8.**	**Larynx**	**13.**	**Bronchi**
4.	**Hepatic portal vein**	**9.**	**Oesophag-ous**	**14.**	**Glottis**
5.	**Post caval vein**	**10.**	**Stomach**	**15.**	**Pharynx**

@apna_pdf

Options:

(a) 2 → 4 → 1 → 5 → 3 → 6 → 12 → 13 → 14 → 15 → 7 → 8 → 9 → 10 → 11

(b) 4 → 2 → 5 → 1 → 6 → 3 → 12 → 13 → 14 → 15 → 7 → 8 → 9 → 10 → 11

(c) 4 → 2 → 5 → 1 → 6 → 3 → 13 → 7 → 12 → 8 → 14 → 15 → 9 → 10 → 11

(d) 4 → 1 → 5 → 2 → 3 → 6 → 12 → 13 → 7 → 8 → 14 → 15 → 9 → 10 → 11

AP EAMCET-05.10.2021 Shift-I

Ans. (b) :

4 → 2 → 5 → 1 → 6 → 3 → 12 → 13 → 7 → 8 → 14 → 15 → 9 → 10 → 11

(4) Hepatic portal vein → (2) Liver → (5) Post caval vein → (1) Heart → (6) Pulmonary arteries → (3) Lungs → (12) Alveoli

(1) Heart → (13) Bronchi → (7) Trachea → (8) Larynx → (14) Glottis → (15) Pharynx → (9) Oesophagous → (10) Stomach → (11) Small intestine

411. Which of the following statements are wrong related to Nematoda?

(i) Body is covered by tough and protective collagenous cuticle

(ii) Excretory system consists of renette gland and ducts

(iii) Alimentary canal is incomplete

(iv) Sense organs like amphids and plasmids occur

(v) Sexes are not separate (Monoecious)

(a) (i) & (ii) only (b) (i) & (v) only

(c) (iii) & (v) only (d) (i), (iii) & (v) only

AP EAMCET-03.09.2021 Shift-II

Ans. (c) : The alimentary canal is complete with a well developed muscular pharynx. Sexes are separate in nematodes (dioecious). Females are longer than males. They are commonly called as **round worms.**

412. Match the following :

Nematode	Common name
(A) Ancylostoma	**(I) Filaria worm**
(B) Enterobius	**(II) Hook worm**
(C) Trichuris	**(III) Pin worm**
(D) Wuchereria	**(IV) Guinea worm**
	(V) Whip worm

The correct match is

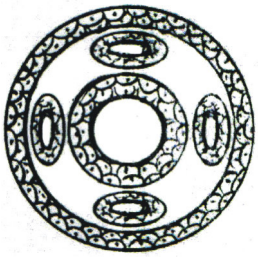
	A	B	C	D
(a)	II	IV	V	I
(b)	II	III	V	I
(c)	I	V	III	II
(d)	I	II	III	IV

TS EAMCET-29.09.2020 Shift-II

Ans. (b) :

	Nematode		Common name
(A)	Ancylostoma	(II)	Hook worm
(B)	Enterobius	(III)	Pin worm
(C)	Trichuris	(V)	Whip worm
(D)	Wuchereria	(I)	Filaria worm

413. Which of the following phyla possess body cavity as shown in the diagram below?



(a) Porifera (b) Coelenterata

(c) Annelida (d) Aschelminthes

Karnataka CET-2019

Ans. (d) : In pseudocoelomata, the body space is a **pseudocoelom or false coelom;** it is a persistent blastocoel enclosed between outer ectoderm and inner endoderm and not lined by mesoderm, e.g., Aschelminthes.

414. Wuchereria bancrofti causes____

(a) Servous cavity filariasis

(b) Lymphatic filariasis

(c) Subcutaneous filariasis

(d) Amoebiasis

MHT CET-2019

Ans. (b) : *Wuchereria bancrofti*, the causative agent of lymphatic filariais (LF) is transmitted by Culex mosquito.

415. Study the following statements regarding filarial worm:

(A) The inflammation in the lymph vessels is called lymphadenitis

(B) Swelling in the extremities of lymph, scrotum and mammary glands is called lymphoedema

(C) Sausage shaped larva undergoes three moulting and transforms into infective 3rd stage microfilaria

(D) 3rd stage microfilaria larva enters the blood vessels of man and undergoes the 3rd and 4th moulting to produce young filarial worm

From the above, identify the correct statement (s)

Options:

(a) B (b) B, C & D

(c) B & D (d) A, B, C& D

AP EAMCET-24.04.2019 Shift-II

Ans. (a) : Swelling in the extremities of the lymph nodes, scrotum, and mammary gland is called lymphoedema, which is a correct statement regarding filarial worm.

Lymphadenitis is an infection of the lymph nodes by bacterial infection. It is a swelling due to buildup of lymph fluid in the body.

416. Coelozoic parasite with syncitial epidermis, pseudocoelom and rhabditiform larva during development.

(a) Taenia (b) Wuchereria

(c) Fasciola (d) Ascaris

AP EAMCET-24.04.2019 Shift-I

@apna_pdf

Ans. (d) : Coelozoic parasite with syncitial epidermis, pseudocoelom and rhabditiform larva are seen during the development of *Ascaris*. It belongs to phylum Aschelminthes. The body is covered by a thick cuticle, the epidermis is syncytial, and there are no cilia found in this phylum, which is one of the characteristics of the Phylum Aschelminthes.

417. Statement (S) : The eggs of Ascaris are described as 'mammillated eggs'

Reason (R) : These eggs are passed out with faecal matter and infect man via contaminated food and water

Which of the following is true?

(a) (S) is true, but (R) is false
(b) Both (S) an (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is false, but (R) is true
(d) Both (S) and (R) are true and (R) is the correct explanation of (S)

TS EAMCET-03.05.2018 Shift-I

Ans. (b) : Ascaris eggs are found in soil and human feces .The eggs of *Ascaris* are surrounded by a protein coat with a rippled surface; hence, the eggs are described as mammillated eggs.

They get into the body when someone eats or drinks something contaminated with the eggs. Most people with ascariasis get it by putting dirty hands in their mouth.

418. Study the following statements with regard to microfilaria larva

(I) Life span of microfilaria larva in man is about 70 days
(II) Sausage–shaped larva becomes infective larva within 10–20 hours
(III) Infective microfilaria attains sexual maturity within 5 to 18 months

Identify the correct statements of above

Options:

(a) I, III (b) I, II
(c) II, III (d) I, II, III

AP EAMCET-28.04.2017 Shift-II

Ans. (a) : Life span of microfilaria larva in man is about 70 days.

Infective microfilaria attains sexual maturity with in 5 to 18 months.

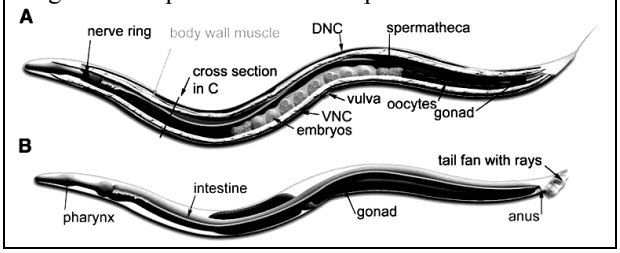
Both (I) and (III) are correct statement regarding to microfilaria larva.

419. The genome of Caenorhabditis elegans consists

(a) 3 billion bp (base pair) and 30000 genes
(b) 12 million bp and 6000 genes
(c) 4.7 million bp and 4000 genes
(d) 97 million dp and 18000 genes

CMC Vellore-2013

Ans. (d) : *Caenorhabiditis elegans* is small (less than 1 mm) nematode with 5 pairs of autosomes and 2 'X' chromosomes that often lives in soil. It has between 19 and 20,000 genes that code for proteins and approximately 100 million base pairs of DNA, making it a great example of the C-value paradox.



420. In the life cycle of Wuchereria, 3rd and 4th moults of microfilaria take place in

(a) lymph vessels of man
(b) stomach of mosquito
(c) salivary glands of mosquito
(d) thoracic muscles of mosquito

AP EAMCET-2013

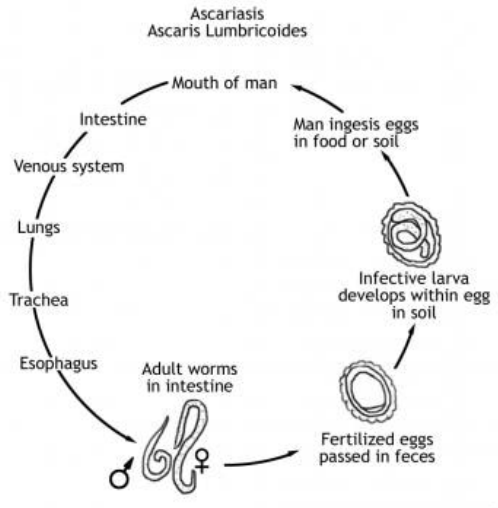
Ans. (a) : In the life cycle of Wuchereria, 3rd and 4th moults of microfilaria take place in lymph vessels of man. The microfilaria develop into first-stage larvae and subsequently into third stage and fourth moults infective larvae. The 3rd stage infective larvae migrate through the hemocoel to the mosquito's proboscis and infect another lymphatic system of man when the mosquito takes a blood meal.

421. In the life of cycle of Ascaris lumbricoides rhabditiform larva undergoes 2^{nd} and 3^{rd} moulting in

(a) Small intestine (b) Liver
(c) Heart (d) Alveoli of lungs

AP EAMCET-2014

Ans. (d) : Ascaris fertilized eggs are expelled from the host's body along with its feces into the soil, where the first larval moulting occurs. This larva lacks the ability to spread infection. By consuming contaminated food and drink, it develops into second stage larvae that infect the host. It passes through its second moulting in the alveoli of the lungs, producing the third stage larva.



@apna_pdf

422. Infection of Ascaris usually occurs by:
(a) mosquito bite
(b) drinking water containing eggs of Ascaris
(c) eating imperfectly cooked pork
(d) Tse-tse fly

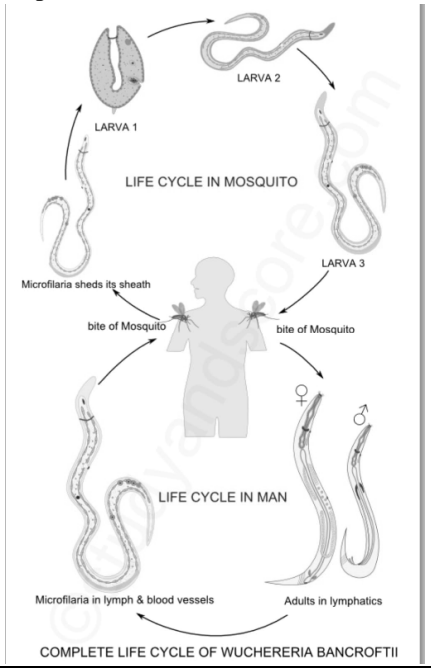
NEET-2013

Ans. (b) : Ascariasis is caused by the round worm, *Ascariasis lumbricoides*. It is an intestinal parasite. The eggs of the Ascaris are excreted along with the faeces of infected person, which contaminates soil, water, and plants etc.
A healthy person acquires infection through the consumption of water or food contaminated with the faecal matter of the infected person. Hence, the infection of Ascaris usually occurs by drinking water containing eggs of Ascaris.

423. The anterior V-spot in microfilaria of Wuchereria represents
(a) nerve ring
(b) cervical papilla
(c) excretory system
(d) reproductive system

WB JEE-2011

Ans. (c) : *Wuchereria bancrofti* also called as **filarial worm** belongs to phylum Aschelminthes.
- The primitive excretory system is represented by the anterior V-spot of *Wuchereria* microfilaria.
- The terminal portion of the alimentary canal is represented by the posterior V-spot, often known as the **tail spot.**



424. Wuchereria is found in:
(a) lymph nodes (b) lungs
(c) eye (d) gonads

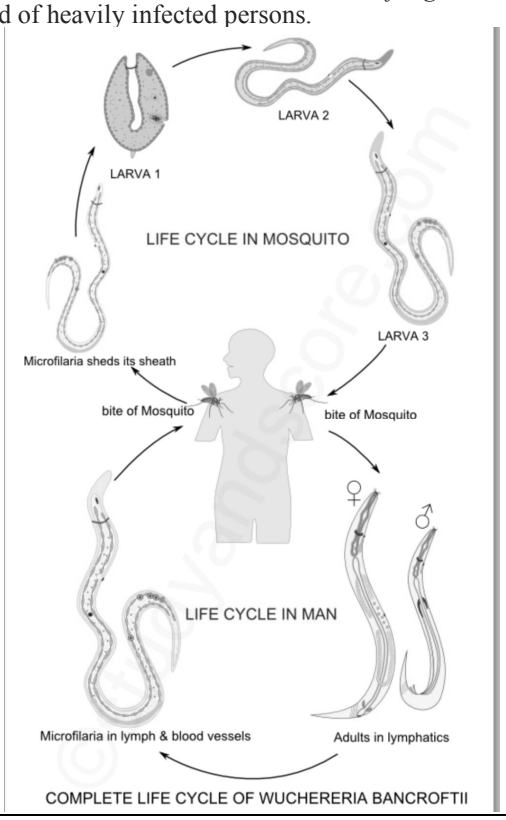
UP CPMT-2007
AIIMS-2002

Ans. (a) : *Wuchereria bancrofti* is a filarial worm found in the lymph nodes of humans, causing a lymphatic filariasis called **Bancroft's filariasis**. They are primarily found in the afferent lymphatic channels of the lower body's lymph glands. Many mosquito species act as a vector for the transmission of *Wuchereria*.

425. Wuchereria bancrofti is transmitted by:
(a) sandfly
(b) tse-tse fly
(c) Anopheles mosquito
(d) Culex mosquito

BVP-2010

Ans. (d) : *Wuchereria bancrofti* is a parasite that infects the lymphatic glands and vessels of humans, and its embryo *Microfilaria bancrofti*, appears in the peripheral blood at night.
Manson (1877–79), who discovered this peculiar periodicity, presumed therefore that infections with this parasite are brought about through the intermediary of blood-sucking insects, which are active at night. On account of the habits of mosquitoes, it directed his attention to the relationship of these insects to the transmission of filariasis and fed *Culex fatigans* on the blood of heavily infected persons.



426. Which one has no intermediate host?
(a) Taenia (b) Ascaris
(c) Fasciola (d) Plasmodium

JIPMER-2005

Ans. (b) : *Ascaris lumbricoides* has no intermediate host. *Ascaris* is a human intestinal worm. The intermediate host in the case of liver fluke is a mud snail. *Ascaris* life cycle occurs in a single host. The intermediate host in the case of tapeworm may be fish, pork, beef, etc.

@apna_pdf

427. Ascaris larva is called:
(a) cysticercus (b) rhabditiform
(c) hexacanth (d) oncosphere
VMMC-2008 / AMU-2008
AIPMT-1992

Ans. (b) : Nematodes (roundworms) are characterized by their rhabditiform larvae. Ascaris is monogenetic since it only has one host, a man, where infection takes place directly. The first larva, also known as the rhabditform larva, forms 10-14 days after cleavage and is not an infectious stage.

428. The embryonated egg of Ascaris represents:
(a) an egg with blastula
(b) an egg with a juvenile
(c) an egg with an egg
(d) an egg with gastrula
VMMC-2013 / Haryana PMT-2000
AIPMT-1997

Ans. (b) : The *Ascaris* embryonated egg is a juvenile-containing egg. The term "embryonated egg" refers to the *Ascaris* eggs that contain the second stage of the juvenile. They can spread infection to a human host. These eggs may survive for 5 to 6 years in the soil under the right temperature and moisture conditions.

429. Rhabditiform larva performs extra intestinal migration through different organs in the body of man. Arrange them in the correct sequence
(A) Liver **(B) Hepatic portal vein**
(C) Heart **(D) Post caval vein**
(E) Lungs **(F) Pulmonary**
(G) Alveoli **(H) Intestine**
(a) D-A-B-E-F-C-H-G (b) B-A-D-C-F-E-G-H
(c) E-F-A-C-B-D-G-H (d) A-B-D-F-C-G-E-H
AP EAMCET-2016

Ans. (b) : The rhabditiform larva enters the body through the skin and travels through the blood stream to the liver. From the liver it travels to the post caval vein, hearts, lungs, and then to the alveoli. The larva then hatches in the alveoli and makes its way to the intestine, where it matures into an adult worm.
The correct sequence of Rhabditiform larvae movement are–
Hepatic portal vein → Liver → Post caval vein → Heart → Pulmonary arteries → Lungs → Alveoli → Intestine.

430. Flooding of the field controls:
(a) Fungi (b) Bacteria
(c) Viruses (d) Nematode
BCECE-2015

Ans. (d) : Nematodes are small, worm-like organisms that can be found in soil, water, and plants. They can be harmful to plants, causing disease such as root-knot nematode and cyst nematode. Flooding fields can be effective method to control nematodes by reducing their population through oxygen deprivation. It helps in managing nematode related disease in plants.

431. Which one is also called Hookworm?
(a) Ancylostoma (b) Enterobius
(c) Rhabditis (d) Ascaris
BCECE-2015

Ans. (a) : *Ancylostoma duodenale* is also known as **hookworm**. It belongs to the phylum Nematoda and has a flexure at its frontal end, giving it an S-shaped worm.

432. Which of the following is not correctly matched?
(a) Sycon → Canal system
(b) Star fish → Radial symmetry
(c) Ascaris → Flame cell
(d) Prawn → Haemocoel
WB JEE-2011

Ans. (c) : Option (c) is not correctly matched because flame cells are present in the phylum Platyhelminthes (flatworms). Flame cells are the specialized excretory cells that help in excretion in animals. In Ascaris, the excretory system consists of one or two large renette gland cells.

433. Pseudocoelomic organism belongs to:
(a) Arthropoda (b) Annelida
(c) Mollusca (d) Aschelminthes
BCECE-2012 / DUMET-2006

Ans. (d) : Pseudocoelom is a form of coelom that differs from actual coelomates in that it is not obtained from mesoderm. It is seen in Aschelminthes or Nematoda phylum organism.
Example:- *Ascaris.*

434. Which one of the following is the infective stage of Ascaris lumbricoides?
(a) Unsegmented egg
(b) Egg with first stage larvae
(c) Egg with second stage larvae
(d) Free third stage larvae
(e) None of the above
CMC Vellore-2015

Ans. (c) : Egg with second stage larvae is the infective stage of *Ascaris lumbricoides*.
The first stage larvae is formed 10-14 days after cleavage and is called *rhabditiform larva* and it is non infectious. In another week it molts to become the second stage larvae which is capable of infection in the host.

435. Pin-worm is:
(a) Ancylostoma (b) Necater
(c) Wuchereria (d) Enterobius
MP PMT-2013 / Punjab MET-2004
AP EAMCET-1998

Ans. (d) : *Enterobius vermicularis* is a parasitic worm known as **pinworm or thread worm** is generally found in human intestines and sometimes lives in the colon and rectum of humans. It is belongs to phylum Aschelminthes or Nematoda.

436. Number of moulds, a larva of Ascaris undergoes to become an adult, is:
(a) one (b) two
(c) four (d) eight
AP EAMCET-2000 / AP EAMCET-1998

Ans. (c) : Ascaris is a monogenetic parasite affecting humans. It causes a disease called **ascariasis.** It undergoes four moult to become an adult. *Ascaris lumbricodes* is the 'large round worm' of humans, and it grows up to the length of 35 cm.

@apna_pdf

437. Posterior end of male Ancylostoma has:
(a) anus (b) curved tail
(c) bursa (d) caudal spine
BVP-2008
Uttarakhand PMT-2007
AP EAMCET-1998

Ans. (c) : The copulatory bursa, which encloses the cloaca, is the large, umbrella-like structure that makes up the posterior end of the male Ancylostoma. The bursa facllitates copulation. Bursa have bursal rays which are of taxonomic importance.

438. Caudal sensory organs (Phasmids) are present in
(a) rotifers (b) nematomorphs
(c) nematodes (d) cestodes
Punjab MET-2011

Ans. (c) : Caudal sensory organs (Phasmids) are present in nematodes. Phasmids are found in the posterior part of male and female nematodes. Phasmid neurons are located in the tail. Additionally, Phasmids neurons are involved in controlling chemorepulsion behaviour.

439. Purgative to expel Ascaris is
(a) oil of Chenopodium (b) tetrachlorethylene
(c) hexylresorcinol (d) all of the above
Punjab MET-2011

Ans. (a) : Purgatives are drugs that cause more frequent bowel movements and looser feces. Some medications, such as oil of chenopodium, are used to treat Ascariasis. The annual blooming plant genus *Chenopodium* is significant in medicine. Chenopodium oil is the name given to the oil obtained from this plant, and every active antihelminthic.

440. In Ascaris, the coelom is:
(a) schizocoelom (b) pseudocoelom
(c) true coelom (d) haemocoelom
UP CPMT-2012
Rajasthan PMT-2008
CG PMT-2008

Ans. (b) : In the phylum Aschelminthes, pseudocoelom is observed. *Ascaris* is a member of the phylum Aschelminthes, which shows the presence of pseudo-coelom. The fluid-filled body cavity present found between the mesoderm and the endoderm called the pseudocoelom.
Pseudocoelom is also known as a **false coelom.**

441. Respiration in Ascaris is :
(a) aerobic respiration
(b) anaerobic respiration
(c) both 'a' and 'b'
(d) none of these
MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (c) : Ascaris breathes anaerobically, because the hosts gut does not have enough oxygen. In this procedure, glycogen travels through glycolysis to produce energy, CO_2 and fatty acids.
If there is a free oxygen present in the host intestine, it appears that aerobic respiration also takes place.

442. One of the following is not a nematode parasite?
(a) Trichinella (b) Ascaris
(c) Dracunculus (d) Schistosoma
Haryana PMT-2001

Ans. (d) : *Schistosoma* is not a nematode parasite, commonly known as **blood flukes,** belongs to the phylum Platyhelminthes.
Disease caused by *Schistosoma* are called as schistosomiasis, also known as **bilharzia or snail fever.**

443. Match the following:

(A) Entamoeba histolytica	**(I) Cytozoic parasite**
(B) Plasmodium	**(II) Coelozoic parasite**
(C) Wuchereria	**(III) Rhabditiform larva**
(D) Extra intestinal migration	**(IV) Monogenic parasite**
	(V) Lymphadenitis

	A	B	C	D
(a)	(IV)	(II)	(I)	(III)
(b)	(IV)	(I)	(V)	(III)
(c)	(IV)	(I)	(II)	(III)
(d)	(IV)	(II)	(V)	(I)

AP EAMCET-2015

Ans. (b) :

(A)	Entamoeba histolytica	(IV)	Monogenic parasite
(B)	Plasmodium	(I)	Cytozoic parasite
(C)	Wuchereria	(V)	Lymphadenitis
(D)	Extra intestinal migration	(III)	Rhabditiform larva

444. Thigmotaxis is not shown by:
(a) Paramecium (b) Amoeba
(c) Ascaris (d) Hydra
BCECE-2010
JIPMER-2009
UP CPMT-2008

Ans. (c) : Thigmotaxis is not shown by *Ascaris*. It is a phenomenon of touch, that there will be stimulus in the organism, when touches a rock or a sand or anything.

445. Which one of the following is first nematode parasite to be discovered ?
(a) Entrobius vermicularis
(b) Amcylostoma duodenale
(c) Ascaris lumbicoldes
(d) Dracunculus medinensis
Rajasthan PMT-2000

Ans. (d) : Roundworms are also known as **Nematodes** belongs to of the phylum Nematoda, and more than half of the species that have been found are parasites of humans, animals, and even plants.
Early Egyptian physicians between 1553 and 1550 BC noted the existence of the Guinea worm. *Dracunculus medinensis*, which was later identified by a German Egyptologist in 1820. This huge, thin, and thread-like nematode can grow up to 1 meter long.

@apna_pdf

446. Which one of the following statements about certain given animals is correct –
(a) Round worms (Aschelminthes) are pseudocoelomates
(b) Molluces are acoelomates
(c) Insects are pseudocoelomates
(d) Flatworms (Platyhelminthes) are coelomates

AIPMT (Screening)-2010

Ans. (a) : Round worms (Aschelminthes) are pseudocoelomate whereas, Flatworms are acoelomate, and Mollusca and Insects are coelomate.

447. Which one of the following groups of animals is bilaterally symmetrical and triploblastic ?
(a) Sponges
(b) Coelentrates (Cnidarians)
(c) Aschelminthes (round worms)
(d) Ctenophores

AIPMT-2009

Ans. (c) : Aschelminthes is a superphylum consisting of psuedocoelomates. They are commonly known as **round worms** and are characterized by the presence of a psuedocoelome. Aschelminthes are bilaterally symmetrical and triploblastic.

448. A triploblastic pseudocoelomate, bilaterally symmetrical human parasite which is oviparous and the transmission is by contact. It is :
(a) filarial worm (b) hook worm
(c) palalo worm (d) tape worm

AP EAMCET-2006

Ans. (b) : Hook worm (Ancylostoma) belongs to phylum Nematode or Aschelminthes are bilaterally symmetrical, triploblastic, and pseudocoelomate animals. It is a human parasite, female are oviparous and the transmission is by contact.

449. From the following a monogenetic parasite is:
(a) Taenia solium (b) Ascaris
(c) Fasciola hepatica (d) Plasmodium vivax

AP EAMCET-2008

Ans. (b) : Monogenetic parasites are the parasites that complete their life cycles in one host only. *Ascaris* is a monogenetic parasite as it completes its life cycle in a single host (human).

450. *Ascaris* is characterized by :
(a) presence of true coelom but absence of metamerism
(b) presence of true coelom and metamerism (metamerisation)
(c) absence of true coelom but presence of metamerism
(d) presence of neither true coelom nor metamerism

Rajasthan PMT-2010
AIPMT-2008

Ans. (d) : Ascaris belongs to the phylum Aschelminthes phylum. It has a pseudocoelom instead of a true coelom, and it body is also not segmented metamerically.

451. Choose the correct statement with reference to Ascaris
(a) Hatching of embryos takes place in the stomach due to lytic enzyme
(b) Adulthood is reached inside the body of the host in ten days time
(c) Development and moulting takes place in the alveoli of lungs
(d) Hatching of embryos takes place within ten hours

UP CPMT-2004

Ans. (c) : Ascaris is a genus of parasitic nematode worms. It is a monogenetic parasite infecting humans and causes the disease called **ascariasis**.
Moulting is a feature of nematodes that allows growth. Usually, four moults occur during its life cycle. The larvae undergo their first moulting in the soil. Then the larvae undergo second and third moultings in the lungs. Then, the fourth moulting occurs in the intestine.

452. Ascaris is:
(a) a parasite
(b) a autotroph
(c) facultative autotroph
(d) facultative heterotrophy

Rajasthan PMT-2004

Ans. (a) : *Ascariasis* is caused by the round worm, *Ascariasis Lumbricoides*. It is an intestinal parasite. The eggs of the *Ascaris* are excreted along with the faeces of infected person, which contaminates soil, water, and plants etc.

453. In Ascaris, eggs are fertilised in the:
(a) Vagina (b) Oviducts
(c) Lower part of uteri (d) Seminal vesicles

BVP-2010

Ans. (c) : In Ascaris, eggs are fertilized the lower part of uteri. The larva matures in alveoli and again migrates to the intestine where it develops into the adult.

454. The infection of Enterobius is caused to man by:
(a) flying (b) piercing
(c) inoculation (d) contamination

UP CPMT-2001

Ans. (d) : *Enterobius* is commonly called **pinworm** which infect the human intestine. It is also called **enterobiasis.** They are small round worms, whitish in colour and named because of their unique tapering shape with a pointed tail. It is a parasite worm which infects the humans and are transmitted by the direct contact with the contaminated surface with pinworm eggs.

455. In which group of animals blastocoels is persistent as body cavity in adult?
(a) Arthropoda (b) Nemathelminthes
(c) Mollusca (d) Annelida

AP EAMCET-2004, 2001

Ans. (b) Nemathelminthes is the group of animals in which blastocoel is persistent as body cavity in adult. Phylum Nemathelminthes comprises of animals commonly called **nematodes or round worms.** The body cavity of nematodes is a persistent blastocoel, called pseudocoel as it is not lined by coelomic epithelium. It is bound on the outer side by muscles while by cuticle on the inner side. It contains a fluid rich in proteins and also contains a few phagocytic cells which help in defense of the body.

@apna_pdf

456. What is the length of female Ascaris lumbricoides ?
(a) 200-350 mm (b) 150-320 mm
(c) 100-150 mm (d) 50-80 mm
Rajasthan PMT-2000

Ans. (a) : Females have straight tails that measure 20 to 35 cm (200-350mm) in length. The tails of males tend to be curled and they are smaller (15–31 cm) than female.

457. Muscle cells of Ascaris are arranged in :
(a) coclomyarian (b) platymydrian
(c) polymyarian (d) holomyarian
Rajasthan PMT-2000

Ans. (b) : Muscle cells of Ascaris are arranged in Platymydrian pattern. It is the most common arrangement and may be the basic type from which more complex arrangements have evolved. The muscle cells are divided into dorsal and ventral fields by the lateral hypodermal cords and further into four by the dorsal and ventral hypodermal cords. This division into functional fields is important in determining the pattern of nematode locomotion.

458. Which one of the following is holotype ?
(a) Oesophagostomum apiostomum
(b) Oesophagostomum columbianum
(c) Oesophagostomum radiatum
(d) Oesophagostomum venulosm
Rajasthan PMT-2000

Ans. (b) : Nodule worms, also known as *Oesophagostomum columbinum,* are parasites of the large intestine of sheep, goats, and certain wild antelopes. They are roundworms belong to the Strongylidae family and are frequently known as "nodules" or "nodular worms". They primarily cause nodular worm disease, also known as **oesophostomiasis,** by infecting the large intestine and occasisonally the distal small intestine.
• Holotype means a single type specimen upon which the description and name of a new species is based.

459. The thin layer of epidermis having scattered nuclei and no partition walls below the cuticle of Ascaris is known as:
(a) multinucleated epidermis
(b) aseptate
(c) coenocytic epidermis
(d) syncytial epidermis
CMC Ludhiana-2011

Ans. (d) : Ascaris has the syncytial epidemis which is made up of an peripheral layer of continuous cytoplasm with distributed nuclei that is joined to the cell bodies below by the tiny cytoplasmic bridge. In animals, the multinucleated state is known as **syncytial.**

460. Amphids are cuticular elevations on ventrolateral lips of Ascaris, these are:
(a) Tangoreceptors (b) Tactoreceptors
(c) Olfactoreceptors (d) Chemoreceptors
CMC Ludhiana-2008

Ans. (d) : Amphids are olfatory chemoreceptors that help in olfactory sensibility or the sense of smell and are located on the lower lips of Nematodes like *Ascaris.*
• Amphids are the primary olfactory and chemoreceptive organs in Nematodes.

461. Sperms in Ascaris are characterized by one unusual feature
(a) long form
(b) lack of flagellum
(c) motility
(d) ability to induce meiosis in egg
AMU-2003

Ans. (b) : Ascaris sperm are amoeboid, asymmetrical, and have tails. Their maturation is completed in vas deferens. Male and female copulate in human intestine, by amoeboid motility, the sperm travel mainly localized in pseudopodia to the uterus, seminal receptacle where they fertilize the ovum, egg develops in soil and form rhabditiform larva which moults further into second rhabditiform larva (Juvenile). Major sperm protein (MSP) 16% of total protein sperm.

G. Annelida

462. Statement I : Peripatus is a connecting link between Annelida and Mollusca.
Statement II: Archaeopteryx is a transitional form between Reptila and Aves.
(a) Both statement I and statement II are correct
(b) Both statement I and statement II are false
(c) Statement I is correct. But statement II is false
(d) Statement I is false. But statement II is correct
TS EAMCET-10.05.2023, Shift-II

Ans. (d) : "Peripatus" It is a genus of veluet worms, which are segmented invertebrates found intropic and subtropical region.
• Peripafous is conecting link between annelida and arthopoda.
• If is living fossils.
• Archaeopteryx is connecting link between replies and bird.
• If is transitional fossil between dinosaurs and birds its appear in cafe Jurassic period.

463. Choose the incorrect statements regarding Hirudinea
A. Male reproductive system has cirrus
B. They are exclusively marine and tubicolous
C. Fertilization is external and development is direct
D. Clitellum is conspicuous during breeding season only.
(a) A, C (b) B, D
(c) C, D (d) B, C
AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Hirudinea (Leeches) are segmented parasitic belonging phylum Annelida.
Hirudinea as hermaphrodites and have clitellum. Clitellum is thickened grlandular present neare head inhirudinea and function is secreted a viscid sac which storeegg.
Clitelum is part of reporoductive system that can seen when the worm is sexually active or mature.
Maximum leach live in fresh water but some are terrestrial or manins.

@apna_pdf

464. The spermathecae in earthworm are present in

(a) 8^{th} and 9^{th} segments
(b) 3^{th} and 4^{th} segments
(c) 6^{th}, 7^{th}, 8^{th} and 9^{th} segments
(d) 15^{th} to last segments

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : The spermathecae in earth worm are present in 6^{th}, 7^{th}, 8the and 9^{th} segmenths.
Spermathecas in earthworms are small, sac-like structures located in the clitellum which is a specializeol.
Segments of the earthworm's body.
These structures store sperm received during copulation for tall later use in fertilizing egg.

465. Match List I with List II :

List I		List II	
A.	**Taenia**	**I.**	**Nephridia**
B.	**Paramecium**	**II.**	**Contractile vacuole**
C.	**Periplaneta**	**III.**	**Flame cells**
D.	**Pheretima**	**IV.**	**Urecose gland**

Choose the correct answer from the options given below :

(a) A-II, B-I, C-IV, D-III
(b) A-I, B-II, C-III, D-IV
(c) A-I, B-II, C-IV, D-III
(d) A-III, B-II, C-IV, D-I

NEET (UG) 07.05.2023

Ans. (d)

A.	**Taenia**	**III.**	**Flame cells**
B.	**Paramecium**	**II.**	**Contractile vacuole**
C.	**Periplaneta**	**IV.**	**Urecose gland**
D.	**Pheretima**	**III.**	**Nephridia**

466. Read the following and find out the correct combinations:

(a) Coelom/Symmetry Phylum Example
Pseudocoelom Platyhelminthes Ascaris
(b) Coelom/Symmetry Phylum Example
Bilateral Cnidaria Hydra
(c) Coelom/Symmetry Phylum Example
Eucoelom Annelida Pheretima
(d) Coelom/Symmetry Phylum Example
Radial Ctenophora Obelia

TS EAMCET-30.07.2022 Shift-II

Ans. (c) :

	Coelom/ Symmetry	Phylum	Example
1.	Pseudocoelom	Aschelminthes	Ascaris
2.	Bilateral	Arthropoda	Insects
3.	Eucoelom	Annelida	Pheretima
4.	Radial	Coelentrata	Obelia

467. Study the following statements regarding unisexual annelids.

(I) These are bristle worms
(II) Gonoducts are present
(III) Head is distinct with sense organs
(IV) Internal fertilization
The correct statements are

Options:

(a) I, III only (b) II, IV only
(c) I, II only (d) III, IV only

TS EAMCET-30.07.2022 Shift-I

Ans. (a) : Annelids are coelomate and triploblastic, body is segmented, organ level of body organization. Nephridia are present for excretion, blood contains haemoglobin (red colour), and Setae helps in the locomotion.
These are bristle worms. Head is distinct with sense organs. Nereis, an aquatic form is dioecious but earthworms and leeches are monoecious.

468. Animals of this class in Annelida have definite number of segments.

(a) Cestoda (b) Polychaeta
(c) Oligochaeta (d) Hirudinea

TS EAMCET-09.08.2021 Shift-I

Ans. (d) : Leeches are segmented parasitic worms that comprises the sub-class Hirudinea within the phylum Annelida. Leeches have 33 body segments, and Hirudinea are monoecious. They have anterior and posterior suckers on ventral side. The organisms lay eggs in cocoons.

469. Match the items in Column-I with those in Column-II

Column-I	Column-II
(A) Podocytes	**(i) Crystallised oxalates**
(B) Protonephridia	**(ii) Annelids**
(C) Nephridia	**(iii) Amphioxus**
(D) Renal calculi	**(iv) Filtration slits**

Select the correct option from the following :

(a) (A)-(iv), (B)-(ii), (C)-(iii), (D)-(i)
(b) (A)-(iii), (B)-(iv), (C)-(ii), (D)-(i)
(c) (A)-(iii), (B)-(ii), (C)-(iv), (D)-(i)
(d) (A)-(iv), (B)-(iii), (C)-(ii), (D)-(i)

NEET (Odisha)-2019

Ans. (d)

Column-I		Column-II	
(A)	Podocytes	(iv)	Filtration slits
(B)	Protonephridia	(iii)	Amphioxus
(C)	Nephridia	(ii)	Annelids
(D)	Renal calculi	(i)	Crystallised oxalates

470. A definite number of body segments is found in

(a) slug (b) leech
(c) earthworm (d) tapeworm

Uttarakhand PMT-2011
Rajasthan PMT-2001

Ans. (b) : The body of leech is divided metamerically into 33 true segments, somites or metameres. The first five segments are jointed to form the anterior sucker, eyes and mouth. The next 21 segments, followed by the last seven segments, are fused to form the posterior sucker. Their longitudinal muscles along with anterior and posterior suckers help in locomotion. They do not have any specific respiratory organ.

471. Metameric segmentation is the characteristic of

(a) Platyhelminthes and Arthropoda
(b) Echinodermata and Annelida

@apna_pdf

(c) Annelida and Arthropoda
(d) Mollusca and chordata

BHU PMT (Mains)-2010
Punjab MET-2006
BCECE-2013

Ans. (c) : Metameric segmentation is characteristic of Annelids and Arthropods.
The phenomenon known as **metamerism** occurs when an organisms body is organized into a linear series of body segments. Such animals bodies have organs and tissues that are observed to be repeated after regular intervals, or segments, and each segment is referred to as a metamere or somite.

472. Connecting link between annelids and molluscs is
(a) Neopilina (b) Peripatus
(c) Periplaneta (d) Limulus

JIPMER-2010,2008

Ans. (a) : The term "connecting link" refers to an animal that possesses characters which common to two related taxonomic groups. *Neopilina* is a connecting link between Annelids and Molluscs, because it shows several characters of both Annelids and Molluscs.
• *Peripatus* is a connecting link between Annelida and Arthropoda.
• *Periplaneta* is a genus of cockroach.
• *Limulus* is a genus of horseshoe crab. It is also known as living fossil and king crab.

473. The nephridia in earthworm are analogous to
(a) nematoblasts of Hydra
(b) flame cells of Planaria
(c) gills of prawn
(d) trachea of insects

AIPMT-1996

Ans. (b) : The nephridia in earthworm are analogous to flame cells of Planaria, since both of them help in excretion.
Analogous organs are those that perform similar function but have a different anatomical structure are said to be analogous structure or organ.

474. Which one is a marine leech ?
(a) Spiunculus (b) Pontobdella
(c) Hirudo (d) Polygordius

Haryana PMT-2011
Punjab MET-2011

Ans. (b) : Pontobdella muricata is a species of marine leech, which parasitic on sharks rays, and skates.
Leech belongs to phylum Annelida.

475. Match the following

List I	List II
(A) Arenicola	**(I) Terrestrial leech**
(B) Hirudinaria	**(II) Marine leech**
(C) Pontobdella	**(III) Lug worm**
(D) Haemadipsa	**(iv) Fresh water leech**

	A	B	C	D
(a)	(I)	(II)	(III)	(IV)
(b)	(III)	(IV)	(II)	(I)
(c)	(II)	(III)	(IV)	(I)
(d)	(I)	(III)	(IV)	(II)

AP EAMCET-2015

Ans. (b) :

A	Arenicola	(III)	Lug worm
B	Hirudinaria	(IV)	Fresh water leech
C	Pontobdella	(II)	Marine leech
D	Haemadipsa	(I)	Terrestrial leech

476. Which one of the following is common in annelida and arthropods?
(a) basal nerve cord
(b) ventral nerve cord
(c) dorsal nerve cord
(d) anterior nerve cord

Rajasthan PMT-2003
Punjab MET-2004

Ans. (b) : The nervous system of Annelida resembles that of Arthropoda, both have metameric segmentation. The nervous system is basically represented by ganglia, arranged segment wise on the ventral nerve cord. Ventral nerve cords are found in some phyla particularly in the Nematodes, Annelids, and Arthropods.

477. Annelids have a central nerve cord that is :
(a) impermeable to K^+ (b) hollow
(c) dorsal (d) ventral

Punjab MET-2005

Ans. (d) : Annelids have a central nerve cord that is ventral.
• The ventral nerve cord is a collection of nerve fibers that runs along the longitudinal axis of various phyla of elongated invertebrates and is a component of the invertebrate central nervous system. It is normally a solid double-strand (pair) of nerve cords.
• Chordates animals have a dorsal, hollow nerve cord.

478. Forest of nephridia are present in:
(a) pharyngeal region (b) clitellar region
(c) anal region (d) none of these

Rajasthan PMT-2005

Ans. (b) : Forest of nephridia are present in clitellar region.
• In earthworm the excretory organs occur as segmentally arranged coiled tubules called nephridia.
• Nephridia are three types in earthworm these are septal nephridia, integumentary nephridia and pharyngeal nephridia.
• Nephridia in Earthworm almost 200-250 in number in each segment, but on the clitellum, where they reach 2000-2500 in number per segment, they are known as the "forest of nephridia." The terminal ducts of these nephridia are open on the body's surface and they lack nephrostomes.

479. Which of the following assists in the locomotion of the organism stated?
(a) Epithelium of Pheretima
(b) Trichocysts of Paramecium
(c) Pedicellariae of Star fish
(d) Posterior sucker of Hirudinaria

JIPMER-2004

Ans. (d) : The Hirudinaria posterior sucker helped the organism for locomotion. It performed looping and crawling movements with the aid of muscles and suckers. Suckers and muscles are necessary for attachment.

@apna_pdf

480. Pheretima and its close relatives derive nourishment from:
(a) Soil insects
(b) Small pieces of fresh fallen leaves of maize, etc
(c) Sugarcane roots
(d) Decaying fallen leaves and soil organic matter

AIPMT (Screening)-2012

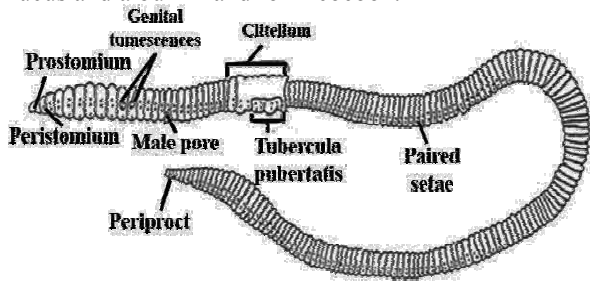
Ans. (d) : Pheretima and its related species feed on the decomposing organic matter in the soil. They consume the leftover plant and animal materials as well, thus they are omnivorous.

481. Which one of the following structure in pheretima is correctly matched with its function:
(a) Typhlosole-storage of extra nutrients
(b) Clitellum-secretes cocoon
(c) Gizzard-absorbs digested food
(d) Setae-defence against predators

AIPMT (Mains)-2011

Ans. (b) : Clitellum is a girdle which contains gland cells that emit a material that dries up to form the cocoon from which the egg and sperms are released to assure fertilization. The earthworms embryo grows inside the cocoon.

- The glandular tissue clitellum present in 14-16 segments forming a thick girdle. The gland secretes mucus and albumin and form cocoon.



482. In Polychaeta, the setae are:
(a) numerous
(b) singly arranged
(c) arranged in bundles
(d) fused

UP CPMT-2011

Ans. (a) : Polychaetes, also referred to as segmented worms, belong to phylum Annelida. On the lateral parapodia, they have a lot of setae.
They include such forms as sand worms, tube worms and clam worms.

483. The larva of phylum Annelida is called as:
(a) Miracidium (b) Trochophore
(c) Glochidium (d) Rhabditiform

VMMC-2011, 2010
Manipal-2010

Ans. (b) : The phylum Annelida contains trochophore larva. They are segmented, triploblastic, and bilaterally symmetric metazoa. It is also occurs in the phylum Molluscs. A trochophore larva is a tiny, pear-shaped, cilated, and unsegmented organism. These creatures are planktotrophs. They can be discovered in marine habitats, with the support of cilia, they move in a wheel-like motion.

484. All worms are :
(a) triploblastic (b) segmented
(c) endoparasites (d) free - living

MGIMS Wardha-2003

Ans. (a) : The term "triploblastic" refers to an animals whose body is made up of the ectoderm, mesoderm, and endoderm, the three embryonic cell layers. A triploblastic embryo is the initial phase for the development of all higher and intermediate animals.

485. How are Annelida advanced over Nematoda ?
(a) Closed circulation
(b) True coelom
(c) Metameric segmentation
(d) All of these

AMU-2006
Punjab MET-1999

Ans. (d) : Compared to Nematodes, Annelids are more advanced. They are true coelomates, and in addition to having a closed circulatory system, they exhibit metameric segmentation. While Nematodes are pseudocoelomates that lack a circulatory system and are unsegmented organisms.

486. Which of the following animal is sanguivorous ?
(a) Nereis (b) Tapeworm
(c) Earthworm (d) Hirudinaria

AMU-2005
Manipal-2004
Uttarakhand PMT-2004

Ans. (d) : The Indian cattle leech, Hirudinaria, exhibits the sanguivorous behaviour, which is characterized by blood sucking nature. When they enter a pond or river, they ingest blood from fish, frogs, cattle, and humans.

487. Which of the following animals is predaceous:
(a) Pheretima (b) Nereis
(c) Hirudinaria (d) None of these

CG PMT-2007

Ans. (b) : Nereis is a marine Polychaete Annelid that burrows under the sea floor and emerges at night for capturing for small creatures. They are free-living, nocturnal, and predaceous animal. *Nereis* possess parapodia which help in swimming. *Nereis* is dioecious and aquatic Annelids.

488. Select the correct statement:
(a) birds are poikilothermic
(b) flatworms are coelomic animal
(c) earthworm is metamerically segmented
(d) fishes are radially symmetrical

CG PMT-2007
BCECE-2005

Ans. (c) : Earthworms belong to the phylum Annelida. The characteristic features of an Annelida is the segmented body. The phenomenon known as metamerism occurs when an organisms body is organized into a linear series of body segments. Such animals bodies have organs and tissues that are observed to be repeated after regular intervals, or segments, and each segment is referred to as a metamere or somite.

@apna_pdf

489. In Pheretima the glands that help in binding the worms during copulation are:
(a) Prostate glands (b) Albumin glands
(c) Accessory glands (d) Mucous glands

AP EAMCET-2003

Ans. (c) : The two pair of accessory gland are located on the ventral body wall, one in each of segments 17 and 19, on the lateral sides of the nerve cord. In earthworm copulation is facilitated by the secretions of accessory glands.

490. In Pheretima, the cells that are analogous to hepatic cells of vertebrates are:
(a) amoeboid cells (b) chloragogen cells
(c) mucous cells (d) circular cells

AP EAMCET-2003

Ans. (b) : Chloragogen cells in Pheretima, which is a type of earthworm, are analogous to hepatic cells in vertebrates. These cells are responsible for storing glycogen and lipids detoxifying substances, and participating in metabolic activities similar to the functions performed by hepatic cells in vertebrates.

491. Nephridia in Pheretima are formed from:
(a) mesenchyme (b) endoderm
(c) mesoderm (d) ectoderm

AP EAMCET-2004

Ans. (d) : Earthworms are triploblastic, they have three distinct germ layers endoderm, mesoderm, and ectoderm. Nephridia are found in pairs and operate similarly to the kidney in vertebrates. The earthworm's nephridia are formed from ectodermal tissues and it is responsible for excretion and osmoregulation in earthworms.

492. External segmentation is absent but internal segmentation is present in
(a) Polychaeta (b) Oligochaeta
(c) Archiannelida (d) Hirudinea

AMU-2008

Ans. (c) : The Archiannelida are only marine organisms.
Internal segmentation is identified by coelomic septa, while external segmentation is identified by barely noticeable weak grooves. The body is divided into multiple chambers that repeat organs in its internal portions. Each chamber has a pair of nephridia and a pair of ganglia.

493. Which of the following is wrongly matched?
(a) Arthropoda - cockroach
(b) Annelida - Hydra
(c) Echinodermata – star fish
(d) Nemathelminthes - Ascaris

J&K CET-2006

Ans. (b) : Hydra belongs to the phylum Coelenterate (Cnidarian) not from Annelida.
- Cockroach belongs to the phylum Arthropoda.
- Star fish belongs to the phylum Echinoderm.
- Ascaris belongs to the phylum Aschleminthes.

494. The dorsal side of the skin of Pheretima is brown due to:
(a) porphyrin (b) melanin
(c) heparin (d) renin

AP EAMCET-2001

Ans. (a) : The dorsal side of the Earthworm (Pheretima) skin is brown because of the pigment porphyrin found in the body wall, which shields the body from strong sunlight and UV rays.

495. Which of the following nephridia does not found in earthworm?
(a) Septal nephridia
(b) Macro nephridia
(c) Integumentary nephridia
(d) pharyngeal nephridia

AFMC-2004

Ans. (b) : Macronephridia are a type of specialized excretory organs found in some Annelids, specifically in the class Polychaeta. These structure are absent in earthworms. Micronephridia are typically larger and more complex than typical nephridia found in earthworms and they act as a osmoregulatory and secretory organs.

496. Match the following colums.

Column-I (Organ of Excretion)	Column-II (Name of Animals)
(A) Nephridia	1. Prawn
(B)Malpighian tubules	2. Spider
(C) Coaxal gland	3. Insect
(D) Green gland	4. Earthworm

(a) A-1 B-2 C-3 D-4 (b) A-2 B-1 C-3 D-4
(c) A-4 B-3 C-2 D-1 (d) A-4 B-2 C-3 D-1

CMC Ludhiana -2013

Ans. (c)

Column-I (Organ of Excretion)	Column-II (Name of Animals)
(A) Nephridia	4. Earthworm
(B)Malpighian tubules	3. Insect
(C) Coaxal gland	2. Spider
(D) Green gland	1. Prawn

497. Each male genital opening of Pheretima has separate opening of
(a) two ducts (b) three ducts
(c) five ducts (d) four ducts

JCECE-2010

Ans. (b) : One prostatic duct and two vasa deferentia, or spermatic ducts, are independent apertures in each male genital opening (at the 18^{th} segment) of the Pheretima. These ducts are responsible for carrying mature sperm, facilitating ejaculation, and eliminating waste products.

498. In Pheretima locomotion occurs with the help of :
(a) circular muscles
(b) longitudinal muscles and setae
(c) circular, longitudinal muscles and setae
(d) parapodia

JCECE-2003

Ans. (c) : In *Pheretima* locomotion occurs with the help of circular, longitudinal muscles and setae. The earthworm can push the setae out of its body to grab the soil around it. To move forward, the worm uses its setae to anchor the front of its body and contracts the longitudinal muscles to shorten its body.

@apna_pdf

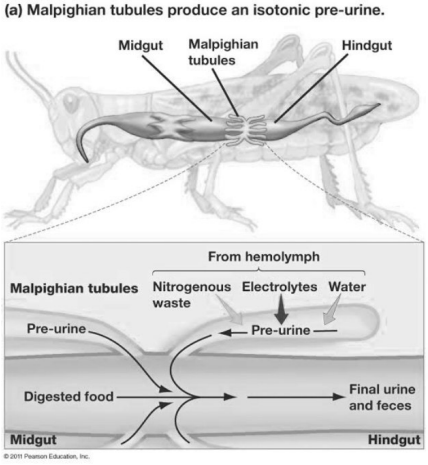
H. Arthropoda

499. Malpighian tubules are:
(a) Excretory organs of insects
(b) Excretory organs of frog
(c) Respiratory organs of insects
(d) Endocrine glands of insects

VMMC-2012 / UP CPMT-2008
MGIMS Wardha-2008
Rajasthan PMT-2008
AIPMT-1990 / UP CPMT-2012

Ans. (a) : Malpighian tubules are found in some insects, which belongs to the phylum Arthropoda.

Malpighian tubules are excretory organs found in insects. They are responsible for removing waste material, such as nitrogenous compounds, from the insect's body. These tubules maintain the internal environment of insects by regulating the balance of water and ions. Malpighian tubules are similar function as kidneys of vertebrates.



500. Which of the following is not an insect?
(a) Locust (b) Lepisma
(c) Termites (d) Spider

Rajasthan PMT -2011 / JIPMER-2005
BVP-2002 / Rajasthan PMT-1999

Ans. (d) : Spider is not an insect because spiders are Arachnids and do not have antenna or wing for flying. Spiders are Arthropods that have eight legs. They have two main body parts, two pincer-like numerous appendages, and three pairs of spinnerets.

501. Superficial meroblastic cleavage occurs in :
(a) reptiles (b) birds
(c) mammals (d) insects

AFMC-2006, 2008
Punjab MET -1999
AIPMT-1991

Ans. (d) : Superficial meroblastic cleavage that occurs in eggs that have a large amount of yolk. The cleavage furrows only penetrate the cytoplasm at the periphery of the egg, leaving the yolk unsegmented. This type of cleavage is founds in insects, which have centrolecithal eggs.

502. Green glands present in some arthropods help in:
(a) respiration (b) excretion
(c) digestion (d) reproduction

Punjab MET-2009
CMC Vellore-2009
Rajasthan PMT-2009
UP CPMT-2001, 2009

Ans. (b) : The excretory organs in the class of Crustaceans consist of a pair of green-colored organs. At the base of the antennae, these glands open. These glands are sometimes known as **antennal or maxillary glands**. They function like invertebrate kidneys. They help in the ion control and removal of wastes materials.

503. Statement I: Cestodes lack digestive system
Statement II: Arachnids have green glands for excretion.
The correct option among the following is :
(a) Both statement I and statement II are correct
(b) Both statement I and statement II are false
(c) Statement I is correct But statement II is false
(d) Statement I is false But statement II is correct

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : Cestoda is parasitic worm belonging β phylum platyhelminthes.

Castodari are mainly fish infecting parasites. Cestodes do not have gut or mouth but absorb nutrients from the host's alimentary tract. Thus digestive system totally absent.

• In arachnids is the class of the phylum arachnida and phylum arthropod. Arthopodce largest phylum of animal kingdom. and axcretory orgon of archarids is coxal gland and malphygtian tubules.

504. Choose the correct option

Column - I			
A-	**Daphnia**	**i.**	**Basking**
B-	**Desert Lizard**	**ii.**	**Blubber**
C-	**Aquatic mammals**	**iii**	**Cyclomorphosis**
D-	**Sea gulls**	**iv**	**Eliminates salts through nostril**

(a) A – ii, B – iii, C – iv, D – i
(b) A – iii, B – ii, C – i, D – iv
(c) A – iii, B – i, C – ii, D – iv
(d) A – iiii, B – i, C – iv, D – ii

AP EAPCET-22.05.2023, Shift-I

Ans. (c) :
- Aquatic mammals like Amazonian manatee and river dolphins are completely aquatic.
- Chyclomorphosis is different generation of individual of the same species cause by seasonal differences.
- Daphnia is commonly called water flease because the salutatory. Swimming style which look like fleas.
- Desert horned lizard also called "horny toads"
- Sea gull are seabirds

@apna_pdf

505. Choose the incorrect combination among the following.

Class	Character	Example
1) Xiphosura	Poisonous Claws	Limulus
2) Arachnida	Coxal Glands	Scutigera
3) Crustacea	Biramous appendage	Sarcoptes
4) Diplopoda	Gnathochilarium	Spirostreptus

(a) 2, 3, 4 (b) 1, 3, 4
(c) 1, 2, 4 (d) 1, 2, 3

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : Diplopod is class of arthropoda which have two pairs of Jointed legs. e.g. eumillipes
Pensephon. Diplopod commonly known as millipetes. Millipedes are a generally show moving the herbivoroue, feeding on decaying plant matter and sometimes live plant.

506. The following are stages of plasmodium in female Anopheles. Their correct sequence is
I) Syngamy
II) Sporocyst
III) Formation of Ookinete
IV) Gametogony
V) Oocyst
(a) IV - I - III - II - V (b) II - V - III - IV - I
(c) IV - V - I - III - II (d) IV - I - III - V - II

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : • The gametocytes effective stage for infected femal anopheles mosquito.
• Sporozoits a motile form ofinfected fumal anaphelese mosquito
• Oocyst a thich walled structures that forms under the mosquito outer gut lining.
Ookinete- The motiles from by fusion of a male female gamele and meiosis take place and form okinete
gamete-make gametocytes have many flagellated microgamets but female gametocyte differentiated to a macrogamete.

507. Read the following regarding Monarch butterfly
A. The Monarch butterfly is highly distasteful to its predator because of a special chemical present in its body.
B. The butterfly acquires the chemical during its caterpillar stage by feeding on a poisonous insect.
The correct option among the following is
(a) Both A and B are true
(b) A is false B is true
(c) A is true B is false
(d) Both A and B are false

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : The monarch butter fly is highly distasteful to its predator because of a special chemical present in body because-they store posison know as cordiac glycosides or cordenolides.
The caterpillar of the monarch butterfly eats only milkweed a poisonous plant that should kill it the caterpillars thrive on the plant even storing its toxins in their bodies as a defense against hungry birds.

508. In hymenopteran insects the unfertilized eggs develop into
(a) Queen bee (b) Worker bee
(c) Super females (d) Drones

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : In hymenopteran insects the unfertilized eggs develop into Drones.
The hymenoptera order of phylum arthropoda and family is called Beekeepers or apiarists.
When none bee goes by many developmental stage and form queen, worker and drone and four stage like egg, larva, pupa and adult the queen lays her egg in hony comb fertilize egg develop into workers or new queen but unfertilized egg develop into drones.

509. Identify the correct option
Statement - I : Some insects add glycerol to their blood as antifreezing agent during winter
Statement - II : Insects are temperature regulators
(a) Statement I and II are correct
(b) Statement I is wrong and II is correct
(c) Statement I is correct and II is wrong
(d) Statement I and II wrong

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : When insects encounter cold temperatures during winter face the sick of their bodily fluids freezing which can be deadly. That is why insects developed a survive strategy by producing glycerol.
Glycerol is a natural antifreeze agent that lowers the freezing does not have temerature regulators.

510. House fly belongs to _____ family.
(a) Calliphoridae (b) Muscidae
(c) Cyprinidae (d) Hominidae

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : House fly belongs to muscidae family. Muscidae are commonly known as house flies or stable flies. The worldwide distribution of these contains almost 4000, described species in over 100 genera.
- Calliphoridae is the family of blow flies.
- Cyprinidae is the family of freshwater fishes.
- Hominidae is the family of apes.

511. In which of the following animals, digestive tract has additional chambers like crop and gizzard ?
(a) Pavo, Psittacula, Corvus
(b) Corvus, Columba, Chameleon
(c) Bufo, Balaenoptera, Bangarus
(d) Catla, Columba, Crocodilus

NEET-2022

Ans. (a) : Pavo, Psittacula and Corvus are all different types of birds, and they share the common characterstic of having a digestive tract with two additional chambers called the crop and gizzard. The crop is a sac like organ that stores food before its passess into the stomach. The gizzard is a muscular organ that grinds food with the help of small stones that the birds swallows.

512. Which of the following is an extinct marine Arthropoda?
(a) Dalmanites (b) Limulus
(c) Scolopendra (d) Scutigera

AP EAPCET-12.07.2022 Shift-I

@apna_pdf

Ans. (a) : The genus Dalmanite belongs to the order Phacopida suborder of Trilobites. They existed from the late Ordovician through the middle of the Devonian. *Redlichiids* and *Ptychopariid bigotinids,* which date to about 520 million years ago, are the earliest trilobites known from the fossil record.

513. In the process of evolution, striated muscles appeared for the first time in the phylum

(a) Annelida (b) Mollusca
(c) Arthropoda (d) Echinodermata

AP EAMCET-11.07.2022 Shift-II

Ans. (c) : In the process of evolution, striated muscles appeared for the first time in the phylum Arthropoda, arranged in bundles for moving particular parts.

514. Lepisma is commonly known as

(a) Jelly fish (b) Cuttle fish
(c) Devil fish (d) Silver fish

TS EAMCET-30.07.2022 Shift-II

Ans. (d) : • Lepisma is commonly known as silver fish. It belongs to phylum Arhropoda. It is found in moist environments. Silver fish are pests because they eat books, wallpaper and other material that contain starch.

• Cuttlefish belong to the class cephalopoda included squid, octopus etc.

• Devil fish (giant squid) is the largest invertebrates in the world.

• **Jelly fish-** belong to coelenterate or cnidaria

515. Which set of excretory organs is found in Arthropoda?

(a) Malphigian tubules, coxal glands and green glands
(b) Malphigian tubules and flame cells
(c) Flame cells and solenocytes
(d) Nephridia and flame cells

AP EAMCET-12.07.2022 Shift-II

Ans. (a) : Coxal gland - Coxal gland in certain arthropods one of a pair of excretory organs consisting of an end sac where intial urine is collected a tubule where secretion and reabsorption may take place and an excretory pore at the base of one of the legs.

Green gland -Paired maxillary and antennal gland (also called green glands) are the principal excretory organs in crustaceans. Ex. prawn(palaemon)

Malphigian tubules- Primary osmoregulatory and excretory organ of insects. Ex. Cockroach.

516. A unit of photoreception in the eye of cockroach is _____

(a) Facet
(b) Crystalline Cone
(c) Rh abdome
(d) Ommatidium

AP EAMCET-03.09.2021 Shift-II

Ans. (d) : Arthropods eyes are made up of repeating units of the ommatidia, each of which junctions as a separate visual receptor.

517. Study the following and find the correct combinations related to Arthropoda

Subhylum / class		Character		Example	
i	Arachnida	A	Extinct marine arthropods	P	Julus
ii	Crustacea	B	Gnathochilarium	Q	Dalmanites
iii	Chilopoda	C	Poison claws	R	Aranea
iv	Diplopoda	D	Biramous thorasic & abdominal appendages	S	Scolopen-dra
v	Trilobita	E	Spinnerets	T	Cancer

Options:

(a) (i-B-R), (ii-D-Q), (iii-C-S), (iv-E-T) & (v-A-P)
(b) (i-E-R), (ii-D-T), (iii-C-S), (iv-B-P) & (v-A-Q)
(c) (i-E-R), (ii-D-T), (iii-B-P), (iv-C-S) & (v-A-Q)
(d) (i-B-P), (ii-D-T), (iii-E-R), (iv-C-S) & (v-A-Q)

AP EAMCET-03.09.2021 Shift-II

Ans. (b) :

	Character	Ex.
(i) Arachnida	Spinnerets	Aranea
(ii) Crustacea	Biramous thoracic and abdominal appendages	Cancer
(iii) Chilopoda	Poison claws	Scolopendra
(iv) Diplopoda	Extinct marine arthropods	Dalmanites

518. Which of the following features is not present in the phylum 'Arthropoda' _____

(a) Metamorphic segmentation
(b) Chitinous exoskeleton
(c) Jointed appendages
(d) Parapodia

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : Arthropods have chitinous exoskeletons with jointed appendages and metameric segmentation. The parapodia that are present in the phylum Annelida are primarily used for breathing and movement. Hence, Parapodia is not present in the phylum Arthropoda.

519. Statement 1- Arthropoda is largest phylum of Animalia which includes insects.
Statement 2- Over one-fourth of all named species on earth are arthropods

(a) Both statements 1 and 2 are correct and statement 2 is the correct explanation of statement1.
(b) Both statement 1 and 2 are correct but statement 2 is not the correct explanation of statement 1.
(c) Statement 1 is correct and statement 2 is incorrect
(d) Both statements 1 and 2 are incorrect

AP EAMCET-25.09.2020 Shift-I

Ans. (c) : Arthropoda is the largest phylum of Animalia which includes insects. Over two-third of all named species on earth are Arthropods. The body of Arthropods is covered by chitinous exoskeleton.

@apna_pdf

520. Match the following:

Sclerite	Location on the head of Cockroach
(A)Vertex	(I) Cheek Sclerite
(B) Frons	(II) Sclerite bordering the occipital foramen
(C) Clypeus	(III) Front large sclerite
(D) Gena	(IV) Narrow rectangular sclerite
	(V) Top of the head

The correct match is

	A	B	C	D
(a)	V	III	IV	I
(b)	III	II	V	IV
(c)	V	I	IV	III
(d)	III	IV	II	I

TS EAMCET-29.09.2020 Shift-II

Ans. (a) :

Vertex – Top of the head
Frons – Front large sclerite
Clypeus – Narrow rectangular sclerite
Gena – Cheek sclerite

521. Male larva of silkworm possesses:

(a) Ishiwata's gland (b) Herold's gland
(c) Green gland (d) Pineal gland

Tripura JEE-2019

Ans. (b) : Male silkworm larvae have a milky white patch called the **Herold gland** that is located between segments 8 and 9 ventrally. In the female, there are two milky white patches on segments 8 and 9, which are referred to as the fore and hind glands, respectively.

522. Match the following lists:

	List-I		List-II
A	Lepidopterans	i	Cry II Ab
B	Coleopterans	ii	Flies, mosquitoes
C	Dipterans	iii	CryI Ab
D	Corn borer	iv	Tobacco budworm, Army worm
		v	Beetles

The correct match is:

	(A)	(B)	(C)	(D)
(a)	v	ii	iv	iii
(b)	iii	ii	i	v
(c)	v	iv	i	iii
(d)	iv	v	ii	iii

TS EAMCET-09.05.2019 Shift-I

Ans.(d):

List - I	List-II
(A) Lepidopterans	tobacco budworm,worm army
(B) Coleopterans	Beetles
(C) Dipterans	Flies, Mosquitoes
(D) Corn borer	Cry I Ab

523. The muscles associated with the heart of insects are:

(a) alary (b) radial
(c) striped (d) pericardial

AP EAMCET-1998 / Punjab MET-2019

Ans. (a) : Alary muscles are associated with the heart of insects. An insect's dorsal diaphragm is located beneath the heart. The dorsal diaphragm is linked to 12 pairs of alary muscles. These muscles support the heart's normal operation.

524. Choose correct option for larva of housefly:

(a) Grub (b) Cypris
(c) Maggot (d) Wriggler

JIPMER-2019 / JCECE-2009
DU MET-2004

Ans. (c) : A maggot is a housefly larva. In contrast to larvae of the Nematocera, such as mosquitoes and crane flies, it is specifically used for the larva of cheese flies and blowflies. Typically, grubs are used to describe beetle larvae. The barnacle's final larval stage is called a cypris larva. A mosquito's aquatic larva is called a wriggler.

525. Trilobite larva is present in the development of

(a) Scolopendra (b) Limulus
(c) Palamnaeus (d) Palaemon

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Limulus is a taxonomic genus of the family limulidae, commonly known as horseshoe crabs or king crab. Morphologically, the horseshoe crabs look like crabs but they are more closely related to the arachnids. these animals are horsehoe-shaped and with a hard carapace and a spine-like tail. They have five pairs of appendages.

526. Which among the following belong to same phyla?

(a) Physalia, Obelia, Pleurobrachia – Coelenterata
(b) Bombyx, Palaemon, Limulus – Arthropoda
(c) Star fish, jelly fish, Sea urchin – Echinodermata
(d) Cattle fish, devil fish, Patella – Mollusca

AIIMS-26.05.2018 Shift-II

Ans. (b) : Bombyx, Palaemon, and Limulus all belongs to the Arthropoda.
It is the largest phylum of animals, which includes insects. The body is covered by a chitinous exoskeleton. The body is divided into three sections: the head, the thorax, and the abdomen. They have jointed appendages.

527. In insects, the respiratory system is classified on the basis of

(A) Number of spiracles
(B) Nature of spiracles
(C) Position of spiracles
(D) Structure of spiracles

Options:

(a) A, C (b) A, B
(c) A, D (d) B, D

AP EAMCET-28.04.2017 Shift-II

@apna_pdf

Ans. (b) : In insects, the respiratory system is classified based on the number and nature of spiracles. The largest number of spiracles found in insects is 10 pairs, 2 thoracic, and 8 abdominal.

528. Commercial silk is obtained from :
(a) cocoon/pupa
(b) caterpillar
(c) adult moth
(d) both egg and adult moth

MGIMS Wardha-2003

Ans. (a) : Mulberry silkworm (*Bombyx mori*) that produes silk in its cocoon. These silkworm's caterpillars eat the leaves of mulberries, and their salivary glands secrete liquid silk.
The larva's silk gland is created by modifying the salivary gland (labial gland). From the cocoon, silk is obtained. The cocoon is made of a single thread of silk that can be upto 1000 m long.

529. Lac is obtained from:
(a) Laccifer (b) Bombyx
(c) Dactylopius (d) Lytta

MGIMS Wardha-2003

Ans. (a) : A variety of Lac Insects species secrete a reddish brown resinous substance known as **Lac.** *Laccifer lacca,* an Indian Lac insect, is significant commercially, found banyan and other plants like Palas, Kusum, and Ber etc, in tropical or subtropical areas.

530. In honey bee royal jelly is secreted from:
(a) corp gland (b) wax gland
(c) pharyngeal gland (d) salivary gland

MGIMS Wardha-2003

Ans. (c) : Royal jelly in honey bees is secreted from the pharyngeal glands of young worker bees. It's a nutrients rich substance that serves as the main food for developing queen bee larvae.

531. Which of the following animal belongs to class Crustacea?
(a) Cockroach (b) Cyclops
(c) Grasshopper (d) Mosquito

WB JEE-2010
BCECE-2006

Ans. (b) : Cyclops belongs to class Crustacea.
They are class of organisms with flexible body, single eye and thick exoskeletons. Calcium carbonate shell makes up the exoskeleton. They can freely swim in water. They are related to crabs, shrimp, prawns, and other animals.
• Cockroach, Grasshopper and Mosquito belong to class Insecta.

532. The major excretory product of arthropods is:
(a) ammonia
(b) urea
(c) uric acid
(d) trimethylamine oxide

BVP-2010

Ans. (c) : The major excretory product of arthropods is uric acid. The harmful ammonia is changed into uric acid, which is a water-saving strategy well-suited for their environment before being expelled in birds, reptiles, and the majority of terrestrial arthropods; as a result, these species are known as uricotelic organisms.

533. Which of the following insect is economically useful?
(a) Laccifer lacca (b) Culex
(c) Musca (d) Dragon Fly

UP CPMT-2010

Ans. (a) The commercially grown Lac insect is called *Laccifer lacca* or *Tachardia lacca.*
On host plants like ber, kusum, palas, and other species, it is primarily cultivated in India and Bangladesh.
• Lac has finds many application-
(i) It is used for making toys that are used in plastics.
(ii) It is used for makings sealing wax and also used in gramophone records.
(iii). The most common byproduct of lac is nail-paint which is used as cosmetics.
(iv). The shell of lac is used in preparation of paints.
(v). Lac is commonly used in making the ink that is used in printers.
(vi). Lac is commonly used as insulating material.

534. Class of spider is:
(a) Reptilia (b) Araneae
(c) Arachnida (d) Neoptera

UP CPMT-2010
AMU-1998

Ans. (c) : Arachnida are a group of joint-legged invertebrate animals (Arthropods) that belong to the Chelicerata subphylum. Spiders, scorpions, ticks mites, camel spiders, and other Arachnids are among the group.

535. The largest phylum in respect of number of species is:
(a) Coelentrata (b) Arthropoda
(c) Protozoa (d) Porifera

UP CPMT-2003
DUMET-2005

Ans. (b) : The largest phylum is Arthropoda, which contains over nine lakh species. They could be parasitic, aquatic, and terrestrial. They have chitinous exoskeletons and appendages with joints. Arthropods are found in almost every habitat on earth and adapted to a wide range of ecological niche.

536. Butterfly belongs to:
(a) Homoptera (b) Procoptera
(c) Hemiptera (d) Lepidoptera

UP CPMT-2003
DUMET-2005

Ans. (d) : Lepidoptera is one of the most well-known and widely distributed insect orders in the world. The entire body of this order is covered in scales, and it possesses wings and a proboscis as well.

537. An insect without metamorphosis is:
(a) silver Fish (b) cray fish
(c) bedbug (d) pediculus

Uttarakhand PMT-2007

Ans. (a) : A biological process of physical development of an animal after birth that involves abrupt changes in the animal's body structure with the cell growth and differentiation is called **metamorphosis.**

@apna_pdf

• No metamorphosis occurs in the most primitive insects, like springtails and silverfish. The only change that takes place in these insects is an increase in size as the insect develops. Silver fish are unique Arthropods that develop through a process called a **metabolous metamorphosis.** This means no metamorphosis or transformation.

538. House-fly possesses:
(a) two pairs of wings
(b) one pair of wings
(c) three pairs of wings
(d) none of the above

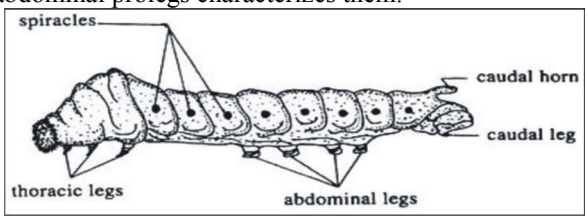
Uttarakhand PMT-2007

Ans. (b) : House-fly belongs to the order Diptera, which means "two wings". The single pair of wings is located on the middle segment of the three segmented thorax.

539. The larva of Bombyx mori is:
(a) cocoon (b) nymph
(c) caterpillar (d) trochophore

DUMET-2009 / Uttarakhand PMT-2007 BVP-2008

Ans. (c) : *Bombyx mori* is the scientific name for the **silkworm moth.** The larva of the silkworm is called a **caterpillar**. Caterpillars are the second stage in the life cycle of moth or butterfly. A long, cylindrical body with three pairs of jointed legs on the thorax and five pairs of abdominal prolegs characterizes them.



540. Which of the following respiratory organs are present in spiders and scorpions?
(a) Book lungs (b) Gills
(c) Gill books (d) Lungs

AFMC -2009

Ans. (a) : Spiders and scorpions have specialized respiratory organs called **book lungs**. These structures, found in their abdomens, allow for gas exchange similar to lungs. Book lungs help these arachnids to breathe on land.

541. The stages between larval moults in an insects are called:
(a) pupae (b) instars
(c) grubs (d) caterpillars

J&K CET-2012

Ans. (b) : The developmental stage of an Arthropods between moults is known as an **instar.** An insect is considered to be in its first instar after emerging from the egg. The next instar occurs after the insect moults, and so on. Both incomplete and complete metamorphosis in insects are referred to as an instar.

542. Which of the following is incorrect regarding insect ?
(a) Cephalization and unjointed appendages
(b) Chitinous exoskeleton and wings
(c) Cephalization and complete metamorphosis
(d) Well developed sensory organs and haemocoel

Rajasthan PMT-1998

Ans. (a) : Class Insecta also known as Hexapoda of phylum Arthropoda.
• Body is covered by chitinous exoskeleton.
• They show cephalization i.e, the ganglia, sensory organ and the mouth get concentrated in the head region forming a CNS.
• Complete metamorphosis contains 3 transformative stages.
• The sensory organs in insects are well developed and they have a circulatory system of open type in which the blood flows through the body cavity directly.
• This body cavity is known as the haemocoel.

543. Find out the correct pair of phylum example :
(a) Echinodermata - Cuttle Fish
(b) Arthropoda - Silver fish
(c) Pisces - Jelly fish
(d) Mollusca - Star fish

Rajasthan PMT-1998

Ans. (b) : A silverfish is a small, primitive insect belongs to order Zygentoma and class Insect. Its common name come from the animal's silver light grey color and the movement that resembles that of a fish.
• Cuttlefish is a marine animal belonging to the phylum Mollusca.
• Starfish is a star-shaped echinoderm belonging to the phylum Echinodermata.
• Jelly-fish is free-swimming marine animal with umbrella-shaped bells belonging to the phylum Cnidaria.

544. Which insect is useful for us ?
(a) Periplanata (b) Musca
(c) Bombyx (d) Mosquitoes

MGIMS Wardha-2005

Ans. (c) : Bombyx mori "Mulberry silk moth" is an insect that produces silk.
It is commercially significant because it is the main source of silk fiber. These are monophagous species that feed only on mulberry leaves, and they're originated in Northern China.

545. Identify the correct match between List-I and List-II :

List-I (Insect parts)	List – II (Peculiarity of mouth)
A. Laccifer	1. Elongated gales well developed
B. Musca	2. Mandibles
C. Beetle	3. Saw-like maxillae
D. Moth	4. Pseudotrachae
	5. Vestigeal mandibles

The correct match is:

	A	B	C	D
(a)	5	4	2	1
(b)	3	4	5	1
(c)	1	2	3	4
(d)	3	4	2	1

AP EAMCET-2004

@apna_pdf

Ans. (d) :

A. Laccifer	(3) Saw-like maxillae
B. Musca	(4) Pseudotrachae
C. Beetle	(2) Mandibles
D. Moth	(1) Elongated gales well developed

546. Common characteristics of mosquitoes, houseflies and cockroaches are :
(a) one pair each of wings and halters
(b) three pair of legs and one pair of developed wings
(c) two pair of legs and two compound eyes
(d) compound and simple eyes

Rajasthan PMT-2011
Haryana PMT-2004

Ans. (b) : These insects (mosquitoes, houseflies and cockroaches) are the organism which are belonging to the group of Arthropoda.
- These organisms have 3 pair of legs and one pair of developed wings.
- The body is composed of 3 parts known as head, thorax and abdomen.
- They have two antennae in the head region which are the sensors for smell or olfaction.
- They have compound pair of eyes which are called as ocelli.

547. Termites cannot digest cellulose of wood in the absence of:
(a) trichonympha (b) trichomonas
(c) mycobacterium (d) pulvinus bird

AP EAMCET-2002, 2001

Ans. (a) : *Trichonympha* is a zooflagellate found in termite guts that digests cellulose. It secretes β-glucosidases, which is cellulose-digesting enzymes that break down cellulose into glucose.
The termites starve to death in the absence of Trichonympha.

548. Arthropods are characterized by:
(a) jointed appendages
(b) open blood vascular system
(c) triploblastic
(d) All of the above

AMU-2005
Manipal-2003
J & K CET-2012

Ans. (d) : Phylum Arthropoda is characterized by the following features -
(i) Their body is triploblastic, coelomate, bilaterally symmetrical and metamerically segmented.
(ii) Each thoracic segment has a pair of jointed legs used for locomotion, feeding or sensory purpose.
(iii) They possess a chitinous exoskeleton that undergoes periodic moulting.

549. Which one is a neem product used as insect repellent ?
(a) Azadirachtin (b) Rotenone
(c) Parathion (d) Endrin

AFMC-2004

Ans. (a) : Azadirachtin, a limonoid-group chemical molecule that serves as an insect repellant, is a secondary metabolite found in the neem seeds and it is considered as low toxic.

550. Sericteris (silk gland) are modified:
(a) Intestinal gland (b) Gastric gland
(c) Salivary gland (d) Endocrine gland

VMMC-2008

Ans. (c) : Sericteris, silk glands, found in spider and certain insects, are modified salivary glands that produce silk. This silk helps in building webs, making egg sacs, and movemenent. Silk glands are located in the abdomen and spiders use spinnerets to manipulate and spin silk fibers for various purposes.

551. Ants belong to order:
(a) Lepidoptera (b) Rhizopoda
(c) Arthropoda (d) Hymenoptera

BVP-2013

Ans. (d) : Ants belongs to the order Hymenoptera, which includes bees wasps, and sawflies. Hymenopterans have two pairs of wings exhibit social behaviors, and are important pollinators. They are known for their diverse roles within colonies ad their stinging ability.

552. Blood does not transport oxygen in:
(a) earthworm (b) pigeon
(c) cockroach (d) hirudinaria

BVP-2013

Ans. (c) : Cockroaches do not use hemoglobin to carry oxygen, hence they do not have red blood. Their blood stream does not carry oxygen either. Hence a cockroach has colorless blood. Blood of cockroaches hemolymph a clear fluid that lacks haemoglobin. The hemolymph is cockroaches primarily serves as a means of nutrient transport and waste removal.
- Colourless blood is mainly founds in male cockroaches, while the female cockroaches may have orange coloured blood.

553. Apis dorsata refers to:
(a) rock bee (b) little bee
(c) Indian bee (d) European bee

BVP-2012

Ans. (a) : *Apis dorsata* also known as **giant honey bee or rock honey bee.** This species is noticeable larger and longer in shape than another honeybees, compared to the common honeybee, they might appear more brighter and more striking in color.

554. Study of ticks and mites is:
(a) Acarology (b) Entomology
(c) Malacology (d) Carcinology

Manipal-2010

Ans. (a) : The study of ticks and mites, which are small Arthropods that belong to the class Archnida is called as **Acarology.**
- **Entomology :** The study of insects.
- **Malacology :** The study of molluscks, such as snails and clams.
- **Carcinology :** The study of crustaceans, such as crabs and lobsters.

@apna_pdf

555. Excretory product of spider is:
(a) uric acid (b) ammonia
(c) guanine (d) none of the above
CMC Vellore-2009
UP CPMT-2009, 2007

Ans. (c) : Spiders excrete guanine as a waste product. Guanine is a nitrogenous base that is a component of DNA and RNA, and spiders excrete it as white, powdery substances.

556. Excretory organ of spider is :
(a) coxal gland (b) flame cells
(c) Malpighian tubule (d) nephridia
BCECE-2004

Ans. (a) : In some Arthropods, the coxal gland is a pair of excretory organs that includes an end sac that is located in the prosoma and is accessible to the environment at the coxae of the walking legs. It is a tubule where the first urine is collected and where secretion and reabsorption may occur. It is present in spiders.
- **Flame cell -** Flame cell/solenocytes are the cheif excretory structure of Platyhelminthes.
- **Malpighian tubule** are excretory organs of insects. These are lying almost freely in haemocoel and open into alimentary canal.
- **Nephridia** are an invertebrate organ that is found in pairs and serves a similar purpose to the kidneys of vertebrates. It eliminates metabolic waste from an animal's body.

557 The development of adult characteristics in a moulting insect is promoted by:
(a) thyroxine
(b) ecdysone
(c) pheromone
(d) juvenile hormone
Uttarakhand-2005

Ans. (b) : The development of adult characteristics in a moulting insect is promoted by ecdysone.
Ecdysone, a steroid hormone released by the prothoracic gland, accelerates insect metamorphosis and controls moulting when it is active.

558. In which of these animals, antennal gland functions as excretory organ?
(a) Human being (b) Cockroach
(c) Planaria (d) Prawn
(e) Earthworm
Kerala PMT-2008

Ans. (d) : The excretory organs in prawns are called **antennary glands or "green glands"** because they are situated close to the base of the larger antennae. Antennal gland functions as excretory organ in prawn.
- The excretory organ of the human is kidney
- The excretory organ of cockroach is Malpighian tubules.
- The excretory organ of Planaria is flame cells.
- The excretory organ of earthworm is Nephrida.

559. Limulus belongs to:
(a) Chilopoda (b) Crustacea
(c) Arachnida (d) Merostomata
BVP-2001

Ans. (d) : Horseshoe crabs (Limulus) belongs to the phylum Arthropoda, come under the class Merostomata, a primitive class of animal that first appeared in the early Cambrian, includes these horseshoe crabs. They currently make up a very small group, consisting of three genera and four species.

560. Heamocyanin is found in :
(a) Nereis (b) Leech
(c) Earthworm (d) Prawn
BVP-2000

Ans. (d) : Heamocyanin is a blue, copper-containing respiratory pigment found in Crustaceans and Molluscs. Most of the prawns are free living aquatic species while some can be terrestrial or parasitic. They have an open circulatory system and contain haemocyanin making their blood appear blue in colour.

561. Match column I with column II for housefly classification and select the correct option using the codes given below:

Column I	Column II
A. Family	**1. Diptera**
B. Order	**2. Arthropoda**
C. Class	**3. Muscidae**
D. Phylum	**4. Insecta**

(a) A-3 B-1 C-4D-2 (b) A-3 B-2 C-4 D-1
(c) A-4 B-3 C-2 D-1 (d) A-4 B-2 C-1 D-3
NEET-2016 Phase-II

Ans. (a) : Phylum – Arthropoda
Class – Insecta
Order – Diptera
Family – Muscidae

562. Which of the following are correctly matched with respect to their taxonomic classification?
(a) Spiny anteater, sea urchin, sea cucumber – Echinodermata
(b) Flying fish, cuttlefish, silverfish – Pisces
(c) Centipede, millipede, spider, scorpion - Insecta
(d) House fly, butterfly, tsetse fly, silverfish - Insecta
NEET-2013

Ans. (d) : All these organisms belong to the phylum Insecta. This category of phylum includes organisms that have three pairs of legs attached to a segmented body. From the above option, the correct matching of organisms with their taxonomic classification is Houseflies, butterflies, tsetse flies, and silverfish insects.

563. Which group of animals belongs to the same phylum?
(a) Sponge, Sea anemone, Starfish
(b) Malarial Parasite, Amoeba, Mosquito
(c) Earthworm, Pinworm, Tapeworm
(d) Prawn, Scorpion, Locusta
NEET-2013

Ans. (d) : Prawns, scorpions, and locusts belong to the same phylum. The prawn belongs to the phylum Arthropoda. It is consumed by humans as nutritious and

@apna_pdf

tasteful food. Scorpions also belong to the phylum Arthropoda. Their bodies are divided into segments and covered with a cuticle consisting of chitin and tanned protein. The locust also belongs to the phylum Arthropoda. The phylum Arthropoda consists of invertebrate animals having an exoskeleton, a segmented body, and paired jointed appendages.

564. 3- segmented club shaped maxillary pulp is present in:
(a) male Culex (b) male Anopheles
(c) female Culex (d) female Anopheles
UP CPMT-2007

Ans. (b) : The three-segmented club-shaped maxillary palp is present in male Anopheles mosquitoes.
The maxillary palps are a pair of appendages that project from the sides of the mosquitos head. They are used for tasting, touching, and grasping. In male Anopheles mosquitoes, the maxillary palps are three-segmented and club-shaped. This helps them to grasp the female mosquito during mating.

565. Daphnia is commonly know as
(a) clam shrimp (b) fairy shrimp
(c) water fleas (d) tadpole shrimp
UP CPMT-2007

Ans. (c) : Water fleas are the common name for Daphnia. Daphnia is a planktonic crustacean of the family Daphnidae. It is a freshwater flea

566. Moulting hormone is secreted by
(a) corpora cardiacum
(b) prothoracic gland
(c) corpora allata
(d) neurosecretory hormone
JIPMER-2005, 2008

Ans. (b) : Moulting hormone is secreted by **prothoracic gland**. The prothoracic gland is also known as the **molting gland**. The molting hormone affects many cells throughout the body, but its principle function is to stimulate a series of physiological events that lead to the synthesis of a new exoskeleton. The hormone secreted from the prothoracic gland is ecdysone, which is known as the molting hormone.

567. Which one feature is common to leech, cockroach and scorpion?
(a) Nephridia (b) Ventral nerve cord
(c) Cephalization (d) Antennae
AIIMS-2009

Ans. (b) : The central nervous system of invertebrates is primarily composed of the ventral nerve cord. It serves the same purpose as the vertebrate spinal cord. Signaling from the brain to the body is coordinated through the ventral nerve cord. Arthropods and Annelids both have a ventral nerve cord that runs beneath the gut and connects to the central ganglia. While the ventral nerve cord in Arthropods is related to the brain in the head area, it is attached to the cerebral ganglion in Annelids.

568. Which one of the following is referred as 'living fossils'?
(a) Sarcoptes (b) Daphnia
(c) Limulus (d) Balanus
AIIMS-2015

Ans. (c) : *Limulus* is a genus of horseshoe crab. It is an living fossil, belonging to the phylum Arthropoda, family Limulidae, and genus Limulus. The horseshoe crab is considered a living fossil because it is one of the very few animals that are still around, and we can find fossils of it dating back 500 million years.

569. What is common among silverfish, scorpion, crab and honey bee?
(a) jointed legs (b) Metamorphosis
(c) Compound eyes (d) Poison glands
AIPMT-1997
Haryana PMT-2000

Ans. (a) : Arthropods mean jointed appendages. Silverfish, scorpions, crabs, and honey bees belong to the phylum Arthropoda and have jointed legs. The phylum Arthropoda is the largest in the kingdom Animalia.

570. Insects eggs are :
(a) microlecithal and centrolecithal
(b) megalecithal and isolecithal
(c) megalecithal and centrolecithal
(d) megalecithal and telolacithal
Punjab MET-2006

Ans. (c) : Eggs with a lot of yolk are referred to as megalecithal. It's the characteristic of insects. Eggs having cytoplasm surrounding the distribution of the egg in the center, or centrolecithal eggs, are those. It's a property of insects.

571. Superficial meroblastic cleavage occurs in
(a) reptiles (b) birds
(c) mammals (d) insects
JCECE-2007

Ans. (d) : Arthropods that are centrolecithal show superficial cleavage. A meroblastic cleavage that combines mitosis and cytokinesis and causes an important amount of nuclei to go to the centrolecithal egg's periphery. Most inscet eggs undergo superficial cleavage.

572. Mosquito:
(a) Omnivores (b) Sanguivores
(c) Frugivores (d) Carrion Eater
Manipal-2002

Ans. (b) : Mosquito are sanguivors. Sanguivores are creatures who feed on or consume the blood of other creatures.
- Mosquito is a example of sanguivores. A frugivore is an animal that is heavily reliant on fruits.
- An Omnivores is an organism that routinely consumes a range of materials, including bears, birds, and even humans.

573. Cray fish is a
(a) crustacean animal (b) edible fish
(c) poisonous fish (d) None of the above
CG PMT-2005

Ans. (a) : Cray fish is a crustacean animal. The scientific term for crayfish, which are freshwater crustaceans and members of the group Astacidea, is Astacus.

@apna_pdf

574. The scientific name of the moth which produce tasar is

(a) Bombyx mori
(b) Antheraea mylitta
(c) Antheraea assamensis
(d) Philosomia ricini

MPPMT-2013
WB JEE-2011

Ans. (b) : The scientific name tasar silk is *Antherae mylitta*.
• Tasar in untamed, wild and forest based silk.

Silkmoth		**Common name**
Bombyx mori	–	Silk worm moth
Antheraea mylitta	–	Tasar silk worm
Antheraea assamensis	–	Muga silk worm
Philosamia ricini–		Erisilk worm

575. Mouth parts of housefly are:

(a) siphoning type
(b) sponging and sucking type
(c) biting and chewing
(d) piercing and sucking

DUMET-2006

Ans. (b) : The mouth parts of houseflies are sponging and sucking types. This type of mouthpiece is used for sucking up liquid or semiliquid food.

576. Which one of the following groups of three animals each is correctly matched with their are characteristic morphological feature?

(a)

Animal	Morphological feature
Scorpion, spider cockroach	Ventral solid central

(b)

Animal	Morphological feature
Cockroach, locust taneia	Metameric segmentation

(c)

Animal	Morphological feature
Liver fluke sea anymone	Bilateral symmetry

(d)

Animal	Morphological feature
Centipede, prawn sea urchin	Jointed appendages

(e)

Animal	Morphological feature
Hook worm, spider	Central nervous system

CMC Vellore-2015

Ans. (a) : The cockroach, spider, and scorpion have a ventral solid central nervous system. They are invertebrates and belong to the phylum Arthropoda. Thus, this is correctly matched. In Taenia, the body is with true segmentation. Taenia is a flat worms and does not exhibt metameric segmentation. Radial symmetry is present in sea anemones but liver fluke has bilateral sysmmmetry. Centipede and prawn have jointed appendages. The joint appendages are absent in sea urchins.

577. Which of the following animals is mostly used in genetics engineering ?

(a) Butterfly (b) Fruit fly
(c) Housefly (d) Dragonfly

DUMET-2005

Ans. (b) : Fruit fly is mostly used in genetics engineering. *Drosophila melanogaster* is known as the fruit fly. Genetic engineering is a branch of science that uses a set of biotechnology techniques to manipulate an organism's genome to create species with desirable traits

578. Cantharidin is obtained from:

(a) Red ants (b) Ball weevils
(c) Beetles (d) Honey bees

MP PMT-2013

Ans. (c) : Cantharidin is obtained from Beetles. It is a toxic monoterpene extracted from coleoptera beetles commonly known as **Spanish flies.**
• Cantharidin is a defensive secretion of meloid beetles.

579. Direction: In the given questions a statement of Assertion (A) is given and a corresponding statement of Reason (R) is given just below it of the statement, mark the correct answer as: Assertion : Compound eyes are found in many Arthropods.
Reason: Each compound eye consists of a large number of visual structures called ommatidia.

(a) If both (A) and (R) true and (R) is the correct explanation of (A)
(b) If both (A) and (R) are true but (R) is not correct explanation of (A)
(c) If (A) is true but (R) is false
(d) If both (A) and (R) are false
(e) If (A) is false but (R) is true

Haryana PMT-2001

Ans. (a): Since Arthropods eyes are composed of repeating components, termed ommatidia, each of which serves as a separate vision receptor, they are known as compound eyes.

580. Insects have:

(a) 3 pairs of legs (b) 4 pairs of legs
(c) 5 pairs of legs (d) None of these

J&K CET-2001
AFMC-2005

Ans. (a) : Insects have three pairs of legs, six legs, and two antennae, and their bodies are divided into three main parts: the head, thorax, and abdomen.

581. Oak silkwrom is :

(a) Antheraea roylei (b) Apis florea
(c) Bombyx mori (d) Clarias batrachus

BCECE-2001

Ans. (a) : *Antheraea roylei* is known as oak silkworm. This silkworm is raised in chain for its silk. It is non-mulberry silk. The caterpillar feed on the leaves of the oak plant.

582. Which is non-poisonous?

(a) Spider (b) Scorpion
(c) Centipede (d) Crab

CG PMT-2004

@apna_pdf

Ans. (d) : The crabs are not poisonous. Spiders are highly venomous, and a small amount of venom can cause serious illness. Scorpion species pass venom and use it to kill or paralyze their prey. Their venom consists of neurotoxins that affect the nervous system of prey. Centipedes are arthropods. Venom is produced by a gland at the base of the fangs. Venom includes chemicals that cause allergic reactions; they have cardio-depressant toxin-S.

583. In honey which of the following sugar is present?
(a) Glucose (b) Glycogen
(c) Sucrose (d) Cellulose

Haryana PMT-2000

Ans. (a) : Honey is approximately 40% fructose, 30% glucose and 17% water with the remaining being other sugar, carbohydrates and a small amount of vitamins and minerals.

584. Haemocoel is found in
(a) Hydra and Aurelia
(b) Taenia and Ascaris
(c) Cockroach and Pila
(d) Balanoglossus and Herdmania

Manipal-2008

Ans. (c) : The animals belonging to phylum Arthropoda and Mollusca have haemocoel. True coelome is present in which blood is filled. Cockroach belongs to the phylum Arthropoda while Pila is a Mollusca animal.

585. Which of the following taxonomic category of housefly is wrongly matched ?
(a) Genus – Musca
(b) Family – Muscidae
(c) Order – Primata
(d) Class – Insecta
(e) Phylum – Arthropoda

Kerala PMT-2013

Ans. (c) :
Phylum – Arthropoda
Class – Insecta
Order – Diptera
Family – Muscide
Genus – Musca

586. Complete metamorphosis is found in:
(a) house-fly and mosquito
(b) house-fly and cockroach
(c) mosquito and cockroach
(d) none of the above

Rajasthan PMT-2005

Ans. (a) : Complete metamorphosis is found in house-fly and mosquito both housefly and mosquito come under order Diptera of class Insecta, such as beetles, bees, ants, butterflies, moths, flies and mosquitoes.

587. What is true about Nereis, Scorpion, Cockroach and Silver fish ?
(a) They all belong to the same phylum
(b) They all have jointed paired appendages
(c) They all possess dorsal heart
(d) None of them is aquatic

AIPMT-2007

Ans. (c) : All invertebrates possess dorsal heart. Nereis is a member of the phylum Annelida's and Scorpions, cockroaches, and silverfish is members of the phylum Arthropoda. they all are invertebrates.

588. Which one of the following pairs is mismatched?
(a) Bombyx mori – Silk
(b) Pila globosa – Pearl
(c) Apis indica – Honey
(d) Kerria lacca – Lac

AIPMT-2007

Ans. (b) : An aquatic gastropod Mollusca called *Pila globosa* is a kind of freshwater snail with an operculum.
• *Bombyx mori,* produces a larvae or caterpillar known as the silkworm. Being the main producer of silk, it is an insect of significant economic importance.
• The Asian honeybee, *Apis indica*, is a subspecies of the Indian honeybee.
• The family Kerridae, also known as the lac insects, includes the insect species *Kerria lacca*.

589. A dorsal horn is present on the ..... of mulberry silk worm (caterpillar).
(a) 8^{th} abdominal segment
(b) 5^{th} abdominal segment
(c) 2^{nd} thoracic segment
(d) Head

Karnataka CET-2009
Manipur-2009

Ans. (a) : The Arthropoda class includes the silkworm. The abdomen of the body has various sections. 11 bodily segments make up the abdomen. On the eighth segment, there is a small dorsal horn and a row of spiracles on the lateral sides.

590. Which of the following have biting and chewing type of mouth parts?
(1) Cimex (2) Larvae of silk moth
(3) Larvae of butterfly (4) Grasshopper
(5) Tse-Tse fly
(a) 2, 4, 5 (b) 2, 5, 4
(c) 1, 2, 4 (d) 3, 4, 5

AP EAMCET-2007

Ans. (a) : Biting and chewing types of mouth parts are found in cockroaches, grasshoppers, locust termites, wasps, book and bird lice, larvae of silk moths, Tse-Tse flies, etc. The mouthparts are developed to suit its habit of feeding on solid food, and as a result, it has well-developed mandibles.

591. Match the following

List I		List II
(A) Green glands	**1.**	**Scolopendra**
(B) Amphids and phasmids	**2.**	**Respiratory organ**
(C) Ctenidia	**3.**	**Shell protein**
(D) Poison claw	**4.**	**Excretory organs**
(E) Concholin	**5.**	**Sense organs**

@apna_pdf

The correct match is

	A	B	C	D	E
(a)	4	5	2	1	3
(b)	1	3	4	5	2
(c)	2	4	5	3	1
(d)	3	4	5	2	1

AP EAMCET-2009

Ans. (a) :

	List I		List II
(A)	Green glands	-	Excretory organs
(B)	Amphids and Phasmid	-	Sense organs
(C)	Ctenidia	-	Respiratory organ.
(D)	Poison Claw	-	Scolopendra
(E)	Concholin	-	Shell protein

592. Bombykol or gyplure is a

(a) drug (b) hormone
(c) antibiotic (d) pheromone

AMU-2007

Ans. (d) : Bombykol or gyplure is a **pheromone.** Pheromone are substances that insects and other animals use to communicate. Female silkworm moths use them to draw in males, for example, these chemical signals are sent by insects to either find food or attract partners. For instance, the natural silk moths of the species *Bombyx mandarina* employ the chemical bombykol.

593. In the life cycle of mosquito, comma-shaped stage is

(a) larval stage (b) pupal stage
(c) imago stage (d) None of these

Uttarakhand PMT-2008
Manipal-2008
BVP-2012

Ans. (b) : In the life cycle of mosquito, comma shaped stage is **pupal stage**. It is the third stage of the life cycle of mosquitoes. Pupal transfer into adult flying mosquitoes and lay their eggs within water filled containers.

594. Match the following with reference to eye of insect

	List-I		List-II
(A)	**Apposition image**	**(I)**	**Secrete crystalline cone**
(B)	**Dioptrical region**	**(II)**	**Refractive region of an ommatidium**
(C)	**Retinulae**	**(III)**	**Region having cornea and crystalline cone**
(D)	**Vitrella**	**(IV)**	**Houseflies**
(E)	**Cornea**	**(V)**	**Photoreceptor cells**

The correct match is

(a) A-V, B-IV, C-III, D-I, E-II
(b) A-IV, B-III, C-V, D-I, E-II
(c) A-III, B-II, C-IV, D-V, E-I
(d) A-IV, B-V, C-III, D-II, E-I

TS EAMCET-2015

Ans. (b) :

List-I	List-II
Apposition image	Houseflies
Dioptrical region	Region having cornea and crystalline cone
Retinulae	Photoreceptor cells
Vitrella	Secrete crystalline cone
Cornea	Refractive region of an ommatidium

595. Entomology is concerned with the study of:

(a) Agricultural practices
(b) Formation and properties of soil
(c) Various aspects of insects
(d) Various aspects of human life

Karnataka CET-2005

Ans. (c) : Entomology is a branch of biology that deals with the study of various aspects of insects. There are many branches of entomology, like apiculture, acarology, applied entomology, etc.

596. Which of the following features is not present in the Phylum - Arthropoda

(a) Jointed appendages
(b) Chitinous exoskeleton
(c) Metameric segmentation
(d) Parapodia

NEET-2016 Phase-I

Ans. (d) : Parapodia is a characteristic of Annelida, which is not present in the phylum-Arthropoda.
Arthropoda are bilaterally symmetrical, triploblastic, matameric segmentation and coelomate animals, The body of arthropods is covered by chitinous exoskeleton.

597. Bilateral symmetry, metameric segmentation, coelom and open circulatory system are the features of

(a) Annelida (b) Arthropoda
(c) Mollusca (d) Echinodermata

JIPMER-2012

Ans. (b) : The members of phylum - Arthropoda show bilateral symmetry, three germ layers in body wall, external metamerism, jointed and paired appendages, haemocoel and open type of circulatory system with dorsal heart.

598. The endocrine gland of insects, which secretes the juvenile hormone, is

(a) corpora albicans (b) corpora allata
(c) corpora myecaena (d) all of these

AIIMS-1997

Ans. (b) : The endocrine gland of insects that secretes the juvenile hormone is the corpora allata. Juvenile hormone inhibits metamorphosis in insects which produced by corpora allata, which are a pair of small gland located behind brain.
Corpora albicans and corpora myecaena are not endocrine glands.

@apna_pdf

599. Assertion (A) : Daphnia populations in a water body, at different seasons of an year showed market variations in their body morphology
Reason (R): Cyclomorphosis in some planktonic organisms is influenced by the variations in temperatures prevailing in their water bodies at different seasons.
(a) Both (A) and (R) are true and (R) explains (A)
(b) Both (A) and (R) are true but (R) cannot explain (A)
(c) Only (A) is correct but not (R)
(d) Both (A) and (R) are wrong

AP EAMCET-2007

Ans. (a) :
• Daphnia, a genus of small planktonic crustacean
• Cyclomorphosis (cyclic change in morphology) is the occurrence of seasonal changes in the phenotype of an organism through successive generations. It occurs in small aquatic invertebrates like Daphnia. Here Cyclomorphosis is influenced by the variations in temperature prevailing in the water bodies at different seasons.
The morphology depend upon the temperature variation in water. So, at different seasons of the year the Daphnia shows different morphology.

600. The organs that assist in sound production in mosquito are
(a) Hairy appendages (b) Mouth parts
(c) Hemielytra (d) Halters

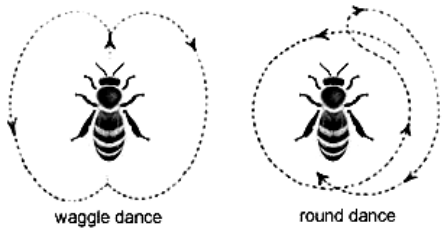
AP EAMCET-2007

Ans. (d) : In flies and mosquito , metathorax bears a pair of small drumstick shaped or club shapeded processes called halters or balancers.
Halters help balancing and improve flight. They are flapped rapidly and work as gyroscopes, telling the insect about its body position during flight. Every vibrating object tends to maintains its plane of vibration, a result of the carioles effects.

601. Which statement is correct:
(a) Apis indica is largest wild honey bee
(b) Wax is waste material of honey bee
(c) K.V. Fritsch discovered the transmission methods in honey bee
(d) Drone of honey bee is diploid

AIPMT-2000

Ans. (c) : Karl Von Fritsch (1967) discovered the transmission methods in the honey bee. He found that viruses can be transmitted between bees through direct contact: He also found that viruses can be transmitted from the queen bee to her offspring.
The largest wild honey bee is Apis dorsata laboriasa.
Drones of honey bee are haploid.
He observed the dance language used by honey bees to communicate the location of food sources.

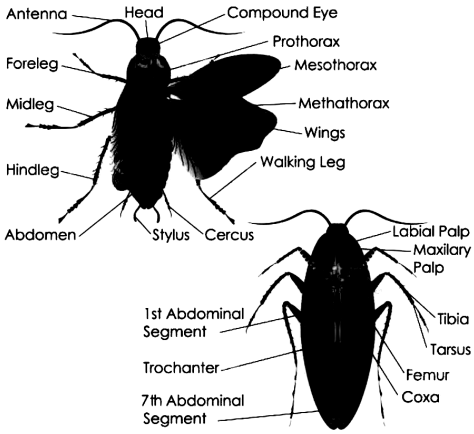


• **Drones of the honey bee are haploid**.

602. Select the correct statement from the ones given below with respect to Periplaneta Americana:
(a) There are 16 very long Malpighian tubules present at the junctions of midgut and hindgut/
(b) Grinding of food is carried out only by the mouth parts
(c) Nervous system located dorsally, consists of segmentally arranged ganglia joined by a pair of longitudinal connectives
(d) Males bear a pair of short thread like anal styles

AIPMT (Screening)-2012

Ans. (d) :



In male cockroach, from the sides of the 9th sternum, there arises, a paired, small unjointed outgrowth called anal styles.
• These are structure sensitive to touch.
• These are absent in female cockroach.
• Nervous system is located ventrally. There are 100 – 150 Malpighian tubules.
• Grinding of food is carried out by mouth parts and Gizzard.

603. Which one of the following is one of the paths followed by air/O_2 during respiration in an adult male *Periplaneta americana* as it enters the animal body?
(a) Hypopharynx, mouth, pharynx, trachea, tissues
(b) Spiracle in metathorax, trachea, tracheoles, oxygen diffuses into cells

@apna_pdf

(c) Mouth, bronchial tube, trachea, oxygen enters cells
(d) Spiracles in prothorax, tracheoles, trachea, oxygen diffuses into cells

NEET (Karnataka)-2013

Ans. (b) : The number of spiracles in cockroach having 10-pairs (2-pairs in thoracic and 8-pairs in abdominal region). In periplaneta Americana respiration takes place by spiracles.

- The thoracic pairs of spiracles are present on pleuron between prothorax – mesothorax and metathorax. Each spiracle open into a chamber called atrium. After atrium the tracheal tube ramifies into fine branches of tracheae, and then tracheoles.

604. Select the correct option with respect to cockroaches

(a) The fore wings are tegmina which are used in flight
(b) Malpighian tubules convert nitrogenous wastes into urea
(c) Males bear short anal styles not present in females
(d) Nervous system comprises of a dorsal nerve cord and ten pairs of ganglion

NEET (Karnataka)-2013

Ans. (c) : In cockroaches, male have paired anal styles on 9^{th} abdominal sternite, which are absent in females. It helps in holding female during copulation.

Fore wings (Mesothorasic) called tegmina are opague dark and leathery and cover the hind wings when at rest.

The hind wings are transparent, membranous and are used in flight.

- Malpighian tubules are main excretory organs which extract nitrogenous wastes and water from haemolymph and reabsorb certain salts, forming Uric acid crystals.
- Nervous system comprises of a ventral nerve cord and 10 pairs of ganglia. Forewings are highly sclerotised and are not used in flight purpose. They are used to protect the hindwings at rest.

605. Life span of worker Honey Bee

(a) 30 days (b) 15 days
(c) 45 days (d) 10 days

AIPMT-1999

Ans. (c) : The life span of worker honey bee is 45 days. When honey production is in full swing, worker honey bees only live for six weeks while they gather food, store nectar, feed larvae and produce honey.

606. Which one of the following have the highest number of species in nature

(a) Angiosperms (b) Fungi
(c) Insects (d) Birds

AIPMT (Screening)-2011

Ans. (c) : The all over insect species in world near about 5.5 million. Beetles belong to coleopteran insect order in which there are approximately 350,000 identified species.

607. Which fish selectively feed on larva of mosquito–

(a) Gambusia (b) Rohu
(c) Clarias (d) Exocoetus

AIPMT-2001

Ans. (a) : Gambusia affinis is regarded as a larvicidal fish as it selectively feeds on mosquito larva. It forms an effective tool for biological control of mosquitoes.

Their diet consists of Zooplankton, small insects and insect larvae, and detritus material. Gambusia feed on mosquito larvae at all stages of life.

608. Statement Biting and chewing mouth parts are the most primitive type of mouth parts in insects.

Reason Holometabolus insects have biting and chewing type of mouth parts in their larvae.

(a) Both Statement and Reason are correct and Reason is the correct explanation of Statement
(b) Both Statement and Reason are correct but Reason is not the correct explanation of Statement
(c) Statement is correct but Reason is wrong
(d) Statement is wrong but Reason is correct

AP EAMCET-2010

Ans. (b) : The Chewing type is considered the most basic one, since, it is common in many free living species (beet, ants etc) and consist of a large mandible and a pair of separate maxillae II (**i.e. labium**) Both type of maxillae, serve to push (he minced food partical into the mouth).

609. Which one of the following arthropods is viviparous?

(a) Palaemon (b) Palamnaeus
(c) Pediculus (d) Peripianeta

AP EAMCET-2010

Ans. (b) : The Scorpion are the oldest known terrestrial arthopods, about 800 Species have been describe some common genera are Palamnaeus are viviparous and the female carry the young one on thier back for some time.

Palaemon – Palaemon is probably **paraphyletic**. Palaemon **serratus** is a typical prawn with a cylindrical body composed of a carapace at the front and six abdominal segments, it is oviparous.

Pediculus – Pediculus is wingless and white to gray and long, dorsoventrally flattened segmented abdomen. It has 3 pairs of clawed leg. It is oviparous.

Periplaneta – The Periplaneta is largest species of common cockroach, and often considered a pest. It is also known as the **ship cockroach**. It is oviparous.

@apna_pdf

610. The larval stage of a harmful insect causing a cavity like pathological condition in human subcutaneous tissue is

(a) naiad (b) nymph
(c) maggot (d) wriggler

AP EAMCET-2008

Ans. (c) : Maggots or gentles are common name for the headless and legless fly larvae. Within human subcutaneous tissue, it results in a diseased state resembling a cavity.

611. Assertion (A): Super position images are formed in the nocturnal insects.

Reason (R): The retinulae lie immediately below the vitrellae and crystalline cone, these are surrounded by retinal sheath, which absorb the light rays hence, super position images are formed in nocturnal insects.

The correct answer is

(a) both (A) and (R) are true and (R) explains (A).
(b) both (A) and (R) are true but (R) cannot explains (A).
(c) only (A) is correct but (R) is wrong
(d) both (A) and (R) are wrong

AP EAMCET-2008

Ans. (c): The compound eye of cockroach (nocturnal insect) forms super position image. It is blue-red image and is due to overlapping of image.

612. Assertion (A) : Arthropoda are the most successful of all the known animal groups.

Reason (R) : Arthropoda exhibits the greatest adaptive radiation and have adapted to diverse habitats.

(a) both (A) and (R) are true and (R) explains (A).
(b) both (A) and (R) are true but (R) cannot explains (A).
(c) only (A) is correct but (R) is wrong
(d) both (A) and (R) are wrong

AP EAMCET-2008

Ans. (a) : Arthropoda are the most successful biological group of animals because they are the most diverse and live in greater range of habitats than do the member of any other phylum of animals. They have chitinous exoskeleton that protects the body.

613. Study the following

(A) It is a terrestrial arthropod.
(B) The prosoma bears a pair of chelicerae, a pair of the pedipalps and four pairs of walking legs
(C) The metasoma ends in a telson.
(D) First pair of walking legs are modified as poisonous claws.

Which of the above are true for heterometrus?

(a) A and C (b) A and B
(c) A and D (d) C and D

AP EAMCET-2008

Ans. (b) : Heterometrus (Giant forest scorpion) is a terrestrial arthopods. Its prosoma bear a pair of chelicerae, a pair of pedipalps and four pair of walking legs.

614. How do you differentiate a butterfly from a moth?

(a) Moth has one pair of wings but butterfly has two pairs of wings.
(b) Moth has feathery antennae but butterfly has club shaped antennae.
(c) Moth has simple eyes but butterfly has compound eyes.
(d) Moth is diurnal but butterfly is nocturnal.

Karnataka CET-2010

Ans. (b) : Butterflies tend to fold their wings vertically up over their back. Moths tends to fold their wing in a tent–like fashion that hide the abdomen. Butterflies are typically larger and have more colorful patterns on their wing. Moth are typically smaller with darb–colored wings.

615. In the insect which feeds on nectar the proboscis of formed by:

(a) Hypopharynx (b) Mandibles
(c) Glossa (d) Labrium

AP EAMCET-2005

Ans. (c): The insect which feeds on nectar the proboscis is formed by glossa. It is used for the gathering of honey. It is an organ of touch and taste.

616. The main excretory organ of prawn is:

(a) Green gland (b) Flame cell
(c) Malpighian tubule (d) Nephridia

AP EAMCET-2005

Ans. (a) : The main excretory organs of Prawn are paired green gland. They are located within the second antennae which are the second pair of appendages attached to the anterior part of the body. Each green gland consists of an end sac labyrinth and a bladder.

- **A flame cell** is a specialized excretory cell found in the simplest freshwater invertebrates, including flatworms, rotifers and nemerteans; these are the simplest animals to have a dedicated excretory system.
- **Malpighian tubule** system is a type of excretory and osmoregulatory system found in some insects like cockroach.
- **Nephridia** are the excretory organs present in annelids such as earthworm, flatworms, cephalochordate, and rotifers contain protonephridia of flame cells for osmoregulation.

@apna_pdf

617. Malpighian tubules are

(a) Excretory organs of insects
(b) Excretory organs of frog
(c) Respiratory organs of insects
(d) Endocrine glands of insects

JIPMER-2009

Ans. (a) : Malpighian tubules are the main osmoregulatory and excretory organs of insects and are considered analogous to the nephridia or kidneys, the corresponding organs of annelids and the vertebrates.

618. Class- Crustacea differs from Insecta in having

(a) two pairs of antennae
(b) jointed foot
(c) chitinous cuticle
(d) none of the above

UP CPMT-2005

Ans. (a) : Both crustaceans and insects are arthropods, which means they have a segmented body with a hard exoskeleton, jointed limbs and a chitinous cuticle.

Crustaceans have two pairs of antennae, while insects only have one pair.

Prawn, crab etc belong class crustacean while cockroach, grasshopper, bees belong insects.

619. Mandibles are absent in

(a) mosquito (b) housefly
(c) honeybee (d) butterfly

UP CPMT-2011

Ans. (b): Generally mandibles absent in houseflies. They have sponging mouth parts that are help in sucking up liquid or semi liquid food.

In mosquitoes, honeybees and butterflies have mandibles, which is essential for chewing food.

620. Which of the following belongs to class 1 Insecta?

(a) julus (b) silver fish
(c) lobsters (d) prawn

UP CPMT-2011

Ans. (b): • Silver fish belong to the phylum arthropoda because it is a type of insects silver fish are wingless insects mostly found in old books, newspaper etc.

• Julus is a type of millibede, which are not insects.

• Lobsters are crustaceans, which is an invertebrates.

• Prawn also belong class crustaceans.

621. Note the following

An insect whose mouth parts are biting and chewing type in the larval condition, while they are siphoning type in the adult and this insect gives an economically important substance during yet another stage of its development.

The insect is

(a) Anopheles (b) Laccifer
(c) Bombyx (d) Apis

AP EAMCET-2009

Ans. (c) : Bombyx- The caterpillar larvae of silkmoth (bombyx mori) are voracious feeder, so they have the continuous supply of food each caterpillar larvae has a mandibulate (biting and chewing) type of mouthparts adapted to feed easily on mulberry leaves while adult has siphoning type of mouth parts. Commercial silk is obtained from the cocoons of **Bombyx mori**.

Anopheles – Malaria is transmitted to humans by female mosquitoes of the genus **Anopheles**. Female mosquitoes take blood meals for egg production and these blood meals are the link between the human and the mosquito hosts in the parasite life cycle.

Laccifer – The **Indian lac insect Laccifer lacca** is important commercially. It is found in tropical or subtropical regions on banyan and other plants. The females are globular in form and live on twigs in cells of resin created by exudations of lac.

Apis – Apis mellifica is used for minor burns with an excessive amount of erythema, swelling and pain. The pain is relieved by the application of ice-cold compresses.

622. Which of the following is an insect ?

(a) Moth (b) Mites
(c) Prawn (d) scorpion

UP CPMT-2002

Ans. (a) : An insect is a small animal that has 6 legs. Most insects have six wings. Ants, moth, flies, butterflies all are insects. Mites are not real insect, they look like insect and belong to class arachnida.

623. Mouth part of mosquito is

(a) sucking and piercing type
(b) sponging type
(c) biting and chewing type
(d) None of the above

UP CPMT-2002

Ans. (a) : The piercing and sucking mouth parts are unusual features of the female mosquito

Sponging type- Found in Housefly and some other flies to suck up the liquefied food.

Biting and chewing type- This type mouth parts represent most primitive and unspecialised type which appeared in early insecets in course of evolution found in orthopteron insects ex. grasshoppers and Cockroches.

624. Scorpion belongs to a class which one of the following also belong?

(a) Ticks (b) Carbs
(c) Branicles (d) Cockroaches

BVP-2004

Ans. (a) : Scorpion and ticks belongs to class Arachnida of Phylum Arthropoda. they are short legged, round bodies mites. scorpions are with curled tails and have exoskeleton made of chitin Arachnida lack jaws and body divided into head, abdomen and cephalothorax Body show tergites & poison gland is present scorpion.

@apna_pdf

I. Mollusca

625. In Mollusca, eye is present over a stalk, called
(a) ostracum (b) operculum
(c) ommatophores (d) osphradium
UP CPMT-2012, 2008, 2007 / VMMC-2012
BCECE-2010 / JIPMER-2009
Rajasthan PMT-2008 / CG PMT-2008

Ans. (c) : The ommatophores of crustaceans are called ophthalmites.
The eye stalk which is a protrusion extending the eye in mollusca away from the body is known as Ommatophore. It appears like a stumpy peduncle, on which eyes are located in molluscs. This is helpful in providing a better field of vision to the organisms such as snails (molluscs). Molluscs have eyes varying from simple structure to complexier ones.

626. Osphradium of Pila globosa is:
(a) photoreceptor (b) chemoreceptor
(c) thermoreceptor (d) tangoreceptor
Punjab MET-2011 / VMMC-2010
AP EAMCET-2005 / DU MET-2004
Manipal-2002 / AFMC-2002 / UP CPMT-2001

Ans. (b) : Osphradium of Pila globosa is a chemoreceptor. It helps to detect the chemical composition of water. It is located in the mantle cavity of the snail and is a small, finger. like structure osphradium has a patch of sensory cells which helpful in detection of food, avoiding predators and selection of suitable habitat.
- The retina contain sensitive cells called photoreceptors.
- Thermoreceptor responsible for changes in temperature.
- Tangoreceptor are stimulated by touch and pressure.

627. Connecting link between Annelida and Mollusca is
(a) Peripatus (b) Lepidosiren
(c) Neopilina (d) Protopterus
Uttarakhand PMT-2009 / VMMC-2009, 2011
DU MET-2004 / UP CPMT-2001

Ans. (c) : Neopilina is the connecting link between annelida and Mollusca.
- It has trochophore larva and has 5 to 6 pairs of ctenidia, 6 pairs of nephredia, 8 pairs of retracer muscles and 2 pairs of auricles like annelida.

628. Veliger larva occurs in phylum
(a) Mollusca (b) Echinodermata
(c) Arthropoda (d) Cnidaria
Punjab MET-2009 / Rajasthan PMT-2009
UP CPMT-2009 / DUMET-2001,2002

Ans. (a) : Veliger larva occurs in the phylum mollusca. It is a free-swimming larva.
- Veliger is the second stage of a larva of mollusks.

Echinoderm larva- Dipleurula, Bipinnaria brachiolaria larva, Doliolaria larva.

629. Correctly matched set of phylum, class and example is
(a) Protozoa-Mastigophora-Entamoeba
(b) Mollusca-Bivalvia-Pinctada
(c) Arthropoda-Diplopoda-Scolopendra
(d) Chordata-Cyclostomata-Phrynosoma
BCECE-2014 / BVP-2014, 2009 / VMMC-2009

Ans. (b) : Mollusca is the second largest phylum of animals the different class of it include class Bivalvia, gastropoda, scaphophoda and cephalopoda Pinctada is a genus of saltwater.

630. The generic name of tusk shell is:
(a) Dentalium (b) Chaetoderma
(c) Chiton (d) Neopuna
BVP-2005 / AMU-2005
Haryana PMT-2004 / Manipal-2003

Ans. (a) : Dentalium is a genus of phylum Mollusca commonly known as tusk shell. The common name is based on the tooth or tusk shaped form of the molluscs.
Tusk shells belongs to the class Scaphopoda, meaning "boat foot". Tusk shell are used to make belts, headdresses, necklaces etc.

631. Natural pearl belong to
(a) Arthropoda (b) Protozoa
(c) Mollusca (d) Echinodermata
UP CPMT-2003 / Punjab MET-2006
DUMET-2005 / Rajasthan PMT-2003

Ans. (c) : A pear is a hard object produced within the soft tissue specifically the mantle of a living shelled mollusk.
Pinctada or pearl oyster is the member of mollusca. Pinctada or the pearl oyster produces the best quality of the pearl. Mollusca is the second largest phylum of the animal kingdom.

632. Assertion (A): Adult gastropods are asymmetrical though there are included in phylum Mollusca.
Reason (R): Symmetry of organism is determined in early developmental stages but not in adults.
(a) Both A and R are correct and R is the correct explanation of A.
(b) Both A and R are correct but R is not the correct explanation of A.
(c) A is correct but R is incorrect.
(d) A is incorrect but R is correct
AP EAPCET-23.05.2023, Shift-II

Ans. (c) : Adult gastropoda, which are a class of mollusks often exhibit asymmetry in their body structure this characteristic is most prominent in their shells which are usually cold and spiral-shaped the coiling of the shell creates an asymmetrical arrangement, where one side body is larger and more developed than other.
This asymmetry is defining feature of astropods and can very in degree across different species.

633. The larval form of gastropods is
(a) Veliger (b) Bipinnaria
(c) Parenchymula (d) Auricularia
TS EAMCET-11.05.2023, Shift-I

Ans. (a) : The larval form of gastropods is called "Veliger".
Veliger are typically free-swimming larvas that have a distinct appearance. They have small coiled shell or shell-like structure, and they often have ciliated band use for locomotion and feeding.
This larval stage allows gastropods to disperse in the water and colonize new areas before selling down and developing into their adult form.

@apna_pdf

634. Choose the correct combination among the following

Class	Part	Function
A. Bivalvia	Radula	Rasping organ
B. scaphopoda	Captacula	Capture of food
C. Pelecypoda	Crystalline style	Digestion of starch
D. Cephalopoda	Osphradium	Water purity testing

(a) A, D (b) B, D
(c) A, C (d) B, C

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Chephalopds, which include squid, octopuses and cuttlefish, possess osphradia (Singular:Osphradium) which are sensory organs responsible for detecting water purity testing.
Osphradia are located in the matte cavity and play a role in various functions such as respiration and chemoreception, helping these animal to their environment.

635. Which of the following statements is correct in relation to molluscans?

(a) Internal shell is present in Aplysia and shell is absent in Doris
(b) Internal shell is present in Doris and absent in Aplysia
(c) Torsion is found in Unio
(d) Shell of octopus contains eight transverse plates

AP EAPCET-12.07.2022 Shift-I

Ans. (a) : In mollucans the internal shell is present in Aplysia and shell is absent in Doris. Aplacophor is small group of molluscus that are characterised by their lack of shell and worm like appearance.

636. The stomach of the animals of this class contains a crystalline style

(a) Scaphopoda (b) Pelecypoda
(c) Cephalopoda (d) Gastropoda

TS EAMCET-31.07.2022 Shift-I

Ans. (b) : Pelecypoda, is class of marine and fresh water molluscs that have laterally compressed body enclosed by a shell consisting of two hinged parts.
In this class-Buccal mass is without radula, subradula and odontophore. Alimentary canal is a coiled tube with crystalline style in the intestine.

637. Match the following related to adaptation in aquatic habitat?

List-I	List-II
i. Gelatinous cocoon	(A) Cartilaginous fishes
ii. Salty fluid that drips through nostrils	(B) Salmon
iii. Trimethyl amine oxide	(C) African lung fish
iv. Anadromous migration	(d) Penguins

A B C D
(a) (i-D), (ii-C), (iii-B), (iv-A)
(b) (i-C), (ii-D), (iii-A), (iv-B)
(c) (i-A), (ii-D), (iii-C), (iv-B)
(d) (i-A), (ii-B), (iii-D), (iv-C)

AP EAPCET-12.07.2022

Ans. (b) : The correct match–

List-I	List-II
Gelatinous cocoon	African lung fish
Salty fluid that drips through nostrils	Penguins
Trimethyl amine oxide	Cartilaginous fishes
Anadromous migration	Salmon

638. The triploblastic animals that exhibit asymmetry in adult stage are?

(a) Echinoderms (b) Cnidarians
(c) Sponges (d) Gastropods

TS EAMCET-10.08.2021 Shift-I

Ans. (d): Gastropods - Asymmetry, animal cannot be cut into equal halves by any plane. Gastropod larval stage is bilateral and adult is asymmetrical **Ex. Snail**.
• **Echinoderms-** Adult echinoderm (Star fish) shows redial symmetry and its larva shows bilateral symmetry.
• **Cnidarians-** Cnidarians shows radial symmetry.Their distinguishing feature is chidocytes, specialized cells that they use mainly for capturing prey.
• **Sponges-** Sponges shows asymmetrical symmetry and similar to other animals in that they are multicellular, heterotrophic, lack cell walls and produce sperm cells.

639. Correctly matched set of phylum, class and example is

(a) Protozoa–Mastigophora–Entamoeba
(b) Mollusca–Bivalvia–Pinctada
(c) Arthropods–Diplopoda–Scolopendra
(d) Chordata–Cyclostomata–Phrynosoma

JIPMER-2012
AP EAMCET03.092021 Shift-I

Ans. (b) : Pinctada species belongs to the phylum Mollusca, class-Bivalvia and subclass-Lamellibranechia. It is commonly known as pearl oysters.

640. Match the following:

Molluscs	Class
A Doris	I. Pelecypoda
B Architeuthis	II. Gastropoda
C. Pinctada	III. Scaphopoda
D. Dentalium	IV. Apoda
	V. Cephalopoda

The correct match is:

A B C D
(a) II V I III
(b) III I V II
(c) IV V III II
(d) II IV I III

TS EAMCET-28.09.2020 Shift-II

Ans. (a) :

	Mollusca	Class
A.	Doris	Gastropoda
B.	Architeuthis	Cephalopoda
C.	Pinctada	Pelecypoda
D.	Dentalium	Scaphopoda

@apna_pdf

641. Match the following:

Mollusc	Class
(A) Neopilina	**I. Tetrabranchiata**
(B) Chiton	**II. Scaphopoda**
(C) Aplysia	**III. Monoplacophora**
(D) Pulsellum	**IV. Polyplacophora**
	V. Gastropoda

The correct match is
Options:

	A	B	C	D
(a)	II	V	IV	I
(b)	I	IV	V	II
(c)	III	II	V	IV
(d)	III	IV	V	II

TS EAMCET-28.09.2020 Shift-I

Ans. (d) :

	Mollusc	Class
(A)	Neopilina	Monoplacophora
(B)	Chiton	Polyplacophora
(C)	Aplysia	Gastropoda
(D)	Pulsellum	Scaphopoda

642. Match the following

List-I	List-II
A. Anadromous	**(I) Anguilla**
B. Catadromous	**(II) Protopterus**
C. Diapause	**(III) Lizards**
D. Aestivation	**(IV) Insects**
	(V) Hilsa

The correct match is

	A	B	C	D
(a)	V	I	IV	II
(b)	V	I	III	IV
(c)	II	IV	I	IV
(d)	III	II	I	IV

TS EAMCET-29.09.2020 Shift I

Ans. (a) : The correct match-

List-I	List-II
Anadromous	Hilsa
Catadromous	Anguilla
Diapause	Insects
Aestivation	Protopterus

643. Radula is a part of which animal.
(a) Mollusca (b) Poriferans
(c) Coelenterata (d) Annelida

JIPMER-2019

Ans. (a) : Radula is a part of Mollusca. In the mouth of members of phylum Mollusca contains a file-like rasping organ for feeding, called radula.
Radula is an organ present in pila that help to cut down the food using the teeth of the radula.

644. Most advanced invertebrates are
(a) Arthropoda (b) Annelida
(c) Mollusca (d) Cephalopoda

JIPMER-2019

Ans. (d) : Any member of the class cephalopoda of the phylum mollusca is highly advanced and exclusively marine animal.
Ex:- Octopus, Cuttlefish and Squid with large heads large eyes and grasping tentacles.

645. Which of the following are true about Mollusca?
(a) Triploblastic and radial symmetry
(b) Bilateral symmetry and calcareous shell
(c) Radula and diploblastic
(d) Calcareous shell and radial symmetry

AIIMS-26.05.2018 Shift-I

Ans. (b) : Mollusca are the second largest animal phylum. They are bilaterally symmetrical, triploblastic, coelomate animals. They have a $CaCO_3$(Calcareous) shell. Radula are specialized structure in mollusca for feeding.

646. Select the correct matching:

	Phylum	Character	Example
(a)	**Hemichordata**	**Notochord**	**Balanoglossus**
(b)	**Mollusca**	**Radula**	**Dentalium**
(c)	**Platyhelminthes**	**Coelomate**	**Dugesia**
(d)	**Coelenterata**	**All marine**	**Hydra**

AIIMS-26.05.2018 Shift-I

Ans. (b) : The radula is tile-like structure used by mollusca for feeding, sometimes compared to a tongue. Dentalium belongs to phylum Mollusca.
- Hemichordates consist of stomochord in the collar area instead of notochord. Stomochord is similar in structure to the notochord. Balanoglossus belongs to phylum Hemichordata
- Platyhelminthes have no circulatory system or body cavity (coelom). Ex- Dugesia, Planaria.
- Coelenterates are all aquatic mostly marine, some (fresh water) animals. Hydra belongs to phylum Coelenterata.

647. Torsion of visceral mass is seen in animals belonging to class
(a) Cephalopoda (b) Scaphopoda
(c) Amphineura (d) Gastropoda

JIPMER-2017

Ans. (d) : Gastropods transform the symmetric bodyplane into a highly asymmetric one through a unique process called torsion.
Torsion is about 180° rotation. Although the oneset of torsion and its completion are readly observed in several species.

648. Ctenidia are the respiratory organs of the following
(a) Arthropoda (b) Annelida
(c) Mollusca (d) Porifera

TS EAMCET-12.05.2017

Ans. (c) : Ctenidia are the respiratory organs of mollusks. They are specialized structures that help mollusks like clams, mussels, and snails extract oxygen from water and eliminate carbon dioxide.

649. Moti is formed from
(a) Limulus (b) Palaemon
(c) Pinctada (d) Plasmodium

VMMC-2010, 2011

Ans. (c) : Pinctada is also known as "mother of pearl".
Pearls are formed when the molluscs start to secrete a lot of very thin concentric layers of nacre, a secretion of carbonate during a matrix that can coat an irritant, either artificial or natural.
Pearl is also known as moti. It's white, highly shining, a globular natural material found within the shell of an oyester which is a mollusca.

@apna_pdf

650. Radula is found in

(a) Pila sp. (b) Chiton sp.
(c) Lamellidens sp. (d) Pinctada sp.

WB JEE-2010 / BCECE-2012

Ans. (a) : The radula is feeding organ of molluscs. It is a minutely toothed, chitinous ribbon, which is used for scraping or cutting food before food enters into the oesophagus.

651. Which of the following have eye structure nearest to that of vertebrates?

(a) Insecta (b) Polychaeta
(c) Cephalopoda (d) Crustacea

AFMC-2000

Ans. (c) : Cephalopod molluscs (Squid, octopus, cuttlefish) possess a well develop nervous system and are highly intelligent. The complex eye of cephalopod molluscs and vertebrates have been considered a classical example of convergent evolution.

- Cephalopods have averted retinae with the rhabdomeric photoreceptors pointing towards the light in contrast to the inverted retinae with ciliary photoreceptors in vertebrates.

652. Which of the following belongs to class – polyplacophora?

(a) Chiton (b) Patella
(c) Pila (d) Murex

AMU-2015

Ans. (a) : Chitons are the only members of the class polyplacophora which is belong to the class of mollusca. chiton are marine mollusks with eight over lapping shell plates.

- Pila, patella and Murex belong to class gastropods.

653. Largest invertebrate is:

(a) Little fish (b) Ship worm
(c) Devil fish (d) Giant squid

Rajasthan PMT-1996 / AFMC-2004

Ans. (d) : The giant squid, is the largest invertebrates which is a deep-sea creature that can grow up to 13 meters (42 feet) long. It is the largest known invertebrates in the world.

- They belong to class Cephalopoda of phylum Mollusca.
- They are found in all the oceans of the world.
- Giant squid - the giant squid is a species of deep ocean dwelling squid in the family architeuthidae.

654.Which one is Devil fish?

(a) Rhinobates (b) Octopus
(c) Sepia (d) Giant squid

Rajasthan PMT-1996

Ans. (b) : Devilfish is the common name of Octopus. In earlier times, its morphology and external appearance was considered to be evil by men in fishing boats Though it shares gills and aquatic habitat with fishes, octopus is not a fish. It comes under the phylum Mollusca.

655. Which of the following belongs to the class Amphineura ?

(a) Chiton (b) Nautilus
(c) Dentalium (d) Pinctada

Manipal-2004
AMU-2005

Ans. (a) : The class Amphineura is a class of marine mollusks that have a shell made up of eight overlapping plates. Chiton belong to class Amphineura. Class amphineura divided into two sub classess.

- Polyplacophora (Chitons)
- Aplacophora (Shell less Chitons).

Dentalium belong to class scaphopoda phylum mollusca. Nautilus belong to class cephalopoda phylum Mollusca. Pinctada (Pearl oyster) is a marine mollusk belong to class Bivalvia.

656. The study of molluscan is called :

(a) Nerology (b) Conchology
(c) Malacology (d) Craniology

AMU-2005 / Manipal-2004
Uttarakhand PMT-2004

Ans. (c) : Malacology is the branch of zoology, which mainly takes up the study of molluscs. Molluscs involve snails and slugs, clams, octopuses and squid.

- Conchology is the study of molluscs shells.
- Neurology is the branch of science in which study of brain (specially neurons)
- Craniology is the study of human skull.

657. Which of the following classes do not belong to phylum Mollusca?

(a) Monoplacophora (b) Gastropoda
(c) Trematoda (d) Pelecypoda

JIPMER-1998

Ans. (c) : Trematoda is a class of parasitic flatworms that belong to the phylum platyhelminthes. Trematoda also known as flukes. It is obligate internal parasites, means they cannot survive outside of a host.

Mollusks are separate phylum of animals that includes snails, clams and octopuses.

Classes-Monoplacophora, Gastropoda and Pelecypoda are belong to phylum mollusks.

658. Phylum Mollusca can be distinguished from other invertebrates by the presence of

(a) bilateral symmetry and exoskeleton
(b) a mantle and gills
(c) shell and non-segmented body
(d) a mantle and non-segmented body

DUMET-2010 / Rajasthan PMT-1998

Ans. (d) : Mollusca can be distinguished from other invertebrates by the presence of a mantle and non-segmented body.

All mollusks contain three main features such as a redulla, A mantle and A foot (for locomotion).

Bivalve mollusks (such as clams and oysters) do not have redulla.

659. Glochidium larva is absent in

(a) Unio (b) Pinctada
(c) Sepia (d) None of these

UP CPMT-2012

Ans. (c) : The Glochidium is a microsporic larval stage of some freshwater mussels, aquatic bivalve. The Glochidium larva absent in sepia belong to class cephalopoda family mollusca.

660. The second largest number of species containing phylum in the animal kingdom is

(a) Annelida (b) Arthropoda
(c) Mollusca (d) Chordata

J&K CET-2009

@apna_pdf

Ans. (c) : The largest number of species containing phylum is Arthropoda.
- The second largest number of species containing phylum in the animal kingdom is Mollusca.
- The phylum mollusca are the largest marine phylum and they are among the most diverse organisms of earth.
- The phylum Mollusca generally contains organisms like snails, squids, clams, oysters, octopuses etc in them.
- The organism of this phylum is also used for an ornamental purpose by humans.

661. The presence of the blood pigment haemocyanin is a characteristic of the following
(a) Asterias and Taenia
(b) Fasciola and Cockroach
(c) Pila and Pheretima
(d) Pila and Carcinus

JIPMER-1997

Ans. (d) : Hemocyanin is copper-containing respiratory pigments found in many mollusks (some bivalves, many gastropods and cephalopods) and arthropods (many crustaceans, some arachnids and the horseshoe crab silimulus). They are colorless when deoxygenated but turn blue on oxygenation.
- Pila and carcinus contain blue blood pigment haemocyanin.
- Cockroaches have hemolymph (colorless blood).
- Asterias also have no respiratory pigment in blood.

662. Which of the following belongs to the class-Gastropoda?
(a) Clam (b) Cuttle fish
(c) Snail (d) Mussel

J&K CET-2012

Ans. (c) : Cephalopods are group of molluscs that include the pearly chambered Nautilus, octopus and the squids. Snail belongs to the class Gastropoda.
Snail is an amphibious mollusc commonly found in ponds, rivers and rice fields. They are herbivorous animal feed mainly on grasses and phytoplankton.
The class Gastropoda (in phylum Mollusca) includes the groups pertaining to snails and slugs. The majority of gastropods have a single, usually spirally, coiled shell into which the body can be withdrawn.
- Gastropoda is the largest class of molluscs comprising over 80% of all molluscs.

663. Correct member of the phyla is :
(a) Arthropoda -Arachnida - Lobstar
(b) Arthropoda - Myriapoda - Scorpion
(c) Mollusca - Cephalopoda - Octopus
(d) Mollusca - Gastropoda - Squid

Rajasthan PMT-1998

Ans. (c) : The Phyla Arthropoda and Mollusca both are large group of animals. Mollusca is the second largest phylum in the phyla group.
- Arthropoda are characterized by their jointed limbs, while mollusks are characterized by their soft bodies and hard cells.
- Gastropoda another class of Mollusca and includes snails and slugs.
- Lobster belong to class crustacea of phyum Arthropoda.
- Myriapoda is a subphylum of arthropoda phylum.

664. Trochophore is the larva of :
(a) Neopilina (b) Chiton
(c) Pila (d) All of these

MGIMS Wardha-2005 / UP CPMT-2005

Ans. (d) : Trachophore is the larva of phylum Annelida and most groups of mollusk. It is small, free swimming larva with a ring of cilia around the head that helps it to swim, it included Neopilina, Pila and Chiton etc.
- Neopilina, chiton and pila belong to phylum Mollusca. Molluscan development is either direct with metamorphosis through the trachophore stage.

665. The phenomenon of torsion occurs in
(a) Gastropoda (b) Pelecypoda
(c) Cephalopoda (d) Amphineura

AMU-2010

Ans. (a) : Early in the development of the gastropods, one of the most important changes to the molluscan body morphology takes place. It is torsion which is a gastropod synapomorphy which occurs in all gastropods during larval development. Torsion is the rotation of the visceral mass, mantle and shell 180° with respect to the head and foot of the gastropd which brings the mantle cavity and anus to an anterior position.

666. The excretory material of bony fish is
(a) urea (b) protein
(c) ammonia (d) amino acid

UP CPMT-2008

Ans. (c) : In bony fishes, ammonia is excretory material because it is very toxic substance to tissues but extremely soluble in water.
- In aquatic animals, this mode of excretion is preferred. Ammonotelic excretion, is the process by which ammonia is excreted

667. Which of the following pair is correct:
(a) Protozoa – Hydra
(b) Arthropoda – Crustacea - cockroach
(c) Mollusca – Cephalopoda - Octopus
(d) Annelide – Polychaeta - leech

Manipal-2000

Ans. (c) : Phylum mollusca is the second largest animal phylum. cephalopoda or 'head foot' is a class of phylum mollusca.
- Cockroach belong to class insecta of phylum Arthropoda.
- Leech belong to class clitellata of phylum Annelide.
- Hydra belong to phylum Coelenterata (Cnidaria)

668. Who is referred to as father of pearl industry ?
(a) Lwanovsky (b) Louis Pasteur
(c) Kokichi Mikimoto (d) Harvey

CG PMT-2007, 2004

Ans. (c) : Kokichi Mikimoto, (1858-1954) a japanese entrepreneur is considered as the father of Modern Pearl industry.
He is also considered as the 'Pearl king'. From the initial success the technique of pearl culture was developed and perfected.

669. Ink glands are found in
(a) sponge (b) star fish
(c) sepia (d) jellyfish

CG PMT-2009

Ans. (c) : There is the presence of a sac-like gland in cephalopods which is known as ink sac.
Sepia (cuttlefish) contains a large ink gland which opens into the rectum.

@apna_pdf

670. Pearls are produced by the animals of phylum
(a) Annelida (b) Arthropoda
(c) Mollusca (d) Echinodermata
CG PMT-2009

Ans. (c) : Animal producing natural pearls belongs to phylum Mollusca.
Mollusca is the second largest phylum of the animal kingdom.
Pearl is produced by marine mulluscs such as pearl oyster and mussel.

671. What is the name of class to which pearl oyster belongs?
(a) Cephalopoda (b) Pelecypoda
(c) Gastropoda (d) Scapoda
JIPMER-2000

Ans. (b) : Pearl oysters belong to the class pelecypoda. Pearl oysters are bivalve mollusks, which means they have two shells that are hinged together. Pelecypoda included clams, mussels and scallops.

672. Cuttle fish belongs to phylum:
(a) Mollusca (b) Protozoa
(c) Pisces (d) Chordata
JIPMER-1995

Ans. (a) : Cuttle fish or Cuttles are Marine Molluscs of the Phyllum Mollusca, class Cephalopoda, Kingdom of animalia and order sepiida. The Cuttle fish are triploblastic and coelomate. The body is divided into the mantle, foot and shell.

673. Which of the following animal belongs to the phylum-Mollusca ?
(a) Devil fish (b) Dog fish
(c) Silver fish (d) Jelly fish
AMU-2012
CG PMT-2010

Ans. (a) • Devil fish belong to phylum mollusca. It is a common name of octopus, Sometimes it is called the Devil Fish due to the appearance of it.
• Jelly fish belong to phylum Cnidaria or Coelenterata.
• Silver fish belong to phylum Arthropoda.
• Dog fish is the common name for scoliodon. They are a type of shark which is a cartilaginous fish under class chondrichthyes of phylum chordata.

674. Molluscan blood contains
(a) Haemoglobin (b) Haemozoin
(c) Haemocyanin (d) All of these
MGIMS Wardha-2011

Ans. (c) : Molluscan blood contain haemocyanin. Most of the molluscan are coelomate. Haemocyanin pigment is found as molluscs. Haemocyanin is rich in copper & haemoglobin is rich in iron. Due to this reason, organisms with hemocyanin in their blood have blue colour blood

675. Select the animal which has the following features is their body
(I) Marine habitat.
(II) Bilateral symmetry and cephalisation.
(III) Haemocoel as principal body cavity.
(IV) Eyes similar to that of vertebrates.
(a) silver fish (b) dog fish
(c) cuttle fish (d) jelly fish
BVP-2015
AP ERAMCET-2010

Ans. (c) : Cuttle fish (Sepia officinalis) are marine animal and shows bilateral symmetry which belongs to order-Sepiida and class-Cephalopods and phylum-Mollusca.
• Cuttle fish is also said to have one of the largest brain-to-body rations of any invertebrate and show cephalisation. The eyes of cuttle fish are similar to the eyes of vertebrates.

676. Which one of the following is a molluscan larva:
(a) lovens larva (b) veliger
(c) parenchymula (d) bipinnaria
AP EAMCET-2000

Ans. (b) : Veliger, larva typical of certain mollusks such as marine snails and bivalves and a few freshwater bivalves. The veliger develops from the trochophore larva and has large, ciliated lobes (velum). The velum forms from the ciliary ring (Prototroch), a characteristic of the trochophore stage.

677. A cephalopod without a shell:
(a) Sepia (b) Loligo
(c) Octopus (d) Nautilus
AP EAMCET-2015, 1999

Ans. (c) : Cuttle fish have a hard internal shell-like structure called a cattle bone and squid have a more flexible internal structure called a pen, both of which are used for internal support. Octopuses have no shell-like structure at all.

678. Shell of molluscs is produced by its
(a) Radula (b) Thorax
(c) Mantle (d) Abdomen
HP CET-2012 / AMU-2002

Ans. (c) : The shell of mollusks is produced by its mantle parts.

679. The biological name of feather star is
(a) Ophiothrix (b) Antedon
(c) Petaceros (d) Clypeaster
Haryana PMT-2011

Ans. (b) : The biological name of feather star is Antedon. Feather stars look like flowers. They have heart, eyes and brain.
• Feather stars eat with their feet. They have sticky mucus that helps them catech their microscopic prey before flinging into their mouths.
Feather stars belong to the class *Crinodiea* and phylum *Echinodermata* along with other marine creatures such as sea stars and sea urchins.

680. Amphineuran mollusc is
(a) Chiton (b) Nautilus
(c) Dentalium (d) None of these
Haryana PMT-2011

Ans. (a) : Chitons are marine mollusks of varying size in the class polyplacophora formerly known as Amphineura. About extant and fossile species are recognized.
• Members of class polyplacophora are better known as "Chitons".

681. Which one of the following is a matching set of a phylum and its three examples?
(a) Cnidaria - Bonellia, Physalia, Aurelia
(b) Platyhelminthes - Planaria, Schistosoma, Enterobius

@apna_pdf

(c) Mllusca - Loligo, Teredo, Octopus
(d) Porifera - Spongilla, Euplectella, Pennatula

JCECE-2015 / BHU PMT (Mains)-2010
AIPMT-2006

Ans. (c) : Loligo(Squid), Teredo (Shipworm), Octopus(Devil fish) all belong to the phylum Mollusca,
- Physalia(Portugese man of war) and Aurelia(Jelly fish) belongs to phylum cnidaria but Bonnelia belongs to Annelida.
- Planaria and schistosoma belong to the phylum platyhelminthes but enterobiuse belong to Nematoda,
- Spongilla and Euplectella belong to phylum porifera but Pennatula belongs to cnidaria.

682. A Molluscan with calcareous spicules is
(a) Chaetoderma (b) Lepidopleurus
(c) Doris (d) Neopilina

AP EAMCET-2014

Ans. (a) : Calcareous spicules, characteristic of the calcarea are composed chiefly of calcium carbonate in crystalline which give them a beautiful shine. e.g. Neomenia Chaetoderma.

683. Mantle, foot and shell are the characteristics of
(a) Nautilus (b) Echinus
(c) Limulus (d) Euplectella

JIPMER-2005

Ans. (a) : The Nautilus is a pelagic marine molluscs of the cephalopod family Nautilidae. The Nautilus is the sole extant family of the super family Nautilaceae. Mantle, foot and shell are the characters of the mollusca.
- Echinus belongs to the phylum Echinodermata.
- Limulus belongs to the phylum arthropods.
- Euplectella belongs to the phylum porifera.

684. Match the following columns.

Columns-I	Columns-II
A. Sea lemon	1. Doris
B. Sea mussel	2. Mytilus
C. Garden snail	3. Helix
D. Grey slug	4. Limax

	A	B	C	D
(a)	1	2	3	4
(b)	4	3	2	1
(c)	4	2	3	1
(d)	3	4	1	2

AIIMS-2015

Ans. (a) :
- Doris is commonly called as sea lemon or seal slug. Sea lemons are sluggish marine molluscs.
- Mytilus is a cosmopolitan genus of medium to large sized edible, mainly saltwater muscles which are widely as food and used in marine culture. Mytilus is commonly called as "sea mussels" mytilus belongs to phylum mollusca found near the tide shore and attached to the rock.
- **Helix**- The garden snail (Helix aspersa) is a terrestrial gastropod mollusk and one of the best knows species in the work. Hence garden snail refers to helix.
- **Limax**- Limax maximus, known by the common names great grey slug and leopard slug, is a species of slug in the family Lamacidae. Hence grey slug refers to Limax.

685. A wood boring mollusc/shipworm is
(a) Chiton (b) Teredo
(c) Limax (d) Patella

AIPMT-1988

Ans. (b) : Teredo is a class-pelecypoda bivalvia. It is commonly known as shipworm and it is destructive to wood in sea water. They are also called Teredo worms or termites of sea.

686. Whose secretion forms the pearls ?
(a) Prismatic layer
(b) Columnar epithelial cells of mantle
(c) Ciliated epithelial cells of mantle
(d) Connective tissue of mantle

CG PMT-2005

Ans. (b) : Pearls is formed due to secretion of the columnar epithelial cells of mantle tissue. The nacreous layer of the pearl is secreted by the outer epithelial layer of the mantle.
Columnar epithelial cells are those cells that have a tendency to change their shape and position and retain the same.

687. Which pair of the following Molluscs possess captacula?
(a) Unio and Mytilus
(b) Sepia and Octopus
(c) Dentalium and Pulsellum
(d) Neomenia and Neopilina

TS EAMCET-15.05.2016

Ans. (c) : Both Dentalium and Pulsellum have bilateral symmetry. In their body, tentacles are replaced by captacula. Captacula are number of minute tentacles present around the foot.
Captacula are thread like cilia-bearing tentacles probe for food, such as forams detrifus and even the occasional buried bivalve and bring it to the mouth where a large radula grinds it up.

688. Which of the following pairs is correct?
(a) annelida-polychaeta-leech
(b) arthropoda-crustacea-cockroach
(c) mollusca-cephalopoda-Octopus
(d) protozoa-Hydra

Punjab MET-2004
Rajasthan PMT-2003

Ans. (c) : Cephalopoda is a class of pylum Mollusca.
• Head and foot regions are combined and modified into a structure which has eyes and eight tentacles, hence the name cephalopod or 'head food'.
• Octopus belongs to this class

689. Which one is an example of living fossil?
(a) Coral (b) Ascidia
(c) Octopus (d) King crab

WB JEE-2014

Ans. (d) : King crab (Arthropoda) are example of living fossils.
An organism is regarded as living fossil if it remains essentially unchanged for a considerably long time in the course of evolution & whose close relatives are generally extinct. King crab continues to remain unchanged for past 190 million years. Hence, it is called living fossil.

@apna_pdf

690. A pearl oyster secretes pearls to
(a) regenerate injured parts
(b) protect itself against invading parasite
(c) harden its mantle cavity
(d) isolate damaged tissues of the body
CG PMT-2004

Ans. (b) : Pearl is a hard sparkling object formed within the soft tissue of a living shelled of molluscs. The pearl is secreted by nacreous layer of pearl oyster as a protection against foreign body such as parasite or a sand particle.

691. Which one of the following matching pairs is incorrect?
(a) Mollusca - Pseudocoel
(b) Cnidaria - Nematocyst
(c) Annelida - Chloragogen
(d) Echinodermata - water vascular system
WB JEE-2015

Ans. (a) : Mollusca are coelomate animals. The body cavity is true coelom often reduced to haemocoel surrounding the heart, nephridia and gonads.

692. Which of the following animals is not only a living fossil but also considered as connecting link?
(a) Sphenodon (b) Limulns
(c) Neopilina (d) Latimeria
AP EAMCET-2007

Ans. (c) : Neopilina is a living fossil and also known as connecting link between two major groups of mollusks - the monoplacophora and the polyplacophora. It has cap-shaped shell and a muscular foot used for locomotion, while on other hand it also shows the characteristic with chitons having multiple shell plates or valves arranged in a row along their dorsal side.

693. Which one of the following phyla is correctly matched with its two general characteristic?
(a) Echinoderamata - Pentamerous radial symmetry and mostly internal fertilization
(b) Mollusca - Normally oviparous and development through a trochophore or veliger larva
(c) Arthropoda - Body divided into head, thorax and abdomen and respiration by tracheae
(d) Chordata - Notochord at some stage and separate anal and urinary openings to the outside
AIPMT-2008

Ans. (b) : Mollusks typically lay eggs and their embryos develop through stages known a as trochopore or veliger larva.

694. Osphradium in mollusca has function of
(a) respiration
(b) reproduction
(c) grinding of food
(d) testing physical and chemical qualities of food
UP CPMT-2005

Ans. (d): Osphradium in mollusca has function of testing physical and chemical qualities of food
Osphradium in mollusca has function of testing physical and chemical qualities of food. Testing physical and chemical qualities of food
• In mollusk, a single or paired sensory attachment to the visceral ganglia is called ospharadium. The major function of ospharadium is to test the incoming water for slit and food particles.

695. In which one of the following, the genus name, its two characters and its phylum are not correctly matched, whereas the remaining three are correct?

	Genus Name	Two Characters	Phylum
(a)	Sycon	(a) Pore bearing (b) Canal system	Porifera
(b)	Periplaneta	(a) Jointed appendages (b) Chitinuous exoskeleton	Arthropoda
(c)	Pila	(a) Body segmented (b) Mouth with Radula	Mollusca
(d)	Asterias	(a) Spiny skinned (b) Water vascular system	Echinoder-mata

AIPMT (Screening)-2012

Ans. (c) : Pila is a genus of freshwater snail belonging to the phylum Mollusca and they have unsegmented body. They have coiled shell and muscular foot for locomotion. The mouth contains a file- like resping organ for feeding, called radula.

J. Echinodermata

696. Aristotle's lantern is a characteristic of the following class of Echinodermata :
(a) Echinoidea (b) Ophiuroidea
(c) Holothuroidea (d) Asteroidea
HP CET-2011 / VMMC-2005
AMU-2004 / BVP-2003
AIPMT-1993/ BVP-2001
Manipal-2001 / Rajasthan PMT-1999
JIPMER-1998 / AIPMT-1993

Ans. (a) : Aristotle's lantern is a characterstics of Sea Urchin in class - Echinoidea of phylum Echinodermata.
Aristotle's lantern was first traced by Aristotle. It is involved in mastication. It is a complex arrangement of muscles and calcareous teeth and plates with forms a reversible organ in most echinoids.

697. Which of the following has radial symmetry in adult and bilateral symmetry in larva?
(a) Annelida (b) Coelenterata
(c) Echinoderms (d) Platyhelminthes
UP CPMT-2013 / Karnataka CET-2012
JCECE-2009 / CMC Ludhiana-2009
AFMC-2008 / DU MET-2004
AIPMT-2004 /BVP-2001

Ans. (c) : In phylum Echinodermata, the larval stage is bilaterally symmetrical whereas adults are radially symmetrical. Radial symmetry is the arrangement of

@apna_pdf

parts of organism around a central axis so that the organism can be divided into similar halves by any plane. Bilateral symmetry can be divided only into mirror halves through a single plane. In echinoderms larvae haves bilateral symmetry but during metamorphosis this is replaced with radial symmetry.

698. Connecting link between Echinodermata and Chordata is

(a) Peripatus (b) Archaeopteryx
(c) Balanoglossus (d) None of these

CMC Ludhiana-2015 / AMU-2008
VMMC-2008 / AP EAMCET 2002

Ans. (c) : Connecting link between Echinodermata and chordata is balanoglossus. It is a marine organism. It can considered as an evolutionary link between vertebrates and invertebrates. It is hemicardata ocean-dwelling acorn worm.

- Archaeopteryx is connecting link between two classes of reptiles and birds.
- Peripatus is a living fossil.

699. In Echinodermata, tube feet are related with

(a) locomotion (b) excretory system
(c) respiratory system (d) reproductive system

HP CET-2011 / VMMC-2005
AMU-2004 / BVP-2003

Ans. (a) : Tube feet are locomotory organs of echinoderms consisting of elongated out growths of the body wall able to be protruded or retracted by alteration of fluid pressure in the water vascular system. In starfish, they are arranged in rows in ambulacral groove.

700. Tube feet is the locomotory organ of

(a) Star fish (b) Jelly fish
(c) Cray fish (d) Silver fish

BHU PMT (Screening)-2011 / CMC-Ludhiana-2011
JIPMER-2010 / AIPMT-1994

Ans. (a) : Tube feet, which are found as part of the water vascular system, are the locomotory organs in star fish. They are the exclusive feature of echinoderms like star fish. They are part of water vascular system which is a hydraulic system in echinoderms necessary for locomotion, ingestion, adhesion and gaseous exchange.

701. Aristotle's lantern is present in

(a) Echinoidea (b) Holothuroidea
(c) Asteroidea (d) Ophiuroidea

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Aristotle's lantern is a specialized feeding orgone structure that foung in some echinoderms and sea urchins.
It is a complex set of calcified structure surrounding the mouth of these organism use for scraping and grinding food.

702. Choose among the following the characters of ophiuroidea of phylum Echinodermata

(a) Madriporite is aboral, tube feet with suckers, Open Ambulacral grooves
(b) Closed Ambulacral grooves, tube feet without suckers. Absence of anus
(c) Arms absent, Anus is aboral, Closed Ambulacral grooves
(d) Open Ambulacral grooves, tube feet with suckers

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : Ophiuroidea is a class within the phylum Echinodermata. That have brittle stars and basket stars.

- Ophiuroids have a central dis that houses the vital organs and long slender arms that are usually distinct from the central disc ophiuriods have tube feet for locomotion but these not use for feeding as extensive as in other echinoderms.
- Ophiuriods has open ambulacral grooves. That run along the under sids of each arm and tube feet used for locomotion feeding and sensory perception.

703. Match the following :

	Larva		**Animals**
(A)	**Bipinnaria**	**(I)**	**Sea urchins**
(B)	**Auricularia**	**(II)**	**Brittle stars**
(C)	**Ophiopluteus**	**(III)**	**Star fishes**
(D)	**Doliolaria**	**(IV)**	**Sea lilies**
(E)	**Echinopluteus**	**(V)**	**Sea cucumbers**

The correct match is:

	A	**B**	**C**	**D**	**E**
(a)	III	IV	V	I	II
(b)	II	III	I	IV	V
(c)	III	V	II	IV	I
(d)	I	IV	II	V	III

TS EAMCET-10.08.2021 Shift-I

Ans. (c) :

Animals	-	**Larva**
Sea urchins	-	Echinopluteus (it is larval stage in echinoidea)
Brittle stars	-	Ophiopluteus
Star fishes	-	Bipinnaria
Sea lilies	-	Auricularia (1^{st} larval stage)/Doliolaria (2^{nd} larval stage)
Sea cucumber	-	Auricularia

704. Water vascular system is found in

(a) sea-anemone (b) sea-pen
(c) sea-cucumber (d) sea-horse

AP EAMCET-24.09.2020 Shift-I
WB JEE-2010

Ans. (c) : Sea-cucumber is the member of phylum echinodermata The most distinctive feature of echinoderms is the presence of water vascular system which helps in locomotion, capture and transport of food and respiration. An excretory system is absent.

- sea-anemone – Adamsia (Coelenterates or Cnidaria)
- sea-pen – Pennatula (Coelenterates or Cnidaria)
- sea-cucumber – Cucumaria (Echinoderms)
- sea-horse – Hippocampus (Pisces)

705. Match the right organism and its phylum

(a) Ancylostoma - Platyhelmenthis
(b) Nereis - Arthropoda
(c) Chaetopleura - Aschehelminthes
(d) Ophiura - Echinodermata

AP EAMCET-25.09.2020 Shift-II

Ans. (d) : Ophiura is a genus of echinoderms belonging to the family ophiuridae.

- Ophiura is also known as Brittle star.
- Ancylostoma (Hookworm) belongs to phylum Aschelminthes.
- Nereis belongs to phylum Annelida.
- Chaetopleura (chiton) belongs to phylum mollusca.

@apna_pdf

706. Which of the following options have features corresponding to the given animals
Aplysia, Asterias, Antedon, Echinus
(a) Water vascular system, Calcareous shell
(b) Water Canal system, Calcareous shell
(c) Calcareous shell, acoelomate
(d) Pseudocoelomate, Water vascular system

AIIMS-26.05.2019 Shift-II

Ans. (a) : The animals aplysia, asterias, antedon and echinus all have a water vascular system for movement and feeding and they also possess a calcareous shell.
Hence, option (a) is correct answer.

707. Match the following :

	Set-I		Set-II
A.	Tornaria	I.	Neometra
B.	Brachiolaria	II.	Balanoglossus
C.	Pentacrinoid	III.	Holothuria
D.	Auricularia	IV.	Pentaceros

The correct match is

	A	B	C	D
(a)	II	I	III	IV
(b)	II	IV	I	III
(c)	I	III	II	IV
(d)	IV	III	I	II

TS EAMCET-08.05.2019 Shift-I

Ans. (b) : Tornaria - Balanoglossus
Brachiolaria - Pentaceros
Pentacrinoid - Neometra
Auricularia - Holothuria.

708. Which of the following is a mismatch pair?
(a) Scales - Reptilia
(b) Comb plates - Mollusca
(c) Choanocytes - Porifera
(d) Parapodia - Annelida

Tripura JEE-2017
AMU-2015

Ans. (b) : Comb plates :- Comb plates are large ciliary structure uniquely seen in comb jellies (ctenophores). A comb plate is constructed from tens of thousands of cillia that are bundled together by structures called compart menting camellae.
• Pleurobrachia is the organism in which comb plates are found. It is not found in mollusca.

709. Secondary radial symmetry is found in
(a) Cnidaria (b) Jelly fish
(c) Echinodermata (d) Hemichordata

VMMC-2011
Uttarakhand PMT-2009

Ans. (c) : Secondary radial symmetry occurs in Echinodermata. Larva of echinoderms are bilaterally symmetrical but in the adult they shows radially symmetry.
• In both larval and adult stages Jelly-fish and Cnidarians shows radial symmetry.
• Hemichordates shows bilateral symmetry.

710. Radial symmetry is found in:
(a) frog (b) starfish
(c) humans (d) Pheretima

Rajasthan PMT-2004

Ans. (b) : When any plane passing through the central axis divides the body of an organism into two equal halves then the symmetry is radial symmetry.
eg:- Star fish, Coral polyp and sand dollars.

711. 'Basket star' belongs to class.
(a) Echinoidea (b) Asteroidea
(c) Crinoidea (d) Ophiuroidea

AFMC-2000 / AIIMS-1999

Ans. (d) : Basket star belongs to phylum Echinodermata and class- ophiuroidea. Basket star related to brittle stars and sea stars. They have radial symmetry which means their body parts radiate from a central point.

712. Starfish belongs to phylum
(a) Porifera (b) Coelentrata
(c) Echinodermata (d) Arthropoda

UP CPMT-2003

Ans. (c) : Starfish belongs to phylum echinodermata. They are triploblastic, coelomate, Body shape is rounded to cylindrical or star-like.
• Porifera includes the sponges.
• Coelenterata includes the multicellular organism with hollow intestines. Ex-hydra.
• Arthropoda includes the insects with jointed appendages.

713. What are the locomatory organs in Echinoderms?
(a) Mantle (b) Tube feet
(c) Ommatidia (d) Pedicullariae

UP CPMT-2012 / Haryana PMT-2004
Manipal-2003

Ans. (b) : Tube feet are a characteristic of the phylum Echinodermata.
• They are a characteristic organ of the star fishes.
• They are a part of the water vascular system, which is a hydraulic system in echinoderms necessary for locomotion, food ingestion, adhesion and gas exchange.
• They are marine animals with spiny skin.
• They have an exoskeleton of the calcareous plates from which the spine arises.

714. Read the statements regarding echinoderms and choose the correct option
(i) All are marine with organ system level of organisation
(ii) Adults are bilaterally symmetrical
(iii) They are dioecious
(iv) Fertilisation is internal and indirect development is observed
(v) Triploblastic and acoelomate animals
(a) i and iii are correct (b) v alone is correct
(c) i, iii and v are correct (d) i and v are correct
(e) i and ii are correct

Kerala PMT-2015

Ans. (a) : • The organisms belongs to the phylum Echinodermata are exclusively marine.
• They are multicellular organisms with well developed organ systems.
• Most members have a circulatory system as well as a digestive system.
• They all show pentamerous. Radial symmetry in the adult stage.

@apna_pdf

715. Which of the following is an exclusively echinoderm character?
(a) Radial symmetry
(b) Tube feet
(c) Mesodermal endoskeleton
(d) Coelom divided

AMU-2010

Ans. (b) : Tube feet is an exclusively echinoderms character which help in locomotion. Tube feet are small, delicate projections attached along the side of a water-filled tube called a radial canal.

716. The response to external stimulus is quicker and more precise in this symmetry:
(a) radial (b) bilateral
(c) spherical (d) biradial

AP EAMCET-2003

Ans. (b) : The response to external stimulus is quicker and more precise in bilateral symmetry.
In bilateral symmetry animals, the anterior end or differentiated into head with the concentration of nervous tissue and nightly efficient sense organs so the bodily function becomes more coordinated.

717. Aristotles lantern is connected with
(a) respiration (b) mastication
(c) excretion (d) support

AMU-2008 / VMMC-2008

Ans. (b) : Aristotles lantern is connected with mastication. Sea urchins possess an intricate mouth apparatus that's located on the underside of their bodies.
- It's referred to as an Aristotle's Lantern.
- The lantern, where present, surrounds both the mouth cavity and the pharynx. It is involved in mastication.

718. Ambulacral system is mainly useful for
(a) locomotion (b) circulation
(c) feeding (d) defence

AMU-2005
Manipal-2004

Ans. (a) : An Ambulacral system is also known as vascular system or hydraulic system. It is a complete system which comprises of pipe like structure known as canals. An ambulacral groove is also found- It extends from the mouth to the technical part of the arm,- It performs various functions such as movement, transportation of food and various other products and exchange of gases (aspiration). It performs locomotion through muscle contraction.

719. Water vascular system is found in
(a) Mollusca (b) Arthropoda
(c) Annelida (d) Echinodermata

CMC Vellore-2010 / AMU-2009
MGIMS Wardha-2009

Ans. (d) : The water vascular system is a hydraulic system typically used by echinoderms like sea stars and sea urchins, for locomotion, food and waste transportation, and respiration.

720. Which of the following is an enterocoelic invertebrate ?
(a) Sepia (b) Cimex
(c) Ophiothrix (d) Polygordius

DUMET-2001
AP EAMCET-1997

Ans. (c) : Ophiothrix is large genus of brittle stars (Ophiuroidea) that is found in oceans worldwide from tropics to Arctic and Antarctic regions which has an enterocoelic coelom (enterocoel). Enterocoelic coelom develops as mesodermal pouches arising from the gut of the embryo.

721. Starfish belongs to the class
(a) Pisces (b) Cephalopoda
(c) Asteroidea (d) Ophuroidea

Rajasthan PMT-2011
AIPMT-1992

Ans. (c) : Starfish belongs to the Asteroidea family.
- It has water channel system and these are radially symmetrical.
- These have tube feet for locomotion.
- These are triploblastic in nature and are coelomale.
- This class has a pentaradial body plan.
- Brittle stars (Ophiurida) and basket stars (Euryalida)
- These are marine organisms with five-fold radial symmetry.

722. The water vascular system performs all but not one function which is that:
(a) excretion (b) respiration
(c) food capturing (d) hormone secretion

VMMC-2003 / Haryana pmt-2001

Ans. (d) : The water vascular system does not have function related to hormone secretion. It primarily performs tasks like food capturing, respiration and movement in certain marine animals.

723. Scientific name of starfish is
(a) Echinus (b) Limulus
(c) Echidna (d) Asterias

AMU-2003

Ans. (d) : Scientific name of starfish is Asterias. It is a phylum of Echodermata.
They are triploblastic and coelomate animals. Digestive system is complete with mouth on the lower (ventral) side and anus on the upper (dorsal) side. The most distinctive feature of echinoderms is the presence of water vascular system which helps in locomotion, capture and transport of food and respiration.

724. The nature of exoskeleton in echinoderms is
(a) calcareous (b) chitinous
(c) siliceous (d) tunicin

J&K CET-2002

Ans. (a) : The calcareous exoskeleton is found in the phylum echinodermata. The Echinodermata have spiny texture skin. They have an exoskeleton made up of spicules. The spicules are spiny structures that are made up of calcium carbonate minerals.

725. Which of the phylum has none of fresh water from?
(a) Echinodermata (b) Mollusca
(c) Chordata (d) Porifera

BVP-2004 / DU MET-2003
Rajasthan PMT-1999

Ans. (a) : Echinodermate animals have an endoskeleton of calcareous ossicles and, hence, the name Echinodermata (spiny bodied). All are marine with organ-system level of organisation. It means phylum Echinodermate has none of fresh water form.

@apna_pdf

726. The presence of tube feet is a characteristic feature of the phylum
(a) Arthropod (b) Annelida
(c) Nemathelminthes (d) Echinodermata
(e) Mollusca
Kerala PMT-2009 / BVP-2005 / Manipal-2002

Ans. (d) : Tube feet is a characteristic feature of the phylum echinodermata. Tube feet are the small tubular projection present in the oral surface of a sea vascular system of the phylum echinoderm. The most important function of the tube is to help locomotion, respiration and feeding.

727. The echinodermata are exclusively.
(a) arboreal insects (b) marine animals
(c) terrestrial insects (d) freshwater forms
Punjab MET-2011 / JIPMER-2010

Ans. (b) : All echinodermata are marine animals.
They are triploblastic and coelomate animals. Digestive system is complete with mouth on the lower (ventral) side and anus on the upper (dorsal) side. The most distinctive feature of echinoderms is the presence of water vascular system which helps in locomotion, capture and transport of food and respiration.

728. Antedon belongs to which of the following class?
(a) Asteroidea (b) Ophiuroidea
(c) Crinoidea (d) Echinoidea
AIIMS-2000

Ans. (c) : Antedon belongs to the class crinoidea. It is a type of marine animal commonly known as a feather star or crinoid. Crinoids are echinoderms characterized by their feathery arms and are part of the class crinoidea.

729. Ambulacral grooves are absent in the living forms of the class
(a) Crinoidea (b) Asteroidea
(c) Ophiuroidea (d) Echinodermata.
AIIMS-2002

Ans. (c) : Ambulacral groove is a furrow bordered by large spines extending along the oral surface of each arm. Each groove of each arm contains two to four rows of hollow tube feet that can be extended or withdrawn.
• The ambulacral grooves are present in asteroidea.

730. Which one of the following does not have an excretory system ?
(a) Myxine (b) Carcharodon
(c) Balanoglossus (d) Asterias
(e) Catla
Kerala PMT-2011

Ans. (d) : Asterias, which is a type of starfish, does not have a traditional excretory system like other animals. Instead of excreting waste through specialized organs, starfish rely on simple diffusion and the movement of fluids within their body cavities to eliminate waste products. This is one of the unique characteristics of starfish anatomy.

731. Autotamy, a phenomenon is well marked in
(a) annelids (b) arthropods
(c) mollusca (d) echinodermata
Punjab MET-2011

Ans. (d) : Autotamy, a phenomenon is well marked in echinodermata. The ability of certain animals to release part of the body that has been grasped by an external agent.
• Organisms of the phylum echinodermata have ability of Autotamy.

732. Water vascular system is a pecularity of :
(a) Porifera (b) Coelenterata
(c) Mollusca (d) Echinodermata
WB JEE-2008/ Punjab MET-2008
Rajasthan PMT-2001

Ans. (d) : Vascular system is a characteristic feature of the phylum echinodermata. The water vascular system helps in food capture. This system is controlled hydraulically.

733. Broken arms are regenerated in
(a) fishes (b) molluscs
(c) echinoderms (d) human beings
BVP-2011

Ans. (c) : Regeneration of broken arms is called restorative regeneration. It occurs in Echinodermata. Echinoderms can regenerate their appendages or limb, internal organs and some parts of nervous system.

734. Which of the following is properly matched?
(a) Platyhelminthes – Trematoda – Planaria
(b) Echinodermata – Asteroidea – Star fish
(c) Arthropoda – Insecta – Spider
(d) Mollusca – Cephalopoda – Unio
BVP-2015 / Manipal-2009 / Karnataka CET-2009

Ans. (b) : Star fish is also called sea star is a marine invertebrate of the class-Asteroidea of phylum-Echinodermata.
• **Trematoda :** Trematodes are flatworm classified in the phylum platyhelminthes, Trematoda subclass - Digenea.
• **Cephalopoda:** Phylum mollusca have class cephalopoda a small group of highly advanced and organized exclusively marine animals.
• The subclass Arachnida represents the diverse group of arthropods that includes spiders, scorpions, mites, ticks etc. Hence, only the (b) is properly matched.

735. Find the odd example.
(a) Sea cucumber (b) Sea urchin
(c) Sea lily (d) Sea fan
Karnataka CET-2007

Ans. (d) : Sea lily is antedon, sea cucumber is cucumaria and sea urchin is echinus. These three belong to phylum Echinodermata. These animal have spiny body (Echino means spine derwa is skin).
Sea fan (Gorgonia) belongs to phylum coelenterate. Therefore, sea fan is an odd example.

736. The bilateria member that exhibits pentaradial symmetry is
(a) Neomenia (b) Nautilus
(c) Neometra (d) Neopilina
AP EAMCET-2008

Ans. (c) : Adult echinoderms have pentamerous radial symmetry, while the larva has bilateral symmetry in Neometra. Neometra acanthaster is a species of echinoderms in the family calometridae.

@apna_pdf

737. In Ophiuroidea, branched arms are seen in

(a) Gorgonocephalus (b) Clypeaster
(c) Salmacis (d) Gorgonia

AP EAMCET-2009

Ans. (a) : Gorgonocephalus is a genus of marine water, brittle stars belonging to the family Ophiuroidea has a basket or fan like branched arms are seen.
Ophiuroidea have five arms joined to central body disc (branched arms) Gorgonocephalus sp., is similar to the Asteroidea.

K. Hemichordata

738. Assertion (A) : Hemichordat is now placed as separate phylum under non-chordata.
Reason (R) : The stomochord of these animals was once believed to be the notochord.

(a) Both A and R are correct and R is the correct explanation of A
(b) Both A and R are correct and R is not correct explanation of A
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct

AP EAPCET-22.05.2023, Shift-I

Ans. (b) : The stomochord and Notochord are two distinct structure fund in chordates.
Stomochord: is present the primitive chordates like hemichordate and located in mouth and intestine and function is supporting the pharyngeal region and aiding in filter feeding.
The Notochord is present in chordate and all vertebrates.
It is flexible, rod like structure that runs thru dorsal side of the body.
Notochord support and provides the basis of muscles attachment.
The Notochord it more complex and fundamental structure in chordates white the stomochord is specific to certain group of phylum like hemichor dates.

739. Radial symmetry is NOT found in adults of phylum _____.

(a) Echinodermata (b) Ctenophora
(c) Hemichordata (d) Coelenterata

NEET (UG) 07.05.2023

Ans. (c) : The hemichordates are represented by organisms such as the acorn worms and they are solitary worms like organisms with a proboscis and collar. They exhibit bilateral symmetry.
• The condition of having similar parts regularly arranged around a central axis.

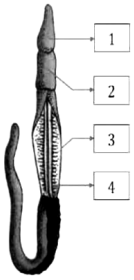
740. Larva of balanoglossus is _____

(a) Tadpole (b) Tornaria
(c) Muller's larva (d) Valrus larva

AP EAMCET-12.07.2022 Shift-II
AP EAPCET-07.09.2021 Shift-I

Ans. (b) : Balanoglossus belongs to the phylum-hemichordata.
The animals in hemichordata have a short notochord present in the anterior part of the body. There are two class in the hemichordata known as 'Enteropheusta' and 'Ptetrobranchia'. The larva of the animals of the formal class is called as tornaria. Tornaria larva is the planktonic larva. It is just like bipinnaria larva of star fishes.

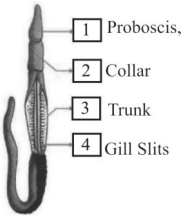
741. Label the parts corresponding to the numbers in the diagram given below?



(a) 1. Collar, 2. Gill Slits, 3. Proboscis, 4. Trunk
(b) 1. Proboscis, 2. Collar, 3. Trunk, 4. Gill Slits
(c) 1. Proboscis, 2. Trunk, 3. Gill Slits, 4. Collar
(d) 1. Proboscis, 2. Gill Slits, 3. Collar, 4. Trunk

AP EAMCET-03.09.2021 Shift-I

Ans. (b) : Given diagram is belongs to balanoglossus of phylum hemichordata. Their body is a cylindrical like worms and divided into 3 main parts : an anterior part is proboscis, a collor & a trunk. The function of gill slits in hemichordate is for the movement of water in the mouth.



742. Match the following

List-I		List-II	
A.	**Trichimella**	**I.**	**Xiphisura**
B.	**Trocophore**	**II.**	**Turbellaria**
C.	**Tornaria**	**III.**	**Porifera**
D.	**Trilobite**	**IV.**	**Polychaeta**
		V.	**Hemichordata**

The correct answer is
Options :

	A	B	C	D
(a)	III	IV	V	I
(b)	III	V	IV	I
(c)	V	III	IV	I
(d)	V	IV	III	II

AP EAMCET-24.04.2019 Shift-I

Ans. (a) : :

	List-I	List-II
A.	Trichimella	Porifera
B.	Trocophore	Polychaeta
C.	Tornaria	Hemichordata
D.	Trilobite	Xiphisura

743. In sea anemone, the symmetry is

(a) Radial (b) Bilateral
(c) Spherical (d) Absent

MGIMS Wardha-2008

@apna_pdf

Ans. (a) : Sea anemone processes a radial symmetry due to its sessile nature. Radial symmetry attributes to the kind of symmetry that separates the body into two halves along a central axis. Radial symmetry is the arrangement of body parts around a central axis or pieces in a pie. Radially symmetrical animals possess top and bottom surfaces, but no left and right sides, or front and back. This type of symmetry is seen in the phylum Ctenophora and Cnidaria.

744. Blood vascular system in hemichordate is :
(a) open (b) reduced
(c) closed (d) absent

AFMC-2006

Ans. (a) : : The circulatory system in hemichordates is simple with an open type. The blood vascular system includes a dorsal heart with two longitudinal vessels. The blood flows openly in the haemocoel.

745. Modern representative of an ancient link between the echinoderms and the chordates is represented by.
(a) Hemichordata (b) Urochordata
(c) Cephalochordata (d) Vertebrates

JCECE-2015

Ans. (a) : Hemichordates are the primitive connecting link between chordates and non-chordates. Hemichordata and echinoderms are generally considered as sister groups as they share similar relations up with each other. Notochord and pharyngeal characteristics are found in hemichordates. These characteristics are common in chordates.
Dorsal heart is found in non-chordates and hemichordates are dorsal heart animal. That's why hemichordate have some character of chordate as well as non-chordate.

746. Excretory organ of Balanoglossus is
(a) Malpighian tubules (b) flame cells
(c) nephridia (d) proboscis gland

Haryana PMT-2011
Kerala PMT-2011

Ans. (d) : Balanoglossus belongs to the phylum hemichordata. Excretory organ of balonoglassus is proboscis gland or glomerulus. This gland situated in front of the central sinus. The gland protrudes throughout the proboscis coelom.
These organs are considered glomerulus because they resemble the glomeruli of kidney of vertebrates. Glomeruli are located on either side of the bladder and form the bladder and central sinus.

747. Match the branches of biology given under Column I with the field of study listed under Column II; choose the answer which gives the correct combination of alphabets of two columns

	Column-I (Branch of Biology)	Column-II (Field of study)	
A	Malacology	p	Reptiles
B	Pomology	q	Fungi
C	Mycology	r	Fruits
D	Ornithology	s	Molluscs
		t	Birds

(a) A = p; B = r; C = q; D = t
(b) A = t; B = s; C = q; D = p
(c) A = s; B = r; C = q; D = t
(d) A = s; B = r; C = p; D = t

Karnataka CET-2004

Ans. (c) : Malacology : Study of molluscs
Pomology : Fruits
Mycology : Fungi
Ornithology : Birds

748. Connecting link between chordates and non-chordates is
(a) Peripatus (b) Balanoglossus
(c) Sphenodon (d) Tachyglossus

UP CPMT-2011

Ans. (b): • Balanoglossus is a connecting link between chordates and non-chordates because it's shows few resemblance with chordates-having notochord, pharyngeal gill slits and on other hand it is also display key features of non-chordates like presence of dorsal heart etc. The tornaria larva of balonoglossus shows a very striking resemblance with the bipinnaria larva of echinodermata.
• Peripatus is an invertebrate and connecting link between the annelida and arthropoda.

L. Chordata

749. The group of anamniota includes
(a) Reptiles and birds
(b) Birds and mammals
(c) Fishes an amphibians
(d) Reptiles and mammals

VMMC-2012 / JIPMER-2009
CG PMT-2008 / BVP-2007
MGIMS Wardha-2006 / AP EAMCET-1998

Ans. (c) : The anamniotes is a group comprising the fishes and the amphibians.
• They are also called lower vertebrates, which lay their eggs in water.
• A vertebrate that lacks an amnion and whose embryos and larvae must therefore develop in water.
• Anamniotes comprise the agnathans, fishes and amphibians.

750. Assertion (A) : The heart of fishes is called branchial heart
Reason (R) : Only deoxygenated blood flows through it.
(a) A and R are true, R is correct explanation for A
(b) A and R true, but R is not correct explanation for A
(c) A is true But R is false
(d) A is false But R is true

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : Heat of fish is two chamberd called singal circuit heart or venus heart.
Heart of fish have one auricle and one vertrical this heart receive deoxygenated blood from whole body except gills.
• Both renal and hepatic portal system is present and RBC are nucleated.

@apna_pdf

751. Example of anadromous migration is

(a) Salmon and Hilsa (b) Anguilla
(c) Catla Catla (d) Labeo

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Migration is very common in fish due to the either breeding purpose for food and for suitable environment fish migration is 3 type

i. Potomodromous

ii. Oceanodromous

iii. Diadromous.

Anadromous fish migration is type of Diadromous fish migration Anadromous fishes are migrate from sea water to fresh water for breeding purpose such as Hilsa, Salmon, Striped bass, Petromy zone.

752. The closest invertebrate relatives of chordates belong to the phylum

(a) Mollusca (b) Echinodermata
(c) Coelenterata (d) Arthropoda

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : The closest invertebrate relatives of chordates belong to the phylum echinodermata because both are possess life part of deuterostome group of animal.

It the blastopare formed posterior opening (anus) called deuteromates animals.

- Despite their anatomical differences, genetic and developmental studies have shown that echinoderme are more closely related to chordates that other invertebrate groups.

753. Assertion (A): It is necessary to know the life history of an ascidian to consider it a chordate.
Reason (R): Ascidians exhibit retrogressive metamorphosis in which larval stages are in a degenerated condition.

(a) Both A and R are true and R is the correct explanation of A.
(b) Both A and R are true but R is not the correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : An ascidian, also know as sea squirt is a marine invertebrate belonging to the phylum chordate. Despite its adult form appearing quits different from other chordates.

The ascidian have notochord, which is a flexible rod-like structure providing support and dorsal nerve cord that eventually divelops into the spinal cord. These indicat the evolutionary connection to vertebrates and other chordates.

Assidian or sea squirt exhibit retrogressive metamosiphosis. This means that during their development series of changes that result in the loss of certain structure, not larval stages.

754. Identify the incorrect pair regarding Vertebrae

(A) Birids - Amphicoelus
(B) Fishes - Procoelus
(C) Urodela - Procoelus
(D) Caecillians - Amphicoelus

(a) A, C (b) A, D
(c) B, D (d) B, C

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : Amphicoelus is veritebral centrum that have both the anterior (front) and posterior (back) end of the vertebral centrum are concave or hollowed out. this creates a biconcave shape, resempling a fingre light or an hourglass.

In birds, amphicoelus present near neck region.

Procoelous vertebrae that having a concave or hollowed out anterior (front) end of the vertebral centrum and convex or rounded posterior (back) end.

Procoelous vertebralcentyum is commonly found in the trunk and fail regions of many urodeles.

755. One of the following is commonly called flying fox

(a) Macropus (b) Draco
(c) Exocoetus (d) Pteropus

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : Flying fox also called certain type of bats the pleropus is genus of fruits bats commonly known as flying foxes due to their fox-like faces and their ability to fly.

Bat also help in pollination called. 'chiropterophilly'

756. The connecting link between reptiles and mammals is

(a) Eusthenopteron (b) Seymouria
(c) Archaeopteryx (d) Cynognathus

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : The connecting link between reptiles and mammals is archaeopteryx.

It is a ancient bird-like dinosaur that lived during the Jurassic period.

Archaeopteryx exhibits characteristics of both reptiles and birds, which provides evidence for the evolutionary transition from reptilian ancestors to modern birds.

While Archaeopteryx does not directly connect reptiles to mammals.

757. The notochordal mesoderm induces the overlying ectodermal cells that are involved in the formation of

(a) Neural groove (b) Neural plate
(c) Neural tube (d) Neural gland

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : The noto chordal mesoderm induces the overlying ectodermal cell that are involve in the formation of Neural plate. The Neural pate thickening of the ectodermal layer, further many neural folds with neural groove formation of neural tube.

758. Prochordate that exhibits bioluminescence

(a) Chaetopterus (b) Pyrosoma
(c) Firefly (d) Jelly Fish

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : Parosoma is prochordata that exhibits bioluminescence.

Bioluminescence the light emission by an organism. Parosoma pinnatum, are known for their bioluminescence often as a defense mechanism or for communication purposes.

759. Blocks of muscles found in cephalochordata are

(a) Matigonemes (b) Myotomes
(c) Myonemes (d) Sarcomere

AP EAPCET-23.05.2023, Shift-I

@apna_pdf

Ans. (b) : In cephalochordate, such as the lancelets or amphioxus, myotomes are segmented muscle blocks along the body.
These mytomes are segmented muscle blocks along the b body.
These mytomes are arranged in series and allow for rhythmic contraction that aid in locomotion helping the animal to swim in a wave like motion .

760. Choose the incorrect statements regarding Hemichordata
A. Stomochord extends into proboscis
B. They have ventral heart with closed type of circulatory system
C. Development includes Tornaria larva
D. Cloacal respiration takes place by respiratory trees.
(a) B, D (b) A, C
(c) B, C (d) A, D

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : Hemichordata are half chordates thy are primitive chordates and they may be responsible for organ of chorodata.
Circulatory system simple and open type having a heart on dorsal side
Excretion is through the proboscis gland or glomerulus connected to blood vessels.

761. Assertion (A) : Life cycle of ectoparasites is more complex with many developmental stages.
Reason (R) : Developmental stages of endoparasites have better chances to reach definitive host.
(a) Both A and R correct explanation of A
(b) Both A and R are correct but R is not correct explanation of A.
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct.

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : The life cycle of ectoparasites which live on the external surface of their host simple life cycle, involving stage like egg, nymph and adult, other can have with additional developmental. stages and interaction.
Endoparasite - have various developmental stage in their file cycle, depending on the specific parasite species, and its host as compairs to uctoparasites.

762. Identify the structure found in the early embryonic stages of amniotes that provides a clue to their aquatic ancestry.
(a) Endostyle
(b) Nuclei Pulposi
(c) Nonfunctional Pharyngeal pouches
(d) Air Bladder

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : Pharyngeal pouches are developmental feature found in the embryos of all vertebrates, in duding amniotes (reptiles, birds, and mammals) These pouches are involved in development of various structures like the gills in aquatic organisms or parts of the ear and throat in terrestrial organism pharyngeal pouches play a role in the embryonic development of various structure, but non function pharyngeal pouches responsible for providing aquatic ancestors, to amniotes.

763. Select the correct statements with reference to chordates.
A. Presence of a mid-dorsal, solid and double nerve cord.
B. Presence of closed circulatory system.
C. Presence of paired pharyngeal gillslits.
D. Presence of dorsal heart
E. Triploblastic pseudocoelomate animals.
Choose the correct answer from the options given below :
(a) C, D and E only (b) A, C and D only
(c) B and C only (d) B, D and E only

NEET (UG) 07.05.2023

Ans. (c) : Vertebrate and a few invertebrates, have a closed circulatory system.
• Phylum chordate is characterized by the presence of a notochord, a dorsal hollow nerve cord and paired pharyngeal gill slits.

764. Given below are two statements : one is labelled as Assertion (A) and the other is labelled as Reason (R).
Assertion (A) : All vertebrates are chordates but all chordates are not vertebrates.
Reason (R) : Notochord is replaced by vertebral column in the adult vertebrates.
In the light of the above statements, choose the most appropriate answer from the option given below:
(a) (A) is not correct but (R) is correct
(b) Both (A) and (R) are correct and (R) is the correct explanation of (A)
(c) Both (A) and (R) are correct but (R) is not the correct explanation of (A)
(d) (A) is correct but (R) is not correct

NEET-2022

Ans. (b) : All chordates are divided into three subphyla-Urochordates, cephalochordate and vertebrate. In subphylum vertebrata, notochord is replaced by bony or cartilaginous vertebral column but in urochordata and cephalochordate notochord is not replaced by vertebral column therefore all vertebrates are chordates but all chordates are not vertebrates.

765. Match the following:

Zoological name	Common name
(A) Hemidactylus	**(I) Flying lizard**
(B) Bungarus	**(II) Flying fox**
(C) Draco	**(III) Wall lizard**
(D) Pteropus	**(V) Krait**

	A	B	C	D
(a)	III	V	I	IV
(b)	II	I	V	III
(c)	III	V	I	II
(d)	IV	III	II	I

TS EAMCET-30.07.2022 Shift-II

Ans. (c) :

Zoological name	Common name
A. Hemidactylus	Wall lizard
B. Bungarus	Krait
C. Draco	Flying lizard
D. Ptecopus	Flying fox

@apna_pdf

766. Study the following table and pick up the incorrect combination (s).

S. No	Group	Salient feature	Example
S.No			
(I)	Cyclostomata	Absence of renal portal system	Lamprey
(II)	Gnathostomata	Internal ears with three semi circular canals each	Lancelet
(III)	Chondrichthyes	Heterocercal caudal fin	Torpedo
(IV)	Osteichthyes	Absence of air bladder	Catla

Options:

(a) I, II (b) II, IV
(c) II, III (d) I, IV

TS EAMCET-30.07.2022 Shift-II

Ans. (b) : Gnathostomata- The semicircular canals are three semicircular inter connected tubes located in the innermost part of each ear the inner ear. The three canals are - the horizontal, superior and posterior semicircular canals.

• Gnathostomata consists of species of fishes which have jaws.

767. Assertion (A): Branchiostoma is often described as typical chordate.
Reason (R): It has a myogenic heart.
The correct option among the following is

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true and (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-30.07.2022 Shift-II

Ans. (c) : Branchiostoma is often described as typical chordate. The Branchiostoma heart is a rosteocaudally extended tube consisting entirely of myocardial cells, there are no chambers, valves endocaldium epicaldium of other differentiated features of vertebrate hearts.

768. Which of the following statements is true?

(a) All chordates are vertebrates but all vertebrates are not chordates
(b) All vertebrates are chordates but all chordates are not vertebrates
(c) All chordates bear jaws
(d) All vertebrates bear jaws

AP EAMCET-11.07.2022 Shift-II

Ans. (b) : All vertebrates are chordates but all chordates are not vertebrates. Vertebrates also have a ventral muscular heart, kidney for excretions and osmoregulation etc.

769. The nerve cord chordates is _____

(a) Single, solid, tubular and non–ganglionated
(b) Double, hollow, tubular and non–ganglionated
(c) Single, hollow, tubular and ganglionated
(d) Single, hollow, tubular and non-ganglionated

AP EAMCET-06.09.2021 Shift-I

Ans. (d): The dorsal nerve cord is a unique feature to chordates, & it is mainly found in the vertebrata, Which is subphylum of Chordate. The nerve cord of chordates lying above the notochord is a single hollow, tubular & non- ganglionated.

770. Which of the following statements are true for the phylum-Chordata?

(A) In Urochordata notochord extends from head to tail and it is present throughout their life.
(B) In Vertebrata notochord is present during the embryonic period only.
(C) Central nervous system is dorsal and hollow.
(D) Chordata is divided into 3 subphyla: Hemichordata, Tunicata and Cephalochordata.

(a) (C) and (A) (b) (A) and (B)
(c) (B) and (C) (d) (D) and (C)

NEET-2020 Phase-I

Ans. (c) : Phylum Chordata belongs to the Kingdom Animalia and includes all the vertebrates.
Characteristics of phylum Chordata :

(1) Notochord : It support the nerve chord of replaced by vertebral column after the embryonic state in all vertebrates.
(2) Dorsal hollow nerve chord : It is a bundle of nerves running along the back.
(3) Pharyngeal slits : They are the openings which allow the entry of water through the mouth without enterning the digestive system. They connect mouth and throat.

771. Match the following

	Group		Types of vertebrae
A.	Pisces	I.	Amphiplatyon
B.	Reptilia	II.	Procoelous
C.	Aves	III.	Opisthocoelous
D.	Mammalia	IV.	Amphicoelous
		V.	Heterocoelous

The correct match is:

	A	B	C	D
(a)	IV	II	V	I
(b)	I	V	II	IV
(c)	III	II	IV	I
(d)	IV	V	III	I

TS EAMCET-28.09.2020 Shift-II

Ans. (a) :

	Group	Type of vertebrae
A.	Pisces	Amphicoelous
B.	Reptilia	Procoelous
C.	Aves	Hetreocoelous
D.	Mammalia	Amphiplatyon

772. Vitelline membrane is a_____

(a) Secondary egg membrane
(b) Primary egg membrane
(c) Tertiary egg membrane
(d) None of these options are correct

AP EAMCET-24.09.2020 Shift-I

@apna_pdf

Ans. (b) : Vitelline membrane is a primary egg membrane. This primary membrane is called as vitelline membrane in insects birds, molluscs and amphilbians. The vitelline membrane or vitelline enevelope is a structure surrounding the outer surface of the plasma membrane of an ovum or in some animals.

773. The distinguishing feature of all chordates is :
(a) a water vascular system
(b) an elastic rod (notochord)
(c) achitinous exoskeleton
(d) a ventrally placed nerve cord

AP EAMCET-24.09.2020 Shift-II
JIPMER-2000

Ans. (b) : The chordates are named for the presence of notochord a flexible, rod shaped structure that is formed in the embryonic stage of all chordates and also in the adult stage of some chordate species. It is located between the digestive tube and the nerve cord, providing skeletal support through the length of the body.

774. Statement (S): Chordates have a tail extending posterior to the anus. It contains skeletal elements and muscles but lacks coelom and visceral organs.
Reason (R) : In aquatic organism it acts as a balancing organ.
The correct answer is
(a) Both (S) and (R) are correct and (R) is the correct explanation to (S).
(b) Both (S) and (R) are correct.
(c) (S) is correct but (R) is incorrect.
(d) (S) is not correct but (R) is correct.

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Chordata have a tail extending posterior to the anus. It contains skeletons element and muscle but lacks coelom and visceral organs. The statocyst is a balance sensory receptor present in some aquatic invertebrate. So statement is correct but reason is incorrect.

775. Match the following

List-I	List-II
(A) Cuttle Fish	**(i) Green glands**
(B) Devil fish	**(ii) Medusoid form**
(C) Cray Fish	**(iii) External shell**
(D) Jelly fish	**(iv) Internal shell**
	(v) Shell is absent

The correct answer is
Options:

	A	B	C	D
(a)	III	V	II	I
(b)	IV	V	II	I
(c)	IV	V	I	II
(d)	III	II	I	V

AP EAMCET-24.04.2019 Shift-II

Ans. (c) :

Cuttle-fish	-	internal shell
Devil-fish	-	Shell is absent
Cray-fish	-	Green gland
Jelly-fish	-	Medussoid form

776. Which of the following represents order of 'Horse'?
(a) Equidae (b) Perissodactyla
(c) Caballus (d) Ferus

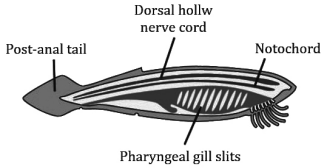
NEET-2017

Ans. (b) : Horse belongs to the 'order perissodactyla' which represents odd toaded mammals.
• Equidae is the family of the horse, equas is the genus, ferus is the species and caballus is a sub species.

777. An important characteristic that Hemichordates share with Chordates is
(a) Absence of notochord
(b) Ventral tubular nerve cord
(c) Pharynx with gill slits
(d) Pharynx without gill slits

NEET-2017 / JIPMER-2000

Ans. (c): The important characteristic that hemichordates share with chordates is pharynx with gill slits.
• These gill slits are narrow opening in the pharynx. The position of these pharyngeal gill slits a lateral in chordates, while dorsal in hemichordates.



778. The type of vertebrae in sub-order ophidian is
(a) amphicoelous (b) acoelous
(c) haterocoelous (d) procoelous

Punjab MET-1999
AFMC-2002

Ans. (d) : The type of vertebrae in sub-order ophidian is acoelous. Ophidia is a suborder, of reptiles that includes the snakes. They have procelous vertebrae. In procelous vertebrae the anterion surface is concave and pestrion surgace is convex.

779. Pick the odd one out.
(a) Chelone, Calotes, Naja
(b) Pavo, Psittacula, Ornithorhynchus
(c) Canis, Felis, Rattus
(d) Bufo, Rana, Hyla

AMU-2015

Ans. (b) : Chelone, calotes, Naja are generally are reptiles.
- Canis, felis and Rattus are generally well evolved creatures. They belongs to the class mammal.
- Bufo, Rana and Hyla are on the whole creatures of land and water. They belongs to the class amphibia.
- Pavo and Psittacula are feathered creatures, while ornithorhynchus is a vertebrate. Pavo and Psittacual are birds, where as ornithorhynchus is mammal. Hence, (b) one is odd.

780. Non-chordates have :
(a) notochord
(b) dorsal tubular nerve chord
(c) pharyngeal gill slitsS
(d) absence of hepatic portal system

BCECE-2005

@apna_pdf

Ans. (d) : Non chordates are characterised by the absence of notochord, pharyngeal gill slits and anal tail.
• Nerve cord in them is double and placed ventrally. Pharyngeal gill slits and the hepatic portal system is also absent in non chordates. Chordates are characterised by the presence of a notochord, dorsal hollow nerve cord, pharyngeal gill slits and a post-anal tail. They have a ventral heart.

781. Which of the following is the characteristic of chordata?
(a) Body is triploblastic
(b) Blind sac body plan
(c) Dorsal hollow nerve cord
(d) Canals and spongocoel are lined by flagellated cells

UP CPMT-2010

Ans. (c) : The phylum chordata is characterized by the presence of a notochord, a dorsal hollow nervecord, pharyngeal gill-slits and a post anal tail. Chordates are triploplastic animals as they have 3 embryonic layer-
(i) ectoderm
(ii) mesoderm
(iii) endoderm
The blind sac body plan is seen in Coelenterates. In porifera. The canal and spongocoel is lined with flagellated cells called choanocytes.

782. The mullerian duct in the female amniotes develops into
(a) Oviduct (b) Ureter
(c) Uterus (d) Seminal receptacle

VMMC-2013

Ans. (a) : The mullerian duct, named after the german physiologist 'Johamas P-Muller' in the embryo becomes the oviduct in the adult female. The Mullerian Duct (MD) which is also called as 'Paramesonephric duct' is the embryonic structure that develops into the Female Reproductive Tract (FRT). They have paired ducts of mesodermal origin in the embryo.

783. All chordates at one or other stage possess
(a) two pairs of pentadactyl limbs
(b) pharyngeal gill slits
(c) movable jaw
(d) vertebral column

MGIMS Wardha-2014

Ans. (b) : In all the chordates, at some stage of their life history, a series of paired lateral gill clefts or gill slits perforate through the pharyngeal wall of the gut behind the mouth.
• They serve primarily for the passage of water from pharynx to outside.

784. Equus rests on
(a) one digit (b) three digits
(c) four digits (d) five digits

Manipal-2011

Ans. (a) : Equus is a genus of mammals in the family Equidae, which includes horses, asses and zebras within the Equidae. Equus is the only recognised extant genus comprising seven living species. Equines are odd toed ungulates with slender legs, long heads, relatively long necks, manes and long tails. The earleast horses had three or four functional toes. But over millions of years of evolution many horses lost their side toes and developed a single hoof. Only horses with single toed (digit) hooves survive today.
The present species of horse (Equus) has one digit only in its toe. As the species evolved horses gradually dropped their digit number down to four, three and then just one.

785. The character which distinguishes vertebrate from other chordates is:
(a) dorsal heart
(b) solid ventral nerve cord
(c) hollow dorsal nerve cord
(d) presence of cranium

JIPMER-1998

Ans. (d) : The four most prominent characteristics that distinguish chordates from species in all other phyla are the presence of a post-anal tail, a notochord, a dorsal, hollow nerve cord, and pharyngeal slits (also called gill slits).
• Vertebrates are the only chordates that have a brain as part of their central nervous system. It shows the presence of cranium.

786. The portal system seen in all vertebrates is:
(a) hepatic (b) renal
(c) both (a) and (b) (d) pulmonary

JIPMER-1997

Ans. (a) : Hepatic portal system is present in all vertebrates.
• The hepatic portal system consists of the hepatic portal vein, inferior mesenteric vein, superior mesenteric vein, and gastrosplenic vein.
• The superior mesenteric vein and the gastrosplenic vein come together to give rise to the hepatic portal vein.
The renal portal system is absent or lacking in mammals.

787. Most of the cartilages in vertebrate embryo are replaced in adult by
(a) Blood (b) Bones
(c) Tendons (d) Ligaments
(e) Muscles

Kerala PMT-2015

Ans. (b) : Most of the cartilages in vertebrate embryo are replaced in adult by bones. In vertebrate embryo, most of the skeleton is made up of cartilage, which is eventually replaced by bone during growth. Cartilage is a specialized type of dense connective tissue designed to give support, bear weight and withstand tension, torsion and bending.

788. Which vertebrate organ receives only oxygenated blood?
(a) Gill (b) Lung
(c) Spleen (d) Liver

JIPMER-2003

Ans. (c) : The spleen is the organ that receives only oxygenated blood. The splenic artery or lineal artery is the blood vessel that supplies oxygenated blood to the spleen. It branches from the celic artery.
• Gills & lungs are respiratory organs that oxygenate deoxygenated blood.
• The liver receives deoxygenated blood, through the hepatic portal system.

@apna_pdf

789. Feature of acraniate vertebrates are :
(a) median and paired fins, 7 gill slits and acoelous vertebral column
(b) paired fin,5 gill slits, coelous vertebral column
(c) median fin, 7 gill slits, acoelous vertebral column
(d) median fin, 5 gill slits and coelous vertebral column

Rajasthan PMT-1998

Ans. (c) : Acraniata are lower chordates that possess a cranium and belong to the phylum chordata.
• They possess a notochord and gill slits are persistent.
• They possess acoelous vertebral column.
• The whole body is segmented, head section is not separate. They possess a dorsal fin. They also have median fin, 7 gill slits, acoelous vertebral column.

790. Which of the following pair include oldest and primitive vertebrates?
(a) Amphioxus and Herdmania
(b) Doliolum and Scoliodon
(c) Balanoglossus and Salpa
(d) Petromyzon and Myxine

Rajasthan PMT-1998

Ans. (d) : Petromyzon and Myxine are oldest and primitive vertebrates. Petromyzon (lamprey) are example of cyclostomes which are also considered as lower vertebrates that is an ectoparasite on other vertebrates. Cyclostomes are jawless vertebrates.
Myxine belongs to the genus of hagfish and belongs to the class cyclostomata. It has a shape like an eel fish.

791. Which one of the following is not an example of accretionary growth?
(a) Increase in the size of muscles due to regular exercise
(b) Prenatal growth of the embryo
(c) Both of the above
(d) None of the above

AMU-2011

Ans. (c) : The accretionary growth can be seen in bone and cartilage. The accretionary growth occurs in the adult stage. It also occurs during the post-embryonic stage. This type of growth occurs when cells become permanent.
In this type cells lose their capacity to divide so there will be necessity of secretion of extracellular matrix for growth.
• In auxetic growth the organism size increase due to cellular enlargement. Auxesis refers to growth from an increase in cell size rather than an increase in the number of cells.

792. In vertebrates the nerve growth factor occurs in the
(a) Salivary secretions (b) Gastric secretion
(c) Pancreatic secretion (d) Lacrymal secretion

AMU-1998

Ans. (a) : Nerve growth factor and its different precursor forms are secreted into human saliva by salivary glands and are also produced by an array of cells in the tissues of the oral cavity. The nerve growth factor (NGF) is a protein growth factor that is necessary for the growth and maintenance of sympathetic neurons and some sensory neurons.

793. Any one of the following set of characters is definetely found at some stage in the life cycle of a chordate:
(a) mammary glands, hair, gill cleft
(b) notochord, gill-cleft, dorsal tubular nervous system
(c) notochord, vertebral column, gill- cleft
(d) dorsal tubular nervous system, vertebral column, scales

VMMC-2006

Ans. (b) : Presence of notochord, dorsal tubular nerve cord, pharyngeal gill clefts, post and anal tail, RBCs and hepatic portal system is distinguishing feature of chordates.
• Solid tubular ventral nerve cord is not a characteristic of phylum chordata.

794. Order Primata contains
(a) shrew and hedge hog (b) bats and vampire
(c) monkeys and man (d) horses and zebra

UP CPMT-2001

Ans. (c) : Primates is an order that includes a diversified group of animals such as lemurs, lorises, monkey, ape and humans.
Primates have large brain (relative to body size) compared to other mammals.
Some primates also have opposable thumbs.

795. Which of the following statements is true?
(a) All chordates are vertebrates
(b) All vertebrates are chordates
(c) Invertebrates possess a tubular nerve cord
(d) Non-Chordates have a vertebral

Karnataka CET-2003

Ans. (b) : Vertebrata is a Sub-phylum under phylum chordata in which, the embryonic notochord gets replaced by a bony or cartilaginous vertebral column in the adult.
• All vertebrates are chordates but all chordates are not vertebrates.
Characters that they share with vertebrates at some point in their lives are- A notochord (become spinal cord), Pharyngeal pouches (becomes inner ear and jawbone in humans) Dorsal hollow nerve chord (becomes vertebral column).

796. Animals having a built in thermostat to maintain constant body temperature are known as
(a) Biothermic (b) Poikilothermic
(c) Oligothermic (d) Homeothermic

VMMC-2012

Ans. (d) : Homeothermy refers to thermoregulation that maintains a stable internal body temperature regardless of external influence.
• Higher chordates such as birds and mammals are examples of homeotherms or warm blooded animals(endotherms).
• Poikilothermic- An organism that cannot regulate its body temperature. They are also called cold-blooded animals.
Biothermic- These are the organism which have the ability to respond to the outer cold temperature by continuous shivering so as to produce heat in their body.
Oligothermic- These are the creatures which can bear relatively low temperature in the environment.

@apna_pdf

797. The Salientia member with digits of fore limbs and hind limbs webbed is:
(a) Rana (b) Rhacophorus
(c) Proteus (d) Hyla

AP EAMCET-2004

Ans. (b) : The Salientia are a total group of amphibians that includes the order Anura. They include the frogs and toads and various extinct proto-frogs.
• The hind limbs help in swimming, walking and burrowing. The hind limbs comprise of five digits and they are larger and muscular than fore limbs that end in four digits. feet have webbed digits that help in swimming.

798. Which of the following is not present in all the chordates?
(a) Vertebral column
(b) Notochord
(c) Dorsal tubular nerve cord
(d) None of these

JIPMER-1995

Ans. (a) : Chordates include Urochordates, Chephalochordates (both are called protochordate.) and vertebrates.
• In vertebrates notochord is replaced by the vertebral column (back bone).
• However, the vertebral column is not present in a protochordate.

799. Which of the given option is correct regarding the statements?
Statement I Cephalochordata bears notochord all along the body throughout life.
Statement II Urochordate bears vertebral column only in tail region throughout the life.
(a) I wrong, II correct
(b) I correct, II wrong
(c) Both I and II are wrong
(d) Both are correct

JIPMER-2013

Ans. (b) : Cephalochordata bear notochord all along the body throughout life.
Cephalochordates have a hollow, dorsal nerve cord pharyngeal gill slits and a notochord.
• Urochordates bear notochord in the tail region in their larval stage only. Hence, statement second is wrong.

800. The scientific name of gharial is
(a) Naja bungarus
(b) Gavialis gangeticus
(c) Hemidactylus flavivridis
(d) None of the above

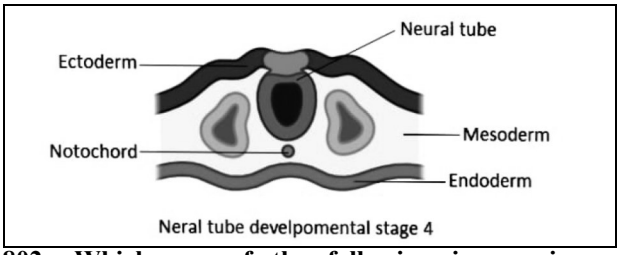
JIPMER-2013

Ans. (b) : The gharial (Gavialis gangeticus) also known as gharial or fish-eating crocodile, is a crocodilian in the family Gavialidae and among the longest of all living crocodilians.

801. Notochord originates from
(a) mesoderm (b) ectoderm
(c) endoderm (d) None of these

JIPMER-2013

Ans. (a) : : The notochord develops ventral to ectoderm and this means it originates from mesoderm.
• First, it lies below the ectoderm then below the neural plate, and finally under the neural tube.



Neral tube develpomental stage 4

802. Which one of the following is a primary character of phylum-Chordata ?
(a) Solid ventral nerve cord
(b) Dorsal tubular nerve cord
(c) Paired nerve cord
(d) Ganglionated nerve cord

VMMC-2015

Ans. (b) : The presence of dorsal nerve chord is a characteristic feature of all chordates but this nerve chord is hollow in nature so that neuron can pass through and present below the dosal part.

803. Presence of claspers is an important character in
(a) Sphyrna (b) Echeneis
(c) Hippocampus (d) Exocoetus

CG PMT-2011

Ans. (a) : Presence of claspers is an important character in 'Sphyrna' . Sphyrna are also known as hammer headed sharks.
This aquatic organism belongs to the phylum chordata and class-chondrichthyes.
• It is a cartilaginous fish. The males can be distinguished from the female, since the male possesses a pair of hard elongated claspers attached to the pelvic fins.

804. Which of the following is a species?
(a) Dipnoi (b) Mammalia
(c) Canis familiaris (d) Carnivora

CG PMT-2011

Ans. (c) : *Canis familiaris* is a species of dog . The scientific name of a dog is *Canis familiaris.*
Dipnoi – Dipnoi is a sub-class of bony fishes comprising the lungfishes.
Mammalia – Class - Mammalia is a higher vertebrates that nourish their young with milk secreted by mammary glands.
Carnivora – Carnivora is an order of placental mammals that have specialized in primarily eating fish.

805. Retrogressive metamorphosis is present in
(a) Herdmania (b) Balanoglossus
(c) Amphioxus (d) All of these

VMMC-2010 / Rajasthan PMT-2006 / AMU-1998

Ans. (a) : Retrogressive metamorphosis is present in herdmania. Retrogressive metamorphosis refers to a specific type of metamorphosis observed in ascidians or tunicates, which are a type or urochordate. Metamorphosis is a process in which an organism undergoes a profound, change in form during post-embryonic development, typically transitioning from a larval stage to an adult stage. In retrogressive metamorphosis the larva possesses advanced characteristics that are subsequently lost or degenerate as it transforms into the adult stage.

@apna_pdf

806. Which animal notochord possesses throughout its life?
(a) Fish (b) Bird
(c) Snake (d) Amphioxus

HP CET-2012

Ans. (d) : The notochard in amphioxus consist of parallel notochard cell and each plate consist of parallel thinner & fibril.
Amphioxus belongs to the phylum chordata (subphylum cephalochordata). In amphioxus, the notochord persist throughout the life.

807. The heart of molluscs and vertebrates are of
(a) neurogenic type
(b) myogenic type
(c) partially myogenic type
(d) partially neurogenic type

CMC Ludhiana -2013

Ans. (b) : The myogenic heart is a characteristic feature of molluscs and vertebrates.
In this type of heart, the heartbeat is initiate by a patch of the modified heart muscle known as SA node.

808. Two chambered heart is a feature of
(a) Amphibians (b) Fishes
(c) Reptiles (d) Birds
(e) Mammals

Kerala PMT-2009

Ans. (b) : Two chambered heart is a feature of fishes.
Fish have a two-chambered heart. It comprises an atrium and a ventricle. Auricle is responsible for taking in blood from body and ventricle pumps out the blood that has entered the heart through gills.
- Amphibians have a 3 chambered heart.
- Reptiles have an incompletely four chambered heart
- Birds have a 4-chambered heart.
- Mammals have a 4-chambered heart. It is composed of two atria and two ventricles.

809. Statement (S) : Marine fishes have aglomerular kidneys
Reason (R) : Aglomerular kidneys increase the loss of water through urine
Correct choice is
(a) Both (S) and (R) are correct but (R) is not the correct explanation to (S)
(b) Both (S) and (R) are correct and (R) is the correct explanation to (S)
(c) (S) is wrong but (R) is correct
(d) (S) is correct but (R) is wrong

TS EAMCET-2015

Ans. (d) : Approximately 40 species of fish are known to possess aglomerular kidneys representing as 0.1% of extant fish species. So, the statement is correct but the reason is not correct because aglomerular kidneys does not increase the loss of water through urine.

810. Pharyngeal gill-slits are found in
(a) Octopus (b) crayfish
(c) dogfish (d) cuttlefish

Uttarakhand PMT-2011

Ans. (c) : Dogfish are chordates. They have pharyngeal gill slits. Pharyngeal gill slits are one of the primary characters of chordates.
- Octopus also called 'Devil fish' belongs to phylum mollusca.
- Cuttlefish belongs to phylum mollusca.
- Cray fish are fresh water crustaceans which belongs to phylum Arthropoda.

811. Which one of the following is a true fish?
(a) Star fish (b) Dog fish
(c) Jelly fish (d) Cuttle fish

UP CPMT-2013

Ans. (b) : Dogfish is a cartilagenous fish. It is also known as Scoliodon. Because of its great sense of smell it is known as dogfish.
- Jelly fish is a Coelenterates.
- Star fish belongs to phylum Echinodermata.
- Cuttlefish belongs to phylum Mollusca.

812. Statement (S) : Lancelets are jawless, primitive fish like vertebrates.
Reason (R) : In lancelets notochord, tubular nerve cord and pharyngeal gill slits are present throughout their life.
The correct answer is
(a) Both (S) and (R) are correct and (R) is not the correct explanation to (S)
(b) (S) is correct but (R) is wrong.
(c) (S) is wrong but (R) is correct
(d) Both (S) and (R) are correct and (R) is the correct explanation to (S).

AP EAMCET-2014

Ans. (c) : Lancelets are not vertebrates, cilia driver currents 'suck' water into the mouth and across the pharyngeal gills. A lancelet has a long body, pointed at both ends, with a large notochord that extends almost from tip to tip and is persist throughout life.
Thus, statement (S) is wrong but the reason (R) is correct.

813. A jawless fish, which lays eggs in fresh water and whose ammocoetes larvae after metamorphosis return to the ocean is :
(a) Petromyzon (b) Eptatretus
(c) Myxine (d) Neomyxine

AIPMT (Re-Exam)-2015

Ans. (a) : Petromyzon (lamprey) belongs the class Agnatha of the subphylum vertebrate, is a migratory marine water jawless fish which shows anadromous migration.
It spawns in fresh water, stop feeding and dies.
Its larva (Ammocoetes) after metamorphosis will return to ocean.
Some of the characteristic of Agnatha are :-
- Jaws are absent.
- Paired fins are generally absent.
- Early species had heavy bony scales and plates in their skin, but these are not present in living species.
- The embryonic notochord persists in the adult
- In most cases skeleton are cartilaginous
- Seven or more paired gill pouches are present.

814. The chordate features shared by the non-chordates are
(a) Bilateral symmetry
(b) Triploblastic condition and bilateral symmetry
(c) Metamerism
(d) All of the above

AIIMS-2011

@apna_pdf

Ans. (d) : The chordates features shared by the non chordates animals are– bilateral symmetry, triploblastic condition and metamerism. These are common features which are common to both chordate and non chordates.

815. A chordate character is
(a) gills (b) spiracles
(c) post-anal tail (d) chitinous exoskeleton

AIPMT-1989

Ans. (c) : Chordate character are notochord, pharyngeal gills slits, nerve cord and post anal tail.
Tail is the part of the body behind the cloacal or anal opening . The tail is reduced or absent in the adult of some chordates.

816. What is common in whale, bat and rat?
(a) Absence of neck
(b) Muscular diaphragm between thorax and abdomen
(c) Extra-abdominal testes to avoid high temperature of body
(d) Presence of external ears

AIPMT-1993

Ans. (b) : Bat, whale and rat is the presence of a muscular diaphragm between thorax and abdomen. The diaphragm separates the thoracic from the abdominal cavity. Whale, bat and rat all are mammals and have diaphram.

817. Among the following organisms point out a completely non-parasitic form
(a) Tapeworm (b) Mosquito
(c) Sea anemone (d) Leech

AIPMT-1994

Ans. (c) : A parasite is an organism that lives on other organism and obtain food, cousin harm, or in (host). Sea anemone is non parasite; it shows mutualism with hermit crab. Mosquito, leech & tapeworm are parasites.

818. A common characteristic of all vertebrates without exception is
(a) the division of body into head, neck, trunk and tail
(b) their body covered with an exoskeleton
(c) the possession of two pairs of functional appendages
(d) the presence of well-developed skull

AIPMT-1994

Ans. (d) : A common characteristic of all vertebrates is the presence of a well-developed skull. This bony structure encases and protects the brain, which is a critical organ in all vertebrate species. The skull also provides attachment points for muscles and serves as a framework for the sensory organs such as the eyes, ears and nose.

819. Besides annelida and arthropoda, the metamerism is exhibited by
(a) mollusca (b) acanthocephala
(c) cestoda (d) chordata

AIPMT-1995

Ans. (d): Metamerism is the repetition of homologous body segments. Animals included in the phylum Annelida, Arthropoda and chordata show true metamerism. In chordates, the segmentation is apparent only in the embryonic stage.

820. Match the following and choose the correct option :

(i) Cyclostomes	**(A) Hemichordata**
(ii) Aves	**(B) Urochordata**
(iii) Tunicates	**(C) Agnatha**
(iv) Balanoglossus	**(D) Pisces**
(v) Osteichthyes	**(E) Tetrapod**

(a) i – A ii – B iii – C iv – D v – E
(b) i – B ii – C iii – D iv – A v – E
(c) i – C ii – E iii – B iv – A v – D
(d) i – C ii – A iii – E iv – B v – D
(e) i – E ii – C iii – B iv – A v – D

BVP-2015 / JIPMER-2013 / Kerala PMT-2011

Ans. (c) :

(i)	Cyclostomes	Agnatha
(ii)	Aves	Tetrapod
(iii)	Tunicates	Urochordata
(iv)	Balanoglossus	Hemichordata
(v)	Osteichthyes	Pisces

821. Which of the following is not found in vertebrates?
(a) Bilateral symmetry (b) Gill opening
(c) Body scales (d) Cnidoblasts

WB JEE-2007

Ans. (d) : Cnidoblasts are not found in vertebrates. These specialize cells contain structure called cnidocysts, which are used by certain animals like jellyfish and corals for defense and capturing prey. Vertebrates do not possess these cells or structures.

822. Vertebrate nails are derivatives of:
(a) stratum lucidum (b) stratum germinatirum
(c) stratum granulosum (d) stratum corneum

MP PMT-2013

Ans. (d) : Vertebrate nails are derived from the stratum corneum, which is the outermost layer of the skin. This layer becomes thickened and hardened to form nails.

823. When embryonic development is completed is mother but the embryo not accept-nutritent from mother. Which is know is :
(a) ovo-viviparous (b) viviparous
(c) oviparous (d) all of these

Rajasthan PMT-1999

Ans. (a) : Ovo-viviparous animals are those who fertilize the egg internally & then hatch the egg inside the mother's body in the mother's womb. The mother retains the egg in the oviduct for a certain time until they all fully developed to be laid outside and survive in the external environment. This is seen in sharks and ray fish.

824. The most primitive vertebrates are
(a) Ostracoderms (b) Cephalochordates
(c) Placoderms (d) Cyclostomes

BVP-2009
VMMC-2009
Uttarakhand PMT-2009

Ans. (a) : Ostracoderms are considered the most primitive vertebrates. They were jawless fish that lived around 500 million years ago. They had bony armor covering their bodies and lacked true jaws. This makes them one of the earliest examples of vertebrates in the fossil record.

@apna_pdf

825. Identify the pair having amphicoelous vertebrae
(a) Scoliodon and Ichthyophis
(b) Crocodylus and Hemidactylus
(c) Ornithorhynchus and Macropus
(d) Ophiophagus and Tropidonotus

TS EAMCET-15.05.2016

Ans. (a) : Amphicoelous vertebra is a type of vertebrae in which the centrum of the vertebrae is concave on both anterior surface and posterior surface. This type of vertebrae is found in scoliodon and Ichthyophis.

826. Which one is not a vertebrate?
(a) Fish (b) Sparrow
(c) Oryctolagus (d) Amphioxus

BVP-2011

Ans. (d) : Amphioxus is not a vertebrate. It is cephalo-chordata which is included in phylum chordate. Amphioxus also called lancelet.

827. Given below are four matchings of an animal and its kind of respiratory organ.

(I)	**Silver fish**	**Trachea**
(II)	**Scorpion**	**Book lung**
(III)	**Sea squirt**	**Pharyngeal slits**
(IV)	**Dolphin**	**Skin**

Correct option:
(a) II and IV (b) III and IV
(c) I and IV (d) I, II and III

Manipal-2015

Ans. (d) : They rise to the water's surface to inhale air through their blowholes, which are essentially nostrils located at the back of their heads.

828. Which one of the following pairs is mismatched?
(a) Pila globosa - Pearl (b) Apis indica - Honey
(c) Kenia lacca - Lac (d) Bombyx mori - Silk

Rajasthan PMT-2010

Ans. (a) : Pearl is mismatched because pila globosa is a species of freshwater snail, where as pearls are typically produced by oysters or mussels. The other pairs correctly associate the respective organisms with their products.

829. Choose the correct statement.
(a) All mammals are viviparous
(b) All cyclostomes do not possess jaws and paired fins
(c) All reptiles have a three-chambered heart
(d) All pisces have gills covered by an operculum

NEET-2016 Phase-II

Ans. (b) : Cyclostomes are Agnathans organisms, they lack both jaws and paired fins.
- Most mammals are viviparous except platypus (Ornithorhynchus) and Echidna (Tachyglossidae) which are oviparous mammals.
- All reptiles have three chambered heart except crocodile which have four chambered heart.
- Bony fishes have gills covered by operculum but cartilaginous fishes do not.

830. The missing link between amphibians and reptiles is
(a) Archaeopteryx (b) Ichthyostega
(c) Seymouria (d) All of these

Punjab MET-2007

Ans. (c) : The missing link between amphibians and reptiles is seymouria. It is a genus of extinct amphibians-like animals that lived during the late carboniferous and early Permian periods. It is considered to be a transitional form between amphibians and reptiles due to its combination of amphibian and reptilian features. This makes it an important evolutionary link in the transition from water-dependent amphibians to more terrestrial reptiles.

831. Retractile claws are found in:
(a) Cat and Lion (b) Leopard
(c) Hyaena (d) All of the above

MP PMT-2013

Ans. (d) : Retractile claws are present in various animals including cats, lions, leopards and hyenas. There claws can be extended and retracted, allowing these animals to control their use for hurting, climbing and other activities.

832. Connecting link between bird and Reptiles is :
(a) Dodo (b) Kiwi
(c) Panguine (d) Archaeopteryx

Rajasthan PMT-1999

Ans. (d) : Archaeopteryx is Connecting link between bird and Reptiles.
Archaeopteryx was a primitive bird with feathers, but its fossilized skeleton looks more like that of a small dinosaur.
- It was about the size of a magpie unlike modern bird it had a full set of teeth a long bony tail and three claws on its wing which may have been used for grasping branches.

833. The ability of animals to regenerate the lost parts of the body was reported by
(a) Carlson (b) Trembley
(c) Patten (d) Storer

CG PMT-2004

Ans. (b) : The ability of animals to regenerate the lost part of the body was reported by trembley.

834. Crocodile and Penguin are similar to Whale and Dogfish in which one of the following features
(a) Have gill slits at some stage
(b) Possess a solid single stranded central nerovous system
(c) Lay eggs and guard them till they hatch
(d) Possess bony skeleton.

AIPMT (Mains)-2010

Ans. (a) : Crocodile, Penguin, Whale and Dogfish belongs to phylum chordates represents that they have similar limb structure but their functions may varies, they have gill slits at embryonic stage of life. They all are viviparous and produces young once.
The presence of a notochord, a dorsal hallows nerve cord and paired pharyngeal gill slits are also a character of chordates.

835. The post anal tail is present in-
(a) Invertebrates (b) Vertebrates
(c) Chordates (d) In all of them

Karnataka CET-2007

Ans. (c) : Post anal tail is a exclusive key feature of chordates. Post and tail is an extention of the body beyond the anus and helps in several functions like locomotion, balance etc.

@apna_pdf

836. What is common between parrot, platypus and kangaroo?
(a) Ovoparity (b) Homeothermy
(c) Toothless jaws (d) Functional post-anal tail

AIPMT-2007

Ans. (b) : Homoeothermy is the maintenance by an animal in which body temperature remains constant and does not change with the change of environmental temperature.
- Homoeothermy occurs in birds and mammals which are described as endotherms.
- Kangaroo is a oviparous animal and has jaw with tooth.
- Parrot, platypus has toothless jaws.
- In kangaroo functional post-anal tail is found.

837. Which one of the following is not a vertebrate?
(a) Sea cow (b) Sea lion
(c) Sea horse (d) Sea hare

JIPMER-2014

Ans. (d) : An invertebrate is a cold-blooded animal without a backbone. They can live both on land and water. Sea hare is commonly known as sea slug. They belong to phylum molluscs. They are marine gastropods.

838. Both hepatic and renal portal systems are found in
(a) Fishes, Amphibians, Reptiles
(b) Amphibians, Reptiles, Mammals
(c) Reptiles, Aves, Mammals
(d) Cyclostomes, Fishes, Amphibians

AP EAMCET-2013

Ans. (a) : In fishes, amphibians and reptiles both hepatic and renal portal system are found.
- A hepatic portal system is a system of veins that carries blood from the digestive tract to the liver.
- A renal portal system is a system of veins that carries blood from the kidneys to the liver.
- In mammals, only the hepatic portal system is present.

839. Renal portal system is
(a) present in all vertebrates
(b) present in all chordates
(c) absent in mammals
(d) present in all mammals

JCECE-2014 / UP CPMT-2006

Ans. (c): Renal portal system is well developed in fishes and amphibians, reduced in reptile and bird and is absent in mammals. This system carries blood from the posterior region of the body to the kidney by renal portal vein.

840. A circulatory system which is formed by capillaries and ends with capillaries is
(a) renal
(b) hepatic
(c) double circulatory system
(d) portal circulation

UP CPMT-2006

Ans. (d): A portal system can be defined as a part of the systemic circulation. A circulator system which is formed by capillaries and ends with capillaries is called as portal circulatory system.
Renal Portal System - A renal portal system is a portal venous system found in all living vertebrates except for hagfish lampreys and mammals. Its function is to supply blood to renal tubules.
Hepatic Portal System - Occurs in all vertebrates and is meant for taking blood from digestive tract pancreases and spleen into liver.
Double Circulatory System - Consist of pulmonary circulation (movement of blood between heart and lung) and systemic circulation (movement of blood between heart and different part of body except long).

841. Heart of elephant is
(a) neurogenic (b) myogenic
(c) both (a) and (c) (d) None of these

UP CPMT-2002

Ans. (b) : The heart of elephant is myogenic in nature. Mygenic heart does not require neural input to beat. The character of this type heart is closed type, mostly present in human body.
Neurogenic– In this type of heart the open type of circulatory system is present. A neurogenic heart beates by nerve impules, mostly present in lower invertebrates like annelids and insects.

M. Urochordata

842. Pick up the organism that emits light
(a) Pyrosoma (b) Mytilus
(c) Pontobdella (d) Aplysia

TS EAMCET-28.09.2020 Shift-I

Ans. (a) : Pyrosomes is the organism that emits light. It is capable of bioluminescence, a phenomenon where it produces and emits light. This ability to glow is a fascinating aspect of pyrosoma's biology.

843. In which among the following animals, retrogressive metamorphosis is found?
(a) Vertebrata (b) Urochordata
(c) Invertebrates (d) Chordates

AIIMS-2017 / AIIMS-2016 / WB JEE-2010

Ans. (b) : Urochordata possesses a unique feature called **retrogressive metamorphosis**. In this type of metamorphosis, an active larva metamorphoses into a sedentary (adult) phase.
- Metamorphosis is the phenomena in which there are converts which transform the organism from its juvenile stage (initial stage) to adult stage (end stage).
- They belong to the group of Urochordates also known as **Tunicates**.
- Tunic is a compound which form protective covering and animals are called tunicate. Tunic is produce by tunicates which are similar to cellulose which contain the cellulose micro fibrils.

E.g. **Herdmania**.

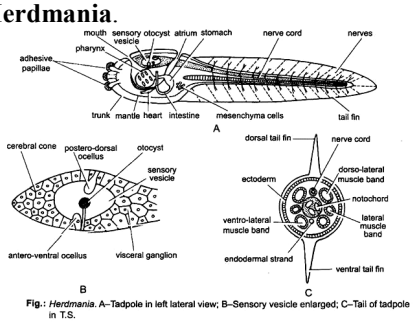


Fig.: *Herdmania*. A–Tadpole in left lateral view; B–Sensory vesicle enlarged; C–Tail of tadpole in T.S.

@apna_pdf

844. At retrogressive metamorphosis the uro chordate larva
(a) loss of notochord
(b) loss of tail
(c) experience reduction of nervous system to a visceral ganglion
(d) all of the above

JCECE-2007

Ans. (d) : Retrogressive metamorphosis in urochordate larvae involves the loss of the notochord, loss of the tail and reduction of the nervous system to a visceral ganglion. This process leads to a simpler anatomical structure as the larva matures into an adult form.

845. Mode of feeding in tunicates is :
(a) acrophagus (b) parasitic
(c) ciliary (d) myxotrophic

Uttarakhand PMT-2010

Ans. (c) : The mode of feeding in tunicates are ciliary or filter type. Tunicates are suspension feeders, means they feed by filtering plankton and other small food particles from the water. They are commonly known as sea squirt.

846. Outer covering of tunicates is formed by :
(a) tunicin (b) cellulose
(c) chitin (d) all of these

Rajasthan PMT-1999

Ans. (a) : The outer leathery covering in tunicates is formed of cellulose like substance called tunicin.
It acts as exoskeleton.
The body covered by the test it formed by tunicin. It protects from predators like sea star snail and fishes.

N. Cephalochordata

847. The protochordate that doesn't have heart, respiratory pigment, blood corpuscles but performs respiration through the external body surface is ————
(a) Oikopleura (b) Doliolum
(c) Branchiostoma (d) Pyrosoma

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : Branchiostoma is a lancelet, a type of choradata that is closely related to vertebrates. It has a notochord, a dorsal hollow nerve chord, and pharyngeal slits. However, it does not have heart respiratory pigment, or blood corpuscles. It respires through its external body surface.

848. The outermost covering of the egg of housefly is
(a) chitin (b) chorion
(c) vitelline membrane (d) plasma membrane

Uttarakhand PMT-2011

Ans. (b) : The hard outer covering of the egg of housefly is known as chorion. The chorion is made up of chitin, a strong, flexible material that is also found in the exoskeleton of insects.

849. Solenocytes are associated with
(a) respiration (b) digestion
(c) excretion (d) nutrition

JIPMER-2008

Ans. (c) : Solenocytes are flagellated cells involved with excretion, ion regulation and osmoregulation in some chordates which belongs to the subphylum Cephalochordata. It is a cup shaped cell that includes group of cilia and this is the main excretory organ of platyhelminthes. In lower vertebrates solenocytes removes the nitrogenous wastes.

850. Persistent notochord is the feature of which among the following?
(a) Chondrichthyes (b) Cyclostomata
(c) Loa loa (d) None of these

BCECE-2015

Ans. (b) : Cyclostomata have a persistent notochord through out of life vertebral column is small imperfect neural arches over the notochord.

851. An animal which has a notochord throughout its life:
(a) fish (b) Amphioxus
(c) bird (d) snake

AP EAMCET-1998
VMMC-2004

Ans. (b) : An animal has a notochord throughout its life is amphioxus. Amphioxus are small marine animals found widely in the coastal water of the warmer parts of the sea and less commonly in temperate water. Amphioxus belongs to the group of cephalochordates.

852. Which of the following is not the example of marine fishes?
(a) Labeo (b) mugil
(c) Hilsa (d) Sardines

WB JEE-2006

Ans. (a) : Marine fishes are the fishes that lives in ocean water. They are also called as salt water fishes, ex. Hilsa, Mugil and Sardines.
• Labeo rohita is a freshwater fish. They are found in rivers and ponds.

853. The devil fish and sea hare are
(a) Mollusca
(b) Crustaceans
(c) Coelenterates
(d) Marine fish and mammal

J&K CET-2008

Ans. (a) : Phylum mollusca including devil fish and sea hare. Among the genus of mollusca largest fish is the Devil. These can be found in the Eastern Atlantic Ocean, south of the Portugal and possibly in the northwest Atlantic. Scientific name of sea hare is Dalabella auricularia. They often hide in seagrass, sand and mud to protect themselves and live in areas that are sheltered from rough currents.

854. Notochord is present in the larva of :
(a) Herdmania (b) Cephalodiscus
(c) Balanoglossus (d) Amphioxus

Rajasthan PMT-1998

Ans. (a) : In Urochordata retrogressive metamorphosis is seen.
- Herdmania is an urochordatates animals. In urochordata, the notochord is present only in the larval tail.
- Balanoglossus is a genus of ocean-dwelling acorn worm

@apna_pdf

855. Statement 1 : Cephalochordata bears noto – chord all along the body throughout life. Statement 2 : Urochordate bears vertebral column only in tail region throughout the life. Which statement is correct?

(a) Both 1st and 2nd are correct
(b) 1st correct, 2nd wrong
(c) 1st wrong, 2nd correct
(d) Both 1st and 2nd are wrong

J&K CET-2006

Ans. (b) : Cephalochordates and vertebrates have a hollow dorsal nerve cord, pharyngeal gill slits and notochord .

■ **Cephalochordates** have notochord all along the body throughout the life.

■ The notochord is retained into adulthood and is never replaced by vertebrae.

■ **Urochordates** have notochord in the tail region in their larval stage only.

856. Presence of notochord throughout the life and length of the body is a feature of:

(a) Urochordates (b) Invertebrates
(c) Vertebrates (d) Cephalochordates

VMMC-2014
AP EAMCET-2001

Ans. (d) : The presence of Notochord is a Mesodermally derived, an preserved flexible solid rod of turgid cells present in chordates.

• It the members of the class cephalochordata notochords are persistent for their lifetime along the whole length of their body.

857. Find the wrongly matched pair,

Animal		Excretory organ/Structure
(a) Balanoglossus	-	Proboscis gland
(b) Earthworm	-	Nephridia
(c) Grasshopper	-	Malphigian tubules
(d) Prawn	-	Flame cells
(e) Amphioxus	-	Protonephridia

Kerala PMT-2015

Ans. (d) :

Balanoglossus	-	Proboscis gland
Earthworm	-	Nephridia
Grasshopper	-	Malphigian tubule
Prawn	-	Green gland
Amphioxus	-	protonephridia

O. Cyclostomata

858. Select the incorrect statements with respect to Cyclostomes:

(A) They lack scales and paired fins.
(B) They have circular mouth with jaws.
(C) They bear 6-15 pairs of gills.
(D) They migrate to deep sea for spawning.
Choose the most appropriate answer from the options given below:

(a) (A) and (B) only (b) (B) and (C) only
(c) (B) and (D) only (d) (A) and (D) only

NEET (Re-Exam)-04.09.2022

Ans. (c) : Cyclostomes is a group of vertebrates

- Circular mouth without jaws.
- The word cyclostomata means rounded mouths.
- Lampreys. Hagfishes both groups have round mouths that do not have jaws, however they have teeth.
- Cyclostomates are marine vertebrates but they show migration of fresh water for process of spawning.

859. Match the name of the animal (column I), with one characteristics (column II), and the phylum/class (column III) to which it belongs:

	Column I	Column II	Column III
(a)	Adamsia	radially symmetrical	Porifera
(b)	petromyzon	ectoparasite	Cyclostomata
(c)	Ichthyophis	terrestrial	Reptilia
(d)	Limulus	Body covered by chitinous exoskeleton	Pisces

NEET-2013

Ans. (b) : Petromyzon is an ectoparasite fish belonging to cyclostomata. They are belong to cyclostomata.

860 . Parents of ammocoete larva show

(a) Paired fins
(b) Placoid scales
(c) Catadromous migration
(d) Anadromous migration

AP EAMCET-2016

Ans. (d) : Ammocoete is the larval stage of the lamprey. Lampreys are anadromous fish, which means that they migrate from the ocean to freshwater to spawn. The parents of ammocoete larvae will also be anadromous fish.

861. Branch of zoology dealing with the study of fishes is called

(a) Arthrology (b) lchthyology
(c) Saurology (d) Herpetology

VMMC-2009

Ans. (b) :

• Study of fishes and fish research is a branch of zoology and is known as ichthyology.

• Arthrology, is the science concerned with the study of the anatomy, function, dysfunction and treatment of joints and articulation.

Saurology- study of lizards.

Herpetology- Study of Reptiles and Amphibians.

862. Which of the following is a catadromous fish?

(a) Hilsa sp. (b) Mystus sp.
(c) Anguilla sp. (d) Channa sp.

WB JEE-2010

Ans. (c) : Eels are catadromous fish, meaning they live in freshwater for most of their lives but migrate to the ocean to breed. The genus Anguilla includes all eels species. So Anguilla species is a catadromous fish.

• Catadromous fishes live mostly in freshwater the freshwater fishes which migrates to sea water for breeding are called catadromous.

863. One of the following animal belongs to Cyclostomata

(a) Channa (b) Loris
(c) Dodo (d) Petromyzon

J&K CET-2008

@apna_pdf

Ans. (d) : One of the animal belongs to Cyclostomata is Petromyzon. Petromyzon is a parasitic lamprey. It has rounded sucker like a moth. They have the eel-like body. The sharp retractable teeth are arranged in circular fashion.

864. Torpedo is commonly known as :
(a) Suckerfish (b) Electric ray
(c) Globefish (d) Sea horse
HP CET-2011

Ans. (b) : Torpedo is commonly known as electric ray as they possess an electric organ a modified muscle tissue. It produce an electric discharge from 8-100 volts form communication, defense and navigation.
Torpedo has a disc-shaped body that is light to dark brown in color on the dorsal surface.

865. Which of the following is characteristic of fishes?
(a) Tail and venous heart
(b) Venous heart and gills
(c) Gills and tail
(d) Scales and gills
Manipal-2000

Ans. (b) : The characteristic features of fishes is Venous heart and gills.
• Heart 2- chambered (1 atrium, 1 ventricle) and venous or single circuit, sinus venosus and renal and portal systems present.
• Erythrocytes nucleated Poikilothermus.
• Locomotion by paired pectoral an pelvic fins along with median dorsal and caudal fins.

866. Select an anadromous fish:
(a) Hippocampus (b) Petromyzon
(c) Exocoetus (d) Anabas
Haryana PMT-2002

Ans. (b) : An anadromous fish is Petromyzon.
■ In anadromous the fish originated in the freshwater and live seawater but again migrates to freshwater. To spawn example Salmon, petromyzon and smelt.

867. The larva of Petromyzon is known as
(a) Redia (b) Spat
(c) Ammocoete (d) Tornaria
AMU-1997

Ans. (c) : The larva of Petromyzon is known as ammocoete.
• Spat is larval stage of oysters which is tiny and freely navigate the water.
• Tornaria larva is found in Hemichordates.

P. Chondrichthyes

868. The larvicidial fish used in biocontrol of mosquitoes :
(a) Gambusia (b) Hilsa
(c) Scalophagus (d) Gold fish
Tripura JEE-2018 / MGIMS Wardha-2014
Uttarakhand PMT-2007 / Punjab MET-2003

Ans. (a) : Gambusia is fish which used in control of mosquitoes by biological method
• Gambusia is also known as western mosquito fish and diet generally larvious of mosquitoes and other aquatic insect.
• Hilsa fish very popular and sold for food fish.
• The Gold fish is freshwater fish in the family Cyprinidae of order Cyprininformes.
• It commonly kept as a pet in indoor aquarium fish.

869. Placoid scales is the characteristic feature of class
(a) Cyclostomata (b) Chondrichthyes
(c) Osteichthyes (d) Amphibia
JIPMER-2013/ VMMC-2011
J&K CET-2011 / JIPMER-2011

Ans. (b) :• Placoid scales is the characteristic feature of condrichthyes (cartilaginous fishes) e.g. shark and ray.
• Placoid scales are after referred to as denticles.

870. The excretory material of bony Fish is
(a) Urea (b) Protein
(c) Ammonia (d) Amino acid
BCECE-2014 / Kerala PMT-2015
BVP-2007 / Rajasthan PMT-2008

Ans. (c) : The excretory material of bony fishes is ammonia. Ammonia is the excretory waste in fishes. It is easily soluble.

871. Jaw less fish like vertebrates are.
(a) Tunicates (b) Osteichthys
(c) Cyclostomes (d) Apods
TS EAMCET-11.05.2023, Shift-II

Ans. (c) : Jawless fish belong to the group Agnatha or cyclostomes this group includes two main classes : mxxini (hangfishes) and petromyzontida (Lampreys) Jawless fish are characterized by their lack of two Jaws and paired fins and they are considered of most primitive vertebrates like cyclostomes.
Cyclostomes are considered living fossils because their character are rarely vertebrates ancestors.

872. Study the following and pick up the correct combinatins.

S.N.	Scientific name	Common name	Character
I	Hippocampus	Sea horse	Female has a brood pouch
II	Trygon	Sting ray	Possesses poison sting
III	Torpedo	Electric ray	Ventral muscles modified into electric organs
IV	Exocoetus	Flying fish	Contains air bladder

Options:
(a) I, II (b) II, IV
(c) I, III (d) III, IV
TS EAMCET-31.07.2022 Shift-I

@apna_pdf

Ans. (b) :

	Scientific Name	Common Name	Character
II	Trygon	Sting Ray	Possesses Poison Sting
IV	Exocoetus	Flying Fish	Contains air Bladder

873. Study the following table and pick up the correct combinations.

S. No	Group	Salient feature	Example
(I)	**Cyclostomata**	**Tongue with horny teeth**	**Myxine**
(II)	**Pisces**	**Dicondylic skull**	**Petromy-zon**
(III)	**Chondrichthyes**	**Claspers in male**	**Scoliodon**
(IV)	**Osteichthyes**	**Presence of operculum**	**Torpedo**

Options:

(a) I, III (b) II, IV

(c) I, II (d) III, IV

TS EAMCET-30.07.2022 Shift-I

Ans. (a) :

	Group	Salient Feature	Example
I	Cyclostomata	Tongue with horry teeth	Myxine
III	Chondrichthyes	Claspers in male	Torpedo, Scoliodon (Dog fish)

874. Study the following table and pick up the correct combination (s).

S.No	Group	Salient feature	Example
I	**Cyclostomata**	**Circular mouth**	**Lamprey**
II	**Pisces**	**Poikilotherms**	**Hag fish**
III	**Chondrichthyes**	**Lamelliform gills**	**Pristis**
IV	**Osteichthyes**	**Placoid scales**	**Labeo**

(a) I, II (b) II, IV

(c) I, III (d) III, IV

TS EAMCET-31.07.2022 Shift-II

Ans. (c) :

	Group	Salient feature	Example
I	Cyclostomata	Circular mouth	Lamprey
III	Chondrichthyes	Lamelliform gills	Pristis

875. Heart in fishes is described as

(a) Nurogenic and bronchial heart

(b) Myogenic, bronchial and venous heart

(c) Neurogenic and venous heart

(d) Neurogenic and alternate heart

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : A fishes heart is called a venous heart because the heart receives blood from veins and sends it to the gills for oxygenation the heart is two-chambered and performs single circulation where it receives and pumps only deoxygenated blood.
The heart in fishes is described as myogenic, bronchial and venous heart.

876. Assertion (A) : Cartilaginous fishes are viviparous
Reason (R) : Males of cartilaginous fishes have claspers to facilitate internal fertilization

(a) Both A and R are correct and R is the correct explanation of A

(b) Both A and R are correct but R is not the correct explanation of A

(c) A is true but R is wrong

(d) A is wrong but R is true

AP EAPCET-12.07.2022 Shift-I

Ans. (a) :
(A) Cartilaginous fishes are viviparous.
(B) Males of cartiliaginous fishes have claspers to facilitate internal fertilization.

877. Which of the following organ found in bony fishes keeps them floating in water without much expenditure of energy?

(a) Gills

(b) Air bladder

(c) Bursa fabrisci

(d) Diphycercal caudal fin

AP EAMCET-12.07.2022 Shift-II

Ans. (b) : Air bladder found in bony fishes is a hydrostatic organ which regulate buoyancy.

878. Which of the following is exclusively marine and considered as scavenger (feeds on dead or dying fish)?

(a) Hag fish (b) Lamprey

(c) Lung fishes (d) Latemaria

AP EAMCET-11.07.2022 Shift-I

Ans. (a) : Hagfish are eel-like fish that are found in all oceans except the Arctic and Antarctic. They are exclusively marine and are considered as scavengers. They feed on dead or decaying fish by rasping their teeth on the fish's flesh. Hagfish are also known for their ability to produce a large amount of slime when threat end.

879. Assertion (A): Heart of fishes is called branchial heart
Reason (R): It receives deoxygenated blood from body parts
The correct option among the following is

(a) (A) is true, (R) is true but (R) is the correct explanation for (A)

(b) (A) is true, (R) is true but (R) is the correct explanation for (A)

(c) (A) is true but (R) is false

(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-II

Ans. (b) : In fishes the heart is divided into two chambered which consists of an auricle and a ventricle. The heart of fish contains and pumps only deoxygenated blood hence the blood does not return to the heart. The blood oxygenate by the gills and does not return back to the heart.

@apna_pdf

880. In fishes, ____ maximizes oxygen transfer from water into the gills.

(a) more permeability for solutes
(b) more thin membranes of gills
(c) more number of gills
(d) counter-current flow

MHT CET-08.10.2020 Shift-I

Ans. (d) : Fish use gills for gas exchange.
Counter-current flow – As the blood flows in the opposite to the water, it always flows next to water that has given up less of its oxygen.
This way the blood is absorbing more and more oxygen as it moves along.
The counter current exchange system found in fish gill maximizes gas exchange efficiency by decreasing the oxygen content of the blood leaving the gill filament.

881. Match the following columns and select the correct option.

Column-I		Column-II	
(A)	**6-15 pairs of gill slits**	**(i)**	**Trygon**
(B)	**Heterocercal caudal fin**	**(ii)**	**Cyclostomes**
(C)	**Air Bladder**	**(iii)**	**Chondrichthyes**
(D)	**Poison sting**	**(iv)**	**Osteichthyes**

	(A)	**(B)**	**(C)**	**(D)**
(a)	(iii)	(iv)	(i)	(ii)
(b)	(iv)	(ii)	(iii)	(i)
(c)	(i)	(iv)	(iii)	(ii)
(d)	(ii)	(iii)	(iv)	(i)

NEET-2020 Phase-I

Ans. (d) :

(A)	6-15 pairs of gill slits:	(ii)	Cyclostomes
(B)	Heterocercal caudal fin:	(iii)	Chondrichthyes.
(C)	Air bladder:	(iv)	Osteichthyes
(D)	Poison sting:	(i)	Trygon

882. Identify the correct differences between Chondrichthyes and Osterichthyes

(a) Chondrichthyes have gill slits covered operculum and Osteichthyes have gill slits without operculum
(b) Chondrichthyes have swim bladder and Osteichthyes do not have swim bladder
(c) Chondrichthyes contain placoid scales and Osteichthyes contain cycloid scales
(d) Chondrichthyes contain terminal mouth and Osteichthyes contain ventral mouth

AP EAMCET-24.09.2020 Shift-I

Ans. (c) : Chondrichthyes contais placoid scale, gill slits are separate and without operculum. Due to absensce of air bladder they have to swim constantly where as osteichthyes contain cycloid/ctenoid scales, they have four pairs of gills which is covered by operculum on each side. Air bladders are present which regulate buoyancy.

883. Study the following and choose The correct combinations.

	Group	**Example**	**Character**
A	**Chondrichthyes**	**Torpedo**	**Dorsal muscle modified into electric organ**
B	**Rhynchocephalia**	**Sphenodon**	**Copulatory organ is hemipenis**
C	**Urodela**	**Salamandra**	**Amphicoelous vertebrae**
D	**Chelonia**	**Testudo**	**Edentate**

Options:

(a) A, C (b) B, C
(c) A. D (d) C, D

AP EAMCET-24.04.2019 Shift-II

Ans. (c) :

	Group	**Example**	**Character**
(A)	Chondrichthyes	Torpedo	Dorsal mscle modified into electric organ
(B)	Rhynchocephalia	Sphenodon	Copulatory organ is hemipenis
(D)	Chelonia	Testudo	Edentate

884. Study the following characters :

A. Aquatic (marine and fresh water) forms
B. Body scaleless
C. Cartilaginous endoskeleton
D. Renal portal system absent

The above characters are found in

(a) Chondrichthyes (b) Hemichordata
(c) Cyclostomata (d) Cephalochordata

TS EAMCET-08.05.2019 Shift-I

Ans. (c) : Cyclostomata are–
(a) Aquatic (marine and fresh water) forms
(b) Body scaleless
(c) Cartilaginous endoskeleton
(d) Renal portal system absent

885. Which one of the following characters is not correct with respect to Ratitae

(a) Flightless birds
(b) Sternum without keel
(c) Syrinx. clavicles are present
(d) males have penis

TS EAMCET-03.05.2018 Shift-I

Ans. (c) : Syrinx and clavicles are not found in Ratitae.
• The characters of Ratitae are flightless sternum without keel, male have penis.

886. Match the following

	List-I		**List-II**
(A)	**Ostracodermi**	**(I)**	**Lobe-finned fishes**
(B)	**Coelocanth**	**(II)**	**Exocoetus**
(C)	**Cyclostomes**	**(III)**	**Extinct jawless fishes**
(D)	**Osteichthyes**	**(IV)**	**Hagfish**

@apna_pdf

The correct match is

	A	B	C	D
(a)	(III)	(I)	(IV)	(II)
(b)	(II)	(III)	(I)	(IV)
(c)	(I)	(III)	(II)	(IV)
(d)	(III)	(II)	(IV)	(I)

TS EAMCET-2015

Ans. (a) :

	List-I	List-II
(A)	Ostracodermi	(III) Extinct Jawless fishes
(B)	Coelocanth	(I) Lobe-finned fishes
(C)	Cyclostomes	(IV) Hagfish
(D)	Osteichthyes	(II) Exocoetus

887. Weberian ossicles are found in:
(a) frog (b) snakes
(c) fishes (d) birds

AIIMS-1999

Ans. (c) : Weberian ossicles is a set of a chain of small bones that connect the auditory system to the swim bladder of fishes.

888. In class -Chondrichthyes
(1) notochord is persistent through life
(2) gill slits are separate and without operculum
(3) skin is tough, containing minute placoid scales
(4) tympanum represents ear
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2010

Ans. (a) : The notochord is a flexible rod that supports the body of the embryo. In Chondrichthyes, the notochord persists throughout life.
The gill slits are separate and do not have an operculum. The operculum is a flap of tissue that covers the gills in bony fish.
The skin is tough and contains minute placoid scales. Placoid scales are tooth-like scales that are embedded in the skin.
Tympanum is absent. Tympanum is a membrane that helps to transmit sound waves to the inner ear. Chondrichtyes do not have a tympanum.

889. A marine cartilaginous fish that can produce electric current is.
(a) Pristis (b) Torpedo
(c) Trygon (d) Scoliodon

AIPMT-2014
AP EAMCET-1998
BVP-2008

Ans. (b) : Torpedo (Electric Ray) is a cartilaginous fish that produces an electric current of around 8-220 volts.
- Scoliodon belongs to the group of a cartilaginous fish.
- Trygon is a cartilaginous fish that lacks an electric organ. They instead have a tail spine consisting of venom. Trygon is also called sting ray.
- Pristis is a cartilaginous fish but it is unable to produce an electric current. It is known as saw fish.

890. Fish which can be used in biological control of mosquitoes/larvicidal fish is
(a) Eel (b) carp
(c) cat fish (d) Gambusia

AIPMT-1989

Ans. (d) : Gambusia is a larvicidal fish. And it is biologically control population of mosquitoes.

891. Which is a true fish?
(a) Cat fish (b) Silver fish
(c) Cuttle fish (d) None of these

JIPMER-1996

Ans. (a) : Cat fish is true fish having prominent barbels without scales.
- Jellyfish belong to phylum coelenterate. Jellyfish is a free-swimming marine animal that has an umbrella shaped body.
- Silverfish (Lepisma) is arthropods. It is a wingless insect.

892. Which of the following is not a lung fish?
(a) Neocerotodus (b) Acipenser
(c) Lepidosiren (d) Protopterus
(e) None of the above

CMC Vellore-2015

Ans. (b) :
– Protopterus is an African lungfish
– Neocerotodus is an Australian lungfish
– Lepidosiren is South American lungfish
– Acipenser commonly known as sturgeon it is not a lung fish.

893. Which one is not a carp?
(a) Labeo rohita (b) Catla catla
(c) Mystus (d) Cyprinus

Punjab MET-2011

Ans. (c) : Mystus is not a carp. Mystus is a genus of fish in the family Bagridae native to Asia. Phylogenetic relationship within this genus are poorly understood, though, it has been suggested that there are two major lineage.

894. Jaws present in which of the following?
(a) Heradmania (b) Fishes
(c) Petromyzon (d) Amphoxus

Rajasthan PMT-1999
MGIMS Wardha-2012

Ans. (b) : Heradmania belong to urochordata.
- Amphioxus is a cephalochordate.
- Fishes belong to Gnathostomata and bear jaw.

895. The character not related to chondrichthyes is
(a) Claspers
(b) Placoid scales
(c) Filamentous gills
(d) Heterocercal caudal fin

AP EAMCET-2015

Ans. (c) : The character not related to chondrichthyes is Filamentous gills.
Claspers-Claspers are located on the inner edge of the anal fins near the male's cloaca.

896. Statement (S): Fishes belonging to "Chondrichthyes" have heterocercal caudal fin.
Reason (R) : These fishes have an air bladder that acts as a hydrostatic organ.

@apna_pdf

(a) Both (S) and (R) are correct and (R) is the correct explanation to (S)
(b) Both (S) and (R) are correct but (R) is not the correct explanation to (S)
(c) (S) is correct but (R) is wrong
(d) (S) is wrong but (R) is correct

TS EAMCET-15.05.2016

Ans. (c) : (S) Fishes belonging to chondrichthyes have heterocercal caudal fin.
(R) Air bladder or swim bladder is buoyancy found most of the bony fishes. It contains gas (O_2) and function as a hydrostatic organ.

897. In which endoskeleton is made up of cartilage?
(a) Dipnoi (b) Mollusca
(c) Elasmobranchii (d) Bony fishes

Rajasthan PMT-1995

Ans. (c) : Elasmobranchii has well-developed endoskeleton made up to cartilage.
• Dipnoi is primitive lung fishes in which the swim bladder present (bony cartilage endoskeleton).

898. Which one of the following is a fish?
(a) Sea peri (b) Sea horse
(c) Sea lion (d) Sea urchin

CG PMT-2009
BVP-2011

Ans. (b) :
• Sea horse (Hippocampus) is a fish belonging to class osteichthyes under phylum chordate.
• Sea urchin (echinus) is a spiny animals under phylum Echinodermata.

899. Scales are absent in
(a) Catia (b) Wallago
(c) Cirrhinus (d) Scoliodon

CMC Vellore-2011

Ans. (b) : Scales are absent in wallago attu and body is covered with naked skin.
• In catla cycloid scales are present.
• Scoliodon have placoid scales on their skin.

900. Which of the following is characteristics of fishes?
(a) tail and venous heart
(b) venous heart and gills
(c) gills and tail
(d) scales and gills

Punjab MET-2004

Ans. (b) : Fish have a single loop circulatory system to take blood from the heart to gill and then the body. Heart of fish is known as venous heart gill of fish used for oxygen intake.

901. Choose the wrong statement
(a) Teeth in Chondrichthyes are modified ctenoid scales
(b) Air bladder in fishes regulates buoyancy
(c) In amphibians, the tympanum represents the ear
(d) Long bones in birds are pneumatic
(e) Reptiles are poikilotherms

Kerala PMT-2014

Ans. (a) The mouth of the members of class chondrichthyes is located ventrally and the teeth are modified placoid scales.

902. Identify the edible freshwater teleosts
(a) sharks (b) rays and skates
(c) Hilsa hilsa (d) Catla catla

Uttarakhand PMT-2007

Ans. (d) : Catla catla is an edible fresh water teleost any bony fish of the subclass teleostei having rayed fins and a swim bladder the group contains most of the bony fish include the hernings, carps, cod, perches etc.

903. Which of the following is not a true fish?
(a) Dog fish (b) Devil fish
(c) Catfish (d) Sawfish

Uttarakhand PMT-2007

Ans. (b) : The fish are characterized by the presence of the scales on their skins. Devil fish also known as octopus and belonging to phylum mollusca.

904. Flying fish is
(a) Torpedo (b) Scoliodon
(c) Anguilla (d) Exocoetus

BVP-2012
MGIMS Wardha-2007

Ans. (d) : Flying fish is also known as the Exocoetus. It belong to the family of Exocoetidae of class Actinopterygii. their body is stream-lined.

905. Which is not a fish?
(a) Scoliodon (b) Electric ray
(c) Whale (d) Sea horse

HP CET-2013

Ans. (c) : The whale is not a fish but it is mammal because whale is warm blooded but fishes are cold blooded.
• Scoliodon is fishes have exoskeleton of placoid scales.
• Electric ray are a group of ray flattered cartilaginous fish with enlarged pectoral fins.
• Seahorse is small marine fish in the genus Hippocampus

906. Which of the following substance is at its lowest level in fish food?
(a) Actin (b) Myosin
(c) Cholesterol (d) Tissue fluid

Uttarakhand-2005

Ans. (c) : The substance is at its lowest level in fish food is Cholesterol. Fish meal is highly nutritive because it contains easily digestible proteins (55-70%), Minerals (10-20%) and water (6-12%).
The maximum cholestrol found eggs, some shellfis, liver, liver pats and offal.

907. Electric organs are found in
(a) sharks (b) porpoises
(c) goldfish (d) rays

CG PMT-2006

Ans. (d) : Electric organs are masses of Flattened cells called electrocytes, which are stacked in regular rows along the side of certain fishes.
• electric organ found in Torpedo, Raja (stingray), Malapterurus.
• In Raja (Sting ray) shape of electric organ is spindle shape and located parallel to the spinal cord in the tail.
• Shark are group of elasmobranch fish characterized by a cartilaginous skeleton.
• Porpoises a aquatic marines mammals and similar appearance to dolphins.

@apna_pdf

908. Ichthyology is study of
(a) aves (b) amphibians
(c) reptiles (d) fishes
JIPMER-2013

Ans. (d) : Ichthyology is study of fish including bony fish, Osteichthyes, cortilaginous fish, Condricnthyes and jawless fish (Agnatha)
- Ornithology, a branch of zoology dealing with the study of birds.
- Herpetology, a branch of zoology that deals with the study of amphibians and reptile.

909. Presence of claspers is an important character in:
(a) Sphyrna (b) Hippocampus
(c) Cyanoglossus (d) Echenis
AP EAMCET-1999

Ans. (a) : The presence of claspers is an important character in "Sphyrna".
They show sexual dimorphism the male bear pair of hard elongated claspers attached to the pelvic fin.
Claspers help in copulation.

910. These organisms have chloride cells
(a) Plants (b) Freshwater fish
(c) Protozoa (d) Birds
BCECE-2009

Ans. (b) : The chloride cell is characteristic feature of marine fish which help to elimination of excess of salts from body fluid is necessary for osmo-regulation.

911. The brood pouch in sea horse is found at the belly of
(a) male (b) female
(c) absent (d) Both (a) and (b)
AMU-2002

Ans. (a) : Seahorse possess the unique characteristic of male pregnancy e.g male not females incubate embryos in a specialized structure called a "brood pouch".
The brood pouch is formed along the ventral midline of the tail.
The lumen of the brood pouch is surrounded by loose connective tissue called pseudoplacenta and dermis.

912. Which one of the following animal contains idiophores in its integument ?
(a) Dog fish (b) Parrot
(c) Siren (d) Orangeutan
Rajasthan PMT-2000

Ans. (a) : Dogfish : Spiny dog fish are slim, with a narrow pointed snout and characteristic white spots. They are gray above and white below. They have two dorsal fins with ungrooved large spines.
Classification

Phylum	-	chordata
Class	-	chondrichthyes
order	-	squalifarmes
family	-	squalidae

913. Which of the following represents the correct combination without any exception?

	Characteristics	Class
(a)	**Mouth ventral, gills without operculum; skin with placoid scales; persistent notochord**	**Chondrichthyes**
(b)	**Sucking and circular mouth;jaws absent, integument without scales; paired appendages**	**Cyclostomata**
(c)	**Body covered with feathers; skin moist and glandular fore-limbs form wings; lungs with air sacs**	**Aves**
(d)	**Mammary gland; hair on body; pinnae; two pairs of Limbs**	**Mammalia**

AIPMT-2015

Ans. (a) : Chondrichthyes are marine animals with streamlined body and have cartilaginous endoskeleton. Mouth is located ventrally. Notochord is persistent throughout life. Gills slits are separate and without operculum. The skin is tough, containing minute placoid scales. Teeth are modified placoid scales which are backwardly directed. Their Jaw are very powerful.

914. Which one of the following categories of animals, is correctly described with no single exception in it
(a) All sponges the marine and have collared cells
(b) All mammals are viviparous and posses diaphragm for breathing
(c) All reptiles posses scales, have a three chambered heart and are cold blooded (poikilothermal)
(d) All bony fishes have four pairs of gills and an operculum on each side
AIPMT (Mains)-2012

Ans. (d) : In bony fishes four pairs of gills and each is covered over by operculum on present either side.
- Prototherian mammals are oviparous.
- Sponges are aquatic mostly marine some freshwater and have choanocytes or collar cells are characterstics of porifera.
- Heart is generally 3-chambered in reptiles but in crocodile it is 4 chambered.
- All mammals are viviparous with exception ornithorhynches- (Platypus) which is oviparous (egg laying)

915. Which one of the following pairs of animals are similar to each other pertaining to the feature stated against them?
(a) Ascaris and Ancylostoma - Metameric segmentation
(b) Sea horse and Flying fish - Cold blooded (poikilothermal)
(c) Pteropus and Ornithorhyncus – Viviparity
(d) Garden lizard and Crocodile - Three chambered heart
AIPMT (Mains)-2012

Ans. (b) : Sea horse and flying fish, belong to class-Pisces and cold blooded animals (Poikilothermic). i.e the temperature of their body varies with the environment.
- Ornithorhynchus is oviparous.
- Garden lizard has a 3-chambered heart while crocodile has a 4-chambered heart.
- Ascaris and Ancylostoma do not show metameric segmentation

@apna_pdf

916. Which one of the following pairs of animals comprises 'Jawless fishes' ?
(a) Guppies and hag fishes
(b) Lamprey and eels
(c) Mackeral and Rohu
(d) Lampreys and hag fishes

AIPMT-2009

Ans. (d) : Lampreys and hag fishes are "Jaw less" fishes. The marine, elongated and freshwater fishes lacking a jaw and paired appendages sometimes considered to belong to the taxon Agnatha. Both lampreys and hag fishes are present in living form.
The lampreys are parasitic fishes. They rasp away flesh and suck out blood from the host fishes. The hag fishes feed upon marine worms and other aquatic invertbrate animals.

917. Sharks and dogfishes differ from skates and rays by
(a) Their pectoral fins distinctly marked off from cyclindrical bodies
(b) Gill slits are ventrally placed
(c) Head and trunk are widened considerably
(d) Distinct demarcation between body and tail

NEET (Karnataka)-2013

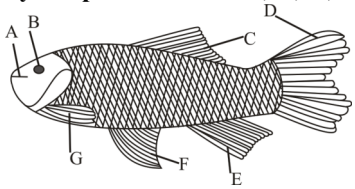
Ans. (a) : Sharks and dogfishes differ from skates and rays by their pectoral fins distinctly marked off from cylindrical bodies.

918. Study the following features of a fish
(A) It is a crossopterygian fish.
(B) It is found in the river Chalumnae.
(C) It does not exhibit aestivation.
(D) It is an urecotelic animal.
Which of the above are true to "Neoceratodus"
(a) A and B (b) B and D
(c) A and C (d) A and D

AP EAMCET-2008

Ans. (c) : Neoceratodus belonging to the genus of lungfish which isthe family of Neoceratodontidae. Neoceratodus jorsteri is the only species and is considered as living fossil.

919. The diagram of Labeo rohita is given below. Identify the parts labelled A, B, C, D, E, F, G.



(a) A = Nostril, B = eye, C = Anal fin, D = Caudal fin. E = Dorsal fin, F = Pectoral Fin, G = Pelvic fin.
(b) A = Nostril, B = eye, C =Dorsal fin, D = Anal fine, E = Caudal fin. F= Pectoral fin, G = Pelvic fin.
(c) A = Nostril, B = eye, C = Dorsal fin. D = Caudal fin E = Pectoral fin, F = Anal fin. G = Pelvic fin.
(d) A = Mouth, B = eye, C = Dorsal fin. D = Caudal fin E =Anal fin, F = Pelvic fin, G = Peectoral fin.

Karnataka CET-2010

Ans. (d) : In the given figure of Labeo rohita.
A–Mouth, B–Eye, C–Dorsal fin
D–Caudal fin, E–Anal fin
F–Pelvic fin, G–Pectoral fin.

920. Which of the following is found exclusively in the sea water?
(a) Prawns (b) Trygon
(c) Crabs (d) Oysters

Karnataka CET-2008

Ans. (b) : Trygon found exclusively in the sea water. It is also called as sting ray is a cartilaginous fish which found exclusively in marine water. It typically inhabits sandy or muddy shallow, coastal waters and is life threatening due to its venomous tail spine.
Prawns, Crabs and Oysters can be found in both fresh and salt water also.

Q. Osteichthyes

921. Match the following related to caudal fins fishes

Types	Character	Example
A. Homocercal	**i. asymmetrical both externally and internally**	**p. Shark**
B. Diphycercal	**ii. vertebral column extends into the larger ventral lobe**	**q. Flying fish**
C. Heterocercal	**iii. symmetrical externally and asymmetrical internally**	**r. Catla**
D. Hypocercal	**iv. symmetrical both externally and internally**	**s. Latimeria**

(a) (A–iv–r), (B–iii–s), (C–ii–p), (D–i–q)
(b) (A–iii–r), (B–iv–s), (C–i–p), (D–ii–q)
(c) (A–iv–r), (B–iii–s), (C–i–p), (D–ii–q)
(d) (A–iv–s), (B–iii–r), (C–ii–p), (D–i–q)

AP EAPCET-07.09.2021 Shift-I

Ans. (b) :

	Type	Charater	Example
(A)	Homocercal	symmetrical externally and asymmetrical internally	r. Catla
(B)	Diphycercal	symmetrical both externally and internally	s. Latimeria
(C)	Heterocercal	asymmetrical both externally and internally	p. Shark
(D)	Hypocercal	vertebral column extends into the larger ventral lobe	q. Flying fish

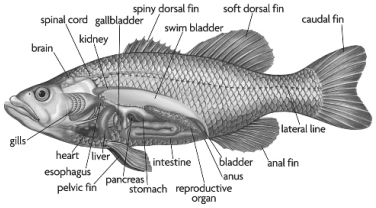
922. Which of the following option is correct?

(a)	Osteichthyes	4 pair of gill slits covered by operculum gills
(b)	Chondrichthyes	6–15 pairs of slits
(c)	Arthropoda	Metamerism and excretion by nephridia
(d)	Platyhelminthes	Bilateral symmetry & coelomate e.g., Taenia and Fasciola

AIIMS-26.05.2018 Shift-II

@apna_pdf

Ans. (a) : Osteichthyes- Osteichthyes is a class having bony fishes. These fishes have 4 pairs of gill slits covered by operculum gills.



923. Statement (S) : Marine lampreys migrate to rivers for spawning.
Reason (R) : Marine lampreys return to sea water after spawning
(a) Both (S) and (R) are correct but (R) is not the correct explanation to (S)
(b) Both (S) and (R) are correct but (R) is the correct explanation to (S)
(c) (S) is wrong but (R) is correct
(d) (S) is correct but (R) is wrong

TS EAMCET-2015

Ans. (d) : Marine lampreys migrates to rivers for spawning. Cyclostomes are marine but migrate to fresh water for spawning.
Spawning:- The process of release of eggs into water by aquatic animals is called spawning.

924. One of the world's most poisonous fish toxins is released by:
(a) clown fish (b) sword fish
(c) eel fish (d) puffer fish

AIIMS-2012

Ans. (d) : The species of puffer fish (family, Tetraodontidae) are the most poisonous in the world.
• **Puffer fish** releases a very potential toxin called **tetrodotoxin**, a variety of neurotoxin. That can cause serious illness and death. These are poisons to central nervous system which are deadlier than cyanide.
• **Clown fishes** are edible , people are strongly advised not to eat them because of the slimy material on their skin.
• **Sword fish** is very common cooking fish.
• **Eel fish** is source of omega-3 fatty acid. It also contains a large quantity of calcium, magnesium, potassium, selenium, manganese, zinc and iron.

925. This is also known as flying fish:
(a) Scoliodon (b) Exocoetus
(c) Pristis (d) Trygon

BCECE-2015

Ans. (b) : Exocoetus is a two wing flying fish the pectoral fins are large to produce a wing like structure which helps the fishes in gliding and floating in air.
• Scoliodon is known as the dog fish, the common name is sand tiger shark.
• Pristis is the sawfish.

926. This is not a freshwater fish:
(a) Pomfret (b) Kalbasu
(c) Rohu (d) Catla

BCECE-2015

Ans. (a) : Pomfret is a bony marine fish belonging to family barmidae.
While Kalbasu, Rohu and catla are freshwater carps.

927. The ancestors of modern day Frogs and Salamanders are
(a) Jawless fish (b) Coelocanth
(c) Icthyophis (d) Amphioxus

Karnataka CET-2015

Ans. (b) : The ancestors of modern day frogs and salamnders are coleocanth.
Coelocanth:- Coelocanths are an ancient group of lobe finned in the actinistia. Sarcopterygians, they are more closely related to lungfish and tetrapods than to ray-finned fish.

928. Which one of the following matching pairs is incorrect?
(a) Shellfish - Pisces
(b) Silver fish - Arthropoda
(c) Cuttle fish - Mollusca
(d) Star fish - Echinodermata

WB JEE-2015

Ans. (a) : (A) Shell fish is the aquatic invertebrate that have a hard outer shell. They are classified under the phylum mollusca.
(B) Silver fish is a small and wingless insect under phylum arthropoda.
(C) Cattle fish is a marine animal belongs to phylum molluscs.
(D) Star fish belong to echinoderms.

929. A fresh water fish:
(a) Scylla serrata (b) Paenaeus indicus
(c) Cyprinus carpio (d) Sardinella longiceps

AP EAMCET-2002

Ans. (c) : Cyprinus carpio freshwater fish belonging family Cyprinidae.
Cyprinidae is family of freshwater fish and commonly called carp of minnow family.
• **Scylla serrata** commonly called mud crab or mangrove crab found in Estuaries and marin water

930. The excretory material of bony fish is
(a) urea (b) protein
(c) ammonia (d) amino acid

BVP-2012

Ans. (c) : The excretory material of bony fish is ammonia. That is why bony fishes ammonotelic and excretory material of cartilaginous fish is urea.
• Uric acid the main nitrogenous excretory product of birds.

R. Amphibia

931. Ichthyophis belongs to____
(a) Reptelia (b) Annelida
(c) Mollusca (d) Amphibia

AP EAMCET-24.09.2020 Shift-II
Karnataka CET-2000 / DU MET-2006
Rajasthan PMT-2004

Ans. (d) : Ichthyophis is commonly refer as caecillians a genus of limbless amphibians.
They are a group of elongated, worm-like amphibians belong to the order Gymnophora. Their skin is smooth and have sensory scales.

@apna_pdf

932. Foramen of Panizzae is found in the heart of
(a) rabbit (b) pigeon
(c) crocodile (d) frog
HP CET-2011 / BCECE-2006
VMMC-2005 / AMU-2004

Ans. (c) : In the heart of the crocodile foramen of panizzae is found in the heart of crocodile which connects the left and right aorta in the heart of all animals of order crocodilian.

933. The Indian salamander is
(a) Siren (b) Tyilotriton
(c) Amblystoma (d) Nectzirus
AMU-2005 / Manipal-2004
Uttarakhand PMT-2004 / AP EAMCET-1997

Ans. (b) : Indian salamander is called as Tylototriton and also called as knobhy.
- Siren is a neoteic salamander.
- Ambystoma tigrinum is a tiger salamander.
- Necturus is aquatic salamander also called waterdogs and mudpuppies.

934. Assertion (A) : Amphibians remained as imperfect group
Reason (R) : Although, Amphibians invaded land, they could not adapt completely to terrestrial life.
(a) Both A and R are true and R is the correct explanation of A.
(b) Both A and R are true and R is not the correct explanation of A
(c) A is true and R is wrong
(d) A is wrong and R is true
AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Amphibiane remained as imperfect group because they live on both land and water.
Head is clearly distinct but neck and tail may be present or absent hence body is mainly consist of two part
(i) Hand
(ii) Trunk
Exo skeleton is absent and digits without claws the teeth are small and homodantous tongue is bifid toward the anterior end.
Alimentary cannel terminates into cloaca .
although, Amphibian invaded land, they could not adapt completely to terrestrial life because fertilization is external in presence to water.
The development is direct and the larva is generally fad pole larva.

935. Pore in the foetal heart of human beings is
(a) Foramen Manro (b) Foramen Ovale
(c) Foramen Magnum (d) Fossa Ovalis
TS EAMCET-11.05.2023, Shift-II

Ans. (b) : The foramen ovals is a small opening in the fetal heart that allows blood to bypass to lungs. During fetal development, the lunge are not yet fully functions, so oxygenated blood from the placenta can be rich directly from the right atrium to the left atrium through the foramen o vale. This helps supply oxygenated blood to the developing fetal.
When body birth and start breach than left atrium increases closing the foramen ovalure.

936. The dental formula of an 18 years old man
(a) 2123/2123 (b) 2122/2122
(c) 2102/2102 (d) 2023/2023
TS EAMCET-11.05.2023, Shift-I

Ans. (b) : The dental formula of an 18 year old man
$\frac{2122}{2122}$ 2, incisor 1, canine, 2 premolar , 2 molars
The dental formula of adult human is
$\frac{2123}{2123}$ 2, Incisor, 1, canine, 2, Premolar, 3, molars.
This show arrangements of incisor, canines, premolar and molare. on one side of upper and lower jaws.

937. Reservoir host for Trypanosoma gambiense.
(a) Monkey (b) Rabbit
(c) African antelope (d) Female culex mosquito
TS EAMCET-11.05.2023, Shift-I

Ans. (c) : The reservoir host for trypanosome gamblense is African antelope.
The African sleeping sickness or African trypanosmiasis is cause of T.gambiense, humans are the main reservoir because the harbor the parasite in their blood stream, allowing it to be transmitted to tsetse flies when they take a blood meal.

938. Which among the following is not an amphibian character
(a) First tetrapods
(b) Monocondylic skull
(c) Three chambered heart
(d) Ureotelic animals
TS EAMCET-11.05.2023, Shift-I

Ans. (b) : Dicondylic skull is characteristic feature of amphibians. It refers to skull with two occipital condyles, which are rounded knod-like structures that articulates with the first vertebra. Monocondylic skull is characteristic feature of replies and birds.

939. Assertion (A) : Monkey is the reservoir host of malarial parasite
Reason (R) : Malaria is transmitted by monkey bite
(a) both A and R are true and R is the correct explanation of A
(b) both A and R are true but R is not the correct explanations of A
(c) A is true and R is false
(d) A is wrong and R is true
AP EAPCET-23.05.2023, Shift-I

Ans. (c) : Monkey is the reservoir host of malarial parasite because some malarial parasite like P.knowlesi is cause malaria in monkey, and it develop in to monkey body and transmitted by mosquito.
Mosquito (Anapheles hackeri) is the vector of P. Knowlesi.
Many life stage found in monkey such as sporozoits , cryptozoite, crytometazoites, schizotstage metacryptozoite, tropchoite, signet ring stage and micro and mega gameto cyte.

940. 'Dicondylic skull' is characteristic features of _____
(a) Reptilia and Aves
(b) Amphibia and Reptilia

@apna_pdf

(c) Aves and Mammals
(d) Amphibia and Mammalia

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : The term "dicondylic skull" describes a particular distinctive feature present in many species of amphibians and mammals.

941. Assertion (A): The development of amphibians takes place in aquatic habitat although they are first vertebrates to come out of water on the land
Reason (R): Amphibians lay anamniotic eggs without a shell, which cannot survive in terrestrial habitat
(a) Both A and R are correct and R is the correct explanation of A
(b) Both A and R are correct and R is not the correct explanation of A
(c) A is correct but R is wrong
(d) A is wrong but R is correct

AP EAMCET-05.10.2021 Shift-I

Ans. (a) :
(A) The Development of amphibians takes place in aquatic habitat although they are first vertebrates to come out of water on the land.
(R) Amphibians lay anamniotic eggs without a shell, which cannot survive in terrestrial habitat.

942. The heart of an amphibian is usually
(a) two chambered
(b) four chambered
(c) three chambered
(d) three and half chambered

Tripura JEE-2021
KVPY SA-2012

Ans. (c) : The heart of an amphibian is usually three chambered with 2 auricles and 1 ventricle. The blood contains R.B.C and nucleate and contain haemoglobin. Blood vascular system contains hepatic and portal system.

943. Male has a brood pouch in _____
(a) Kangaroo (b) Hippocampus
(c) Penguin (d) Ostrich

AP EAMCET-06.09.2021 Shift-I

Ans. (b): Hippocampus (Seahores; Pisces:- Syngnathidae) Posses the unique characteristic of male pregnancy incubate embryos in a specialized structure called a **brood pouch** . The brood pouch is formed along the ventral midline of the tail.

944. Choose the correct option
(a) Amphibia–Frog, Salamander, Bufo, Ichthyophis
(b) Reptiles – Lizard, Turtle, Hyla, Ichthyophis
(c) Birds – Pigeon, Parrot, Balaenoptera, Flying fox
(d) Arthropods–Apis, Ancylostoma, Laccifer, Nereis

AIIMS-26.05.2019 Shift-I

Ans. (a) : Amphibians means 'the organisms which can lives on both land and water'. Frog, Salamander, Bufo, Ichthyophis all are amphibians.
- Hyla, Ichthyophis are amphibians so the option (b) is incorrect.
- Balaenoptera, Flying fox are mammals so the option (c) is incorrect.
- Ancylostoma is genus of nematodes and Nereis is a genus of polychaete belong to annelids so the option (d) is also incorrect.

945. 'Sternum' also known as 'breast bone' first appeared in which of the following animals
(a) Pisces (b) Amphibians
(c) Reptiles (d) Birds

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Sternum also called breastbone, that lies in the middle of the frontal part of the chest.
- It is first appeared in Amphibians.
- Sternum classified into three main parts i.e. manubrium, body and xiphoid (serve as a point for muscular attachment).

946. Which ONE of the following organisms respire through the skin?
(a) Blue whale (b) Salamander
(c) Platypus (d) Peacock

KVPY (SA)-2018

Ans. (b) : Salamander are belong to class amphibians that respire through their skin. Salamanders characterized by their lizard-like appearance, with slender bodies, blunt snouts, short limbs and presence of a tail in both larvae and adults.

947. Among vertebrates tympanum, sternum are first appeared in
(a) Pisces (b) Amphibians
(c) Reptiles (d) Aves

AP EAMCET-25.04.2018 Shift-I

Ans. (b) : Tympanus, sternum are first appeared in amphibians. A thin membrane that vibrates in response to sound waves is the eardrum, which is referred to as the tympanum.
Sternum is the flat bone located in the middle of the chest, commonly referred as the breastbone.
Amphibians lack true sternum instead amphibian have a more simplified ribcage structure.

948. Statement (S): The amphibian blood is composed of erythrocytes, leucocytes and thrombocytes. The thrombocytes help in haemostasis.
Reason (R): The haemostasis regulates the body temperature in poikilotherms.
Which of the following is true?
(a) Both (S) and (R) are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-I

Ans. (c) : (s) The amphibians blood is composed of erythrocytes leucocytes and thrombocytes. The thrombocytes help in haemostasis.
(r) Haemostasts is a process to prevent haemo-range by arresting and keeping the blood within the damaged vessels walls or coagulation.

@apna_pdf

949. 'Organ of Jacobson' helps in

(a) Touch (b) Vision
(c) Smell (d) Hearing

JIPMER-2017

Ans. (c) : Organ of jacobson's help in smelling. The organ of jacobson's, also known as the vomeronasal organ, is a chemosensory organ that helps animlas to detect pheromones. Pheromones are chemical signals that are released by animals to communicate with each other. Pheromones present on the roof of the mouth and connected with nasal cavity by duct. The organ of jacobson's is found in many animals, including snakes, lizards and mammals.

950. The upper pigmented part of frog egg is concerned with :

(a) nourishment (b) camouflage
(c) respiration (d) colouration

BCECE-2002

Ans. (b) : The upper pigmented part of frog egg is concerned with camouflage.
The pigmented pattern of frogs and their lack of colour on the ventral surface allow frogs to escape from predators. Usually, the underside of the frog is lighter color than the top side for the reason that if the frog is hanging on top of the water and a predator is searching for a frog, the sun's glare makes the frog difficult to spot, thus acting as a camouflage.

951. Salamander is:

(a) Mollusca (b) Annelida
(c) Bird (d) Amphibian

J&K CET-2003, 2002

Ans. (d) : Salamanders are the extinct species of amphibians belonging to the order caudata.
It is also known as living fossils.
Salamander diversity is most abundant in the Northern Hemisphere and most species are found in the holarctic exozone.

952. Amphibians were dominant during

(a) Carboniferous (b) Silurian
(c) Ordovician (d) Cambrian
(e) Jurassic

Kerala PMT-2009

Ans. (a) : Amphibians were dominant during Carboniferous. Carboniferous period of palaeozoic era is known as the age of amphibians.
This period was characterized by a worm and humid climate, which was ideal for amphibians.

953. Proteus anguinus is an example for

(a) Photokinesis
(b) Circannular Rhythms
(c) Effect of light on Pigmentation
(d) Photoaxis

AP EAMCET-2014

Ans. (c) : Proteus anguinus is an example for effect of light on Pigmentation. Its skin lack pigments, giving its body white, posty appearance.
It also has a pink due to blood capillaries near the skin, and as it translucency shows the contours of the internal organs.

954. Which of the following are correct for axolotl larva?

(a) It shows neoteny and paedogenesis
(b) Absence of thyroxine affect metamorphosis
(c) It is the larva of Hemichordata

(a) (i), (ii), (iii) (b) (i) and (ii)
(c) (ii) and (iii) (d) (iii)

UP CPMT-2007

Ans. (b) :
(I) It show neoteny and paedogenesis.
(II) Absence of thyroxine affects metamorphosis.
(III) It is the larva of salamander.

955. Which is not a true amphibian animal?

(a) Salamander (b) Toad
(c) Tortoise (d) Frog

AIPMT-1988

Ans. (c) : A Tortoise is not a true amphibian animal. Tortoise is a reptile. A tortoise can live on both land and water. Tortoise lay their eggs on land & burried them.
They are vertebrates i.e., they have a backbone and they are covered in scales. Toad, Salamander and frog are true amphibian animals.

956. Fire bellied toad is

(a) Amphiuma (b) Bombina
(c) Necturus (d) Salamandra

AIPMT-1988

Ans. (b) : Fire- bellied toad is commanly known as Bombina. fire- bellied, small amphibian characterized by bright orange colour.
Marking on the underside of its grayish body and limbs.

957. Necturus is

(a) hell bender (b) congo eel
(c) mud puppy (d) blind worm

AIPMT-1988

Ans. (c) : The common name of Necturus is mud puppy. A genus of aquatic salamanders is called Necturus . It is also known as waterdrogs.

958. The following organs appeared for the first time in amphibians

(a) Syrinx, urinary bladder and cloaca
(b) Tympanum, sternum and lacrimal glands
(c) Harderian glands, sebaceous glands and lacrimal glands
(d) furcula, four chambered heart and palate

AP EAMCET-2016

Ans. (b) : Tympanus, sternum and lacrimal glands are appeared for the first time in amphibians : - Tympanum (tympanic membrane or eardrum) covers the middle ear.
Sternum connects to ribs and supports formation of a complete strong rib cage.
Lacrimal glands are paired exocrine glands these are located on the lacrimal fossa of orbit.

@apna_pdf

959. Which of the following are exclusively marine?
(a) Porifera (b) Amphibians
(c) Echinodermates (d) Mollusca
JIPMER-1996

Ans. (c) : Echinodermata exclusively found in deep sea marine water. eg.- Echinus, Starfish.
- **Porifera–** Lives in freshwater except few are found in saltwater, eg.-Haliciona.
- **Mollusca–** Mostly found in freshwater, seashore, saltwater. eg.- Pila.
- **Amphibia–** Exclusively fresh water organism and can live on both wate and land.

960. Spiral valve is present in
(a) right auricle (b) sinus venosus
(c) truncus arteriosus (d) right ventricle
Punjab MET-2011

Ans. (c) : The truncus arteriosus in some amphibians, including lungless salamanders has a spiral valve. The truncus arteriosus is a muscular tube that extends from the heart and serves as an outflow tract. The spiral valve is a ridge with a spiral form that extends into the truncus arteriousus lumen. By creating turbulence, it helps to slow down and regulate blood flow.

961. Which type of kidneys are found in amphibians?
(a) Holonephric (b) Mesonephric
(c) Pronephric (d) Metanephric
JCECE-2003
Rajasthan PMT-2002

Ans. (b) : Mesonephric kidneys are found in amphibians.
The mesonephric kidney is a temporary excretory organ which functions during larval stage of amphibians life cycle. It helps in excrete waste material of developing embryo and larvae.

962. Limbless amphibians are called
(a) paddle worms (b) glow worms
(c) caecilian worms (d) pin worms
J&K CET-2009

Ans. (c) : Limbless amphibians are inclued sub-class Lissamphibia and order-Gymnophonia or Apoda.

963. Incomplete double circulation is seen in
(a) Fish (b) Amphibians
(c) Birds (d) Mammals
(e) Arthropods
Kerala PMT-2015

Ans. (b) :
- Incomplete double circulation is seen in Amphibian and Reptiles.
- The amphibian have 3-chambered heart with 2 auricles and 1 ventricle.
- Normally oxygenated blood gets circulated all over the body and deoxygenated blood is carried back to heart.
- However deoxygenated blood can also be stunted to body and oxygenated blood cab be shunted back to lungs.
- Bird and mammals are worm-blooded animal have 4-chamber heart that separate oxygenated and deoxygenated blood.

964. Dicondylic skull with 10 pairs of cranial nerves is present in :
(a) Pisces (b) Amphibia
(c) Reptilia (d) Mammalia
Rajasthan PMT-1998

Ans. (b) : Diconcylic skull with 10 pairs of cranial nerves is present in amphibia.
Dicondylic skulls are known as the skull which connected to the body with articulatory condyles. It is present in mammals and amphibian.

965. Limbless amphibians belong to the order
(a) anura (b) urodela
(c) gymnophiona (d) lissamphibia
VMMC-2014 / UP CPMT-2001

Ans. (c) : Order-Gymnophiona (Apoda) - 165 species of burrowing caecilian, elongated bodies, and limbless , dermal scales embedded in annular folds of skin eyes without eyelids.

966. Axolotl is name given to larva of
(a) Roundworm (b) Amphioxus
(c) Ambystoma (d) Silkworm
Haryana PMT-2011, 2004 / Manipal-2003

Ans. (c) : The best example is axolotl larva of Ambystoma the axolotl larva is well known for retaining external gills throughout life. The presence of external gills is a larval characteristic which is permanently retained by Axolotl.
- Round worm larva is know as Rhabdifiform.
- Amphioxus larva is know as lancelet
- Silk worm larva is know as caterpillar.

967. Neoteny is seen in amphibians belonging to order
(a) Urodela (b) Gymnophiona
(c) Anura (d) Apoda
BHU PMT (Screening)-2011

Ans. (a) : Neoteny can be defined as the failure or delay of the larva to metamorphose while becoming sexual mature and best examples is the axolotl larva of Ambystoma if tyroxine or deficiance of water the Neoteny are effected and change in adult.
Neoteny found in order urodela or caudate
- Partial neoteny found in tadpoles of Hyla arborea Rana esculena
- Partial neoteny found in Ambystoma.

968. An animal, which has both exoskeletal and endoskeletal structures is a
(a) freshwater mussel (b) tortoise
(c) frog (d) jelly fish
Manipal-2009 / Karnataka CET-2009

Ans. (b) : The exoskeleton of tortoise consist of carapace and plastron and endoskeleton consists of an axial skeleton. Thus tortoise possess both exoskeleton and endoskeleton.
Exoskeletone structure provides protection animal body by external injuries. while endoskeleton provied machanical and structural support to the body.
- Frog have only endoskeleton because vertebrate.
- Jelly fish. Slugs, Leeches and Jellyfish have exoskeleton.

@apna_pdf

969. Epidermal scale is the characteristic feature of class - Reptilia, which of the following class is without epidermal scale?
(a) Fish (b) Aves
(c) Mammals (d) Amphibian

VMMC-2010

Ans. (a) : The epidermal scale absent in fish because chondrichthyes have placoid scales and osterichthyes have ctenoid scales both of which are mesodermally originated.

- Epidermal scales are scales that arise from the outermost embryonic layer know as epidermal.
- Reptiles have dry bodies that are covered by epidermal scales or scutes and they are mostly terrestrial.
- Bird or aves and mammals are the only vertebrates that are worm-blood.

970. The largest RBCs among vertebrates are found in
(a) amphibians (b) reptiles
(c) mammals (d) aves

CMC Ludhiana-2014

Ans. (a) : Largest R.B.C is found in Amphibia e.g salamender 66 micrometer.
But invertebrate amphibian which is a long cylindrical body with four vestigial legs and feet comprising three toes the largest blood corpuscle is present.

971. Salamander can regenerate
(a) tail (b) limbs
(c) external gills (d) All of these

AMU-2003

Ans. (d) : All salamander demonstrates the potential to regenerate complex structure like entire limbs, a tail muscular tissues, substantial parts of their central nervous system and heart.
Thus salamander have both their regenerative mechanisms have been discovered.

972. Which animal is roofed terrapin ?
(a) Trionys (b) Kachuga tectum
(c) Chrysemys (d) Chelone

Rajasthan PMT-2000

Ans. (b) : Roofed Terrapin:- The Indian roofed turtle (pangshura tecta) is a species of turtle in the family Geoemydidae. It can be distinguished by the distinct "roof" at the topmost part of the shell.

973. Which animal is Surinam toad ?
(a) Pipa (b) Bufo
(c) Bombimntor (d) Alyte

Rajasthan PMT-2000

Ans. (a) : The common surinam toad or star fingered toad is a purely aquatic species of frog in the family pipidas with a widespread distribution in south America.

- These toads do not have teeth or a tongue so they use their webbed like front feet to handle food and swallow their prey.

974. Consider the following four statements (A-D) related to the common Frog Rana tigrina and select the correct option stating which one are true(T) and which ones are false(F)
Statements
(A) On dry land it would die due to lack of O_2 if its mouth is forcibly kept closed for a few days
(B) It has four-chambered Heart
(C) On dry land it turns uricotelic from ureotelic
(D) Its life-history is carried out in pond water

	(A)	(B)	(C)	(D)
(a)	F	T	T	F
(b)	T	F	F	T
(c)	T	T	F	F
(d)	F	F	T	T

AIPMT (Mains)-2011

Ans. (b) : Rana tigrina (frog) releases the CO_2 and takes the oxygen. Frogs breath through their skin, mouth lining and lungs to obtain oxygen. In frogs three chambered heart present. It has one ventrical and two atria.

975. Ureters act as urinogenital ducts in
(a) frog males
(b) human males
(c) human females
(d) frog both males and females

AIPMT (Mains)-2011

Ans. (a) : Ureters act as urinogenital ducts in frog males. In frog each kidney is composed of several structure and functional unit called **uriniferous tubule** or **nephron**.

- The ureters acts as urinogenital duct which opens in to cloaca (cloaca is a type of chamber which is the main function to pass urine, sperms and other faecal matter outside the body).

976. Select the animal from the examples given below which exhibits neoteny in its larval stage
(a) Amphiuma (b) Typhlonectes
(c) Ambystoma (d) Necturus

AP EAMCET-2010

Ans. (c) : Neotenic amphibians such as the **axolotl (Ambystoma mexicanum)** are often unable to undergo metamorphosis under natural conditions. Neoteny is a condition in which larval characters exhibit in adult.
Amphiuma – Amphiuma are **eel-like salamanders** with vestigial legs, they lack eyelids and a tongue.
Typhlonectes – Typhlonectes is a genus of amphibians in the family Typhlonectidae. These fully aquatic caecilians are found in Amazon Basin.
Necturus – Necturus is a genus of aquatic salamander native to the Eastern United State and Canada, they are commonly known as **water dogs mudpuppies**.

977. Which type of cleavage is exhibited in eggs of amphibian like frog?
(a) Holoblastic and equal
(b) Meroblastic and discoidial
(c) Unequal holoblastic
(d) Meroblastic superficeal

UP CPMT-2014

Ans. (c) : Amphibians exhibited holoblastic unequal cleavage in eggs. In mesolecithal and telolecithal eggs, the cleavage form of blastomeres of unequal size.

978. The pair of amphibians found in Indian peninsula is
(a) Amphiuma
(b) Tylototriton and Ichthyophis

@apna_pdf

(c) Hyla and Ambystoma
(d) Psittacus and Apteryx

AP EAMCET-2009

Ans. (b) : Tylototriton is a genus of newt known as **Crocodile newts**, out of which T. verrucosus (Himalayan Crocodile newt) found in Indian peninsula. Ichthyophis peninsula is a species of caecillian commonly found in southest Asia.

S. Reptilia

979. Regeneration of tail in lizards is an example of
(a) epimorphosis (b) morpholaxis
(c) hetero morphosis (d) parthenogenesis

CMC Ludhiana-2012 / Manipal-2000
Punjab MET-2004 / BVP-2000

Ans. (a) : Replacing of lost organ of the body by proliferation of new cells from surface cell of injured part is called epimorphosis.
In lizards the regeneration of tail is the example of epimorphosis.

980. Which is a reptile?
(a) Salamander (b) Newt
(c) Toad (d) Turtles

J&K CET-2012
Rajasthan PMT-2004
Karnataka CET-2002
AMU-2002

Ans. (d) : Turtles are an order of reptiles known as Testudines. The main character is shell which are made of keratin, the material of hair, horns and claws. Turtles are ectornerms or coldblooded, omnivores.
- Newt is a salamander in the sub family pleurodelinae.
- Toad is common name for some frogs and class-amphibians.
- Salamander are group of amphibians.

981. Which of the following snake in not poisonous?
(a) Naja-naja (b) Python
(c) Hydrophis (d) Bungarus

Rajasthan PMT-2011
UP CPMT-2001
AIIMS-2000
Rajasthan PMT-1995

Ans. (b) : Python is a genus of non-venomous belong to family pythonidae, Phython are large constrictor snake known for their impressive size and strength. Mostly found in African & Asian continents.
- Naja-naja commonly known as Indian cobra and Bungarus (krait) belongs to the family elapidae which are deadliest venomous snakes families found in South Asia & Indian subcontinent.
- Hydrophis is also belongs to family elapidae, commonly known as hydrophilids, which are highly adapted reptiles live in marine water found in Indian and pacific Oceans.

982. Number of cranial nerves in snakes that belong to class Reptilia
(a) 12 pairs (b) 10 pairs
(c) 8 pairs (d) 14 pairs

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : Cranial nerb in reptiles 10 pairs and its example snakes.
- Reptile bird and mammals have 12 pairs cranial nerb present.
- Vagus nerbe is the longest cranial nerb in the body contain both motor and sensory.
- Trochilior nerbe is [IV] cranial nerb. It is smallest cranial nerb.

983. Identify the group in which sinus venosous is present but conus arteriosus is absent.
(a) Amphibia (b) Reptilia
(c) Aves (d) Mammals

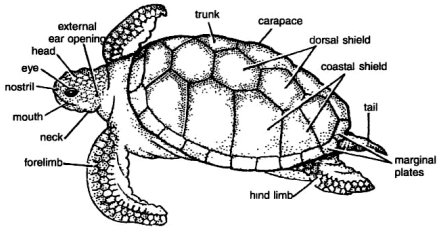
AP EAPCET-22.05.2023, Shift-I

Ans. (b) : Reptiles are characterized by a fully septation of the atrium, incomplete septation in the ventricle except in crocodylia and a ventricularization of conus.
The heart of amphibian contain two addition chamber called conus and arterious distribute blood to the body and sinus.

984. Which of the following animals has three chambered heart?
(a) Scoliodon (b) Hippocampus
(c) Chelone (d) Pteropus

NEET (Re-Exam)-04.09.2022

Ans. (c) : Reptiles except crocodiles have 3 chambered heart with 2 atria & partially divided single ventricle.



- Four chambered heart found in birds & mammals
- Two chambered heart present in fishes.

985. Which of the following is a living fossil in Reptiles?
(a) Archeopteryx (b) Limulus
(c) Sphenodon (d) Dinosaur

AP EAPCET-11.07.2022 Shift-I
DU MET-2003

Ans. (c) : Tuatara resembling most lizards are endemic to New Zealand.
Tuatara (Sphenodon) have been referred to as living fossils because they retain many basal characteristic from around the time of the mesozoic era.

986. Reptilian egg is described as
(a) Cleidoic, amniotic and megalecithal
(b) Microlecithal and amniotic
(c) Centrolecithal and amniotic
(d) Alecithal and amniotic

AP EAMCET-12.07.2022 Shift-II

Ans. (a) : Reptilian eggs are described as cleidoic (haiving a cell), amniotic (with specialized fetal membranes) and megalecithal (containing a large yolk). This combination of features is characteristic of reptile eggs, helping then adapt to terrestrial environments.

@apna_pdf

987. The Urinary bladder is absent in_____

(a) Wall lizard
(b) Snake and Crocodile
(c) Chameleon
(d) Snake

AP EAMCET-24.09.2020 Shift-II

Ans. (b) : Snake and crocodile is a uricotelic both produces uric acid as their primary nitrogenous waste product, which reduces the water loss compared to the excretion of liquid urine.

988. The vestiges of girdles are found in

(a) cobra (b) krait
(c) rattle snake (d) python

AP EAMCET-25.09.2020 Shift-II
AMU-2010

Ans. (d) : Vestigial pelvic girdle means the pelvic bone is present but they do not perform any function. It is found in python and boas. Snakes have prolonged bodies without any legs, inspite of the fact that the pythons have minimal rear appendages bones for support.
The pelvic girdle of python has no connection with their spine and it is simply float in muscle mass.

989. Match the following

	List -I		List –II
A.	**Vascular cloacal wall**	**I.**	**Squamata**
B.	**Thecodont dentition**	**II.**	**Chelonia**
C.	**Living fossil**	**III.**	**Crocodilia**
D.	**Jacobson's organ**	**IV.**	**Sphenodon**
		V.	**Cotylosauria**

The correct match is:

	A	B	C	D
(a)	II	III	I	V
(b)	II	III	IV	I
(c)	II	I	III	V
(d)	II	V	IV	III

TS EAMCET-28.09.2020 Shift-II

Ans. (b) :

Vascular cloacal wall	-	Chelonia
Thecodont dentition	-	Crocodilia
Living fossil	-	Sphenodon
Jacobsons organ	-	Squamata

990. Identify the following organism with Jacobson's organs, paired hemipenis and 12 pairs of cranial nerves

(a) Tropidonotus (b) Trionyx
(c) Chameleon (d) Bungarus

AP EAMCET-24.04.2019 Shift-I

Ans. (c) : Jacobson's organs, paired hemipenis and 12 pairs of cranial nerves are found in chameleon.
(1) Their colour change is not just a survival instinct.
(2) Chameleons tongues are their secret weapon.
(3) Chameleon cannot re-grow their tail.
(4) chameleon spit is incredible sticky.

991. Study the following table

	Group	Feature	Example
A	**Cyclosto -mata**	**Renal portal system is absent**	**Branchiostoma**
B	**Reptilia**	**Megalecithal and cleidoic eggs**	**Tropidonotus**
C	**Aves**	**Corpora quadrigemina**	**Psittacula**
D	**Amphi-bia**	**Collumella auris in middle ear**	**Rhacophorus**

Identify the correct combinations
Options :

(a) A, C (b) A, B
(c) C, D (d) B, D

AP EAMCET-24.04.2019 Shift-I

Ans. (c) :

	Group	Feature	Example
A	Cyclosto-mata	Renal portal system is absent	Jawless fishes
B	Reptilia	Megalecithal and cleidoic eggs	Turtle and tortoise
C	Aves	Corpora quadrigemina	Psittacula
D	Amphibia	Collumella auris in middle ear	Rhacophorus

992. Match the following ?

	Set-I		Set-II
A.	**Chelonia**	**I.**	**Sphenodon**
B.	**Rhynchocephalia**	**II.**	**Hemidactylus**
C.	**Crocodilia**	**III.**	**Testudo**
D.	**Squamata**	**IV.**	**Gavialis**

The correct match is

	A	B	C	D
(a)	IV	II	III	I
(b)	II	III	I	IV
(c)	III	I	IV	II
(d)	I	IV	II	III

TS EAMCET-08.05.2019 Shift-I

Ans. (c) :

Chelonia	-	Testudo
Rhynchocephalia	-	sphenodon
crocodilia	-	Gavialis
Squamata	-	Hemidactylus

993. Among the following animals, the best conserver of water is

(a) Frog (b) Turtle
(c) Cobra (d) Tiger

MHT CET-2019

@apna_pdf

Ans. (c) : Cobra is the best conserver of water.
The king cobra-one of the most venomous snakes on the planet.
Can literally stand up and look a full-grown person in the eye.
It up to 18 feet long and toxic bite is powerful enough to kill an elephant.
It feed upon small mammals, lizards and birds.

994. Select the option with correct matching of animal group and its examples –
(a) Mammalian–Platypus, Rattus, Camelus Pavo
(b) Aves – Neophron, Struthio, Sphenodon, Passer
(c) Reptilia–Calotes, Heloderma, Uromastix, Draco
(d) Amphibia–Bufo, Hyla Rhacophorus, Ophiosaurus

AIIMS-27.05.2018 Shift-II

Ans. (c) : Calotes (green lizard), Heloderma (poisinous lizard), Uromastix (spiny-tailed lizard), Draco (flying lizard) all are lizards and belongs to class reptilia.
- Pavo is belong to class Aves so the option (a) is incorrect.
- Sphenodon is a living fossils belong to class reptilia so the option (b) is incorrect.
- Ophiosaurus is a reptile so the option (d) is also incorrect.

995. Select the correct option for Reptilia –
(a) 4 chambered heart - Chelone
(b) Tympanum represents ear - Crocodile
(c) External ear present – Ophiosaurus
(d) Dry and scaly skin – Salamndra

AIIMS-27.05.2018 Shift-I

Ans. (b) : The tympanum represents ear – Crocodile. The tympanum an external hearing structure.

996. Match the following

List-I	List-II
(p) Chelonia	**(i) Alligator**
(q) Rhynchocephalia	**(ii) Chameleon**
(r) Crocodilia	**(iii) Sphenodon**
(s) Squamata	**(iv) Testudo**

The correct answer is

	(p)	(q)	(r)	(s)
(a)	(i)	(ii)	(iii)	(iv)
(b)	(iv)	(iii)	(i)	(ii)
(c)	(iii)	(ii)	(i)	(iv)
(d)	(iv)	(iii)	(ii)	(i)

TS EAMCET-02.05.2018 Shift-I

Ans. (b) :

	List – I	List – II
p	Chelonia	Testudo
q	Rhynchocephalia	Sphenodon
r	Crocodilia	Alligator
s	Squamata	Chameleon

Chelonia is the order of class reptilia. Turtles belong to the order of chelonia an example of testudo often known as the mediterranean tortoises, is a member of this group.
Rhynchocephalia– The species tuatara (sphenodon) is belong to order of Rhynchocephalia.
Crocodilia– They first found in the upper cretaceous period. They are ecotothermic animals which have four chamber heart. Ex.- Aligator.
Squamata– It is the larges order of raptiles, it comprised mostly lizards and snakes.

997. In reptiles, this region of vertebral column contains only two vertebral.
(a) Sacral (b) Cervical
(c) Lumbar (d) Caudal

AP EAMCET-28.04.2017 Shift-I

Ans. (a) : The number of sacral vertebrae varies from animal to animal.
- Amphibia have a single sacral vertebra.
- Reptiles have two sacral vertebra.
- Mammals have three or more sacral vertebra.

998. *Sphenodon punctatus* belongs to
(a) Reptilia (b) Amphibia
(c) Osteichtyes (d) Aves

Tripura JEE-2017

Ans. (a) : Sphenodon punctatus (Tuatara) belongs to reptilia and are endemic to New Zealand.
Sphenodon punctatus is the only living member of its order, which originated in the Triassic period around 250 million years ago and flourished during the Mesozoic era.
Sphenodon's body and tail are laterally compressed with a series of spines dorsally present along the middle line. Their limbs are pentadactyl, and its legs are short and primitive. The hind limbs of Sphenodon are usually plantigrade.

999. Which of the following statements are correct?
(i) Venom of cobra is neurotoxic
(ii) Venom of sea snake is neurotoxic
(iii) Venom of viper is haemotoxic
(a) (i) ,(ii) and (iii) (b) (i) and (iii)
(c) (i) and (ii) (d) (ii) and (iii)

UP CPMT-2007

Ans. (a) :
(I) Venom of cobra is neurotoxic
(II) Venom of sea snake is neurotoxic
(III) Venom of viper is haemotoxic

1000. Typhlops is
(a) sea snake (b) glass snake
(c) blind snake (d) grass snake

AIPMT-1988

Ans. (c) : A genus of blind snakes in the family typhlopidae found in Africa, Asia and Europe.

1001. Study the following and identify the correct match

Scientific name	Common name	Character
I. Draco	**Flying lizard**	**Cleidoic egg**
II. Bungarus	**Pond snake**	**Poisonous**
III. Ptyas	**Rat snake**	**Non-poisonous**
IV. Vipera russelli	**Chain viper**	**Non-poisonous**

@apna_pdf

(a) II, III (b) III, IV
(c) I, III (d) I, IV

AP EAMCET-2016

Ans. (c) :

Scientific name	Common name	Character
Draco	Flying lizard	Cleidoic egg
Bungarus	Krait	Poisonous
Ptyas	Rat shake	non – poisonous
Viper resselli	Chain viper	poisonous

1002. Which of the following sets of derivatives of integumentary structures characterized birds as glorified reptiles?
(a) Syrinx and uropygial glands
(b) claws and uropygial glands
(c) Scales and claws
(d) Syrinx and scales

JIPMER-2002

Ans. (c) : The sets of derivatives of integumentary structures characterized birds as glorified reptiles is Scales and claws.
- Syrinx (sound box) is made up of expanded tympanum. the sound is produced by the vibration of the tympaniform membrane during expiration.
- Uropygial gland or oil gland or green glands are the only skin gland present. They are located at the root of the tail.

1003. The number of digits in the limb used for walking by reptiles are:
(a) 4 (b) 2
(c) 5 (d) 6

BCECE-2015

Ans. (c) : 5 digits (pentadactyle) links are used for locomotion by reptiles.

1004. Sinus venosus is present in :
(a) birds only
(b) birds and mammals
(c) reptiles and birds
(d) fishes, amphibians and reptiles

DUMET-2002

Ans. (d) : Sinus venosus is characteristic feature of fishes, amphibians and reptiles.
In the hearts of various invertebrates including fish, amphibians, and reptiles, is a tiny chamber called the sinus venosus. It functions as the body's first receiving chamber, taking in deoxygenated blood and bringing it back to the heart.

1005. Pick out the odd one :
(a) Annelida (b) Reptilia
(c) Insecta (d) Taenia

DUMET-2002

Ans. (b) :
(1) Reptiles are vertebrates they have backbones.
(2) Their bodies are completely covered with scales.
(3) They are cold-blooded.
(4) Reptiles produce shelled eggs or bear live young.
(5) All species fertilize eggs internally.
(6) All species of reptiles have at least one lung.

1006. Which of the following is connecting link between reptiles and birds?
(a) Archaeopteryx (b) Euglena
(c) Neopilia (d) Latimeria

DUMET-2005 / Rajasthan PMT-2003
UP CPMT-2003

Ans. (a) : Archaeopteryx is considered as a connecting link between reptiles and birds because it looks like a birds and has wings like birds.
However its teeth and tail are like those of reptiles.
There by suggesting that birds have evolved from reptiles.

1007. The venom of cobra is:
(a) Neurotoxic (b) Hemolytic
(c) Cardiotoxic (d) Hepatotoxic

MP PMT-2013

Ans. (a) : The venom of cobra is neurotoxic. It affects the nervous system. It contains proteins and enzymes that interfere with nerve signals, leading to paralysis and potentially respiratory failure in its prey.

1008. One of the following is a poisonous snake:
(a) Enhydrina (b) Typhlops
(c) Python (d) Eryx

AP EAMCET-1998

Ans. (a) : Enhydrina commonly known as the beaked sea snake or common sea snake is the species which is highly poisonous snake.
- **Phython–** It is large and non-poisonous species.
- **Eryx–** It is non poisonous snakes commonly known as (Sand boas).
- **Typhlops–** It is also known as blind snake because eye without movable eyelids.

1009. The type in sub order Ophidia is:
(a) Amphicoelous (b) Acoelous
(c) Heterocoelous (d) Procoelous

AP EAMCET-1998
Manipal-2002

Ans. (d) : In the procoelous vertebrae, the anterior surface is concave and posterior surface convex.
• Ophidia is a group of squamate reptiles including modern snakes and reptiles including modern snakes and reptiles more closely related to snakes than to other living groups of lizards.

1010. Camouflage of Chameleon is associated with
(a) chromosome (b) chromomere
(c) chromoplast (d) chromatophore

Punjab MET-2011

Ans. (d) : Camouflage of chameleon is associated with chromatophore.
Chromatophore are pigmented cell which produce colour. In various species including fish, amphibians, reptiles chromatophore present.

1011. Olfactory organs of a snake is :
(a) Johtisons organ (b) Johansburgs organ
(c) Jacobson's organ (d) Jacksons organ

Manipal-2001

Ans. (c) : Snakes have also developed a highly a specialized scenes organs known as the Jacobson's organ which allows as the literally taste and smell the air.
The Jacobson's organ is found at the base the snakes nasal cavity.

@apna_pdf

1012. The exact cause of death of cobra bite person is
(a) inactivation of nerves
(b) inactivation and contraction of nerve and muscle
(c) contraction of muscle and destruction of erythrocytes
(d) destruction of RBCs

BVP-2014

Ans. (a) : The exact cause of death of cobra bite person is inactivation of nerves. The venom of cobras contains neurotoxins that block the transmission of nerve impulses, which can lead to paralysis of the respiratory muscles and heart. This can lead to dead within minutes.

1013. The truly land animals are
(a) newts (b) lung-fishes
(c) salamanders (d) Calotes

J&K CET-2010

Ans. (d) : Calotes– This is known as forest lizard some other species which is type of "blood suckers" due to their red head. It is truly land species.

1014. In which animal poison gland is present?
(a) Male platypus (b) Female-Lizard
(c) Male Lizard (d) Frog

Rajasthan PMT-1995

Ans. (a) : The platypus is venomous animal. It is often known as the duck-billed platypus, is an indigenous semi aquatic egg.

1015. In which of the following reptiles four chambered heart is present?
(a) Lizard (b) Snake
(c) Scorpion (d) Crocodile

JCECE-2003
Rajasthan PMT-2002

Ans. (d) : Generally reptiles have two artia and one partially divided ventricle i.e. three chambered heart but crocodiles have 4 chambered heart among reptiles.

1016. Archaeopteryx is a connecting link between
(a) Pisces and Amphibia
(b) Reptiles and Aves
(c) Amphibia and Aves
(d) Reptiles and Mammals

DUMET-2007
Rajasthan PMT-1995
WB JEE-2015

Ans. (b) : Archaeopteryx is the connecting link between reptiles and birds as it exhibits characteristics from both of these phyla.

1017. In which of the following animal anal tail is found?
(a) Earthworm (b) Lower invertebrates
(c) Scorpion (d) Snake

BVP-2008 / Uttarakhand PMT-2007
AIPMT-2001

Ans. (d) : The presence of post and tail used for balancing is a primary feature of chordates. The post-anal tail is present in chordates at some stage in the file. The post-anal tail is the spinal cord extending beyond the animals anus situated is the posterior region. Snakes are classified in the phylum chordata while earthworm is lower invertebrates and scorpion are non-chordates.

1018. On the feeding habit, the common house lizard Hemidactylus can be termed as
(a) entomophagous (b) phytophagous
(c) saprophagous (d) sanguivorous

BVP-2011

Ans. (a) : On the feeding habit the common house lizard Hemidactylus can be termed as entomophagous.
The common house lizards belong to the genus
- Hemidactylus – they are reptiles.
- Phytophagous – feeding on plants
- Saprophagous – feeding on dead and decaying matter
- Sanguivorous – feeding on blood

1019. Snake has :
(a) movable eyelids (b) immovable eyelids
(c) no eyelids (d) eyelids in pouches

Punjab MET-2004
Haryana PMT-2000
Manipal-2000

Ans. (b) : A snake has immovable eyelids. Snakes belong to the phylum chordata, class reptilia. They comes under vertebrates.
All reptilia have movable eyelids except snakes.

1020. Which of the following one is not a snake?
(a) Rattle snake (b) Rat snake
(c) Glass snake (d) Blind snake

Rajasthan PMT-1996

Ans. (c) : Glass snake is not a true snake because it is snake look like limbless lizard in the subfamily anguinae.
Ophisaurus of commonly called glass snakes, glass lizards or joint snakes.

1021. Which one is poisonous Lizard?
(a) Flying Lizard (b) Granular Lizard
(c) Sand Lizard (d) Beaded Lizard

AMU-2011 / Haryana PMT-1999
Rajasthan PMT-1996

Ans. (d) : The poisonous lizard are mexical beaded lizard and gila monster are the only venomous lizard both have share many character.
- Both have bony studs called osteoderms over their upper bodies. giving them a beaded appearance.
- Venom is produced from gland for defense against predator and venom by grooved teeth and chewed.
- Draco genus of Reptilia is known as flying lizard. Flying dragons or gliding lizards and not poisonous.
- Lacerta agilis is called sand lizard.

1022. Which of the following branch of biology is correctly matched?
(a) Ornithology - Study of mammals
(b) Herpetalogy-Study of molluscs
(c) Ophiology-Study of snakes
(d) Therology-Study of birds

MGIMS Wardha-2014

Ans. (c) : Ophiology is the branch of herpetology dealing with snake.
- Herpetalogy is the branch of zoology dealing reptiles and amphibian.
- Ornithology is a branch of zoology dealing with the study of bird.

@apna_pdf

1023. Ornithorhynchus is a connecting link between
(a) fishes and amphibians
(b) Annelida and Arthropoda
(c) Annelida and Mollusca
(d) reptiles and mammals

KVPY SA-2016
MGIMS Wardha-2014

Ans. (d) : Ornithorhynchus (Duck-billed platypus) is connecting link between reptiles and mammals.
- Lungfish (Protopterus) is the connecting link between fishes and amphibians.
- Seymouria and sphenodon is connecting link between, amphibian and reptile.
- Peripatus is a connecting link between annelida and arthrododa
- Neopilina is a connecting link between annelida and mollusca.

1024. The fangs of python which pulled out can
(a) not come again
(b) come again with half the length
(c) come again with same length
(d) come again with double length

Manipal-2012
AFMC-2002

Ans. (c) : The fangs of a python can re-grow. In fact, snakes replace all of their teeth regularly, including their fangs. The process of replacing a fang is called ecdysis, or shedding. When a fang is shed, a new fang is already growing in behind it. The new fang will eventually grow to the same length as the old fang.

1025. Loreal pit in vipers act as which receptor?
(a) Photo (b) Thermo
(c) Auditory (d) Gastatory

Manipal-2011
AP EAMCET-2002

Ans. (b) : Loreal pit present on the vipers head and enabling pit vipers to maintain their body temperature. Loreal pit located behind the nostril and centre of each eye and covered by lacunas scales.
- Gastatory is touch sensitive receptor.
- Photoreceptor is found in green plant.
- Auditory is a hearing receptor.

1026. Which snake feed on another snake is
(a) black cobra (b) king cobra
(c) rattle snake (d) anaconda

J&K CET-2009

Ans. (b) : King cobra is ophiophagy snake. It is venomous snake. The king cobra is famous for its diet of other snake.
The king cobra (ophiophagus hannah) is the world's longest venomous snake, which can be measured upto 6.7 meters or 22 feets in length.

1027. Snake, a terrestrial animal that excretes nitrogen wastes in the form of uric acid is known as
(a) uricotelic
(b) ureotelic
(c) ammoniotelic
(d) Not confirmed for any type

J&K CET-2014

Ans. (a) : Snakes are known as uricotelic animals. Uricotelism means the process of excreting nitrogenous waste in the form of uric acid. The adaptation is advantageous for animals with limited water availability, as uric acid is less soluble in water compared to other nitrogenous waste products like ammonia and urea.

1028. A lizard-like member of Reptilia is string on a tree with its tail coiled around a twig. This animal could be
(a) Hemidactylus showing sexual dimorphism
(b) Varanus showing mimicry
(c) Calotes (garden lizard) showing camouflage
(d) Chamaeleon showing protective colouration

Rajasthan PMT-2010

Ans. (d) : A lizard-like member of Reptilia is string on a tree with its tail coiled around a twig. This animal could be Chamaeleon showing protective colouration.
- Chameleon (girgit) shows defensive colouration with its surrounding e.g. known as twig

1029. Post anal tail can be traced in
(a) cobra (b) earthworm
(c) scorpion (d) centipede

AMU-2011
CMC Ludhiana-2008

Ans. (a) : Post anal tail is a basic characteristic of chordates such like some reptile like cobra. It help in the balancing and direction of body. It is the posterior elongation of body of chordata (reptiles) out of the anus and that tail is covered with scale.

1030. In which of the following sub - classes of Reptile the skull has a solid roof ?
(a) Anapsida (b) Diapsida
(c) Segnapsida (d) Parapsida

VMMC-2006 / AMU-2007

Ans. (a) : Anapsida skull is called solid roof because in this skull there is no opening in temporal fenestry. Due to lack of opening it become solid so called social roof. Turtle is the example of Anapsidan skull. Anapsida is a sub class of reptiles.

1031. Teeth are absent in
(a) fishes (b) reptiles
(c) frogs (d) turtle

CG PMT-2007

Ans. (d) : Turtles include terrestrial, marine and freshwater species, having a shell made up of a dorsal carapace and a ventral plastron. Teeth are absent in them having being replaced by a horny beak.
- No species of turtle has teeth. The reason is that they are not required to eat their food.

1032. Poisonous sea-snakes possesses a:
(a) compressed tail (b) printed tail
(c) depressed tail (d) conical tail

Uttarakhand-2005
CG PMT-2009

Ans. (a) : Sea snakes are completely aquatic and have adapted to sea environment in many ways. The tail are compressed and become paddle like which help in the swimming and direction. The sea snake which tail become paddle (compressed) like are poisonous and pointed tail of snake are non-poisonous.

@apna_pdf

1033. The reptilian character of prototheria is:
(a) Diaphragm
(b) T-shaped interclavicle
(c) Seven cervical vertebrae
(d) Only one aortic arch present

AP EAMCET-2001

Ans. (b) : The reptilian character of prototheria is the presence of a T-shaped interclavicles bone. The interclavicles is a bone found in the shoulder region, and its T-shaped structure is feature commonly seen in reptiles.

1034. Viper venom affects:
(a) circulatory system (b) nervous system
(c) respiratory system (d) none of the above

AFMC-2004

Ans. (a) : Viper venom affects is circulatory system. The evidence in experimental animals on the mechanisms of venom action in relation to changes in either external or internal factors is considered. the cardiovascular system and renal haemodynamics are affected by the venom.

1035. Moulting in snakes is done by shedding
(a) Cornified cells
(b) Stratified germinativum
(c) Epidermis
(d) Dermis

MGIMS Wardha-2011

Ans. (a) : Snakes shed their old skin through moulting, a process where the outermost layer of cornified cells is shed. This helps them grow, remove parasites, and renew their appearance.

1036. The extinct reptiles without temporal fossae belong to
(a) Chelonia (b) Synaptosauria
(c) Ichthyopterygia (d) Cotylosauria

Manipal-2009

Ans. (d) : The extinct reptiles without temporal fossae belong to cotylosauria.

1037. Tachyglossus is a connecting link between
(a) reptiles and birds
(b) amphibians and reptiles
(c) birds and mammals
(d) reptiles and mammals

DUMET-2009

Ans. (d) : Tachyglossus (echidna) an ant eater is a connecting link between reptiles and mammals due to its egg-laying reproduction and primitive reptilian characteristics, even though it is a mammal that produces milk for its baby.

1038. Reptilian feature of Archaeopteryx:
(a) feathers with barbules
(b) presence of abdominal ribs
(c) U-shaped furcula
(d) presence of beak.

AP EAMCET-2002

Ans. (b) : Reptilian feature of Archaeopteryx is presence of abdominal ribs, jawed teeth, clawed finger long and scally tail with free caudal vertebrae and presence of abdominal ribs. . It is connecting link between reptiles and aves.

1039. Which one of the following is a viviparous non-poisonous snake?
(a) Uropeltis (b) Enhydrina
(c) Ptyas (d) Ech is carinata

AP EAMCET-1997

Ans. (a) : In Uropeltis, tail is short and found in a large flat rough shield so it is named rough tailed snake. it is the viviparous, non-poisonous snake.
• U. macrolepis, commonly known as the Bombay earth snake, the Bombay shield tail, and the large- scaled shield tail, is species of snake in the family Uropeltidae.
• The species are endemic to southern India.

1040. A connecting link demonstrates characteristics of more than one groups. What will be the connecting link between reptiles and mammals from those given below ?
(a) Chimaera (b) Balanoglossus
(c) Neopilina (d) Echidna

VMMC-2015

Ans. (d) : Spiny ant eaten have some character like their legs on the side as dianosours rather than underneath them and presence of cloaca like reptiles to lay egg in the pouch. While the presence of hair and they produced milk for nourishment of children.

1041. Gynacomastism" is characteristic feature of:
(a) oviparous mammals (b) pouched mammals
(c) oviparous reptiles (d) viviparous snakes

AP EAMCET-2000

Ans. (a) : Gynacomastism is a phenomenon where the breast gland tissue increased and developed in male due to imballance of hormones like estrogen and testosteron. Gynacomastism is a phenomenon of development of mammary gland in male. In these, both male and female suckle the young one. It is found in oviparous mammals like platypus, Echidna and other monotremate mammals.

1042. Kidney of adult reptiles are
(a) mesonephric (b) metanephric
(c) pronephric (d) both (a) and (b)

AMU-1996

Ans. (b) : Reptiles, birds, and mammals all have a meta nephric kidney.
• The glomeruli are well developed in this type of kidney.
• The excretory process is aided by the metanephric kidneys.
• These are paired structures found in the abdominal region.
• They are made up of nephron units that are involved in blood filtration and the elimination of nitrogenous wastes from the body.

1043. A snake is identified to be having large hexagonal vertebral and the dorsal surface bluish with narrow white streaks, it is
(a) Echis carinata
(b) Bungarus coeruleus
(c) Vipera russelli
(d) Hemibungarus

Manipal-2010

@apna_pdf

Ans. (b) : Bungarus coerules (Kraits) is highly poisonous snake. Common krait has black or steel grey colour with white arches on the back. central scales of back are larger arid hexagonal. Viper russelii is a poisonous snake with triangular head having V-mark. Mark has 3 rows of black spots appearing like chain.

• Hemibungarus is a venomous elopid snake. it is commonly known as coral snake or oriental coral snake.

1044. Which one of these does not belong to the order Galliformes?

(a) Jungle fowl (b) Peacock
(c) Phesant (d) Green parrot

Haryana PMT-2011

Ans. (d) : In the classification of aves galliformes is an order where ground feeding heavy-bodied birds are classified in which turkey, chickens, quail and other running fowl catagories. Indian pea fowl (Pavo cristatus), red jungle fowl, golden pheasant and great curassow. While green parrot is classified under psittacipormes order of aves.

1045. Which of the following is not a characteristic of snakes ?

(a) Eggs (b) Sternum
(c) Scales (d) Kidney

AMU-2003

Ans. (b) : Sternum is not a characteristic of snakes.
Sternum also called breastbone, that lies in the middle of the frontal part of the chest.

• It is first appeared in Amphibians.

1046. Cleidoic eggs are found in

(a) fishes (b) amphibians
(c) few reptiles (d) none of these

CMC Ludhiana-2011

Ans. (c) : Cleidoic egg:- cleidoic egg are defined as having a thick, rigid outer shell made of calcium carbonate

- Bird and Reptile that lay eggs has cleidoic eggs which are an adaptation for the land.
- Cleidoic egg has a protective shell, and is laid out of water. The shell is porous to air and may be flexible or calcareous (hard).

1047. Regeneration of tail in lizard is an example of:

(a) Morphogenesis (b) Parthenogenesis
(c) Epimorphosis (d) Heteromorphosis

Manipal-2002

Ans. (c) : Epimorphosis : This type of regeneration is seen is both Animal and plant. In some species the epimorphosis process undergoes differentiation to form a relatively undifferentiated mass of cell that redifferentiate to form the new structure.

Example:- Regeneration of planarian, regeneration of tail in lizard.

1048. A snake is identified to be having large hexagonal vertebrals and the dorsal surface bluish with narrow white streaks, it is :

(a) echis carinata (b) bungarus coeruleus
(c) vipera russelli (d) hemibungarus

AP EAMCET-2006

Ans. (b) : Bungarus (kraits) are highly poisonous snakes. This nocturnal snake inhibits a wide variety of habitats. Found in Indian subcontinent, in south east Asia and in southern china.

Which is black or steel grey colour with white arches on the back. Central scales of back are larger and hexagonal.

1049. The characteristics of class Reptilia are :

(a) Body covered with dry and cornified skin scales over the body are epidermal they do not have external ears
(b) Body covered with moist skin which is devoid of scales, the ear is represented by a tympanum, alimentary canal, urinary and reproductive tracts open into a common cloaca
(c) Fresh water animals with bony endoskeleton, air-bladder to regulate buoyancy
(d) Marine animals with cartilaginous endoskeleton, body covered with placoid scales

NEET (Karnataka)-2013

Ans. (a) : Reptiles are mostly terrestrial animals. The body is coated in dry, cornified scales and organisms calssified as Reptilia are cold-blooded. They all have three chambers in their hearts and breathe through their lungs, with the exception of crocodiles. They have tympanums instead of external ears. Reptiles poikilotherms. snakes and lizard shed their scales as skin cast. Sexes are separate. They are oviparous and development is direct.

1050. Reptiles like mammals originated in

(a) Jurassic (b) Triassic
(c) Cretaseus (d) Permian

AIPMT-1999

Ans. (b) : Between 252 and 201 million years ago, during the Triassic period, reptiles of the order therapsida gave rise to mammals.

Therapsids, member of the sub family synapsida (also known as the mammal-like reptiles) were often unimpressive in comparison to other reptiles of their period.

1051. Syndactyly, prehensile tail and long protrusible tongue are the unique features of

(a) Horse fish (b) Chameleon
(c) Rhesus monkey (d) Archaeopteryx

Karnataka CET-2008

Ans. (b) : Syndactyly, prehensile tail and long protrusible tongue are the unique features of chameleon. Chameleons can also change their skin colour.

Chameleon comes under sub- order - lacertilia that induces lizards of order squamata.

1052. Which of the following character is not related to Indian chain viper?

(a) Large black rings occur in three rows on the dorsal surface of the body
(b) Subcandals are present in two rows
(c) An arrow mark (↑)is present on the head
(d) Head is triangular covered by small scales

AP EAMCET-2013

@apna_pdf

Ans. (c) : The Indian chain viper is known for its distinctive chain-like pattern on its back and its head is triangular covered by small scales. A part from it, subcandals are present in two rows, contributing to its unique physical features. However, the presence of an arrow mark on the head is not characteristic associated with the Indian chain viper.

1053. The extinct reptiles without temporal fossae belong to

(a) Chelonia (b) Synaposauria
(c) Ichthyopterygia (d) Cotylosauria

AP EAMCET-2009

Ans. (d) : Extinct reptiles without temporal fossae, which are openings in skull, belong to the group Cotylosauria. These reptiles had a unique skull structure that distinguished them from other group like chelonian, synapsida and Ichthyopterygia.

1054. A four chambered heart is not found in …….

(a) Snake (b) Crocodile
(c) Mammals (d) Birds

Karnataka CET-2004

Ans. (a) : A four chambered heart is not found in snake. They have a three chambered heart instead. In contast crocodiles, mammals and birds have four-chambered hearts that efficiently separate oxygen-rich and oxygen poor blood.

T. Aves / Birds

1055. Sound box of birds is called

(a) pygostyle (b) larynx
(c) syrinx (d) synsacrum

Rajasthan PMT-2011 / Haryana PMT-2002
AIPMT-1992 / AMU-2014 / BVP-2001

Ans. (c) : Sound box of birds is called syrinx.
Syrinx produces sound without the vocal folds of mammals. This is the organ found near the base of the trachea in birds.

1056. In birds the B-Iymphocytes mature in:

(a) thyroid gland (b) bone marrow
(c) green gland (d) bursa of fabricius

AP EAMCET-2001
AP EAMCET-12.07.2022 Shift-II

Ans. (d) : In birds the B-Iymphocytes mature in bursa of fabricius. The bursa of fabricus is a primary lymphoid organ in birds that is responsible for the amplification and differentiation of B-lymphocytes which are capable of local antibody production.

1057. Which one of the following organisms bears hollow and pneumatic long bones?

(a) Ornithorhynchus (b) Neophron
(c) Hemidactylus (d) Macropus

NEET-2021

Ans. (b) : Hollow and Pneumatic long bones are present in animals that comes under the class Aves. A for example–**Neophron,** it is commonly known as vulture.

- Ornithorhynchus (Platypus) – duck like bird snout belong to class: Mammalia.
- Hemidactylus (Wall lizard) is a member of class: Reptilia.

1058. Urinary bladder is absent in

(a) reptiles (b) aves
(c) amphibians (d) mammals

AP EAMCET-03.09.2021 Shift-I
AMU-2002

Ans. (b) : The Urinary bladder is absent in class Aves which includes birds. They lack a urinary bladder because the waste product is mostly uric acid. They are uricotelic in nature and excrete waste with feces.

1059. Identify the vertebrate group of animals characterized by crop and gizzard in its digestive system

(a) Amphibia (b) Reptilia
(c) Osteichthyes (d) Aves

NEET-2018

Ans. (d) : Crop and gizzard are found in the digestive tract of birds (Aves). Crop helps in storage and softening of food particles whereas gizzard (muscular stomach) helps up in its crushing and churning.

1060. Choose the correct match:

(a) Aves – Pneumatic bones
(b) Reptiles – 4 chambers heart
(c) Amphibia – Scales on body
(d) Osteichtyes – Persistent notochord

AIIMS-26.05.2018 Shift-II

Ans. (a) : Pneumatic bones are mostly found in birds (Aves). They help in flight and respiration because they are hollow and light weight bones.

- Four chambered heart is found in the **reptile** crocodile, Although **reptiles** show three - chambered heart generally, Thus, the crocodiles is an exception to it. It carries two auricles and two ventricles, just like mammals,
- **Amphibian** skin is thin, moist and devoid of scales.
- **Osteichthyes**, popularly referred to as the bony fish, is a diverse, super class of fish that have skeletons primarily composed of bone tissue.

1061. The major excretory product of birds is

(a) Urea (b) Uric acid
(c) Nitrates (d) ammonia

KVPY (SA)-05.11.2017

Ans. (b) : Uric acid is considered as a major excretory product mainly in birds, reptiles and terrestrial arthropods

1062. Life span of parrot is?

(a) 140 years (b) 60 years
(c) 80 years (d) 40 years

AIIMS-2011

Ans. (a) : In any natural organism the life span depends upon between the birth and the natural death.
The approx life span in parrot is 140 year.

1063. National bird of India is:

(a) Psittacula (b) Passer domesticus
(c) Pavo cristatus (d) Parakeet

AIIMS-2009 / Rajasthan PMT-2000

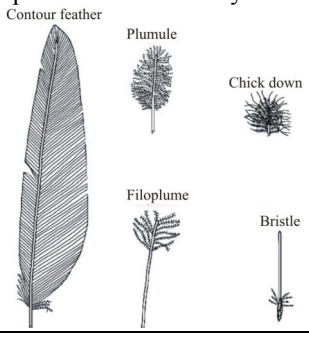
Ans. (c) : India's national bird is the peacock and its scientific name is Pavo cristatus.

- The peacock was proclaimed as the national bird of India in 1963.

@apna_pdf

1064. Delicate hair-like feathers which remain sparsely distributed over the body are?
(a) Coverts (b) Filoplumes
(c) Plumules (d) Remiges
AIIMS-2009

Ans. (b) : Delicate hair- like feathers which remains sparsely sparsely distributed over the body are Filoplumes.
They are a type of feather generally found in birds. They are hair-like feathers with a small tuft of barbs at the tip and a small, inconspicuous shaft filoplumes do not play a significant role in flight or insulation but are believed to have sensory functions, helping birds defect changes in the position of their body feathers.



1065. Which of the following are uricotelic animals?
(a) Rohu and frog
(b) Camel and frog
(c) Lizard and crow
(d) Earthworm and eagle.
AIIMS-2002

Ans. (c) : Organism whose principle excreta is uric acid are called uricotelic animals and the process of elimination of uric acid is called uricotelism. e.g. insect, reptiles and birds are uricotelic animals.

1066. Bird vertebrae are
(a) acoelous (b) heterocoelous
(c) amphicoelous (d) procoelous
AIPMT-1988 / AIIMS-1999

Ans. (b) : In Birds heterocoelous (saddle shaped) vertebrae are present and these are characteristic of bird's necks. It provide flexibility for the movement.

1067. Feet of kingfisher are modified for
(a) wading (b) perching
(c) running (d) catching
AIPMT-1988
Punjab MET-2011

Ans. (a) : In the kingfisher, feet is modified for wading. kingfisher if flash-eating bird.

1068. Both male and female pigeons secrete milk through
(a) salivary glands
(b) modified sweat glands
(c) crop
(d) gizzard
AIPMT-1988

Ans. (c) : Both male and female pigeon secrete milk through crop during breeding season. It is formed by the degeneration of the epithelial cells lining the crop. The milk included water, fat, protein and lactose.

1069. Flight muscles of bird are attached to
(a) clavicle (b) keel of sternum
(c) scapula (d) coracoid
AIPMT-1989
J&K CET-2001

Ans. (b) : The flight muscles of birds are attached to an extension of the sternum. It is also known as carina.
Flight muscles hepl to fly of birds. kell is the extension of the sternum of birds.

1070. Penguin occurs in
(a) Australia (b) Antarctica
(c) Africa (d) America
AIPMT-1990

Ans. (b) : Penguins occur in Antarctica, (lower southern hemisphere) It is the a group of aquatic, flightless birds.

1071. Which is common between ostrich, penguin and kiwi?
(a) Running birds (b) Migratory birds
(c) Flightless birds (d) Four toed birds
AIPMT-1993

Ans. (c) : Flightless birds are birds that through evolution lost the ability to fly. ostrich, penguin and kiwi are flightless birds. emu, cassowary and rhea are also flightless bird.

1072. The skull of a bird is
(a) dicondylic (b) mono condylic
(c) amphicondylic (d) none of these
Punjab MET-1999

Ans. (b) : The skull of a bird is mono condylic.
This means that it has a single occipital condyle, a rounded projection at base of the skull that articulates with the first vertebra. This unique feature allows birds to have a greater range of head movement and contribute to their ability to fly.

1073. Some vertebrae in birds fuse to form:
(a) sacrum (b) synsacrum
(c) coccyx (d) none of these
AFMC-2005

Ans. (b) : Some vertebrae in birds fuse to form synsacrum.
The syncacrum is a skeletal structure of birds, in which the sacrum is extended by incorporation of additional fused or partially fused caudal or lumbar vertebrae and it can only be seen in birds. Some posterior thoracic vertebrae, the lumbar, sacral and a few anterior caudal vertebrae are fused to form a complex bone called synsacrum.
• The innominate bones are fused with the synsacrum to a greater or lesser extent, according to species, forming an avian pelvis.

1074. Which of the following group of animals maintains high and constant body temperature such as mammals?
(a) Reptiles (b) Amphibians
(c) Birds (d) Fishes
AFMC-2005

@apna_pdf

Ans. (c) : Birds belongs to class Aves. Birds and mammals are Homeotherms.
Homeothermy, also known as endothermy, refers to the ability of an organism to maintain a relatively constant body temperature, regardless of the external temperature fluctuations.
Hence, birds maintains high and constant body temperature such as mammals.
Birds, Amphibians and fishes are poikilothermic animals (cold blooded).

1075. The red jungle fowl is
(a) Gallus gallus (b) Ravo cristatus
(c) Choriotis nigriceps (d) Raja hansa
AMU-2015

Ans. (a) : The red jungle fowl is Gallus gallus which is a tropical birds belongs to family phasianidae. It is widespread throughout south and South East Asia. It is formely known as the bankiva or bankiva fowl. In India, it is found in panchkula distic in Haryana.

1076. Which one is the most important characteristic feature of birds?
(a) Forelimbs modified into wings
(b) Bipedal vertebrate
(c) Homoiothermal
(d) Exoskeleton of feathers
BVP-2010

Ans. (d) : Exoskeleton of feathers is the most important characteristic feature of birds.
The aves belong to the phylum chordata of the animal kingdom.
Characteristics of Aves-
- Birds are worm-blooded animals.
- Their forelimbs are modified into wings.
- There are epidermal scales on their legs.
- The endoskeleton is bony with long hollow pneumatic bones.
- Features are an exoskeletal structure which is a characteristic feature of birds. The feathers can be useful for sexual attraction between the two sexes in birds for the process of sexual Reproduction.

1077. The scientist, who described the birds as glorified reptiles, was :
(a) Romer (b) Huxley
(c) Mendel (d) Robert Hook
JIPMER-2004
Punjab MET-2003

Ans. (b) : The scientist, who described the birds as glorified reptiles, was Huxley. He described the birds as glorified reptile. It is typically believed that each mammals and birds are derived from reptiles.
- Archaeopteryx is a fossil bird showing each reptile and bird features.

Hence, birds are known as glorified reptiles by Huxley.
- He was known as "Darwin's Bulldog" for his advocacy of Charles Darwin's Theory of Evolution.

1078. Incomplete division of egg during cleavage is known as :
(a) meroblastic (b) holoblastic
(c) meridional (d) spiral
JIPMER-2004 / Punjab MET-2003
MP PMT-1996,1999

Ans. (a) : Incomplete division of egg during cleavage is known as meroblastic. It refers to a type of a cleavage in embryonic development where only a portion of the egg divides, resulting in an embryo that is partially surrounded by yolk. This type of cleavage is common in eggs with a large amount of yolk, such as bird eggs.

1079. Beak is toothed in
(a) pelican (b) kiwi
(c) ostrich (d) Archaeopteryx
MGIMS Wardha-2007 / Rajasthan PMT-2006
BVP-2012

Ans. (d) : Beak is toothed in Archaeopteryx. It is a genus of feathered dinosaurs that lived around 150 million years ago during the late Jurassic period. It is often considered as transitional form between dinosaurs and modern birds due to its combination of reptilian and avian features. The fossils of Archaeopteryx provide valuable insights into the evolutionary link between reptiles and birds.

1080. Pigeon is a
(a) oviparous organism
(b) viviparous organism
(c) ovo-viviparous organism
(d) None of the above
J&K CET-2014

Ans. (a) : Pigeon is a oviparous organism.
Oviparous animals are those animals in which fertilissation generally takes place internally but embryo development takes place externally. Birds, Reptiles and Amphibians are oviparous.
Offsprings of oviparous animal are at greater risk of survival compared to viviparous animals.

1081. Synsacrum of fowl consists of about
(a) 29 vertebrae (b) 3 vertebrae
(c) 16 vertebrae (d) single vertebrae
UP CPMT-2008 / Uttarakhand PMT-2008
VMMC-2012

Ans. (c) : The synsacrum of fowl consist of about 16 vertebrae.
The synsacrum is a skeletal structural of birds and other danseurs, in which the sacrum is extended by incorporation of additional fused or partially fused caudal or lumbar vertebrae. This structure is only found in birds. It is formed by the fusion of 16 vertebrae these are last thoracic vertebra, six lumbar vertebrae, two sacral vertebrae and seven caudal vertebrae.

1082. Characteristic features such as four-chambered heart, feather and pneumatic bone is applicable to the class of vertebrate
(a) Cyclostomata (b) Aves
(c) Reptilia (d) Mammalia
CG PMT-2007 / J&K CET-2006

Ans. (b) : The feathers of the birds are the single external feature to distinguish birds from other vertebrates.
- The presence of hollow and light bones is a characteristic feature of birds that helps them to reduce body weight.
- The forelimbs are specially modified for flight, having a large surface area and very little weight.
- Birds have 4-chambered hearts made of the right atrium, right ventricle, left atrium and left ventricle.

@apna_pdf

1083. The bird without pecten is:
(a) Pteropus (b) Apteryx
(c) Eryx (d) Gallus
AP EAMCET-2004

Ans. (b) : Bird without pecten is apteryx.
Pecten is a soft rectangular highly vascular pigmented folded structure. It is present in eyes of all birds except apteryx.
- The pecten solves this problem by greatly reducing the number of blood vessels in the retina.
- This also leads to the extremely sharp eyesight of birds such as howks.

1084. The largest endangered bird in India is
(a) vulture
(b) flamingo
(c) great indian bustard
(d) great indian hornbill
CG PMT-2009
Haryana PMT-2009

Ans. (c) : The great Indian bustard, the bird of Rajasthan, is considered Indian's most critically endangered bird.
- It is considered the flagship grassland species that represents the health of the grassland ecology.
- Its population is confined mostly to Rajasthan and Gujarat. Small populations occur in Maharashtra, Karnataka and Andhra Pradesh.

1085. The long bones are hollow and connected by air passage. These are characteristic of
(a) Mammalia (b) Aves
(c) Reptilia (d) Sponges
AMU-2006

Ans. (b) : The long bones are hollow and connected by air passage. These are characteristic of aves.
Aves are the animals that fly so their body weight should be less and for this their bones are hollow and connected by air passages.
• Reptilia, land vertebrates and mammals do not have hollow bones.
Most of the bones are pneumatic bone and filled with air sacs.

1086. Quill feathers at the base of quill wings are called :
(a) remiges (b) barbules
(c) coverts (d) down feathers
DUMET-2001

Ans. (c) : Quill feathers at the base of quill wings are coverts. Coverts feathers are small feathers that cover the bases of larger flight feathers, helping to streamline the wings and are provide additional support during flight. The name coverts indicate that they cover the other feathers.

1087. Feathers seen only in Nestlings:
(a) contour (b) filoplumes
(c) quill (d) down
AP EAMCET-2002

Ans. (d) : Nestlings are young birds that are still in the nest and are unable to fly. They are typically covered in down feathers and are cared for by their parents until they are ready to fledge (leave the nest).

1088. Bone marrow is absent in the bones of
(a) Pisces (b) Amphibia
(c) Reptilia (d) Aves
CMC Vellore-2014
BCECE-2007

Ans. (d) : Bone marrow is absent in the bones of birds (aves). Unlike mammals, where bone marrow is present in the bones and is responsible for producing blood cells, birds have a different arrangement where their bones are hollow and filled with air sacs, which helps then be light weight for flying.

1089. In which one meroblastic segmentation is found
(a) Dog (b) Monkey
(c) Owl (d) Rhinoceros
Rajasthan PMT-2000

Ans. (c) : Meroblastic segmentation is a type of embryonic development where only a part of the egg divides into smaller cells, while the rest remains undivided. In the case of the owl, this type of segmentation occurs during its early development.

1090. Which of the following sets of derivatives of integumentary structures characterise birds as glorified reptiles ?
(a) Scales and claws
(b) Syrinx and uropygial gland
(c) Claws and uropygial gland
(d) Syrinx and scales
AMU-2003

Ans. (a) : Scales and claws are integumentary structures that are characteristic of birds. Scales cover the legs and feet of birds, providing protection and support. Claws found on the tips of bird's toes, and used for perching, climbing and catching prey. Additionally, feathers are another important integumentary structure that distinguishes birds, playing a crucial role in flight, insulation and communication.

1091. Which of of the following is not a bird?
(a) Magpie (b) Albatross
(c) Himalayan quail (d) Bufo
J&K CET-2004

Ans. (d) : Among the given options, "Bufo" is not a bird. It is a genus of true toads, which are amphibians. The other options, magpie, Albatross and Himalayan quail are all types of birds.

1092. Pneumatic bones are expected to be found in
(a) house lizard (b) flying fish
(c) pigeon (d) tadpole of frog
JIPMER-2010
AFMC-2000

Ans. (c) : Pneumatic bone are hollow bones filled with air, found in Aves or birds. It makes the skeleton light in weight which makes it easy to fly.
• These bones reduce body weight and increase buoyancy thus, indirectly helping bird to fly.

1093. Which one of the following characteristics is not shared by birds and mammals
(a) Warm blooded nature
(b) Ossified endoskeleton
(c) Breathing using lungs
(d) Viviparity
NEET-2016 Phase-I

@apna_pdf

Ans. (d) : Birds are always oviparous. Viviparity is not shared by birds and mammals. Viviparity means to give birth to young who develop inside the body of the mother rather than hatching from eggs. Mammals are viviparous and birds are oviparous.

1094. Which one of the following in birds, indicates their reptilian ancestry?
(a) Two special chambers crop and gizzard in their digestive tract
(b) Eggs with a calcareous shell
(c) Scales on their hind limbs
(d) Four-chambered heart

AIPMT-2008

Ans. (c) : As a form of adaptation to living on land, reptiles dry skin is protected from water loss by scales. In addition to having scales on their hind limbs, birds are reptile ancestors.

1095. Which of the following is a flightless bird?
(a) Ostrich (b) Emu
(c) Kiwi (d) All of these

UP CPMT-2011
JIPMER-2000

Ans. (d) : Flightless birds are birds that lost the ability to fly through evolution Ostrich, Kiwi, Emu, all are flightless bird.

U. Mammalia

1096. One of the following is a very unique feature of the mammalian body -
(a) Presence of diaphragm
(b) Four chambered heart
(c) Rib cage
(d) Homeothermy

JCECE-2015 / Punjab MET-2006
AIPMT-2004 / JCECE-2003
Rajasthan PMT-2002 / AIIMS-1998

Ans. (a) : Presence of Diaphragm is unique feature of the mammalian body.
- Diaphragm present only in mammalian body. The work of diaphragm is to separate the stomach from the heart.
- Homeothermy is found in Amphibians mammals and birds.
- Birds, mammals and crocodile have four-chambered heart.
- Rib cage is found in most tetrapod.

1097. In rabbit, head of epididymis present at the head of the testis is called
(a) Vas deferens (b) Cauda epididymis
(c) Gubemaculum (d) Caput epididymis

UP CPMT-2012 / MGIMS Wardha-2008
BVP-2007 / CG PMT-2008

Ans. (d) : In rabbit, head of epididymes present at the head of the testis is called caput epididymis. The most obvious function of the epididymis is to transport sperm from the rete testes to the vas deferens.
- Epididymes a long tube that is located near each testicle.

1098. Which of the following is viviparous?
(a) Running birds (b) Whales
(c) Bats (d) Both (b) and (c)

HP CET-2011 / BCECE-2006
VMMC-2005 / AMU-2004

Ans. (d) : Whale and bats both are viviparous. Viviparous animal gives birth to living young from within the body rather than laying eggs. Almost all mammals and some reptiles are viviparous.

1099. Mammary glands are modifications of
(a) Sebaceous glands (b) Scent glands
(c) Ceruminous glands (d) Sweat glands

TS EAMCET 10.05.2023 Shift-I

Ans. (d) : Mammary gland are modification of sweat glands. Sweat glands are type apocine gland that present surface of the skin.
Mammay glands are present in all female mammals and are generally non function in males.
They first appear in embryonic fife as clumps of cell peoliferating from a longitudinal ridge of ectoderm along the so called milk line, from the buds, or beginnings of the lower limbs to those of the upper limbs.
The number of these clumps that ultimately become breasts, or mammas varies with each mammalian species according to the size of its litter.
The glandular tissue itself is made up of 15- 20 lobes composed of solid cords of ducats cells each lobe is sub divided into many smaller lobules separated by broad fibrous suspensory bonds (cooper's ligaments) which connect the skin with the fascia or sheet of connective tissue that covers the pectoral muscles beneath the breast.

1100. Statement I: The animals that can withstand wide fluctuations in salinity are called eurythermal animals.
Statement II: Animals such as camels can be conformers upto a particular range of temperature and regulators afterwards.
The correct option among the following is
(a) Both statements I and II are true
(b) Both statements I and II are false
(c) Statement I is true. But statement II is false
(d) Statement I is false. But statement II is correct

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : The animals that can survival wide range of temperatures are called eurythermal animals. The animal that can survival only narrow range of lemperuture is called stenothermic.
The animals that can withstand wide fluctuation in salinity are called euryhaline.
The camels can be con formers upto a particular range of temperature and regulators after wards is a example of eurythermal animal.

1101. Rats belong to the class
(a) Rodentia (b) Cetacea
(c) Mammalia (d) Carnivora

AP EAPCET-22.05.2023, Shift-II

@apna_pdf

Ans. (c) : The classification of rat	
Domain	Eukaryota
Kingdom	Animalia
Phylum	Chordata
Class	Mammalia
Clade	Simplicidentata
Order	Rodentice

Rat are various medium-sized, long tailed rodents. Rat are also called mice by their size.
The best known rat species are the black rat and brown rat.
The rat use in subjects for scientific research.
The class mammalian is characterized by the presence of milk-producing mammary gland for feeding their young and outhe character is a neocortey region of the brain, for or hair and three middle ear bones.

1102. The unique mammalian characteristics are:
(a) pinna monocondylic skull and mammary glands
(b) hairs, tympanic membrane and mammary glands
(c) hairs, pinna and mammary glands
(d) hairs, pinna and indirect development

NEET (UG) 07.05.2023

Ans. (c) : Animals belonging to C (as) mammalian are referred to as mammals.
- Mammals are worm-blooded animals who give birth to their young one's (Viviparity)
- They have mammary glands that help them produce milk to feed their younger ones.
- Mammals have several cervical vertebra.
- Hairs presents throughout the body which helps animals adapted to their environment.

1103. In mammals, dentition is
(a) Acrodont and homodont
(b) Homodont and thecodont
(c) Acrodont and heterodont
(d) Thecodont, heterodont and diphyodont

AP EAMCET-12.07.2022 Shift-II

Ans. (d) : Human dentition is described as thecodont diphyodont and heterodont. It is called thecodont type because each tooth is fixed in a separate socket present in the jaw bones.
It is called diphyodont type because we get only two sets of teeth, milk teeth and permanent teeth.
Heterodont – An adult human has 32 permanent teeth which are of 4 different types (Heterodont dentition), namely incisors (I), canine (C), premolares (PM) and molars (M).

1104. Match the following related to adaptation in aquatic habitat?

List-I	List-II
(i) Gelatinous cocoon	(A) Cartilaginous fishes
(ii) Salty fluid that drips through nostrils	(B) Salmon
(iii) Trimethyl amine Oxide	(C) African lung fish
(iv) Anadromous migration	(D) Penguins

(a) (i–D), (ii–C), (iii–B), (iv–A)
(b) (i–C), (ii–D), (iii–A), (iv–B)
(c) (i–A), (ii–D), (iii–C), (iv–B)
(d) (i–A), (ii–B), (iii–D), (iv–C)

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : Gelatinous cocoon- African lung fish
Salty fluid that drips - penguins
through nostrils -
Trimethyl amine oxide - Cartilagenous fishes
Anodromous migration - Salmon.

1105. The smallest mammal is _____ .
(a) Hog Nose Bat (b) Pigmy water shrew
(c) Pigmy Mole (d) Plasmodium

AP EAMCET-03.09.2021 Shift-II

Ans. (a) : The smallest mammal is Hog Nose Bat. It is commonly known as bumblebee bat. It measures around 1 to 1.3 inches in length & weights around 2 grams.

1106. Assertion (A) : Mammals have a relatively large brain when compared to that of other animals in relation to body size.
Reason (R) : Number of optic lobes is four in the mammals and two in others vertebrates.
(a) Both A and R are correct and R is the correct explanation of A.
(b) Both A and R are correct and R is not the correct explanation of A.
(c) A is correct but R is wrong.
(d) A is wrong but R is correct.

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Mammals have a large brain for their body size than most members of other vertebrates. Number of optic lobes is four in the mammals & 2 in other vertebrates. Hence, option (b) is correct.

1107. Study the following table and pick up the correct combinations.

	Class	Common name of animals	Special feature
I	Echinoidea	Sea urchins	Aristotle's lantern
II	Cephalopoda	Clams	Crystalline style
III	Holothuroidea	Sea cucumbers	Respiratory trees
IV	Gastropoda	Squids	Torsion

Options:
(a) II, IV (b) I, III
(c) I, II (d) II, III

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Conjugation : conjugation is the process by which one bacterium transfers genetic material to another through direct contact.
- During conjugation one bacterium serves as the donor of the genetic material and the other serves as the recipient.
- The Donor bacterium carries a DNA sequence called the fertility factor, or F-factor.

1108. Which among the following is a Metatherian mammals ?
(a) Kangaroo (b) Echidna
(c) Shrew (d) Pangolin

AP EAMCET-25.09.2020 Shift-II

@apna_pdf

Ans. (a) : Masupials are a type of metatherian mammals that include kangaroos. Kangaroos are marsupials that are known for their powerful hind legs. Marsupials are characterized by giving birth to relatively underdeveloped offspring, which then continue to grow and develop while attached to their mother's nipples inside the pouch.

1109. Match the following

List - I	List - II
A. Anadromous	**I. Anguilla**
B. Catadromous	**II. Protopterus**
C. Diapause	**III. Lizards**
D. Aestivation	**IV. Insects**
	V. Hilsa

The correct match is

	A	B	C	D
(a)	V	I	IV	II
(b)	V	I	III	IV
(c)	II	IV	I	IV
(d)	III	II	I	IV

TS EAMCET-29.09.2020 Shift-I

Ans. (a) : Anadromous - Hilsa
Catadromous - Anguilla
Diapause - Insects
Aestivation - protopterus.

1110. Structure analogous to the placenta in mammals.

(a) Chorion (b) Amnion
(c) Yolk sac (d) Allantois

JIPMER-2019

Ans. (a) : The chorion is a membrane that surrounds a developing fetus which is associated with the amnion. The chorion plays a vitat role in the exchange of blood and gases between mother and fetus. The chorion also functions to eliminate fetus waste.

1111. Which all belong to the same phylum?

(a) Mammalia – Balaenoptera, Delphinus, Rattus, Felis
(b) Porifera – Euspongia, Scypha, Pennatula
(c) Arthropoda – Crab, Limulus, Aplysia, Cockroach
(d) Coelentrata – Hydra, Gorgonia, Obelia, Sycon

AIIMS-26.05.2018 Shift-I

Ans. (a) : Balaenoptera is blue whale, Delphinus is Dolphin Rattus is rat and Felis is cat ,all belong to the same phylum chordata.

- Pennatula and Gorgonia belongs to phylum Cnidaria.
- Aplysia belongs to phylum Mollusca.
- Sycon is belongs to Porifera.

1112. Which of the following is correct

(a) Macropus– Ear pinna, body hairs, 4 chambered heart
(b) Pavo–Long bones ossified, fore limbs modified to wings
(c) Ichthyophis–covering on eyelids, Scales present
(d) Limulus–chitinous exoskeleton, 3 pair of legs

AIIMS-26.05.2018 Shift-II

Ans. (a) : Macropus is a marsupial genus that belongs to the family macropodidae.

- This genus includes all terrestrial kangaroos.
- Macropus have Ear pinna, body hairs and 4 chambered heart.
- Macropus have hair on skin and pinna, belongs to class mammalian.

1113. Select the incorrect –

(a) Annelida – Nereis, Hirudinaria, Lumbricus
(b) Echinodermate–Echinus, Cucumaria, Asterias
(c) Reptilia–Hemidactylus, Ophiosaurus, Chelone
(d) Mammalia – Betta, Rattus, Felis

AIIMS-27.05.2018 Shift-I

Ans. (d) : Mammalia is a name for the group of animals that have mammary glands based on the examples, it is clear that Betta is a genus of fish that contains ray-finned fishes that are member of the super class pisces and does not belong to the mammal family. Cat species fall under the genus felis, which a member of mammalia orders.
The class mammalia includes the genus Rattus which include many types of rats.

1114. Match the animals of Column I with their respective classes in Column II and choose the correct answer :

Column I	Column II
1. Aptenodytes	**I. Aves**
2. Hemidactylus	**II. Chondrichthyes**
3. Carcharodon	**III. Mammalia**
4. Pteropus	**IV. Reptilia**
	V. Osteichthyes

Select the code for the correct answer from the options given below :

	1	2	3	4
(a)	V	II	IV	I
(b)	I	IV	III	II
(c)	V	I	II	III
(d)	I	IV	II	III

Karnataka CET-2018

Ans. (d) : Bird come under the class of Aves. They are characterized by the beaks and the feather present on their body. chondrichthyes in a class of fish that consist of cartilaginous fishes.
Mammalia is a vertebrate animal and consist of mammals. Class reptilia consist of reptile and amphibians.
Osteichthyes consist of fishes mainly bony fishes.

Sr. No.	Column-I	Sr. No	Column-II
1.	Aptenodytes	I	Aves
2.	Hemidactylus	IV	Reptilia
3.	Carcharodon	II	Chondrichthyes
4.	Pteropus	III	Mammalia

1115. The amnion of mammalian embryo is derived from

(a) ectoderm and mesoderm
(b) endoderm and mesoderm
(c) ectoderm and endoderm
(d) mesoderm and trophoblast

NEET-2018

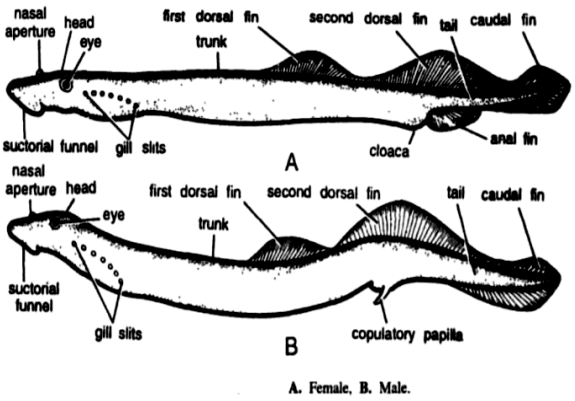
@apna_pdf

Ans. (a) : The amnion, which is a protective membrane surrounding the embryo, develops from the both the ectoderm (outermost germ layer) and the mesoderm (middle germ layer) during the early stages of embryonic development in mammals. This combination of layers forms the structure of the amnion.

1116. Which of the following does not come under the class mammals?
(a) Flying fox (b) Hedgehog
(c) Manatee (d) Lamprey

AIIMS-2007

Ans. (d) : Lampreys do not belong to the class of mammals. They are jawless fish.while Hedgehog, flying fox and Manatee all belong to the class of mammals.



A. Female, B. Male.

1117. Which one of the following is not mammalian character?
(a) Presence of milk producing glands
(b) Skin is unique in possessing hair
(c) Presence of external ears called pinnae
(d) Homodont type of dentition

AIIMS-2016

Ans. (d) : Mammals have heterodont teeth, which are different kinds (Incisor, Canine, Premolar and Molar) of teeth with distinct purposes in contrast to the majority of vertebrates, which have homodont teeth, i.e. morphologically and functionally identical.

1118. All mammals without any exception are characterized by
(a) Viviparity and biconcave red blood cells
(b) Extra-abdominal testes and a four chambered heart
(c) Heterodont teeth and 12 pairs of cranial nerves
(d) A muscular diaphragm and milk producing glands

AIIMS-2006

Ans. (d) : Mammals are characterized by having a muscular diaphragm and milk-producing glands which are unique features among animals. The diaphragm helps with breathing and the milk-producing glands are used to nourish their young. These traits distinguish mammals from other types of animals.

1119. Which animal has the longest gestation period?
(a) Shark (b) Walrus
(c) Elephant (d) Dog

AIIMS-2010

Ans. (c) : Gestation is the time of growth that occurs when an embryo or fetus is being carried inside of an animal, particularly one that is viviparous.
The normal gestation time of an elephant is around 95 weeks or almost two years. This is the longest pregnancy period one could possibly think of in the animal kingdom.

1120. Which of the following is common among mammals?
(a) They do not moult
(b) They have seven cervical vertebrate
(c) The are carnivores
(d) They have ventral nerve cord

AIIMS-2014

Ans. (b) : Mammals are commonly characterized by having seven cervical vertebrate in their necks, which sets them apart from other animals. This anatomical feature is a distinctive trait of animals.

1121. Which of the following teeth are lophodont?
(a) Incisor and canine
(b) Canine and premolar
(c) Premolar and molar
(d) Premolar and incisor

AIIMS-2002

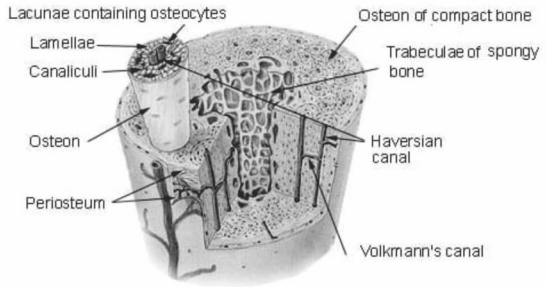
Ans. (c) : Lophodont teeth are commonly found in mammals like herbivores and have raised, ridged surfaces that help in grinding plant material. Premolar and molar refers to the type of teeth that exhibit lophodont characteristics.

1122. Haversian canal in the bone of mammals are connected by small blood vessel canal called:
(a) Schlemm's canal (b) Volkmann's canal
(c) Portal capillaries (d) Sinuses

AIIMS-2015

Ans. (b) : Volkmann's cannals are channel that run transversely through the bone, connecting the Haversian canals, and are essential for maintaining bone health and function through vascularization and communication.

Compact Bone and Spongy (Cancellous Bone)



1123. Hair occur in all mammals except those of
(a) rodentia (b) chiroptera
(c) primata (d) cetacea

AIPMT-1988

Ans. (d) : Hair is present in all mammals except those of the group cetacean, which induces whales, dolphins and porpoises. These aquatic mammals have evolved adaptations such as streamlined bodies and blubber for their marine lifestyle, leading to the loss of external hair.

@apna_pdf

1124. Eutherians are characterised by
(a) hair skin
(b) true placentation
(c) ovoviviparity
(d) glandular skin

AIPMT-1989

Ans. (b) : Eutheria includes viviparous placenatal mammlas. Eutherians are characterized by true placentation. It has a choriollantoic placenta. True placenta is absent in all marsupials.

1125. An egg laying mammal is
(a) kangaroo (b) platypus
(c) koala (d) whale

J&K CET-2005
AIPMT-1992

Ans. (b) : The platypus is a duck billed beaver-tailed, otter-footed and egg laying aquatic mammals.

1126. Role of spleen in mammal is
(a) to control blood pressure
(b) to assist liver
(c) to act as haemopoietic tissue
(d) to assist kidneys

Punjab MET-2009

Ans. (c) : Role of spleen in mammal is to act as haemopoietic tissue. The spleen is the largest lymphatic organ in the body and is positioned in the superior abdomen (tummy). The spleen has important hematopoietic functions, until the 5^{th} month of gestation. After birth, erythropoietic functions cease, except in some hematologic disorders. As a major lymphoid organ, the spleen retains the ability to produce lymphocytes and as such, remains an hematopoietic organ.

1127. Select the correct set of animals of class-Mammalia.
(a) Lion, bat, whale, ostrich
(b) Whale, bat, kangaroo, hippopotamus
(c) Lion, hippopotamus, penguin, bat
(d) Hippopotamus, penguin, whale, kangaroo

MGIMS Wardha-2013
J&K CET-2006

Ans. (b) : Mammals are members of class mammalia. Air breathing vertebrate animals characterized by the possession of endothermy, hair, 3 middle ear bones, and mammary glands functional in mothers with young.

• Penguin and ostrich are flightless birds, Lion and Hippopotamus' are terrestrial mammals.

1128. If Henle's loop were absent from mammalian nephron, which of the following is to be expected?
(a) The urine will be more concentrated
(b) The urine will be more dilute
(c) There will be no urine formation
(d) There will be hardly any change in the quality and quantity of urine formed

MGIMS Wardha-2010

Ans. (b) : Henle's loop, also known as the loop of Henle plays a crucial role in the kidney's ability to concentrate urine if it were absent, the kidney's ability to creates concentrated urine would be compromised, leading to more dilute urine being produced.

1129. The eggs of eutherian mammals are:
(a) mesolecithal type (b) microlecithal type
(c) telolecithal type (d) megalecithal type

MGIMS Wardha-2003

Ans. (b) : The eggs of eutherian mammals are microlecithal type.

• Some Embryologists also describes microlecithal egg as alecithal eggs.

• Where mesolecithal type of egg are found in frogs and toads, telolecithal egg are found in birds, reptile and some amphibians and megalecithal egg are found in bony fishes, reptiles and monotremes.

1130. Which one of the following is a very unique feature of the mammalian body ?
(a) Homeothermy
(b) Presence of diaphragm
(c) Four chambered heart
(d) Rib cage

Manipal-2007

Ans. (b) : The presence of a diaphragm is a unique feature of the mammalian body. It is a muscular structure that separates the thoracic and abdominal cavities and plays a crucial role in breathing by contracting and relaxing to control the inhalation and exhalation of air. This feature is not found in other vertebrates groups.

1131. Ornithorhynchus is an example of
(a) dinosaur
(b) monotreme mammal
(c) marsupial mammal
(d) eutherian mammal

WB JEE-2009

Ans. (b) : Ornithorhynchus anatinus (duck-billed platypus) is a monotreme mammal, which belongs to sub-class-prototheria (Primitive egg laying mammals), order- Monotremata (living prototherians).

• The snout is soft, moist and rubbery in texture.

• Hence, ornithorhynchus is a monotreme mammal and semi-aquatic oviparous mammals.

1132. The snow leopard is
(a) Panthera pardus (b) Panthera uncia
(c) Panthera tigris (d) Hylobates hoolock

AMU-2015

Ans. (b) : The scientific name of the snow leopard is panthera uncia. Snow leopard or panthera uncia is a carnivore that belongs to class-mammalia of phylum chordata classified under Kingdom-Animalia.

• Indian leopards are also listed under the vulnerable category as per IUCN red list as there is a decrease in population.

1133. Mammals having traits of both reptiles and mammals are
(a) monotremes (b) marsupials
(c) whales (d) bats

BVP-2010

Ans. (a) : Monotremes are mammals that exhibit traits of both reptiles and mammals. They lay eggs like reptiles but still produce milk to nurse their young similar to other mammals. Examples include the platypus and echidnas.

@apna_pdf

1134. Echolocation is found in

(a) bat (b) cat
(c) dog (d) horse

UP CPMT-2003

Ans. (a) : Echolocation is a biological ability found in bats that allows them to navigate and locate prey by emitting high - frequency sound waves and interpreting the echoes that bounce back to them. This helps them build a mental map of their surroundings and hunt effectively in the dark.

1135. Milk glands are characteristics of

(a) all vertebrates
(b) only mammals
(c) only placental mammals
(d) only ruminants

Manipal-2013, 2011
Haryana PMT-1999

Ans. (b) : Milk gland are characteristic of only mammals. The most unique mammalian character is the presence of mammary glands producing milk for sucking the young. In human, mammary glands are organized in structures called breasts. Breasts have alveoli that are surrounded by milk-secreting cuboidal cells; these cells drain the milk into the nipple.

1136. Which of the following monkey has prehensile tail ?

(a) Loris (b) Tarsiers
(c) Spider monkey (d) Rhesus monkey

AFMC -2011

Ans. (c) : Spider monkeys are a type of primate found in the tropical forests of central and south America. They are known for their distinctive long limbs prehensile tail, and a lack of thumbs.

1137. Blood platelets are found only in the blood of :

(a) birds (b) reptiles
(c) mammals (d) amphibians

Manipal-2004

Ans. (c) : Blood platelets found only in the blood of mammals. Platelets are irregularly shaped membrane bound cell fragments. They usually lack nuclei and are formed from special bone marrow. They are responsible for blood clotting. They survive for 5 to 9 days before being destroyed by the spleen and liver.

1138. An egg laying mammal is

(a) Delphinus (b) Macaca
(c) Ornithorhynchus (d) Macropus

J&K CET-2008

Ans. (c) : Majority of mammals are viviparous but Ornithorhynchus is an oviparous mammal and commonly known as the platypus. Mammals give birth to their young ones so they are called viviparous. But there are some exceptions like platypus (ornithorynchus).

1139. The largest corpuscle in mammalian blood are:

(a) basophils (b) erythrocytes
(c) monocytes (d) lymphocytes

HP CET-2011

Ans. (c) : Monocytes are the largest type of white blood cells found in mammalian blood. They play a crucial role in the immune system by engulfing and destroying foreign particles, dead cells and pathogens. Monocytes can further differentiate into macrophages, which are highly effective in clearing up debris and helping to initiate immune responses.

1140. Camel in its hump stores:

(a) water for emergency
(b) fat for emergency
(c) both fat and water for emergency
(d) fat and proteins as reserve food for emergency

HP CET-2011

Ans. (b) : Camel in its hump store fat for emergency.
• Camels use the humps to store energy rich fat deposits allowing the gangly beast to travel days through the desert without stopping for a bite to eat.

1141. Which of the following is incorrectly matched?

(a) Rabbit – Microelocithal, isolecithal
(b) Frog – Mesolecithal, centrolecithal
(c) Human – Mesolecithal, ceritrolecithal
(d) Birds – Macrolecithal, telolecithal

HP CET-2011

Ans. (c) : Rabbit – Microelocithal, isolecithal
Frog – Mesolecithal, telolecithal
Human – Mesolecithal, ceritrolecithal
Birds – Macrolecithal, telolecithal

1142. The first animal domesticated by primitive man was:

(a) dog (b) horse
(c) cat (d) cow

JIPMER-2003

Ans. (a) : The first animal domesticated by primitive man was dog. Dogs were likely domesticated from wolves tens of thousands of year ago.

1143. In male mammals primary germ cell is formed by :

(a) cortex of testis
(b) medulla of testis
(c) germinal epithelium
(d) apical part of embryo

Rajasthan PMT-1998

Ans. (c) : In male mammal primary germ cell is formed by germinal epithelium. The germinal epithelium in mammals refers to the outermost layer of cells covering the ovary or testis in females it play a crucial role in producing and releasing eggs (oocytes) during ovulation. In males, it contributes to the production of sperm cells through spermatogenesis.

- In males it covers the wall of seminiferous tubules within testes.
- In female it covers the outer most layer of the ovary.

1144. Assertion (A) :- Bats and whales are classified as mammals.
Reason (R) :- Bats and whales have four chambered heart.

(a) A is correct and R is its explanation
(b) A is correct and R is also correct but R is not explanation to A
(c) A is correct and R is wrong
(d) A and R both are wrong

AMU-2011

@apna_pdf

Ans. (b) : Bat and whale are mammals. Bats and whales are classified as mammal because they are viviparous.

- Bats are only mammals that fly.
- It gives birth to its young ones and feed milk. Having ear pinna, four chambered heart.
- Whales are the world's largest mammals. They are well known for their intelligence and for their often complex social behaviours.
- Whale is largest marine mammals which have four chamber hearts.

1145. In mammals, the lower jaw is made of:

(a) madulla (b) dentary
(c) mandible (d) ethmoid

VMMC-2006

Ans. (c) : Mandible is the largest and strongest bone in face. Mandible is the only moveable bone of the skull and is attached to muscles involved in chewing and other mouth movements also called lower jaw bone.

- Mandible forms the lower jaw and holds the lower teeth in place.

1146. 'Mammalian thymus' is mainly concerned with

(a) regulation of body temperature
(b) regulation of body growth
(c) immunological functions
(d) secretion of thyrotropin

UP CPMT-2008

Ans. (c) : The mammalian thymus is primarily concerned with immunological functions. It plays a crucial role in the development and maturation of T cells, which are important for the immune system's defense against infections and diseases. The thymus provides an environment for T cells to mature and acquire their specific functions in recognizing and fighting off harmful pathogens.

1147. The part where fertilization of ovum takes place in rabbit, humans and other placental mammals is

(a) ovary (b) uterus
(c) vagina (d) fallopian tube

UP CPMT-2001

Ans. (d) : The part where fertilization of ovum takes place in rabbit human and other placental mammal is fallopian tube. It is around 10 cm long, muscular, tubular and ciliated structure. It lies in pelvic region, just above the urinary bladder. It is composed of outer serosa, middle muscularis and inner mucosa. mucosa is made up of simple ciliated columnar cells and secretory cells which provides protection and nourishment to the ovum. Each fallopian tube is divided into infundibulum, ampulla, isthmus, and uterine part.

1148. In mammals, the brain centre, which regulates body temperature, is situated in

(a) cerebellum (b) cerebral lobe
(c) hypothalamus (d) medulla oblongata

UP CPMT-2001

Ans. (c) : The hypothalamus is a small but vital region located at the base of the brain, just above the brainstem and below the thalamus.

- The hypothalamus helps manage our body temperature, hunger and thirst mood sex drive blood pressure and sleep.

It also maintains our body's internal balance that is known as homeostasis.

1149. Sub class Prototheria is related with egg laying mammal such as:

(a) Kangaroo (b) Echidna
(c) Primate (d) None

Manipal-2000

Ans. (b) : Sub class prototheria is related with egg laying mammal such as echidna.

1150. Which one of the following animals lay eggs yet the female secretes milk?

(a) Bat (b) Kangaroo
(c) Platypus (d) Ostrich

CG PMT-2009
MGIMS Wardha-2009

Ans. (c) : The platypus is a mammal that lays eggs, which is unusual for mammals. However, like other mammals, female platypuses secrete milk to nourish their offspring, even though they do not give birth to live young. This combination of egg-laying and milk secretion sets them apart from most other mammals.

1151. Diaphragm is found in

(a) crocodile (b) kangaroo
(c) ostrich (d) snake

Manipal-2013

Ans. (b) : Diaphragm is found in kangaroo. The diaphragm placed beneath the lungs is a respiratory muscles that aids in the breathing process. It is a big dome-shaped muscle in the body that acts as the primary respiratory muscle.

- The diaphragm is the only organ that all mammals have and without it no mammals can live.

1152. Haversian system is diagnostic feature of

(a) avian bones (b) reptilian bones
(c) mammalian bones (d) bone of all animals

AMU-2008

Ans. (c) : Haversian system is diagnostic feature of mammalian bones. The haversian system is the cylindrical column like structure in compact bones. It is also known as osteon which is a series of concentric circles called Lamillae found in compact bones of mammals, Down the middle of each of these systems is a hollow tube that hold a blood vessel.

- Each Haversian canal generally contains one or two capillaries and many nerve fibres.

1153. Ancestors of mammals belong to

(a) Therapsida (b) Ornithischia
(c) Silusoidea (d) Chelonea

AMU-2008

Ans. (a) : Ancestors of mammals belong to therapsida. Therapsid are order of synapsids (class synapsida) that are believed to include mammals and their immediate evolutionary ancestors other than the mammals. All lineages of the therapsids are extinct with the last known non-mammalian theropsids dying out in early cretaceous period.

- Synapsids include all mammals.
- Therapsids include mammal, like reptiles, from which mammals evolved.
- Dinosaurs are reptiles, whereas dinosaurs are a therapsid and as such more closely related to mammals.
- Therapsid, initiated the eventual transition to the mammals.

@apna_pdf

1154. Besides bats, echolocation also occurs in
(a) primates
(b) wild cat
(c) whales and dolphins
(d) beavers

AMU-2008

Ans. (c) : Echolocation occurs when an animal emits a sound wave that bounces off an object, returning an echo that provides information about the object's distance and size.
• Wales and Dolphins have echolocation system which involves the generation of ultrasonic sound which in turn produces echoes which are then reflected back by any obstacles in their path. This helps them in locomotion and catching their prey even with poor visibility.

1155. The bone of a mammal contains Haversian canals which are connected by transverse canals called as:
(a) Bidder's canal (b) Semicircular canals
(c) Volkmann's canal (d) Eustachian canal

Haryana PMT-1999

Ans. (c) : Haverspian canal is the bone of mammals are connected by small blood vessel canal called Volkmann's canal.
Volkmann's canal also knows as perforating canal. These are small channels found in bone tissue that run perpependicular to the central haversian canals. Volkamann's canals play crucial role in allowing blood vessels and nerves to penetrate deep into bone tissue providing nourishment and communication to osteocytes. within the bone matrix.

1156. Suckling the young by both male and female parents is observed in:
(a) Pangolin (b) Macropus
(c) Loris (d) Ornithorhynchus

AP EAMCET-2001

Ans. (d) : Suckling the young by both male and female parent is observed in ornithorhynchus (duck-billed platypus). Platypus lays eggs in nests. The beak or bill is broad and flat just like a duck. Hence named as duck-billed platypus, pinnae are absent. Both the webbed feet and flattened tail help in swimming. Mammary glands are present but nipples or teats are absent.
• Platypus has some characters common with reptiles, egg laying habit, reptilian type of excretory system it is a connecting link between reptiles and mammals.

1157. Mammary glands are modified
(a) sweat glands (b) ceruminous glands
(c) glands of Zeis (d) inguinal glands

AMU-2005

Ans. (a) : Mammary glands are modified sweat glands. Functionally, they are produce milk. These glands are located in the breast overlying the pectoralis major muscles. These glands are present in both male and females. Mammary glands function regulated by hormones.
Ceruminous gland in the skin of the humans external auditory canal are modified apocrine gland.

1158. Which of the following is an exclusive character of class mammalia ?
(a) Homoiothermy
(b) Internal fertilization
(c) Presence of a 4-chambered heart
(d) Presence of a muscular diaphragm

CMC Ludhiyana – 2012
Rajasthan PMT - 2010
AMU-2009

Ans. (d) : An exclusive characteristic of class mammalia is the presence of a muscular diaphragm. This structure separates the chest cavity from the abdominal cavity and plays a key role in breathing. While other options like homoeothermic (regulation of constant body temperature), internal fertilization, and a 4-chambered heart are important features of mammals, they are not exclusive to mammals and can be found in other animal class as well. Light crocodiales, (Reptiles).

1159. Flippers of seal are modified:
(a) fins (b) hind limb
(c) forelimb (d) gills

AFMC-2004

Ans. (c) : Flippers of seal are modified forelimb. Seal is a marine gregarious and carnivorous fish. The forelimb are modified into paddle for swimming adaptation.
• Flippers of seals have 5 digits which are webbed and have claws.
• Flippers of the seal are the modified form of forelimbs. These are the examples of Homologous organ.

1160. Jaws of shark contain
(a) thecodont teeth (b) acrodont teeth
(c) pleurodont teeth (d) None of these

AMU-2012

Ans. (b) : Cartilaginous fishes, like sharks and rays, have one set of oral Jaws made mainly of cartilage. The large sharks commonly sleep in worm waters. They were characterised by sharp sight and smelling power, great muscular strength, agility, strong Jaws with sharp acrodont teeth.
• Acrodont teeth are the weakest, and don't have a firm attachment inside the Jaw.

1161. Which one of the following characters is not typical of the class-Mammalia?
(a) Seven cervical vertebrae
(b) Thecodont dentition
(c) Ten pairs of cranial nerves
(d) Alveolar lungs

CG PMT-2006

Ans. (c) : Every mammals has 12 pairs of cranial nerves and not 10. Therefore, this option does not belong to class mammalia.
• In higher vertebrates there are 12 pairs of cranial nerves; olfactory, optic, oculomotor, trochlear, trigeminal, abducent, facial, vestibulocochlear, glossopharyngeal, vagus, accessory and hypoglossal.
• Cranial nerves are concerned with the head , neck and other facial regions of the body.

@apna_pdf

1162. External ears are characteristics of

(a) mammals (b) reptiles
(c) amphibians (d) pisces

CG PMT-2006

Ans. (a) : External ears are a characteristic features of mammals.
- The external ear is also known as the pinna.
- The primary function of external ear is to perceive sound vibrations and subsequently focus it on the eardrum.
- The external ears might play a role in regulating body temperatures in these groups of animals.

1163. Identify the group, which includes animals all of which give birth to young ones directly?

(a) Dolphin, kangaroo, bat, cat
(b) Platypus, penguin, bat, hippopotamus
(c) Shrew, bat, kiwi, cat
(d) Lion, whale, ostrich, bat

Manipal-2009
Karnataka CET-2009

Ans. (a) : Animals that give birth to babies are called viviparous animal. Dolphin, kangaroo, Bat, Cat, Whale, Seals and others are mammals and thus give birth to live babies.
All mammals are viviparous except lower mammals as - duck billed platypus. Dolphin, kangaroo, bat, cat, shrew, lion, whole and hippopotamus are viviparous mammals.
All birds including flight and flight less birds are oviparous. eg. → Penguin, Ostrich, Kiwi.

1164. Eggs of egg laying (prototherians) mammals are :

(a) macrolecithal (b) telolecithal
(c) alecithal (d) mesolecithal

DUMET-2001

Ans. (a) : Eggs of egg laying (prototherians) mammals are macrolecithal. Enormous amount of yolk is present in macro lecithal eggs and here yolk is several times greater than cytoplasm. These eggs may be small or big.
- It is also called polylecithal egg.
- Telolecithal - An egg that has a large quantity of yolk where the yolk is inevenly distributed all through the cytoplasm. eg. Arthopoda.
- Mesolecithal - These are the eggs that have intermediate amount of yolk.
  eg. → fishes, amphibians
- Alecithal egg - This is one which has a negligible amount of yolk or no yolk e.g. human ovum.

1165. Lower jaw of mammals made up of

(a) one bone (b) two bones
(c) many bones (d) None of these

VMMC-2010

Ans. (a) : The lower Jaw of mammals consists of only one bone, the dentary where as jaws of other vertebrates are composed of more than one bone.
- This bone joint the skull at the squamosal bone.
- In mammals the lower Jaw is known as the mandible while the upper jaw is made up of the maxillary.

Other vertebrates like fish, reptiles and birds usually have complex multipart jaws.

1166. Which one is correctly matched?

	Animal	Characteristic	Taxon
(a)	Millipede	Ventral nerve cord	Diplopoda
(b)	Duck-billed platypus	Oviparous	Mammalia
(c)	Silverfish	No Pectoral and pelvic fins	Insect
(d)	Sea anemone	Diploplastic	Cnidaria

(a)

Animal	Characteristic	Taxon
Millipede	Ventral nerve cord	Arachnids

(b)

Animal	Characteristic	Taxon
Silver fish	Pecotral and pelvic fins	Chordata

(c)

Animal	Characteristic	Taxon
Duck – billed Platypus	Oviparous	Mammalia

(d)

Animal	Characteristic	Taxon
Sea anemone	Triploblastic	Cnidaria

BVP-2015
NEET (Karnataka)-2013
AP EAMCET-2011

Ans. (c) : Duckbill platypus is a small oviparous aquatic mammal which consists of a beak-like a duck and webbed forelimbs which help them in swimming.

	Animal	Characteristic	Taxon
(a)	Millipede	Ventral nerve cord	Diplopoda
(b)	Duck-billed platypus	Oviparous	Mammalia
(c)	Silverfish	No Pectoral and pelvic fins	Insect
(d)	Sea anemone	Diploplastic	Cnidaria

1167. Ancestors of mammals belongs to

(a) Therapsids (b) Ornithischia
(c) Silusidea (d) Chelonia

VMMC-2008

Ans. (a) : Therapsids are a genus of synapsids known to include mammals and their immediate evolutionary ancestry.
- Therapsida links to the ancestor of mammals, as there are numerous similarities found in both of them.
- Some of therapsida features are.

(i) Vertical limbs that stretch out of the body.
(ii) The large jaw and heterodont teeth.
(iii) The appearance of hair on the body.

1168. Which animals (mammals) contain more amount of yolk then cytoplasm in their eggs?

(a) Placenta mammals
(b) Aquatic mammals
(c) All eutherians
(d) Prototherians

BVP-2013

@apna_pdf

Ans. (d) : Animals (mammals) contain more amount of yolk then cytoplasm in their eggs prototherians?

- These monotremes have macrolecithal eggs which means the yolk content is several time more than the cytoplasmic substance. The egg may be small or big but having huge amount of yolks. For example- the eggs of reptiles, birds etc.
- Placental mammals have alecithal eggs that contain a very small amount of yolk.

1169. A group of animals having marsupium is

(a) Monotremata (b) Eutheria
(c) Metatheria (d) Pantotheria

Rajasthan PMT-2011

Ans. (c) : Metatheria mammals are also knowns as marsupials. These are non-placental mammals. The presence of pouch is the characteristic feature of marsupials. The pouch is fold of skin with only one opening ..

1170. Fertilization of ovum takes place in rabbit, man and other placental mammals in

(a) ovary (b) fallopian tube
(c) cervix (d) uterus

Rajasthan PMT-2009

Ans. (b) : Fallopian tubes are part of female reproductive system in mammals. They are called oviducts. In mammals fertilization takes place in fallopian tube. In Rabbit, man and other placental mammals fertilization occurs in ampula region of fallopian tube. The egg cell is transported from an ovary to a fallopian tube where it may be fertilized.

1171. Right systemic arch is absent in

(a) reptiles (b) birds
(c) mammals (d) none of these

AMU-1996

Ans. (c) : Right systemic arch is absent in mammals. Systemic arch originates from the systemic aorta that develops from left ventricle. The sixth arch becomes the pulmonary aorta that divides into two pulmonary arteries and each artery goes to each lung.
In bird systemic artery on right side while in mammal in left side.

1172. The example of oviparous mammal is

(a) Talpa (b) Erinaceous
(c) Macropus (d) Echidna

AMU-1996

Ans. (d) : Echidna is known as spiny anteaters. It is a monotremes (egg laying mammals) belonging to family Tachyglossidae.

- Echidna is an oviparous organism among the mammals i.e. it lays eggs and does not give birth to young ones it feeds its young ones with its milk.

1173. Salivation in mammals is under the control of

(a) medulla oblongata (b) mesencephalon
(c) hypothalamus (d) cerebellum

AMU-1996

Ans. (a) : Salivation in mammals is under the control of medulla oblongata. Nervous control of salivation. The superior and inferior salivary nuclei located in the pons and medulla directly control salivation.
Preganglionic Parasympathetic fibers from the superior salivary nucleus travel over the facial nerve.

- Preganglionic fibers from the inferior salivary nucleus travel to the otic ganglion and stimulate Parotid gland secretion.

1174. The egg found in monotremata is

(a) microlecithal
(b) Mesolecithal
(c) Macrolecithal
(d) None of these

HP CET-2012

Ans. (c) : Macrolecithal egg has a quantity of yolk is more than cytoplasm. Macrolecithal eggs are present in gymnophiona, teleost fishes, birds, amphibians, and monotremes (egg laying mammals like marsupials).

- Monotremes are endothermic with a high metabolic rate have hair on their bodies, produce milk through mammary glands to feed their young have singie bone in lower jaw.

1175. Which is not a fish?

(a) Scoliodon (b) Electric ray
(c) Whale (d) Sea horse

VMMC-2003

Ans. (c) : Whales is not a fish. It is fully aquatic mammal.

- Whales are warm blooded animal and breath air by lungs bear live young and nurse them with milk, Their adaptations for aquatic life include a thick layer of blubber. Which insulates them from cold and provide buoyancy.

1176. In ureotelic animals urea is formed by:

(a) Ornithine cycle (b) Caris cycle
(c) Krebs cycle (d) EMP pathway

VMMC-2003

Ans. (a) : The ureotelic animals urea is formed by ornithine cycle also known as urea cycle.

- In this biochemicel reaction urea (produces from ammonia ammonia is highly toxic but urea is less.
- Animals that use this cycle called ureotetic such as amphibian and mammals.
- Krebs cycle also known as citric acid cycle (CAC) this cycle use to organism generate energy.
- EMP pathway also known as glycolysis in this pathway glucose degradation occur

1177. Role of spleen in mammal is

(a) to control blood pressure
(b) to assist liver
(c) to act as haemopoietic tissue
(d) to assist kidneys

Rajasthan PMT-2009
CMC Vellore-2009

@apna_pdf

Ans. (c) : The spleen plays very important role in regard to red blood cells (erythrocytes) and the immune system. It is also act as haemopoietic.
- It removes old R.B.C and holds a reserve of blood.
- The spleen is found in all vertebrate.

1178. Oviparous mammals are :
(a) Kangaroo (b) duck billed platypus
(c) Whale (d) Rabbit

BCECE-2002

Ans. (b) : Oviparous animals are animals that lay their eggs, with little or no other embryonic development within the mother. example - birds.
Egg laying mammals are primitive mammals classified under sub-class prototheria. Example – ornithorynchus (duck billed platypus).
Mammals are mostly viviparous (give birth to young ones), but duck billed platypus is oviparous and belongs to mammalian category because it feed its young ones by its milk.
Kangaroo, whale and rabbit are viviparous mammals.

1179. In mammals, carbohydrates are stored as :
(a) glycogen in liver and spleen
(b) lactic acid in muscles
(c) glucose in liver
(d) glycogen in liver and muscles

BCECE-2003

Ans. (d) : Corbohydrates in mammals are primarily stored as glycogen, found in both the liver and muscles. This stored glycogen can be broken down into glucose when body needs energy.

1180. Hairless mammals are
(a) rodents (b) chiropterans
(c) primates (d) cetaceans

Haryana PMT-2011

Ans. (d) : Hairless mammals like cetaceans (dolphins and whales) have evolved to live in aquatic environment, which is why they have minimal hair or none at all. This adaptation helps them move more efficiently in the water and reduces drag.

1181. Zygomatic process in mammals arises from
(a) mandible (b) maxilla
(c) premaxilla (d) squamosal

AMU-2003

Ans. (d) : Zygomatic process in mammals arises from squamosal. The zygomatic process of the maxilla is a rough triangular shape which separate the anterior, zygomatic and orbital surface.
A long slender process of the temporal bone helping to form the zygomatic arch which protect the eye.

1182. In mammals, digestion of starch starts from
(a) mouth (b) stomach
(c) oesophagus (d) duodenum

AMU-2002

Ans. (a) : In mammals, the digestion of starch begins in the mouth. Salivary amylase, and starch into simpler sugars like maltose. This process initiates the digestion of carbohydrates before the food even reaches the stomach.

1183. Right lung of rabbit is divided into
(a) four lobes (b) two lobes
(c) six lobes (d) eight lobes

UP CPMT-2009
Punjab MET-2009

Ans. (a) : The right lung of rabbit is made up of 4 lobes and the left lung is made up of 2 lobes.

1184. The cavity in the region of diencephalon in the brain of rabbit is called
(a) lateral ventricle (b) third ventricle
(c) foramen of Monro (d) iter

AMU-2005

Ans. (b) : The cavity in the region of diencephalon in the brain of rabbit is called third ventricle. This is a fluid-filled cavity located in the region of the diencephalon in the brain of a rabbit. It plays a crucial role in the circulation and exchange of cerebrospinal fluid, helping to cushion and protect the brain.

1185. In which of the following eggs meroblastic cleavage occurs ?
(a) isolecithal (b) microlecithal
(c) centrolecithal (d) telolecithal

Rajasthan PMT-1998

Ans. (d) : Meroblastic cleavage occur in telolecithal egg meroblastic cleavage generally occur in fertilized eggs that contain a greater quantity of Yolk.
In meroblastic cleavage the cleavage furrow form but do not progress into the yolk.
Isolecithal eggs refer to the even distribution of yolk in the cytoplasm. It occurs in organism with very little yolk like mammals.

1186. Vivipary is found in:
(a) Coelenterata (b) Protozoa
(c) Rabbit (d) Pisces

Rajasthan PMT-2004

Ans. (c) : Vivipary is found in rabbit. It refers to the phenomenon where seeds or embryos develop inside the parent's body and are born alive.

1187. The dorsal diverticulum of urethra in male rabbit is
(a) uterus (b) uterus masculinus
(c) prepuse (d) vas deferens

VMMC-2010

Ans. (b) : The dorsal diverticulum of the urethra in a male rabbit is known as the "uterus masculinus" Despite its name, it does not serve the same purpose as a uterus in females. Instead, it is a small structure related to reproductive anatomy in rabbits.

@apna_pdf

1188. Zygomatic arch of rabbit is formed of
(a) maxilla, periotic and jugal
(b) periotic, jugal, and palatine
(c) maxilla, squamosal and jugal
(d) maxilla, premaxilla and squarmosal

UP CPMT-2009
Rajasthan PMT-2009

Ans. (c) : The zygomatic arch of a rabbit is made up of the maxilla, squamosal, and jugal bones. These bones come together to create the body structure that extends from the side of the skull and plays a role in supporting the jaw and facilitating.

1189. Which of the following has discoidal placenta?
(a) Rabbit (b) Deer
(c) Sheep (d) Pig

BCECE-2007

Ans. (a) : A discoidal placenta is a type of placenta that is found in rabbits. It is named "discoidal" because it is shaped like a disc. This type of placental allows for efficient exchange of nutrients and waste between the mother rabbit and her developing embryos.

1190. Ruminants belong to order
(a) Proboscida (b) Artiodactyla
(c) Asthma (d) Cancer

JIPMER-2010

Ans. (b) : Ruminant, like cows, sheep, and deer belong to the order Artiodactyla. This group of mammals is characterized by having an even number of toes on each foot and a specialized stomach with four compartments for digesting plant material through a process called rumination.

1191. The number of lobes in left lung of rabbit is–
(a) two (b) three
(c) four (d) five

Uttarakhand PMT-2010

Ans. (a) : Lung of Rabbit:- The right lung of rabbit is made up of 4 lobes and the left lung is made up of 2 lobes.
• Rabbit lungs have nosepta, the right lung has four lobes and the left lung has three lobes air flow volume is higher in the left lung rabbits at rest respire mostly through the activity of the diaphragm.

1192. Valve of Thebesius is present in the heart of–
(a) fish (b) frog
(c) Chamaeleon (d) rabbit

Uttarakhand PMT-2010

Ans. (d) :: The valve of Thebesius is located in the heart of a rabbit. It is a small valve that helps prevent backflow of blood in the heart's coronary veins.

1193. Which is present in male rabbit but not present in female rabbit?
(a) Urethra (b) Vagina
(c) Uterus (d) Vas deferens

JCECE-2012

Ans. (d) : The vas deferens is present in male rabbit and is responsible for transporting sperm from the testes to the urethra. It is not present in female rabbits.

1194. Which one hormone of the pituitary of the Rabbit controls the protein metabolism and growth of skeleton?
(a) lodo thyroxine
(b) Leutotrophic hormone
(c) Somatotrophic hormone
(d) Oxytosine

Rajasthan PMT-2002

Ans. (c) : Somatotrophic hormone of the pituitary of the Rabbit controls the protein metabolism and growth of skeleton. Somatotropin also known as human growth hormone in its human form is a peptides hormone that stimulates growth, cell reproduction and cell regeneration in human and other animals. It is thus important in human development
• Somatotrophic hormone a Natural hormone of pituitary gland makes and releases that acts on many parts of the body to promote growth in children.

1195. Which gland is associated with fur hairs of Rabbit?
(a) Mucous gland (b) Sweat gland
(c) Mammary gland (d) Sebaceous gland

Rajasthan PMT-2002

Ans. (d) : Sebaceous gland is associated with fur hairs of Rabbit. This gland secrete sebum through the sebaceous duct.
• Sebaceous gland enlarges and become functionally active during puberty.

1196. Sertoli cells are associated with :
(a) kidney of Rabbit (b) ovary of Frog
(c) testis of Rabbit (d) ovary of Rabbit

Rajasthan PMT-1999

Ans. (c) : Sertoli cell are one of the most important cells necessary for sperm production in male. It is associated with the testis of rabbit.

1197. In rabbit, end of a long bone is connected in another by
(a) tendon (b) ligaments
(c) muscle (d) cartilage

UP CPMT-2012

Ans. (b) : In rabbit, end of a long bone is connected in another by a ligament. It is a fibrous connective tissue that attaches bone to bone. It also serve to hold structure together and keep them stable.
Tendon:- A tendon is a fibrous connective tissue that attaches muscle to bone.
Muscles are soft tissue present in most of the animals contain protein filament made out from myosin and actin.
Cartilages are soft and flexible in nature. They functions as a connective tissues that joints of 2 or more bones.

@apna_pdf

1198. The branch of biology, which deals with the study of processes and functions of an organism, is called

(a) Histology (b) Anatomy
(c) Physiology (d) Entomology

BVP-2007

Ans. (c) : Physiology is branch of biology that aims to understand the mechanism of living thing from the basis of cell function at the ionic and molecular level of the integrated behaviour of the whole body and the influences of the external environment.

- Histology is branch of biology that studies the microscopic anatomy of biological tissue.
- Anatomy is the study of the internal structure of organism.
- Entomology is the study of insects.

1199. Which of the following vessel in rabbit start with capillaries and ends in capillaries?

(a) Pulmonary artery
(b) Renal vein
(c) Hepatic portal vein
(d) Renal artery

JCECE-2003
Rajasthan PMT-2002

Ans. (c) : Hepatic portal vein in rabbit start with capillaries and end in capillaries.

Renal vein carries the deoxygenated blood from the kidney to the inferior vena cava.

- Pulmonary artery carry deoxygenated blood from the right side of body to lungs.

1200. Which is the National Aquatic Animals of India

(a) Sea- horse
(b) Gangetic shark
(c) River dolphin
(d) Blue whale

NEET-2016 Phase-I

Ans. (c) : The National Aquatic Animal of India is Ganga Dolphin from 2010. Ganga River Dolphin is found only in the India subcontinent and has two species the Ganges river dolphin and the Indus river dolphin.

1201. What is true for mammalia:

(a) Platypus is oviparous
(b) Bats have feather
(c) Elephant is a ovoviviparous
(d) Diaphragm is absent in them

AIPMT-2000

Ans. (a) : Mammals are viviparous that means they give birth to offsprings. Primitive mammals called prototherians, like the Platypus ley eggs, so they are oviparous.

Bat is a mammal so they have no feather.

Elephant is viviparous animal.

Presence of diaphragm is unique feature of mammal.

1202. Which one of the following statements is totally wrong about the occurrence of notochord, while the other three are correct

(a) It is present throughout life in Amphioxus
(b) It is present only in larval tail in Ascidians
(c) It is replaced by vertebral column in adult frog
(d) It is absent throughout life in humans from the very beginning

AIPMT (Mains)-2011

Ans. (d) : Human belongs to the phylum chordata, group vertebrata. These organisms are characterized by the presence of a notochord embryonic stage that changes into the backbone and skull.

1203. In which one of the following the genus name, its two characters and its class/phylum are correctly matched ?

	Genus name	Two characters		Class Phylum
(a)	Aurelia	(A)	Cnidoblasts	Coelenterata
		(B)	Organ level of Organization	
(b)	Ascaris	(A)	Body Segmented	Annelida
		(B)	Males and females distinct	
(c)	Salamander	(A)	A tympanum represents ear	Amphibia
		(B)	Fertilization is external	
(d)	Pteropus	(A)	Skin possesses hair	Mammalia
		(B)	Oviparous	

AIPMT (Screening)-2011

Ans. (c) : Salamander belongs to the phylum Amphibia having tympanum & fertilization are internal. Near about 90% species of salamander shows internal fertilization and few primitive possess external fertilization such as Asiatic salamander

1204. Which one of the following groups of animals is correctly matched with its one characteristic feature without even a single exception ?

(a) Mammalia : give birth to young ones
(b) Reptilia : possess 3-chambered heat with one incompletely divided ventricle
(c) Chordata : possess a mouth provided with an upper and a lower jaw
(d) Chondrichthyes : possess cartilaginous endoskeleton

AIPMT (Screening)-2011

@apna_pdf

Ans. (d) : The pisces class includes cartilaginous fishes as a sub class known as chondrichthyes.
They are jawed vertebrates having scales, paired fins, paired nares, a heart with chambers arranged in series and a cartilage-based skeleton compared to a bone-based one. Sharks, rays are common example of this group.

1205. In mammals the secondary palate is formed by the union of
(a) premaxilla, pterygoid and squamosal bones
(b) maxilla, quadrate and palatine bones
(c) premaxilla, maxilla and palatine bones
(d) premaxilla, quadrate and squamosal bones

AP EAMCET-2008

Ans. (c) : In mammals the secondary palate is formed by the union of premaxilla, maxilla and palatine bone. The secondary palate of mammals, the bony palate that separate the nose from the mouth is formed by the in growth of two opposing shelves, one from the left and one from the right. The presence of secondary palate is related to mastication.

1206. The success of mammals on earth is largely because;
(a) They can conform to the changes in the environment.
(b) They can reduce metabolic activity and go into a state of dormancy during unfavorable conditions in the environment.
(c) They have the ability to maintain constant body temperature.
(d) They can take care of their young ones as they have mammary glands to suckle them.

Karnataka CET-2014

Ans. (c) : The success of mammals on earth is largely because they have the ability to maintain constant body temperature. Majority of animal and nearly all plants cannot maintain a constant internal body temperature. Their body temperature changes with the ambient temperature.

1207. Common among all mammals is:
(a) Ventral nerve cord
(b) Seven cervical vertebrae
(c) All are carnivores
(d) All are producers

AP EAMCET-2005

Ans. (b) : Presence of seven cervical vertebrae in the neck is common feature in a mammals. These vertebrae are acoelous covered by cartilaginous pads that called epiphysis.

1208. Identify from the following group of animals, which exhibit oestrous cycle.
(a) Lion, deer, dog and cow
(b) Cow, monkey, elephant and ape
(c) Monkey, ape, man and elephant
(d) Lion, dog, monkey and ape

Karnataka CET-2016

Ans. (a) : Oestrous cycle homologous to menstrual cycle occurs in non primates. It occurs only during breeding season of a species. It depending on the species and this cyclical breeding activity may continue for as long as six months in animals.

1209. Palaemon (prawn) is a:
(a) fish
(b) insect
(c) soft shell mollusk
(d) crustacean

J&K CET-2000

Ans. (d) : Prawn belong to crustacea class of mandibulata.
Palaemon is nocturnal & omnivorus.

1210. What are the locomatory organs in Echinoderms?
(a) Mantle
(b) Tube feet
(c) Ommatidia
(d) Pedicullariae

UP CPMT-2012

Ans. (b) : An echinoderms move by using many tube feed. Tube feet are the many small tubular projections found n the oral face of echinoderms arms. They are characteristic of the water vascular system of echinoderm phylum.

1211. Which of the following is entero coelomate invertebrate ?
(a) echinodermata
(b) arthropoda
(c) annelida
(d) mollusca

Punjab MET-2004

Ans. (a) : An animal develops from enterocoel is called as enterocoelomate.
e.g. : Echinodermata.

1212. Which of the following character is not found in all the chordates:
(a) Diaphragm
(b) Coelom
(c) Pharyngeal gill clifts
(d) Dorsal nerve cord

AIPMT-2000

Ans. (a) : Diaphram is solely found in mammals. It is a dome-shaped, muscular partition that separates the thoracic and abdominal cavities in mammals.

@apna_pdf

05 MORPHOLOGY OF PLANTS

A. Root and Regions of Root

1. Quiescent centre is the zone of :
(a) least mitotic activity in the root apex
(b) least mitotic activity in the shoot apex
(c) maximum mitotic activity in the root apex
(d) maximum mitotic activity in the shoot apex

JIPMER-2006
WB JEE-2010 / VMMC-2007
MGIMS Wardha-2005
UP CPMT-2005

Ans. (a) : Quiescent centre is the zone of least mitotic activity in the root apex.
• The quiescent centre of roots consists of a rarely dividing pool of stem cells within the root apical meristem.

2. Identify the correct sequence of steps in the formation of root nodules in legumes
(a) Formation of infection thread
(b) Curling of root hair
(c) Stimulation of cell division in cortex and pericycle
(d) Release of sugars and aminoacids by legume roots
(e) Release of bacteria into cortical cells
(a) e, d, a, b, c (b) c, d, a, b, e
(c) b, d, a, c, e (d) d, b, a, e, c

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : When bacteria Rhizobium is grow on susceptible aria of root hair and the start divide.
Then the infection of root hairs causes the curling of root hair
Than Rhizobium bacteria go into innercortex and inner cortical and pericycle cells start to divided and the division of cortex and pericycle made a root nodules
Than the root nodules start to release of sugar and aminoacids by legume root.

3. Arrange the following in order of their occurrence (from top to bottom) in the regions of the root tip
I. Region of maturation
II. Region of elongation
III. Region of meristematic activity
IV. Root cap region
The correct sequence is
(a) I, III, II, IV (b) III, I, IV, II
(c) II, III, I, IV (d) I, II, III, IV

TS EAMCET-08.05.2019 Shift-I

Ans. (d) : Region of root from top to bottom are as follows-
I. Region of maturation
II. Region of elongation
III. Region of meristematic activity
IV. Root cap region

4. The types of roots present in mustard plant is
(a) Fibrous roots
(b) Adventitious roots
(c) Tap roots
(d) Nodulated roots

SRM JEEE-2018

Ans. (c) : Tap roots system is present in mustard plant. It is main root of a primary root system. It is growing vertically downward and gives off small lateral roots.
- Fibrous root system is opposite of a tap root system. It is usually formed by moderately branching roots growing from the stem.
- Adventitious roots include those formed on stem and leaf cutting and those produced by air layering. Nodulated roots are generally found on the roots of leguminous plants like beans, peas etc.

Nodules are symbiotic relationship between leguminous plants and N_2-fixing bacteria rhizobium.

5. Root hairs develop from the region of
(a) Maturation
(b) Elongation
(c) Root cap
(d) Meristematic activity

NEET-2017

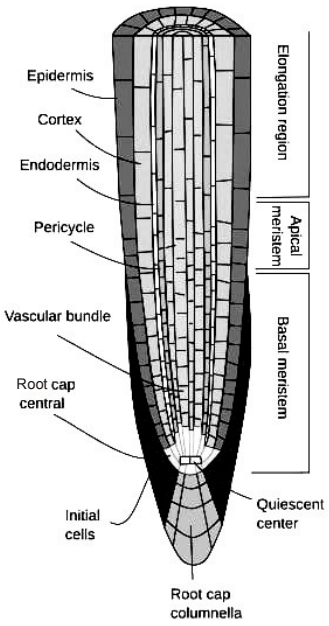
Ans. (a) : Root has three prominent regions-
(i) Region of maturation.
(ii) Region of elongation.
(iii) Region of meristematic activity.
• Root hairs develop from the region of maturation. Certain epidermal cells from this region from fine and delicate, thread-like structure called **root hairs**. It helps in the absorption of water and minerals. Root hair are long tubular-shaped outgrowth from root epidermal cells.

6. Best material for the study of mitosis in laboratory is: -
(a) Anther (b) Root tip
(c) Leaf tip (d) Ovary

BVP-2011
AIPMT-2002

Ans. (b) : Root tip as compared to the leaf tip/anther/ovary is the best material to study of mitosis.
Root tip have active meristematic zone where cells divide mitotically leading increase in length of the root.
So, the root tips are the most commonly used for studying mitosis.
Example :- (*Allium cepa, Allium sativum*) Root tip.

@apna_pdf



7. Quiescent centre theory was proposed by:
(a) Nageli (b) Schmidt
(c) Hanstein (d) Clowes

BVP-2005

Ans. (d) : Quiescent centre theory was proposed by a British biologist **Frederick Albert Lionel Clowes** (F.A.L. Clowes) in 1961 in Maize and observed an inactive center in between root cap and active meristematic region. The quiescent centre, play a crucial role in maintain the surrounding stem cells and promoting root growth.

8. Roots play insignificant role in absorption of water in
(a) Wheat (b) Sunflower
(c) Pistia (d) Pea

AIPMT (Re-Exam)-2015

Ans. (c) : Pistia is hydrophyte and in hydrophyte roots are poorly developed. Roots play insignificant role in absorption of water in pistia. Pistia, also known as water lettuce
• Hydrophytes are free floating plants float on surface. How ever roots are well developed in mesophyte and Xerophytes.

9. The cells of the quiescent centre are characterised by
(a) having dense cytoplasm and prominent nuclei
(b) having light cytoplasm and small nuclei
(c) dividing regularly to add to the corpus
(d) dividing regularly to add to tunica

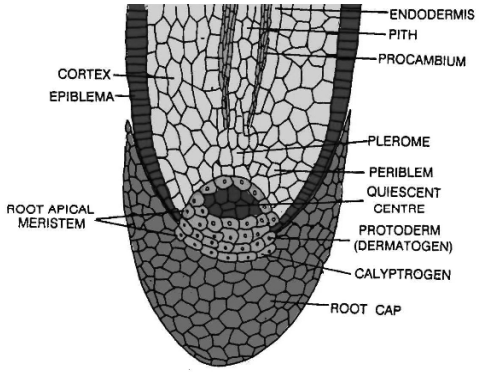
AIIMS-2008

Ans. (b) : Quiescent centre is a region in the apical meristem of a root where cells do not divided or the cell division proceeds at a very slow rate.
The cells with a quiescent centre have small dictyosomes, nuclei and nucleoli with little cytoplasm. These cells contain endoplasmic reticulum, mitochondria and contain low concentrations of RNA, DNA and protein.

10. The quiescent centre in root meristem serves as a:
(a) Site for storage of food which is utilized during maturation
(b) Reservoir of growth hormones
(c) Reserve for replenishment of damaged cells of the meristem
(d) Region for absorption of water.

Punjab MET- 2006
AIIMS-2003

Ans. (c) : A zone of inactive cells is present in the central part of the root apex is called **quiescent centre.** The cells of the quiescent centre have a lower concentration of the proteins, DNA and RNA and these are maintained at a lower mitotic activity.
• It is responsible for providing the cells to the root apical meristem during the injury or the heavy growth period.



QUIESCENT CENTER

11. Which of the following feature connot be considered to distinguish underground stem from a root ?
(a) Presence of nodes and internodes
(b) Presence of axillary and terminal buds
(c) Absence of scale leaves and adventitious roots arising from nodes
(d) Presence of exogenous branches

MGIMS Wardha-2015

Ans. (c) : Rhizomes are underground stems which grow beneath the surface of soil, they are frequently fleshy and serve as organs of food storage. Sometimes the rhizomes are condensed into solid swollen forms, which are known as corms. The tubers are also underground parts which may either be modified roots or stems.

12. What will be the correct sequence of four zone in a longitudinal section of root, starting from the tip upward?
(a) Root cap-Cell divsion – Cell maturation – Cell enlargement
(b) Root cap – Cell division –Cell enlargement – Cell maturation
(c) Cell division – Cell maturation – Cell enlargement – Root cap
(d) Cell division – Cell enlargement – Cell maturation – Root cap

Manipal-2014
Manipal-2007
AMU-2001

@apna_pdf

Ans. (b) : Root cap → Cell division → Cell enlargement → Cell maturation.
(i) Root cap :- The root cap, a small tissue at the tip of the root protects the root from environmental stress and function in gravity perception.
(ii) Cell division :- An apical meristem lies behind the root cap and it produces the cells that give rise to the primary body of the plant.
(iii) Cell growth :- Cell growth is as fundamental for growth of organisms as is cell division implicit in cell growth is an increase in cell size.
(iv) Cell maturation :- The cellular developmental process, independent of morphogenetic change, that is required for a specific cell to attained fully functional state.

13. The casparian strips are present in cells of :
(a) Periderm (b) Epidermis
(c) Hypodermis (d) Endodermis
Manipal-2001

Ans. (d) : The casparian strips are present in cell of endodermis. Casparian strips are a cellular feature found in the roots of all higher plants. They are ring like, hydrophobic cell wall impregnations.

14. The lateral roots originate from
(a) exodermis (b) endodermis
(c) pericycle (d) vascular bundles
Rajasthan PMT-2003, 2006

Ans. (c) : The lateral roots originates from pericycle which becomes meristematic and undergoes periclinal and anticlinal division. These lateral roots extend outwords from the main root, providing additional anchorage and nutrient absorption for the plant.

15. In T.S. of root :
(a) metaxylem present inner side and protoxylem in outer side
(b) protoxylem present in inner side and metaxylem in outer side
(c) protoxylem remains absent
(d) protoxylem and metaxylem are not present on same radius
Rajasthan PMT-2001

Ans. (a) : In T.S of root metaxylem present inner side and protoxylem in outer side. Protoxylem is the first formed primary xylem that mature before the plant organs complete their elutriation while metaxylem is the later formed primary xylem that matures after the completion of the growth of the plant organs. Moreover, protoxylem has smaller cells. Whereas, metaxylem contains larger cells.

16. Root pressure is measured by :
(a) barometer (b) auxanometer
(c) manometer (d) photometer
Rajasthan PMT-2001

Ans. (c) : Root pressure is measured by manometer. A manometer is an instrument used to measure and indicate root pressure. The root pressure theory was first given by Priestley in the year 1916. Otto von Guericke discovered the manometer in the year 1661.

17. Chicory powder which is mixed with coffee powder is obtained from:
(a) Root (b) Leaf
(c) Stem (d) Seeds
VMMC-2014
BHU PMT (Screening)-2005

Ans. (a) : Chicory powder which is mixed with coffee powder is obtained from root. Root chicory (*Cichorium intybus var. Sativum*) has long been cultivated in Europe as a coffee substitute. The roots are baked, roasted, grind, and used as an additive especially in the Mediterranean rigion.

18. The stimulus for geotropism in roots is perceived by:
(a) root cap (b) quiescent centre
(c) root tip (d) None of these
BVP-2011

Ans. (a) : The stimulus for geotropism in root is perceived by root cap. The root cap is located at the tip of the root and protects the root apical meristem (RAM), a zone of dividing cell that produces all cells in the root.

19. Which will die first, if the phloem tissue is damaged ?
(a) Shoot (b) Leaves
(c) Roots (d) Apical meristem
BVP-2011

Ans. (c) : If the phloem tissue is damaged, the roots will likely die firs. Phloem is responsible for transporting nutrients and sugars from the leaves to other parts of the plant, including the roots. Without this nutrient supply, the roots may not be able to sustain themselves, leading to their death. The shoot and apical meristem may still receive some nutrients from stored reserves, but the roots survival is more dependent on the continuous flow of nutrients through the phloem.

20. Quiescent centre possesses
(a) Actively dividing cells
(b) Meristematic cells
(c) Passive cell
(d) Storage cells
CMC Vellore-2011

Ans. (b) : The quiescent center (QC) is known to maintain the root meristem, and thus ensure root growth.
Quiescent centre is a zone of mitotically inactive zone in the meristematic region of the roots, apical meristem.

21. Which of the following is a total root parasite?
(a) Cuscuta (b) Rafflesia
(c) Santalum (d) Monotropa
BVP-2009

Ans. (b) : Rafflesia is a total root parasite found in sea shores of Java and Sumatra and Shri Lanka. Species of Rafflesia are all thought to be holoparasites of Lianas of the genus *Tetrastigma*. It is also known as queen of parasite.

22. The apical meristem of the root is present
(a) only in adventitious roots
(b) in all the roots
(c) only in radicals
(d) only in tap roots
Rajasthan PMT-2007

Ans. (b) : The apical meristem of the root is present in all the roots. Apical meristems occur at growing shoot and root tips. Root apical meristems produce the root cap.

@apna_pdf

23. The structures present in the roots to absorb water and minerals is
(a) epidermal extensions
(b) hypodermis
(c) endodermis
(d) epidermal appendages

JIPMER-2013

Ans. (a) : Root hairs are the lateral epidermal extensions or tubular outgrowths in the root of plant. Root hair help plants to absorb water from the soil. They contain large vacuole having cell sap. The cell sap has a greater concentration of salts as compare to surrounding soil water hence water drawn inside by the process of osmosis. Root hair are fine hair - like outgrowths of root epidermal cells which increase the surface area for the absorption of water and exchange of gases.

24. Pneumatophores are commonly found in:
(a) hydrophytes (b) xerophytes
(c) mesophytes (d) mangroves

BHU PMT-2002
UP CPMT-2006, 2005

Ans.(d) : There's breathing roots called pneumatophores that are part of halophytes, such as mangrove trees. because they thrive in the saline marshes, halophytes have breathing roots that stick out into the water and absorb oxygen.
Ex:- *Rhizophora*

25. The root system growing near the base of the radical in monocots is:
(a) haptera (b) anchoring roots
(c) clinging roots (d) seminal roots

Punjab MET-2003

Ans. (d) : The root system growing near the base of the radical in monocots is 'seminal roots. Seminal roots arise from base of radicle.

26. Quiescent centre is found in root apex and acts as
(a) permanent source of active initiates
(b) reservoir of resistant cells
(c) reservoir of passive cells to form new apex if root apex is damaged/killed
(d) all of the above

MGIMS Wardha-2007

Ans. (d) : The quiescent center of roots consist of a rarely dividing pool of stem cells within the roots apical meristem. It is act as a permanent source of active initiates and reservoir resistant cells. It also has reservoirs of passive cells to form a new apex if roots apex is damaged or killed.

27. Which of the following region of root is responsible for increase in length of root?
(a) Root cap region
(b) Meristematic region
(c) Region of elongation
(d) Mature region

MGIMS Wardha-2014

Ans. (c) : The region of elongation is responsible for the growth of the root in length. In the region of elongation, the cells increase in length, there by increasing the length of the roots.
Region of cell elongation occurs behind the cell division layer, cells are elongated with large central vacuole and dense protoplasm.

28. Maximum amount of growth in root occurs
(a) in the presence of light
(b) at its apex
(c) behind the apex
(d) in the presence of soil

Manipal-2011

Ans. (c) : Maximum growth in root occurs behind the apex. Apex portion of roots is made of protective tissue, root cap and the region of cell division is situated below the root cap. Maximum growth occurs in exponential phase of sigmoid curve. During this period, cells divide mitotically to increase length and girth of the plant.

29. Histogens capping root apical meristem is :
(a) dermatogen (b) calyptrogen
(c) periblem (d) plerome

AFMC -2011

Ans. (b) : According to histogen theory proposed by **Hastein** (1868) the apical meristem consists of three distinct zones of meristematic cells called histogens. Calyptrogen is a histogen layer found in the root apical meristem that forms the root caps.

30. Removal of apical (terminal) bud of a flowering plant (or pruning of a flowering plant) leads to
(a) formation of new apical buds.
(b) formation of adventitious roots on the cut side
(c) early flowering (or stopping of floral growth)
(d) promotion of lateral branches

AFMC-2007

Ans. (d) : Removal of apical bud of a flowering plant leads to the promotion of lateral branches. At the removal of apical bud, the lateral buds grow vigorously. It shows the apical bud suppresses the growth of lateral bud just below it, that is known as apical dominance. The lowered IAA concentration allows the lateral buds to grow the produce new shoots, which compete to become the lead growth.

31. Which one of the following is the specific xerophytic adaptation?
(a) Presence of spines
(b) Absence of stomata
(c) Presence of long tap root system
(d) Presence of stipular leaves

J&K CET-2014

Ans. (c) : Root system in xerophytic plant is well developed the root are branched, long and reach deep into the soil to absorb more water. So, the 'presence of long tap root system' is one of the specific xerophytic adaptation. Other common adaptation in xerophytes are small or compound leaves, spines, waxy cuticle and variety of stomata adaptation.

32. Find the incorrect statement.
(a) Root hairs are unicellular elongations
(b) Root hairs absorb water and minerals
(c) Trichomes are unicellular elongations
(d) None of the above

AMU-2010

Ans. (d) : According to the given options no one is a incorrect statement. Root hairs are unicellular elongations. Projected from epidermal cells and it absorb water and minerals, Trichomes are a unicellular or multicellular elongations. Trichomes are leaf hair which are derived from one or more epidermal cells present on leaf surface.

@apna_pdf

33. Which of the following region lying between meristematic region and root cap?
(a) Elongation region (b) Stationary region
(c) Root hair region (d) Quiescent centre
Manipal-2015

Ans. (d) : The quiescent centre is the region lying between the meristematic region and root cap. It is an inactive cell region present behind the root cap. They are wed to replace the meristematic cells of the root cap. In this region cell division proceeds very slowly or not at all but cells are capable of resuming meristematic acitivity.

34. Fibrous roots develop in maize from :
(a) upper internodes (b) upper nodes
(c) lower nodes (d) lower internodes
Haryana PMT-2011
JIPMER-2000

Ans. (c) : Maize is classified as a grass having a fibrous root system, rather than a tap root. This type of root system is found in most of the monocots. In maize, the fibrous roots is a nodal root system where the roots originate at one of the lower stem nodes of the plants. In fibrous root system, the primary root is short lived and replaced by a large number of roots
Ex:- Wheat, maize, rice.

35. Coralloid root is the feature of:
(a) Cycas (b) Mosses
(c) Pinus (d) Selaginella
BHU PMT (Mains)-2008
AMU-2002

Ans. (a) : Coralloid roots are specialized roots that are present in cycas. These roots are associated with nitrogen - fixing cyanobacteria. Cycas have small specialized roots associated with nitrogen - fixing cyanobacteria present at cortex region as Anabaena. These specialized roots are called coralloid roots.

36. Cuticle is absent in:
(a) mesophytes (b) young roots
(c) mature stems (d) leaves
DUMET-2009

Ans. (b) : Cuticle is absent in the young roots, It is a waxy layer that is farmed above the epidermis of the stem and leaves. This layer checks the loss of water from the plants. It is a waxy cuticle present on roots, it prevents absorption of water and salts from the soil, It is absent in the young roots to facilitate the entry of water into the roots.

37. A fibrous root system is excellent for:
(a) food storage
(b) nitrogen fixation
(c) absorbing water from deeper layer of soil
(d) providing good anchorage for the plant
DUMET-2009
AMU-2001

Ans. (d) : A fibrous roots system is excellent for providing good anchorage for the plant. These roots are highly branched roots and have more root hairs as well as more surface area than a tap root system. The fibrous roots of the plant are diversified into different direction increasing the surface area for anchorage.
Ex:- Wheat, maize, rice

38. If a primary root continues to grow, the type of root system will be known as:
(a) secondary (b) fibrous
(c) tap (d) stilt
DUMET-2009

Ans. (c) : If a primary root continues to grow, then the type of root system will be known as tap root, A tap root is a prominent and core root from which lateral roots emerge. **Ex:-** as in mustard

39. In which of the following are inulin crystals found?
(a) Wheat root (b) Mango root
(c) Dahlia root (d) Sugarcane root
Haryana PMT-2011

Ans. (c) : Inulin is a natural storage carbohydrate present in more than 36, 000 species of plants including wheat, onion, and garlic. It is a polysaccharide that is found in the roots and rhizomes of plants as a storage material. It is present mainly in the roots and tuber. In Dahlia roots, the inulin depositions appear fan like crystals.

40. Root cap is absent in
(a) mesophytes (b) hydrophytes
(c) xerophytes (d) lithophytes
HP CET-2013
Haryana PMT-2011
JCECE-2010

Ans. (b) : Root cap is absent in 'Hydrophytes', In hydrophytes roots are not present or not developed properly because they have abundant water in the surrounding environment so don't need to put extra effort to obtain them. It only the root cap is replaced by the root pockets and poorly developed root hairs are present. *Pistia* is a hydrophytes where root pockets are present.

41. In which of these plants are all roots?
(a) Wolffia (b) Podostemon
(c) Lemna (d) Utricularia
Haryana PMT-2011
MGIMS Wardha-2011

Ans. (b) : Podostemon is a hydrophytes in which the main plant body is root. It is an aquatic plant with thread-like roots that attaches the rocks. They have a pleiotropic, dorsiventral root system.

42. Which part of root absorbs both water and minerals ?
(a) Zone of cell differentiation
(b) Zone of cell formation
(c) Zone of cell elongation
(d) Terminal portion of roots
AMU-2003

Ans. (a) : Zone of cell differentiation, also known as the zone of maturation. Zone of cell differentiation part of root which absorbs both water and minerals because in this region root hairs are present.

43. Hygroscopic roots are found in
(a) Bryophyllum (b) Vanda
(c) Rhizophora (d) All of these
AMU-2002

@apna_pdf

Ans. (b) : Hygroscopic roots are a type roots which absorb water from the atmosphere. Hygroscopic roots occur in Vanda because it is an epiphyte which absorbs moisture from the atmosphere as its source of water. Epiphytic species of Vanda possess very large and modified aerial root systems. These aerial root system are used for food consumption and water absorption.

44. In a woody dicotyledonous tree, which of the following parts will mainly consist of primary tissues?
(a) Stem and root
(b) All parts
(c) Shoot tips and root tips
(d) Flowers, fruits and leaves

JIPMER-2007

Ans. (d) : Primary tissues are the first tissues that develop during the growth of a plant and are responsible for the primary growth of the plant. These tissues are derived from the apical meristems, which are located at the tips of the shoots and roots. The remaining tissues are called secondary tissues. A dicot stem and root undergo secondary growth and hence have some secondary tissues. Branches of a dicot tree also show secondary growth. Flowers, fruits and leaves are all made of primary tissues.

45. Which one of the following pairs is wrongly matched while the remaining three are correct
(a) Agave – Bulbils
(b) Penicillium - Conidia
(c) Water hyacinth - Runner
(d) Bryophyllum – Leaf buds

AIPMT (Mains)-2011

Ans. (c) : Water hyacinth is a free-floating perennial plant. The dark green leave blades are circular and are attached to the petiole. They have a thick and branched fibrous root system and modified stem called as offsets. They grow horizontally outward and downward from plants and they show vegetative propagation.

- *Bryophyllum* produces vegetative buds on leaves.
- Agave has bulbils on their flower stalks.
- *Penicillium* produced asexually through conidia and due to presence of chain of conidia, *Penicillium* also called as painter's brush.

46. Which one of the following conditions in seen in the roots of a plant having submerged assimilatory roots and spongy petioles?
(a) Triarch (b) Monarch
(c) Tetrarch (d) Diarch

AP EAMCET-2008

Ans. (b) : Monarch is a condition found in roots of a plant having assimilatory submerged roots and spongy petiole and stele with one xylem
Ex:- *Trapa natans.*
Tetrarch- The stele with 4 xylem strands.
Ex:- *Gossypium*.
Triarch- The stele with 3 xylem strands.
Ex:- *Pisum*.
Diarch- Stele with two xylem strand. **Ex:-** *Nicotiana*.

B. Modification of Root

47. Sucking root are present in :
(a) Tubisoire (b) Betel
(c) Cuscuta (d) Orchids

Manipal-2010
AMU-2009
Punjab MET-1999
AFMC-2000

Ans. (c) : Sucking roots are seen in Cuscuta plant. Sucking roots, also known as Haustoria roots, are joint in parasitic plants Cuscuta is a complete stem parasitic plant, it gets its water and nutrients needed from the host. They can not carry out photosynthesis, because they lacks chlorophyll. The mode of nutrition in Cuscuta is heterotrophic.

48. Pneumatophores are positively:
(a) geotropic (b) phototropic
(c) aerotropic (d) rheotropic

HP CET-2011
VMMC-2005
AMU-2004
BVP-2003

Ans. (c) : Pneumatophores are positively 'aerotropic'. These roots are another name for 'Breathing roots'. They are positively aerotropic, negatively geotropic and negatively hydrotropic. Because they grow vertically upward and have breathing pore called pneumatophores. They are connected with internal parenchymatous tissues i.e; Aerotropic.

49. In which pneumatophores are found ?
(a) Tinospora (b) Pinus
(c) Rhizophora (d) None of these

Haryana PMT-2004
Manipal-2003
JIPMER-2003
Rajasthan PMT-2000,2001

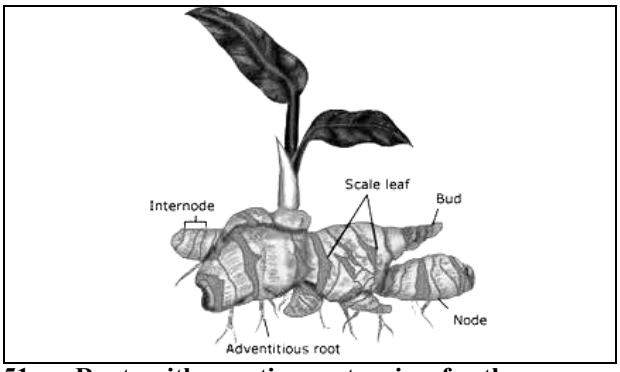
Ans. (c) : Pneumatophores are found in 'Rhizophora'. These are specialized erect roots that are present above the ground. It is also called breathing roots. They are present in Rhizophora and mangrove trees. In Rhizophora, pneumatophores roots are found which is helpful to get oxygen for respiration from atmosphere.

50. Which of the following statement is not correct?
(a) Rhizome is a condensed form of stem
(b) The apical bud in rhizome always remains above the ground
(c) The rhizome is aerial with no distinct nodes and internodes
(d) The rhizome is thick, prostrate and branched

NEET (Re-Exam)-04.09.2022

Ans. (c) : These are non-green with distinct nodes and internodes. There are axillary as well as apical buds. These are brownish in colour. The common types of rhizomes are fleshy due to the storage of food material. It also contains terminal buds.
E.g.:- Ginger

@apna_pdf



51. Roots with negative geotropism for the purpose of oxygen is found in the following:
(a) Pillar roots (b) Stilt roots
(c) Pneumatophores (d) Velamen roots

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Pneumatophores are specialized root structures that grow out from the water surface and facilitate the aeration necessary for root respiration in hydrophytic trees.
Pneumatophores are the specialized erect roots (a modification of root) which facilitate the exchange of gases in plants growing in marshy areas.

52. Identify the formation of the prop roots, stilt roots and pneumatophores respectively.
(A) Vertically growing upwards
(B) Roots coming out of the lower nodes of the stem
(C) Roots developing into vascular tissue of the host
(D) Hanging roots from the branches
(E) Roots that help in absorption of moisture
Options:
(a) A, B, C (b) B, C, D
(c) D, B, A (d) D, B, E

TS EAMCET-09.08.2021 Shift-I

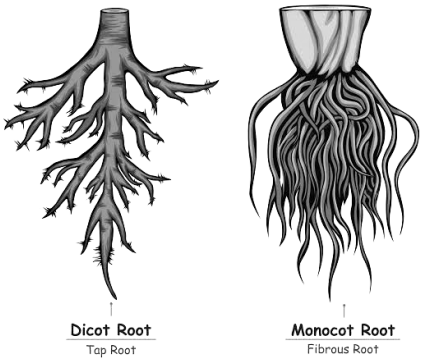
Ans. (c) : The formation of the prop roots, stilt roots and pneumatophores respectively-
Hanging roots from the branches, roots coming out of the lower nodes of the stem, vertically growing upwards.
• Prop roots and stilt roots and aerial roots occurs on the ground. These supporting roots are termed stilt roots.

53. The roots that originate from the base of the stem are:
(a) Primary roots (b) Prop roots
(c) Lateral roots (d) Fibrous roots

NEET-2020 Phase-I

Ans. (d) :
- Fibrous roots originate from the base of the stem. It is seen in the monocots. For eg. Wheat, Rice etc.

They perform functions like absorbing water and minerals from the soil and also provide support to the plant.
- Primary root originates at the germination stage from the radicle of the seed.
- Prop root is a modification of adventitious roots. Usually Adventitious roots develop from the stem and leaves. The prop root provides additional support to the plants because they have very strong roots. E.g- Banyan tree, Mangroves etc.



54. In *Ipomoea batatas* the food is stored in____
(a) Stem tuber (b) Leaves
(c) Buds (d) Tuberous root

MHT CET-2019

Ans. (d) : In *Ipomoea batatas* the food is stored in tuberous root. A tuberous root or storage root is a modified lateral root enlarged to function as a storage organ.

55. General function of the root system is absorption and conduction of water and minerals besides anchoring. But in this case the roots are fibrous and become swollen due to storage of food. Indicate the plant:
(a) Potato (b) Carrot
(c) Taeniophyllum (d) Asparagus

TS EAMCET-08.05.2019 Shift-II

Ans. (d) : General function of the root system is absorption and conduction of water and minerals beside anchoring but in this case the roots are fibrous and become swollen due to storage of food, indicate Asparagus plant.

56. Assertion (A): Tap roots of sweet potato become swollen to perform functions other than absorption and conduction of water
Reason (R) : Roots in some plants are modified for storage of food.
The correct answer is:
(a) Both (A) and (R) are true (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) Is true but (R) is false
(d) (A) Is false but (R) is true

TS EAMCET-09.05.2019 Shift-I

Ans. (d) : Root modifications are the permanent change in the structure which are caused so that the plant can be able to withstand and adjust to the environment.
Storage roots, such as carrots beets and sweet potatoes are examples of roots that are specially modified for storage of starch and water they usually grow underground as protection from plant eating animals.

57. Match the following

	Column-I		Column-II
(i)	Tap root	(A)	Sweet potato
(ii)	Adventitious root	(B)	Turnip
(iii)	Stem	(C)	Wheat
(iv)	Fibrous root	(D)	Potato

@apna_pdf

(a) (i) – A, (ii) – B, (iii) – C, (iv) – D
(b) (i) – B, (ii) – C, (iii) – A, (iv) – D
(c) (i) – B, (ii) – A, (iii) – D, (iv) – C
(d) (i) – D, (ii) – C, (iii) – B, (iv) – A

AIIMS-26.05.2019 Shift-II

Ans. (c) :

(i) Taproot	(B) Turnip
(ii) Adventitious root	(A) Sweet potato
(iii) Stem	(D) Potato
(iv) Fibrous root	(C) Wheat

•**Taproot-** When roots are arises from radical is called **Tap root**.

• **Adventitious root-** The roots arise from parts of the plant other than the radical and are called **adventitious roots**. **For examples:-** Sweet potato.

• **Stem-** Each eye represents a node, bearing one or more buds subtended by a leaf scar (scale leaf). For example: Potato.

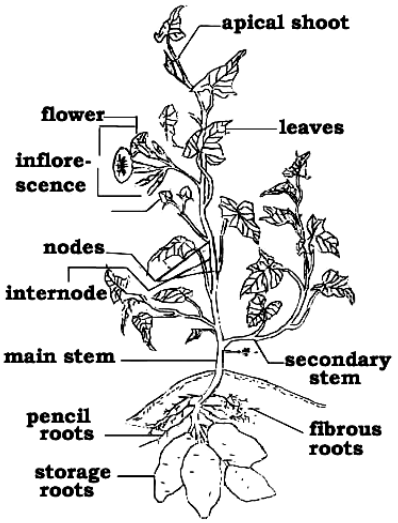
• **Fibrous root-** It is usually formed by thin, moderately branching roots growing from the stem. **For example:-** Grass, wheat, rice, marigold, white clover, maize, banana, millet, bamboo and onion.

58. Sweet potato is a modified:
(a) Stem
(b) Adventitious root
(c) Rhizome
(d) Tap root

NEET-2018
BVP-2002

Ans. (b) : Sweet potato is a modified adventitious root, meant for the storage of food.

- They are swollen part contain high amount of starch. e.g. of modified adventitious roots include Cassava, Dahlia.



59. Indicate the statement which is not correct?
(a) Stem tuber of potato, rhizome of Zingiber and corm of Colocasia help in perennation to tide over unfavourable conditions for growth
(b) Roots of Taeniophyllum and Avicennia called pneumatophores, help to get oxygen for respiration
(c) The haustorial roots of Striga and Cuscuta help to optain water and minerals from the host plant
(d) Rhizobium inhabit the root system to fix almospheric nitrogen by forming nodules, nodular roots in Pisum, Cajanus, Cassia etc.

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Pneumatophores are specialized aerial roots found in plants like mangroves (Avicennia) that help with gas exchange, specifically taking in oxygen for respiration. However, Taeniophyllum is a leafless epiphytic orchid that does not have roots for oxygen uptake, it relies on its host plant for nutrients and water.

60. Pneumatophores occur in
(a) Halophytes
(b) Free-floating hydrophytes
(c) Submerged hydrophytes
(d) Carnivorous plants

NEET-2018

Ans. (a) : Pneumatophores is characteristics of halophyte, it is breathing roots found in mostly halophyte e.g. mangroves.

- Pneumatophore are a type of aerial root grow above the ground and absorb water directly from the air

61. Indicate the statement which is not correct?
(a) Stem tuber of potato, rhizome of Zinziber and corm of Colacasia help in perennation to tide over unfavorable conditions for growth.
(b) Roots of Taeniophyllum and Avicennia called pneumatophores, help to get oxygen for respiration
(c) The haustorial roots of Striga and Cuscuta help to obtain water and minerals from the host plant
(d) Rhizobium inhabit the root system to fix atmospheric nitrogen by forming nodules, nodular root in Pisum, Cajanus, Cassia, etc

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Roots *Taeniophyllum* and *Avicennia* called preumatophores, help to get oxygen for respiration is incorrect statement because pneumatophores, commonly found in mangrove species that grow in brackish soil plants have lateral roots that grow upward to act as sites of oxygen intake for the submerged primary root system.

62. Roots of the following hydrophytes are fixed to substratum, but their long petiolated leaves keep them floating on water surface
(i) Salvinia
(ii) Victoria regia
(iii) Utricularia
(iv) Nymphaea
The correct combination is
(a) i & ii (b) ii & iii
(c) iii & i (d) ii & iv

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : Hydrophytes are aquatic plants that grow only in water.
Free floating hydrophytes are the plants that remain floating on the surface of water but in some species the roots remain embedded in the mud and only some parts on the plant like flowers and leaves float on water.
e.g:- *Victoria regia* , *Nymphaea, Salvinia* etc.

@apna_pdf

63. Some plants like Viscum and Striga send roots into the xylem of the host plant to get water and minerals. Such roots are called as
(a) Velamen roots (b) Nodular roots
(c) Stilt roots (d) Haustorial roots

TS EAMCET-12.05.2017

Ans. (d) : Some plants like Viscum and Striga send roots into the xylem of the host plant to get water and minerals. Such roots are called as haustorial roots.

64. Coralloid roots in Cycas are inhabited by
(a) Anabaena (b) Fungi
(c) Trititcum (d) Lemna

UP CPMT-2013

Ans. (a) : Coralloid roots in Cycas are inhabited by *Anabaena*. The coralloid roots contain symbiotic cyanobacteria (blue-green algae), which fix nitrogen and in association with root tissues, produce such beneficial amino acids as a Asparagine and citrulline.

65. The lpomoea batatas (sweet potato) is:
(a) underground root
(b) underground stem
(c) modified leaf
(d) modified phylloclade

J&K CET-2002

Ans. (a) : The lpomoea batatas (Sweet potato) is underground root. The sweet potato (*Ipomoea batatas*) is a dicotyledonous plant that belongs to the bindweed or morning glory family, convolvulaceae. Its large starchy, sweet tasting tuberous roots are used as a root vegetable.

66. Roots which develop from any part of plants except radical are called?
(a) Top root
(b) Advantitious roots
(c) Pneumatophores
(d) Coralloid root

BVP-2001

Ans. (b) : Roots develop from any part of plants except radical are called Adventitious root. Adventitious roots, arising from the stem of the plants, are the main component of the mature root system of many plants. Their development can also be induced in response to adverse environmental conditions or stresses.

67. The floating roots are found in:
(a) Viscum (b) Vanda
(c) Tinospora (d) Jussiaea

BVP-2001

Ans. (d) : The floating root are found in *Jussiaea*. Free floating macrophytes are found suspended on water surface with thcir root not attached to the substrate, sediment, or bottom of the water body. They are easily blown by air and provide breeding ground for mosquitoes. Example includes *Pistia* spp. commonly called water lettuce, Water cabbage or Nile cabbage.

68. Velamen is present in:
(a) parasitic roots (b) assimilatory roots
(c) epiphytic roots (d) fusiform roots

AIIMS-1998

Ans. (c) : Epiphytic roots are adventitious roots found in epiphytes. Velamen is present in epiphytic roots. An epiphyte is an organism that grows on the surface of plant for getting shelter and derives its moisture and nutrients from the air, rain, water (in marine environments) or from debries accumulating around it.

69. Velamen present in orchids help in ?
(a) Absorbing water from support
(b) Respiration
(c) Absorption of moisture from air
(d) Synthesising food

AIIMS-2007

Ans. (c) : Orchids are the epiphytes that possess aerial roots. These aerial roots contain a spongy tissue called velamen.
- Velamen tissue is a non-living, multi-layered epidermal cells.
- These roots hang freely in the air and absorb the moisture from the air by a special type of tissue called as velamen.

70. Which of the following is correctly matched?
(a) Monstera –Fibrous root
(b) Dahlia –Fasciculated root
(c) Azadirachta – Adventitious root
(d) Basil – Crop roots

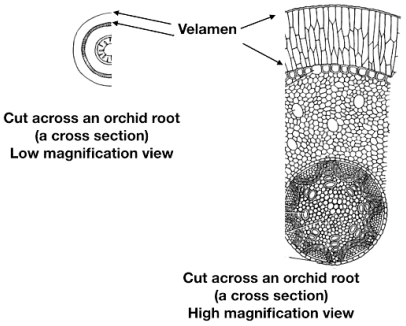
AIIMS-2012

Ans. (b) : Fasciculated roots are found in **Dahlia** and **Asparagus**. It's arising from the stem base in clusters.
- **Monstera-** The central root of Monstera is short-lived. Many roots form after it dries, forming a fibrous root structure.
- **Azadirachta-** (Neem) has tap root system. Some other. **Exa-** Carrot, Radish etc.
- **Basil plants-** The basil plants grow from thick tap-root system.

71. Velamen is a specialized tissue found in
(a) Aerial roots of Orchids
(b) Succulent leaves
(c) Pneumatophores
(d) Stilt roots.

AIIMS-2001
Manipal-2002
BVP-2000

Ans. (a) : Velamen is a multi-layered tissue that is spongy in nature which covers the aerial roots of epiphytic plants such as orchids. It helps in the absorption of water.



72. Radish is a modified root and an example of :
(a) napiform root (b) fusiform root
(c) conical root (d) tuberous root

J&K CET-2005

Ans. (b) : Radish is a modified root and an example of fusiform root. These modified roots usually are swollen and assume different form such as spindle shaped.
e.g :- Beet, turnip, radish (top shaped).

@apna_pdf

73. In which the pneumatophores are found?
(a) Tinospora (b) Pinus
(c) Rhizophora (d) None of these
DUMET-2003

Ans. (c) : Pneumatophores are present in halophytes. eg. Rhizophora. It is the genus of mangroves that grow in salt water and lakes.

74. Which one is not a product of root?
(a) Sugarbeet (b) Radish
(c) Carrot (d) Potato
MP PMT-2013

Ans. (d) : Potato is not a product of root because it is a modification of underground stem called stolons where food is stored and becomes tuberous.

75. Stilt roots are found in:
(a) Rhizophora (b) maize
(c) banyan (d) colocasia
AMU-2014

Ans. (b) : Stilt root are found in maize. A true root that arises from the lower trunk and runs obliquely to the ground providing additional support for the tree. Stilt roots are adventitious root.
eg.:- Sugar cane, mangrove.

76. In sugarcane, the adventitious roots are called:
(a) prop roots
(b) prop and tuberous roots
(c) pneumatophores
(d) None of the above
Punjab MET-2011

Ans. (d) : In sugarcane the adventitious root are called stilt roots. The roots which develop from the basal nodes of the main stem are known as stilt roots.
Stilt roots are found in both Maize and sugarcane plant and it is also found in bamboo and pine.

77. Velamen and spongy tissue is found in:
(a) breathing roots (b) parasitic roots
(c) tuberous roots (d) epiphytic roots
Rajasthan PMT-2002

Ans. (d) : Velamen and spongy tissue is found in epiphytic root. An epiphyte is on organism that grow on the surface of a plant and derives of moisture and nutrients from the air, rain, water (in marine environments). eg. Orchid

78. Which of the following plants has haustorial roots?
(a) Pea (b) Trapa
(c) Lily (d) Cuscuta
J&K CET-2003

Ans. (d) : Cuscuta plants has haustorial roots. A specialized modified root of parasitic plant that penetrates into a host plant and functions to acquire necessory nutrients from the host plant.

79. Parasitic phanerogams absorb water and solutes from the host plant by:
(a) mycorrhizal roots (b) clinging roots
(c) haustoria (d) adventitious roots
J&K CET-2010

Ans. (c) : Haustoria highly modified stem or root of a parasitic plant or a specialized branch or tube originating from a hair like filament (hyphae) of a fungus. The haustorium penetrates the tissues of a host and absorbs nutrients and water.

80. Respiratory roots (pneumatophores) are present in:
(a) mesophytes (b) halophytes
(c) xerophytes (d) None of these
MGIMS Wardha-2012

Ans. (b) : Respiratory roots (pneumatophores) are present in halophytes. Pneumatophores commonly found in mangrove species that grow in saline, mud. Flats are lateral roots grow upward out of the mud and water to function as the site of oxygen take for the submerged primary root system.

81. Buttress roots are found in:
(a) Pandanus (b) Terminalia
(c) Banyan (d) Sorghum
Haryana PMT-2000

Ans. (b) : Buttress roots are found in Terminalia. Buttress roots are developed by many trees. e.g. *Heritiera littoralis* and *Pelliciera rhizophorae.* Buttress root provide huge trees stability especially in tropical areas, and the buttress roots can grow up.

82. Which of the following have succulent root ?
(a) Opuntia (b) Aloe
(c) Agave (d) Asparagus
Punjab MET-2005

Ans. (d) : Succulent root are found only in Asparagus. They are white or light in colour. Asparagus has succulent roots because the plant stores food in them, making them fleshy and helpful for perennation. Succulents absorb water through their roots from the surrounding air.

83. In one plant adventitious roots are modified for storage and in the other plant a lateral branch with short internodes and each node bearing a rosette of leaves and a tuft of roots is found. They are
(a) Sweet potato and Pistia
(b) Eichhornia and Jasmine
(c) Carrot and mint
(d) Turnip and Chrysanthemum
(e) Sweet potato and mint
Kerala PMT-2014

Ans. (a) : In one Plant adventitious roots are modified for storage and in the other plant a lateral branch with short internods and each node bearing a rosette of leaves and a tuft of roots is found they are sweet potato and pistia.

84. A root was described as it adventitious root because:
(a) arose from plumule
(b) was used variously for storage of food
(c) was swollen
(d) was growing in marshy place
VMMC-2007
Rajasthan PMT-2005
UPCPMT-2002

Ans. (a) : A root was described as it adventitious root because arise from plumule. Post embroyonic roots can develop from stems, leaves or other vegetative non root organs, either constitutively. Such root are referred to as adventitious.

85. Which of the following is a total root parasite?
(a) Rafflesia (b) Santalum
(c) Cuscuta (d) Monotropa
VMMC-2011

@apna_pdf

Ans. (a) : Total parasites plants are heterotropic plants that depend entirely on the host plant, including shelter, water, and food for all their requirements. Rafflesia is a total root parasite. It is known as the queen of parasites.
• Cuscuta is total stem parasite, santalum is a woody flowering plant, monotropa is herbaceous perennial vine (also known as Indian pipe).

86. Rhizome which grows vertically upwards are:
(a) corms (b) stolon
(c) bulbils (d) root stock
AFMC-2005

Ans. (d) : Dense rhizomes grow vertically. They produce roots on the lower side while shoots grow upright from the head. Rhizome is known as a part of plant. It is also known as root stalk However, it is a stem that crops and grows horizontally under the ground and produces plant systems such as root and shoot of a new plant. Plant such as Banana and *Alocasia indica* represent rhizomes.

87. Tuberous roots are found in:
(a) *Beta vulgaris* (b) *Daucus carota*
(c) *Ipomoea batatas* (d) *Raphamus sativus*
Manipal-2004
Uttarakhand PMT-2004
AMU-2005

Ans. (c) : Tuberous roots are found in *'Ipomoea batatas'*. *Ipomeca batatas* are the scientific name of sweet potato. Tuberous roots have modified lateral storage roots. Some plants store food materials in their root. Plants like raddish, carrot and sweet potato are known as plants having tuberous roots. Tuberous root is the modification of adventitions root system.

88. Assimilatory roots are present in
(1) Loranthus and Viscum
(2) Tinospora and Trapa
(3) Saccharum and Pandanus
(4) Taeniophyllum and Podostemon
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct
BHU PMT (Mains)-2009

Ans. (c) : Assimilatory roots are present in Tinospora and Trapa and Taeniophyllum and Podostemon. Assimilatory roots modified adventitious roots that turn green and carry out photosynthesis. The assimilatory roots are present in the diversity of habitats. Tinospora has climbing photosynthetic roots. Trapa has under water root called hydrophytes. Taeniophyllum have flat ribbon like green velamen root viscum is parasitic plant.

89. Primary root is :
(1) positively geotropic
(2) positive hydrotropic
(3) negative geotropic
(4) negative hydrotropic
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct
BHU PMT (Mains)-2008, 2005

Ans. (b) : Primary root is positively geotropic and positively hydrotropic. It is the basic component of root systems, As the roots always grow in the downward direction or in the direction of the force of gravity they are regarded as positively geotropic. Roots are showing their positive hydrotropic nature. Who the root grows towards the presence of the moisture content then the roots are known as positively hydrotropic.

90. Which one is/are not rootless?
(1) Raphamus and Daucus
(2) Beta vulgaris and sweet potato
(3) Utricularia
(4) Wolffia
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct
BHU PMT (Mains)-2011

Ans. (b) : Rootless plants are which lack roots. Wolffia and utricularia both are root less plant and, the *Raphamus, Daucus, Beta vulgaris* and sweet potato are not a rootless plant.

91. Breathing roots are found in:
(a) Rhizophora (b) Epiphytes
(c) Avicennia (d) Both (a) and (c)
BHU PMT (Mains)-2011

Ans. (d) : Breathing roots are seen in Avicennia and Rhizophora plant. Avicennia have pneumatophores that project above the mud to facilitate gas exchange for the submerged primary roots. Pneumatophores or breathing roots are respiratory roots found in halophytes such as mangroves. Pneumatophores have open pores in the air called lenticels which help in absorbing O_2 directly from the air.

92. Haustorial root is exceptional to:
(a) Zea mays (b) Cactus
(c) Cuscuta (d) Orchids
BHU PMT (Mains)-2011
DUMET-2001
Manipal-2001

Ans. (c) : Haustorial root is exceptional to 'Cuscuta', Haustorial root is an underground portion of the plant that takes water and nutrients from the soil and serves as a string anchor few the plant. Cuscuta is the total stem parasitic plant which possesses haustorial roots for absorption of nutrients from the host plant.

93. Fibrous root system is better adapted than tap root system for :
(a) transport organic matter
(b) absorption of water and minerals
(c) storage of food
(d) anchorage of plant to soil
BHU PMT-2001

Ans. (d) : Fibrous root systems consists of many fine hair like roots that form a thick mat below the surface. These root systems are very effective at water and mineral absorption as well as plant stabilization. This root systems help prevent soil erosion as they anchor plants to the top layer of soil fibrous roots provide better and firm anchorage to the plant. It helps the plants of anchorage to soil very firmly.

94. The photosynthetic or assimilatory roots are observed in :
(a) Banyan (b) Vanda
(c) Cuscuta (d) Tinospora
J&K CET-2009

@apna_pdf

Ans. (d) : Assimilatory roots are also known as photosynthetic roots. When exposed to the sun, develop chlorophyll and manufacture food. These roots can be found in terrestrial plants, aquatic plants and epiphyte like orchids. A plant with photosynthetic roots is 'Tinospora because these roots are aerial and green containing chlorophyll, so they absorb sunlight and photosynthesize.

95. The aerial, short and branched roots of an autotrophic plant that provide stability are known as :
(a) lateral roots (b) haustoria
(c) velamen roots (d) clinging roots

BCECE-2010
AP EAMCET - 2007

Ans. (d) : The aerial, short and branched roots of an autotrophic plant that provide stability are known as, 'clinging roots'. Clinging roots are example of adventitious roots. They are known as hygroscopic roots and are found in epiphytes and space parasites. This kind of root creates clinging or aerial roots after the plant attaches to the tree's bark. **Ex:-** Orchid

96. Find the incorrect match :
(a) Tap root — Carrot
(b) Adventitious root — Sweet potato
(c) Prop root — Banyan tree
(d) Stilt root — Turnip

AMU-2010

Ans. (d) : Stilt roots are found in maize and sugarcane. Stilt roots are adventitious roots that grow form lower stem nodes and join and become deeper in the soil. Turnip are the tuberous roots which are tap roots. Tuberous root arise from the node of stem and assume irregular in shape.

97. Dahlia and Asparagus possess:
(a) Stilt roots (b) Fusiform roots
(c) Tuberous roots (d) Fasciculated roots

AMU-1998

Ans. (d) : Dahlia and Asparagus possess the fasciculated type of roots. Fasciculated roots are tuberous roots that originate at the base of the stem and form clusters. They swell and become thick to store food. The fasciculated root of dahlia act as a vegetative propagation for the production of new plant.

98. Plant roots are usually devoid of chlorophyll and cannot perform photosynthesis. However, there are exceptions. Which of the following plant root can perform photosynthesis?
(a) Arabidopsis (b) Rice
(c) Tinospora (d) Hibiscus

KVPY SB & SX-2012

Ans. (a) : Plant roots can perform the photosynthesis. As root hair cells do not carry out photosynthesis, they do not contain chloroplasts. Plants roots usually do not have chlorophyll but some epiphytic plants grow green and accumulate chlorophyll for photosynthesis. Arabidopsis is the dicot plant which develops the chloroplasts in roots.

99. The plant which bears clinging roots is:
(a) trapa (b) orchid
(c) screw pine (d) podostemon

UP CPMT-2001
BHU PMT (Screening)-2007
JIPMER-2010

Ans. (b) : The clinging roots are non absorptive adventitious root arise from nodes or internodes. The plant which bears clinging roots is 'orchid'. Orchids are epiphytes, the clinging roots system, is present in them. Orchids live on the branches of trees so their roots are modified to absorb water from the atmosphere by hanging freely in the air.

100. The character found only in halophytes is:
(a) sunken stomata (b) vivipary
(c) velamen tissue (d) heterophylly

Haryana PMT-2009

Ans. (b) : The character found only in halophytes is 'vivipary'. Plant vivipary is the process of giving birth to young seedlings in advanced stages of development. It is commonly seen in mangroves like Rhizophora. Mangrove plants are salt-loving thus halophytes. In viviparous germination, the seeds germinate while still attached to the parent plant.

101. Pneumatophores the respiratory root are characteristic feature of :
(a) Avicennia (b) Sonneratia
(c) Rhizophora (d) All of these

VMMC-2014

Ans. (d) : Pneumatophores are also called respiratory roots. Pneumatophores are found in the vegetation which is found in marshy and saline lakes. The primary function of pneumatophores is to help plants to get the oxygen needed for the respiration process because the found at O_2 lack places. Here, Avicennia, Sonneratia and Rhizophora all of are the example of pneumatophores.

102. Stilt roots are reported from:
(a) pandanus (b) radish
(c) mango ginger (d) Bryophy/fum

Manipal-2013

Ans. (a) : Stilt roots are reported from pandanus also known as screw pine. Stilt roots provide mechanical support to the plants. In pandanus the stilt roots develop only from the lower surface of the oblique stem to provide support. These roots are adventitious and often branched. Other examples of stilt root are maize, sugarcane.

103. Velamen-is found in:
(a) Vanda (b) Rosa
(c) Viscum (d) Santalum

AMU-2005

Ans. (a) : Velamen is found in 'vanda'. Velamen is a spongy tissue which is found in all epiphytic orchids and vanda. It is made up of multiple epidermis that covers the roots. Velamen is found in the aerial roots. It is helpful in absorption of moisture from atmosphere, also synthesis food in presence of chloroplast.

104. The thick roots that hang down from a banyan tree are called:
(a) stilt roots (b) prop roots
(c) pneumatophores (d) buttress root

BHU PMT (Screening)-2011
J&K CET-2014

@apna_pdf

Ans. (b) : The thick roots that hang down from a banyan tree are called prop roots. Simply a hanging roots of banyan trees are known as prop roots. These are the hanging adventitious roots arising from the aerial branches growing downwards, to provide the structural support of plants. Prop roots are pillar like roots, young prop roots hang in the air are hygroscopic, they appeared on absorption of water.

105. Special kinds of roots called pneumatophores are characteristics of the plants growing in:
(a) sandy soils
(b) saline soils
(c) marshy places and salt lakes
(d) dryland regions

Haryana PMT-2010

Ans. (c) : Special kind of roots called pneumatophores are characteristics of the plants growing in marshy places and salt lakes. These kind of roots are commonly found in mangrove species that grow in saline mud flats, these are found growing in saline marshes, roots growing vertically upwards become negatively geotropic, have breathing pore called pneumathores. They are present in Rhizophora and mangrove trees.

106. A type of cells called 'Velamen' occur in:
(a) orchid roots (b) lily roots
(c) grass roots (d) groundnut roots

AP EAMCET-1997

Ans. (a) : A type of cells called 'velamen' occur in orchid roots. Velamen is a specialized tissue found in the aerial roots of some orchids or vanda. Velamen is a spongy, multiple epidermis that covers the roots of some epiphytic or semi-epiphytic plants, such as orchid species. Velamen is provide support, prevent water less, and assist the plant in absorbing water directly from atmosphere. The epiphytic roots are devoid of root hairs and root caps.

107. In plants growing in marshy saline soils, the major function of roots that grow in the air above is to:
(a) respire (b) absorb moisture
(c) exude salts (d) absorb nutrients

AP EAMCET-1997

Ans. (a) : In plants growing in marshy saline soils, the major function of roots that grow in the air above is to respire. Their upper ends bear lenticels for exchange of gases. The plants which grow in the marshy areas are called mangroves. Pneumatophores are emerge out of soil and water, they are commonly known as breathing roots.

108. Root modification means:
(a) Permanent internal changes in the roots
(b) Temporary internal changes in the roots
(c) Permanent structural changes in the roots
(d) Temporary structural changes in the roots

J&K CET-2007

Ans. (c) : Root modification means permanent structural changes in the roots. Modification of the roots is simply the change found in physiology and morphology of the root for a particular adaptation as for storage of food, respiration, mechanical support. The roots are altered to allow a plant to adapt more effectively to the environment in different forms, by performing specific functions other than those of their normal function.

109. Dahlia has:
(a) tendrillar roots (b) respiratory roots
(c) nodular roots (d) storage roots

AP EAMCET-2000

Ans. (d) : Dahlia has a storage types of roots. Dahlia and Asparagus are some other examples of plants with modified roots for food storage. Storage roots are the roots that are specially modified for storage of food and water. In Dahlia fasciculated root is present in which roots arise in cluster from lower node of stem and thickened in entire length.

110. The following is a xerophyte, containing air spaces in the stem and roots:
(a) Eichhornia (b) Opuntia
(c) Aloe (d) Rhizophora

AP EAMCET-1999

Ans. (b) : Opuntia is a xerophyte, which is containing air spaces in the stem and roots. Its stem is modified into a succulent and flat green structure. Opuntia modified leaves thick cuticle and flat green leaf like structure is known as phylloclade's which performs the functions of photosynthesis. The leaves gets modified into spines to help in reducing transpiration.

111. Pneumatophores are usually present in
(a) Murraya (b) Eichhonia
(c) Avicennia (d) None of these

HP CET-2012
VMMC-2004

Ans. (c) : Pneumatophores are usually present in 'Avicinnea'. Pneumatophores are specialized roots developing in mangrove plants. Avicennia is a mangrove species. It develop a flat root system. Avicennia and Rhizophora are facultative halophytes and have mechanisms to inhibit salt absorption by their roots and to excrete salt from their leaves.

112. Which are of the following has epiphytic features and aerial and flattened photosynthetic roots, without formal organisation of stem and leaves?
(a) Tinospora (b) Trapa
(c) Taeniophyllum (d) Vanda

Manipal-2010

Ans. (c) : Taeniophyllum is an epiphytic orchid with thick flattened photosynthetic roots. These roots are green aerial, adventitious which prepare food materials by photosynthesis.
- Tinospora possesses aerial climbing photosynthetic root
- In trapa, the green assimilatory roots are submerged like other roots. They develop from stem nodes and are highly branched to increase photosynthesis.

113. Thigmotropism is best seen in
(a) tendrils (b) leaf apex
(c) root apex (d) stem apex

CMC Vellore-2009

Ans. (a) : Thigmotropism is best seen in tendrils. It is a movement due to contact with a foreign body. It is most conspicuous in tendrils, which coil around support and help the plant in climbing. It is best observed in tendrils and twining plants. It is also known as haptotropism. It is the movement or change in orientation of a plant's growth as a reaction to touch. Example of tendrils of sweet pea coiling around a support.

@apna_pdf

114. Floating roots are the characteristic feature of
(a) Viscum (b) Cuscuta
(c) Vanda (d) Jussiaea

BCECE-2007

Ans. (d) : Floating plant have leaves that float on the water surface. Floating roots are the characteristic feature of 'Jussiaea'. Floating roots are the modification of adventitious roots. These roots arise from the node of the aquatic plants. It is most commonly in Jussiaea. These roots help in floating and respiration.

115. Pneumatophores are helpful in
(a) protein synthesis
(b) respiration
(c) carbohydrate metabolism
(d) transpiration

AMU-2003
MGIMS Wardha-2005

Ans. (b) : Pneumatophores are helpful in respiration process. It helps the plant to get oxygen for respiration. It helps in mangrove plant to absorb gases, such as nitrogen, and nutrients, such as iron, from poor soil. They are also called breathing roots. Simply it present in Rhizophora and mangrove trees.

116. When the root is swollen in the middle and tapers at both ends, it will be called as
(a) tuberous root (b) conical root
(c) fusiform root (d) napiform root

AMU-2001

Ans. (c) : When the root is swollen in the middle and tapers at both ends, it will be called as fusiform root. Fusiform roots are swollen in the middle portion and tapering towards the end. Example of fusiform root is radish fusiform means spindle shaped. Their primary junction is the storage of food.

117. Pneumatophores are found in :
(a) The vegetation which is found in marshy and saline lake
(b) The vegetation which found in saline soil
(c) Xerophytes
(d) Epiphytes

AIPMT-2000

Ans. (a) : Pneumatophores are found in the vegetation which is found in marshy and saline lake.
Pneumatophores, commonly found in mangrove species that grow in saline mud flats and grow upward out of the mud and water to oxygen intake for the submerged primary root system.

118. Respiratory roots are found in
(a) Rhizopus (b) Orchid
(c) Vallisnaria (d) Mangrove plants

UP CPMT-2005

Ans. (d): Pneumatophores or breathing roots or respiratory roots found in halophytes such as **mangroves**. They often grow in saline swamps, so breathing roots come out of the water to consume oxygen.
• **Rhizopus** is a genus of common saprophytic fungi on plants and specialized parasites on animals.
• Most **orchids** species grow in tropical forests but others can be found in semi- desert region, near the Seashore and in the tundra.
Vallisneria is a submerged plant that spreads by runners and sometimes forms tall underwater meadows.

119. Which of the following groups of plants are propagated through underground root?
(a) Pistia, Chrysanthemum and pineapple
(b) Ginger, potato, onion and zamikand
(c) Sweet potato, Asparagus, Tapioca and dahlia
(d) Bryophyllum and Kalanchoe

MGIMS Wardha-2013

Ans. (c) : When the plant propagation from the vegetative part of a parent plant through asexual mode is called as vegetative propagation. Vegetative propagation are mainly cutting, layering, grafting types. It uses several of the plant parts for reproducing the plant asexually. It is possible because of the presence of meristematic tissue capable of cellular differentiation, in many plant tissues.
A part of root, stem and leaf can promote adventitious roots and form a new plant. Some other plants have swollen fleshy roots called tuberous root. These tubers bear buds, which can develop into new plants if covered with moisture soil. **Example sweet potato, tapioca, dahlia and asparagus.**

120. Black pepper is
(a) herb (b) shrub
(c) tree (d) climber

Haryana PMT-2008

Ans. (d) : Black pepper (*Piper nigrum*)is a flowering vine, cultivated from its fruit, which is usually dried and used as a spice and seasoning. The pepper plant is a weak climbing or trailing shrub with adventitious roots. Black pepper is native to the Malabar coast of India and is one of the earliest spices known.

C. Stem and its Modification

121. The modified stem of Opuntia is
(a) phyllode (b) phylloclade
(c) cladode (d) staminode

JIPMER-2010
BHU PMT (Screening)-2007
CG PMT-2006
JIPMER-2005
Haryana PMT-2005
BHU PMT-2003
AMU-2001

Ans. (b) : The modified stem of opuntia is known as phylloclade. Opuntia is a xerophytic plant. Leaves are modified into spine, so the functions of photosynthesis is performed by stem which is thick, fleshy and flattened structures.

122. The underground stem that has contractile roots is:
(a) Rhizome (b) Corm
(c) Stem tuber (d) Bulb

AP EAMCET-2005
VMMC-2010
AFMC-2010
CMC Vellore-2010

Ans. (b): Corm– It is a condensed structure which grows vertically under the soil surface. They possess spherical node and internodes and they possess contractile roots. **Ex– Colocasia, Alocasia, Zaminkand etc.**

@apna_pdf

a) Rhizome– It is a fleshy and horizontal stem found under the soil. Small nodes and internodes are found which are covered with scaly leaves.
Ex– Ginger, Turmeric, Canna, Water lily and Banana.
c) Stem tuber– The tip of underground branches become swollen in the soil. Eyes are found on them which are axillary buds and they are covered with scaly leaves. **Ex– Potato.**
d) Bulb– The stem is reduced and has a disc like structure which surrounds with numerous fleshy scaly leaves. Many roots arise from its base and food is stored in their fleshy leaves. They show apical growth. **Ex– Onion and Garlic.**

123. Medicinal plant of Solanaceae
(a) Atropa (b) Petunia
(c) Cestrum (d) Scilla

TS EAMCET 10.05.2023 Shift-I

Ans. (a) : The medicinal plant of solanaceae is Atropa belladonna that belong the family-Solanaceae.
The Atropa belladonna also called belladonna or deadly night shade.
The atropine a type of alkaloids that use dilate pupils of eyes. The Belladonna has used in herbal medicine for centrurles as a pain reliever.
Petunia is belonging to family Night shade
Cestrum is belonging to family Night shade
Scilla is belonging to family Asparagaceae.

124. Identify the correct set of statements :
(A) The leaflets are modified into pointed hard thorns in Citrus and Bougainvillea
(B) Axillary buds form slender and spirally coiled tendrils in cucumber and pumpkin
(C) Stem is flattened and fleshy in Opuntia and modified to perform the function of leaves
(D) Rhizophora shows vertically upward growing roots that help to get oxygen for respiration
(E) Subaerially growing stems in grasses and strawberry help in vegetative propagation
Choose the correct answer from the options given below :
(a) (A), (B), (D) and (E) Only
(b) (B) and (C) Only
(c) (A) and (D) Only
(d) (B), (C), (D) and (E) Only

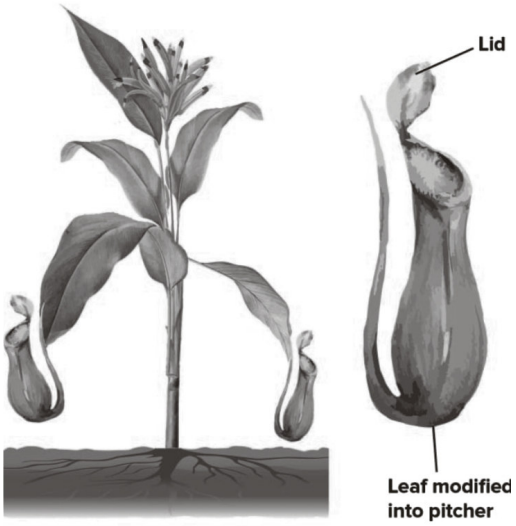
NEET-2022

Ans. (d) : Axillary buds of stems get modified into woody straight and pointed thorns. Thorns are found in many plants such as citrus and bougainvillea.
• Axillary buds form slender and spirally coiled tendrils in cucumber and pumpkin, in these plants the tendrils help in climbing and provide support.
• Stem is flattened and fleshy in Opuntia and modified to perform the function of leaves, the stem is modified to carry out photosynthesis due to the absence of leaves.
• Rhizophora shows vertically upward growing roots that help to get oxygen for respiration, these roots are called pneumatophores.
• Subaerially growing stems in grasses and strawberry help in vegetative propagation, these stem are called stolons and can form new plants when they touch the ground.

125. Which of the following is not stem modification
(a) Flattened structures of Opuntia
(b) Pitcher of Nepenthes
(c) Thorns of citrus
(d) Tendrils of cucumber

AP EAMCET-03.09.2021 Shift-II
NEET-2016 Phase-I

Ans. (b) : Pitcher of Nepenthes or pitcher plant is a modification of leaf not stem. It is a plant that is insectivorous. In this plant a pitcher like structure is transformed from a leaf lamina that traps insects.



Pitcher plant showing lid and pitcher

Stems of some plants are modified to perform different functions. Tendrils develop from axillary buds are spirally coiled and help plants to climb such as in cucumber. Opuntia, a plant grows in arid reasons modify their stem into flattened structure. In citrus fruits stems modified into pointed thorns to protect plants from grazing animals.

126. Vegetative propagule of Curcuma is_____
(a) Runner (b) Rhizome
(c) Offset (d) Corm

AP EAPCET-07.09.2021 Shift-I

Ans. (b) : Vegetative propagule of Curcuma is Rhizome. A rhizome is an underground part of the plant that run horizontally and has the ability to produce root and shoot systems in plant.

127. What is the eye of potato?
(a) Axillary Bud (b) Accessory Bud
(c) Adventitious Bud (d) Apical Bud

AP EAMCET-25.09.2020 Shift-I

Ans. (a) : Axillary bud is the eye of potato. Potato eyes are sprouts, and they occur when the potato is ready to begin its next phase of life, growing new Potatoes.

128. Which are the modified parts of cladophylls?
(a) Leaf
(b) Petiole
(c) Branches of limited growth
(d) Branches of unlimited growth

TS EAMCET-29.09.2020 Shift-I

@apna_pdf

Ans. (c) : Branches of limited growth modified parts of cladophylls. Cladophylls is one of the parts of the plant. It is modified part of the stem, and it resemble the function of the leaf.

129. Which of the following is the sink end of the plant?
(a) Stem tuber (b) Cotyledon
(c) Leaf (d) Apical bud

MHT CET-2019

Ans. (b) : Cotyledon is the sink of the plant and rhizome. Sink are related to transport of organic solutes.

130. Which ONE of the following properties causes the plant tendrils to coil around a bamboo stick?
(a) Tendril has spines
(b) The base of the tendril grows faster than the tip
(c) Part of the tendril in contact with the bamboo stick grows at a slower rate than the part away from it
(d) The tip of the tendril grows faster than the base

KVPY (SA)-2018

Ans. (c) : Tendrils are sensitive to touch and when they come in contact with an object they do not move as fast as the part of the tendril away from the object. This causes the tendrils to coil around the object and thus cling to it tendrils are considered to be modified flower clusters which are themselves viewed as modified shoots.

131. Tendrils are modifications of:
(a) stem or leaf (b) stem only
(c) leaf only (d) aerial roots only

KVPY (SA)-2018

Ans. (a) : Tendrils may be modified leaves, leaflets, leaf tips or leaf stipules they may however, be derived as modified stem branches. They help in support and attachment by clasping, gripping near by objects. Example - grapes.

132. The 'eyes' of potato are located at the____
(a) Root apex (b) Leaf apex
(c) Nodes (d) Inter-nodes

MHT CET-2018

Ans. (c) : The 'eyes' of potato are located at the nodes. Potato tubers have nodes or eyes from which the new growth begins. The new stems growing from each eye are called sprout which rise to the new plant.

133. In watermelon the spirally coiled stem modifications which help in climbing are developed from
(a) Apical bud (b) Adventitious bud
(c) Axillary bud (d) Terminal bud

TS EAMCET-02.05.2018 Shift-I

Ans.(c): In watermelon the spirally coiled stem modification which help in climbing are developed from Axillary bud. Tendrils are specialized stem or leaf modification. Which are thread-like structures used by climbing plants for support and attachment.

134. Phylloclade is the modification of:
(a) root (b) stem
(c) leaf (d) flower

Tripura JEE-2017
J&K CET-2002
Rajasthan PMT-2001

Ans. (b) : Phylloclade is the modification of stem in plants for carrying out photosynthesis as well as for structural support and survival.

135. Potato is cultivated by:
(a) seeds (b) buds
(c) root cutting (d) tubers

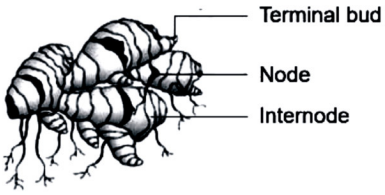
BHU PMT-2002

Ans. (d) : Potato is cultivated by tubers. The cultivated potato (S. tuberosum) is divided into two sub - species *Solanum tuberosum* and *Andigena*.

136. In ginger vegetative propagation occurs through:
(a) Offsets (b) Bulbils
(c) Runners (d) Rhizome

AIPMT-2015

Ans. (d) : In Ginger, vegetative propagation occurs through **Rhizome.** Rhizomes are stems which grow horizontally under the ground. In ginger the underground stem are swollen with food reserves. The terminal bud grows upward to produce the flowering shoot and the lateral buds grow out to form new plant.



Rhizome – Ginger

137. When we peel the skin of a potato tuber, we remove:
(a) periderm (b) epidermis
(c) cuticle (d) sapwood

Assam CEE-2014

Ans. (a) : When we peel the skin of a potato tuber we remove Periderm. Periderm potato is underground stem with this mind, the "skin" or periderm of the potato tuber very much resembles the bark on the stem (trunk) of a tree like the bark of a tree, the periderm is a tough coating that protects from moisture loss and from invasion by diseases, insects and other pests.

138. Which one of the following is an example for sub-aerial modification of stem ?
(a) Agave (b) Oxalis
(c) Asparagus (d) Tridax
(e) Polyalthia

Kerala PMT-2009

Ans. (b) : Oxalis sub-aerial modification of stem. Oxalis is a large genus of flowering plants in the wood sorrel family oxalidaceae.

139. In opuntia spines are modification of:
(a) Stem (b) root
(c) leaf (d) flower

AIIMS-2000

Ans. (c) : Spines are also modified leaves. In opuntia spines are fully transformed leaves that protect the plant from herbivores, radiate heat from the stem during the day, and collect and drip condensed water vapour during night.

@apna_pdf

140. Ginger is a stem and a root because it:
(a) lacks chlorophyll
(b) grows parallel to soil surface
(c) stores food material
(d) has nodes and internodes

Haryana PMT-2008
JIPMER-1999
AIIMS-1998

Ans. (d) : Ginger is a stem and a root because of has nodes and internodes. The ginger plant has a thick, branched rhizome (underground stem) with a brown outer larger and yellow centre that has a spicy citrasy aroma.

141. An example of edible underground stem is:
(a) Carrot (b) Groundnut
(c) Sweet potato (d) Potato

AIPMT-2014

Ans. (d) : Modified stems located below ground are bulbs, corn, rhizomes, and tubers. Potato is the edible portion is an underground stem that is a tuber.
• Carrot is a modified tap root for storage of food. Groundnut is an edible seed.
• Sweet potato is a modified adventitious root specialised for food storage.

142. Identify a pair of the following plants, which show modification of axillary buds into tendrils and hooks respectively
i. Hugonia **ii. Duranta**
iii. Passiflora **iv. Dioscorea**
(a) i, ii (b) ii, iii
(c) iii, i (d) iv, i

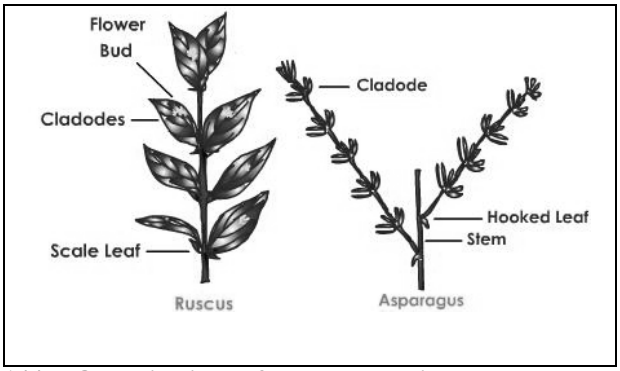
AP EAMCET-2008

Ans. (c) : Tendrils are a modification of stem as modified axillary bud in **Passiflora**. In some plants, terminal leaf lets are modified into curved hooks for helping the plant in climbing such structures are called hooks. **Example -Hugonia.** Tendrils are a thread like structures which helps the plant in climbing.
• **Duranta** is a genus of flowering plants in the Verbena family. They are commonly cultivated as hedges and ornamental plants.
• **Dioscorea** is a genus family **Dioscoreaceae.** The vast majority of the species are tropical, with only a few species extending into temperate climates.

143. 'Cladode's is a characteristic morphological feature of:
(a) Asparagus and Ruscus
(b) Casuarina and Opuntia
(c) Cladophora and Cactus
(d) Citrus and Euphorbia

AMU-1997
AIIMS-2014

Ans. (a) Cladode is a modified stem in which the branches of limited growth become green and flat-like leaf, eg.–Asparagus and Ruscus. They may store food for the plant.



144. Organisation of stem apex into corpus and tunica is determined mainly by:
(a) Planes of cell division
(b) regions of meristematic activity
(c) rate of cell growth
(d) rate of shoot tip growth.

AIPMT-1988
BVP-2008

Ans. (a) : Tunica carpus theory discover by **Schmidt (1924).** Tunica and corpus 2 regions can be distinguished by their plane of cell division.
• **Tunica :-** It is the outer zone consisting of one or more peripheral layer of cells. In dicotyledons, there are one to five layers of tunica while in monocotyledons, there are one to three layer of tunica. They undergo anticlinal division. The outer layer primordia and hypodermal cells.
• **Carpus :-** Carpus is the central undifferentiated multilayered mass of cells surrounded by tunica. The cells are comparatively layer and divided by irregular division in all planes and from procambium and ground meristem.

145. An underground specialized bud with reduced disk like stem, covered with fleshy leaves is called:
(a) bulb (b) rhizome
(c) bulbil (d) rhizophore

J&K CET-2000

Ans. (a) : A bulb consists of relatively large, usually globe shaped, underground bud with membraneous or fleshy overlapping leaves arisig from a short stem. Bulbs are produced by monocotyledons plants in which the usual structure is modified for storage and reproduction.

146. Part of the plant which is cultured to obtain virus free clones is:
(a) leaf (b) root tip
(c) shoot tip (d) embryo

JCECE-2007

Ans. (c) : Part of the plant which is cultured to obtain virus free clones is shoot tip. Shoot tip culture is the culture of terminal part of shoot to a plant in in-vitro condition or in lab called as shoot tip culture.
Mostly the shoot tip culture used for obtain disease free plant without genetically changes.

147. The underground stem of this genus is a rhizome:
(a) Allium (b) Gloriosa
(c) Scilla (d) Lilium

Uttarakhand PMT-2010

@apna_pdf

Ans. (b) : The underground stem of this genus is a rhizome Gloriosa.
• Gloriosa is a perennial herb growing from a fleshy rhizome. The plant is used to cure arthritis, gout rheumatism, inflammation, ulcers, bleeding, skin diseases, leprosy, snakebites etc.

148. Which of the following plants have long slender and coiled stem tendrils developed from axillary buds ?
(a) Grapevine and pumpkins
(b) Australian acacia and watermelon
(c) Bougainvillea and cucumber
(d) Strawberry and grapevine
(e) Alstonia and pumpkins

Kerala PMT-2011

Ans. (a) : Grapevine and pumpkin plants have long slender and coiled stem tendrils developed from axillary buds. That form in very leafless and spirally coiled branches and help the vulnerable plant climb a support referred to as a stem tendrils.

149. Ginger multiplies vegetatively by:
(a) tuber (b) corm
(c) sucker (d) rhizome

DUMET-2004

Ans. (d) : Ginger multiplies vegetatively by rhizome although often referred to as ginger root, ginger actually comes from the rhizome. As cardamom and turmeric etc.

150. Stem modified for photosynthetic function by appearing like leaves are known as:
(a) Phyllode (b) Phylloclade
(c) Cladode (d) Tendril

MP PMT-2013

Ans. (b) : Stem modified for photosynthetic function by appearing like leaves are known as phylloclade. Leaves are the main sites for photosynthesis, the process by which plants synthesize food.

151. Cladode is a modification of:
(a) stem (b) root
(c) leaf (d) petiole

J&K CET-2013

Ans. (a) : Cladode is a modification of stem. Cladodes (also called cladophylls or phylloclades) are shoot systems in which leaves do not develop rather, the stems, become flattened and assume the photosynthetic functions of the plant.

152. In sweet pea tendrils are modified:
(a) stipule (b) stem
(c) leaf (d) leaflet

Rajasthan PMT-2002

Ans. (d) : In sweet pea tendrils are modified leaflet. Tendrils may be modified leaves leaflets, leaf tips or leaf stipules they may however, be derived as modified stem branches.

153. Turmeric a commonly used colorant and antiseptic is taken from which part of the plant?
(a) Stem (b) Root
(c) Flower (d) Fruit

Haryana PMT-2001

Ans. (a) : Turmeric (Curcuma domestica) a commonly used colorant and antiseptic is taken from stem part of the plant. Turmeric has been put to use as a food stuff, cosmetic and medicine. It is widely used as a spice in South Asian and Middle Eastern cooking.

154. Assertion (A) : Subaerial stem modifications participate in vegetative reproduction.
Reason (R) : They store water and food
(a) (A) and (R) are correct, (R) explains (A) correctly.
(b) (A) and (R) are correct, (R) explanation incorrect.
(c) (A) is correct, (R) is false.
(d) (A) is false, (R) is correct.

AP EAMCET-2015

Ans. (c) : Sub aerial stems are modified for vegetative reproduction are runners, stolons, suckers and offsets are different type of sub aerial stem modifications.

155. Which one of the following is not an insectivorous plant?
(a) Monotropa (b) Drosera
(c) Utricularia (d) Nepenthes

J&K CET-2010

Ans. (a) : Monotropa is parasitic upon a fungus that is in a symbiotic relationship with a hemlock tree. Monotropa uniflora also known as ghost plant, ghost pipe or Indian pipe is an herbaceous perennial plant.

156. Which one of the following is a modified stem that performs photosynthesis ?
(a) Tendrils (b) Bulbils
(c) Phylloclades (d) Prickles

J&K CET-2010

Ans. (c) : Phylloclades is a modified stem that performs photosynthesis. Phylloclades and cladodes are flattened, photosynthetic, shoots, which are usually considered to be modified branches.

157. Cladodes are found in:
(a) Asparagus (b) Opuntia
(c) Parkmsonia (d) Psidium guajava

Rajasthan PMT-2003
Manipal - 2002

Ans. (a) : Cladodes are found in *Asparagus*. Cladodes also called cladophylls or phylloclades) are shoot systems in which leaves do not develop rather then stems become flattened and assume the photosynthetic functions of the plant.

158. Stem is reduced in:
(a) Rhizome (b) Corm
(c) Bulb (d) Tuber

BHU PMT (Mains)-2007

Ans. (c) : Stem is reduced in bulb. Onion has the most reduced form of stem as it is a bulb. Bulb is a modified stem that is the resting stage of certain seed plants particularly perennial monocotyledons. A bulb consists of a relatively large, usually globe shaped under ground bud with membraneous or fleshy overlapping leaves arising from a short stem.

159. Pseudostem develops in:
(a) Ginger (b) Eichhomia
(c) Banana (d) Asparagus

BVP-2011

@apna_pdf

Ans. (c) : The Pseudostem is the part of the banana plant that looks like a trunk. Which consists of a soft central core and tightly wrapped up to 25 leaf sheaths, it is fleshy and mainly consists of water.

160. A tree that has strong erect stem with hollow internodes and solid nodes is known as:
(a) Caudex (b) Deliquescent
(c) Scape (d) Culm

J&K CET-2011

Ans. (d) : A tree has strong erect stem with hollow internodes and solid nodes is known as Culm. Culm is an aerial stem which bearing flower. eg.:- Bamboo and grass

161. Stem tendrils are seen in:
(a) Citrus and Bougainvillea
(b) Citrus and Watermelon
(c) Cucumber and Pumpkins
(d) Opuntia and Bougainvillea
(e) Pistia and Eichhornia

Kerala PMT-2013

Ans. (c) : Stem tendrils are seen in cucumber and pumpking. It is develop form auxillary buds.

162. Which of the following is not a rhizome?
(a) Nelumbium (lotus) (b) Curcuma (turmeric)
(c) Crocus (kesar) (d) Zingiber (ginger)

JCECE-2015

Ans. (c) : *Crocus sativus* also known as *Autumn crocus* or *Saffron crocus*, is the only variety that produces an edible part.

163. Which of the following has most reduced form of stem?
(a) Rhizome (b) Stolons
(c) Runner (d) Bulb

Uttarakhand-2005
AIIMS-2000

Ans. (d) : 'Bulb', has most reduced form of stem. Onion is an example for Bulb. In some plants, the stem is in the form of a reduced small disc which is not differentiated into nodes and internodes. Stem is extremely reduced in bulb. A bulb is a short stem with leaves or leaf bases.

164. Hydrophytes are characterised by :
(a) thick and large leaf
(b) delicate and mucilagenous stem
(c) short spinous stem
(d) all of the above

MGIMS Wardha-2003

Ans. (b) : Plants which are growing near water or in water is known as hydrophytes plants.
- Root system and conducting tissue is poorly developed. There plants are spongy.
- The plant body of these plants usually thin and delicate. Leaves are very thin membranous and the stem is slender and may remain covered with mucilage.

165. The interxylary phloem is found in the stem of:
(a) Cucurbita (b) Salvia
(c) Calotropis (d) None of these

JIPMER-2013

Ans. (c) : Interxylary phloem is strands or bands of phloem embedded within the secondary xylem of a stem or root of a plant that has a single vascular cambium. Initially vascular bundle behave normally of forming secondary xylem towards inner side and secondary phloem towards outerside. But later it produce small patches of secondary phloem towards inner side which are embedded in secondary xylem. There patches are termed as interxylary phloem.

166. Potato is a modification of:
(a) stem (b) rhizome
(c) root (d) leaf

UP CPMT-2009
Punjab MET-2009

Ans. (a) : Potato is a type of storage stem that has been modified it grows from underground stems. potato is rich in starch. Tuber is thickend part of a stem which grows underground. Tubers have bud from which a new plant can arise by vegetative propagation.

167. Cotton fibre is basically a type of
(a) trichome (b) scale
(c) dried seed coat (d) non glandular hair

WB JEE-2010

Ans. (c) : Cotton fibres are the purest form of cellulose, nature's most abundant polymer, nearly 90% of the cotton fibres are cellulose.
Cotton fibre is obtained from the seed part of the flower.
- The raw fibres are separated from the seeds by a process known as ginning.

168. How does pruning help in making the hedge dense ?
(a) It induces the differentiation of new shoots from the rootstock
(b) It frees axillary buds from apical dominance
(c) The apical shoot grows faster after pruning
(d) It releases wound hormones

JCECE-2009

Ans. (b) : Pruning help in making the hedge dense as it frees the axillary buds from apical dominance. Apical buds produce high concentration of hormone auxin which inhibits the growth of lateral buds. When the apical buds are removed by pruning, the lateral bud grow. This produces dense bushy growth.

169. One of the plants introduced from the new world to the old world is:
(a) wheat (b) potato
(c) rice (d) sugarcane

BHU PMT (Mains)-2009

Ans. (b) : One of the plants introduced from the new world to the old world is potato.
The plants that were native to the Americas (new world) have been spread around the world (old world) through the columbian exchange. These plants include potato, sweet potato, tomato and maize etc.

170. Stem is modified into cladode:
(a) Casuarina (b) Asparagus
(c) Opuntia (d) Euphorbia

J&K CET-2008

Ans. (b) : Cladodes (modified stem) are the short, fleshy and green stems that have single internodes. The cladode is the aerial modification of the stem.
A very common example of sessile stem modified to form the cladode in Asparagus.

@apna_pdf

171. Which of the odd type of vegetable in a basket containing the following?
(a) Beet roots (b) Potatoes
(c) Carrots (d) Radishes
Karnataka CET-2002

Ans. (b) : Radishes, Beet roots and carrots are thick fleshy and bulging to enable then to store food. They for the roots of the plant whereas potato is a modification of stem.

172. Zingeber officinale is a:
(a) leaf (b) modified stem
(c) root (d) modified root
UP CPMT-2012

Ans. (b) : *Zingeber officinale* or ginger is under-ground modified stem called a rhizome. Ginger is widely used as a spice and is ayurveda and traditional medicine.
Rhizome do not perform the function of roots, i.e. anchorage and obsorption, rather serves as reservoir for storage food.

173. The aerial vertical stout part of the banana is formed the :
(a) stem (b) leaf sheaths
(c) lamina of leaves (d) midrib of leaves
JIPMER-1999

Ans. (b) : The aerial vertical stout part of the banana is formed the leaf sheaths. The banana leaf consists of a long, tube like structure called a sheath.
The tight packing of numerous sheaths form the pseudostem. One pseudostem may have over 40 leaves during its lifetime.

174. The prickly pear plant, which is botanically named as Opuntia is an excellent example of
(a) Phyllode (b) Cladode
(c) Phylloclade (d) None of these
AMU -2000

Ans. (c) : The prickly pear plant, which is botanically named as opuntia is an excellent example of phylloclade. Phylloclade is the modification of stem. The stem becomes flattened, green, leaf like and performs photosynthesis.

175. Green leaf-like modified aerial stems/branches with a single internodes are called:
(a) Phylloclades (b) Phyllodes
(c) Bulbils (d) Cladodes
Karnataka CET-2003

Ans. (d): They are flattened leaf-like branches and structure that are photosynthetic in nature.
Phylloclade usually having one or two internodes long and succulent is called as cladode.

176. An example of xerophytic plant with cladode is:
(a) Asparagus (b) Aloe
(c) Agave (d) Argemone
AP EAMCET-2001

Ans. (a) : Xerophytic exhibit a number of special features in their morphological organs. Its structures minimize transpiration cladodes are an aerial modification of the stem which help reducing the transpiration.
cladode may be made up of only inter node.
ex:- *Asparagus*.

177. Viscum is a:
(a) total root parasite (b) total stem parasite
(c) partial root parasite (d) partial stem parasite
AFMC-2004

Ans. (d) : *Viscum album* is a partial stem parasite as it absorb only minerals and water from the host and does not absorb food. It is capable in making food its own by photosynthesis.

178. Corm is an:
(a) Underground vertical leaf
(b) Underground swollen stem
(c) Underground horizontal root
(d) Underground horizontal leaf
MGIMS Wardha-2011

Ans. (b) : An underground stem axis with swollen bare and enclosed by dry scale like leaves is called as corm. The shape of the corm is almost spherical or somewhat flattened from top to bottom due to excessive deposition of food material.

179. A horizontal underground stem is a:
(a) corm (b) phylloclade
(c) rhizome (d) rhizoid
DUMET-2009

Ans. (c) : A horizontal underground stem is a rhizome. Rhizome is the modification of stem for the production of the new plants. They are also called as root stock for eg. :- Ginger, Iris and Violet.
Rhizomes are used to store starches and protein which helps plants to survive under unfavourable season.

180. Thorns which help in climbing are found in:
(a) Carissa (b) Ulex
(c) Bougainvillea (d) Lawsonia
AP EAMCET-2000

Ans. (c) : Thorns which help in climbing are found in Bougainvillea. In Bougainvillea, The axillary bud gets modified into a woody thorn. Thorns are curved which helps the plant in climbing.

181. In which of the following plants does the stem performs the function of storage and perennation?
(a) Wheat (b) Ground nut
(c) Raddish (d) Ginger
CMC Vellore-2014

Ans. (d) : Ginger is an underground stem. It is the modification of stem and produce the new plants. It store food, so it is fleshy and can survive in drought condition.

182. In Ruscus , the stem is a:
(a) Phyllode (b) Cladode
(c) Offset (d) Sucker
Rajasthan PMT-2011
JIPMER-2011

Ans. (b) : In Ruscus, the stem is a cladode are a type of phylloclade which only has one internode. Cladodes are an aerial modification of the stem to reduce transpiration in plant.
The leaves are either present as scales or highly reduced.

183. In turmeric stem is a:
(a) Tuber (b) Bulb
(c) Rhizome (d) Corm
Rajasthan PMT-2011

@apna_pdf

Ans. (c) : In turmeric stem is a Rhizome. Rhizomes found below in soil. It possess nodes and internodes and is fleshy due to the storage of food. It is also known as root stock.
Rhizome is the modification of stem for the production of new plants.

184. Dahlia is propagated through:
(a) Roots (b) Stem
(c) Bud (d) Leaf

BCECE-2009

Ans. (b&a) : Dahlia is propagated through stem. Dahlia possess tuberose roots and new plants arise from buds present on roots dahlia reproduce asexually through vegetative tissue known as bulbs.

185. Passiflora is an example of:
(a) cladode (b) thorn
(c) stem tendril (d) phylloclade

Haryana PMT-2011

Ans. (c) : *Passiflora* is an example of stem tendril A thin, thread - like structure used by climb as for support and attachment by parasitic plants. Generally by coiling around the suitable host found by touch is called a stem tendril. They may be branched or unbranched.
Common examples of tendril - Producing plants are the grape, members of the squash or melon family (cucurbitaceae) the sweet pea (*Lathyrus odoratus*), and the passion flowers (passiflora species).

186. Rootstock is:
(a) found in Musa and Alocasia
(b) is underground stem
(c) Specialized rhizome growing up vertically instead of horizontally
(d) All of these

Haryana PMT-2011

Ans. (d) : Rootstock is an underground stem called specialized rhizome which grows vertically upward instead of horizontal.
Rootstock is the base and root portion of a grafted plant. It is found is Musa and Alocasia.

187. Stems modified into flat green organs performing the functions of leaves are known as:
(a) Scales (b) Cladodes
(c) Phyllodes (d) Phylloclades

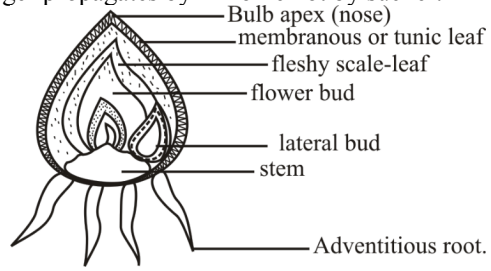
NEET-2016 Phase-I
JIPMER-1998

Ans. (d) : Stem modified into flat-green organs performing the functions of leaves are known as Phylloclades.
• Cladode is also a phylloclade but is of limited growth.
• Phyllodes are modified petioles which are leaf like in appearance and function.
• Scales are non-green and do not take part in photosynthesis.

188. Which one of the following is correctly matched?
(a) Chlamydomonas-Conidia
(b) Yeast-Zoospores
(c) Onion-Bulb
(d) Ginger-sucker

AIPMT (Screening)-2012

Ans. (c): Onion propagate by bulb which is an underground, modified stem.
A bulb consists of a relatively large, usually globe shaped, underground bud with fleshy overlapping leaves arising from a short stem.
• Chlamydomonas is an algae and conidia are not found in algae.
• Yeast and other ascomycetes characteristically produce ascospores.
• Ginger propagates by rhizome not by sucker.



189. Phyllode is present in:
(a) Australian Acacia (b) Opuntia
(c) Asparagus (d) Euphorbia

AIPMT (Screening)-2012

Ans. (a) : Phyllode is a modified petiole or a shoot that connects the stem with leaf and its function resembles that of leaf eg. Australian Acacia.
In several species of Acacia found in the deserts of Australia, the bipinnate lamina is absent.
Instead petiole and part of the rachis become flattened into sickle shaped structure for performing the function of food synthesis.

190. Which one of the following statement is correct?
(a) Flower of tulip is a modified shoot
(b) In tomato, fruit is a capsule
(c) Seeds of orchids have oil-rich endosperm
(d) Placentation in primrose is basal

AIPMT (Screening)-2011

Ans. (a) : In the tulip, flower is a modified stem.
Their flower buds are known for being perfectly symmetrical.
Tulips are the national flower of both Iran and Turkey.
- The fruits of the tomato are of berry type.
- The seeds of orchids are non- endospermic.
- Placentation is arrangement of the ovules on the placenta inside the ovary. Primrose has a free central placentation.

191. Phylloclades are
(a) green, photosynthetic, succulent stems of indefinite growth
(b) one internode long stems
(c) leaf modifications
(d) none of the above

J&K CET-2004

Ans. (a) : Phylloclades are green photosynthetic, often succulent stems of indefinite growth. Phylloclade formation is an adaptation for xerophytes. eg. *Opuntia, Casuarina* etc.
• Some plant groups instead have flattened green stem as the chief photosynthetic organs. These are called either cladodes or phylloclades.

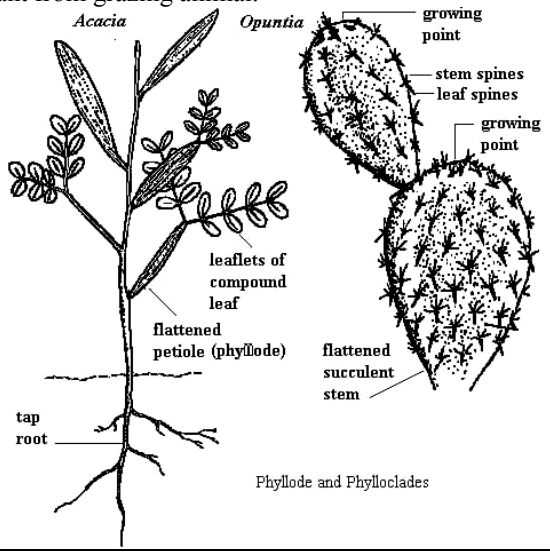
@apna_pdf

D. Leaf and types of Leaf and its Modification

192. Leaves become modified into spines in:-
(a) Pea (b) Onion
(c) Silk Cotton (d) Opuntia

AIPMT-2015
AP EAMCET-1998
CMC Vellore-2011
BHU PMT (Mains)-2011
JCECE-2005
Manipal-2000
Punjab MET-2014

Ans. (d) : The leaves are modified into spines in opuntia. Opuntia is a Xerophytic plant, It grows in the desert where water is very limited. In it, the leaves of areoles are modified into sharp and pointed spines, their main function is the protection, spines help to reduce the loss of water by transpiration, they also protect the plant from grazing animal.



193. When a plant has different types of leaves, the condition is known as
(a) heterophylly (b) anisophylly
(c) myrmecophily (d) None of the above

BVP-2014
VMMC-2005
AMU-2004
BVP-2003

Ans. (a) : The plant which show more than one type of leaves or shape of leaves on the same or different stem is known as heterophylly. The phenomenon is seen in semi-aquatic plants. Ex. *Limnophila*.
Anisophylly:- Plant having pairs of leaves with significant difference in their size between two leaves.

194. In a dorsiventral leaf the position of xylem
(a) Xylem surrounds phloem.
(b) Xylem is towards adaxial epidermis
(c) Xylem is surrounded by phloem.
(d) Xylem is towards abaxial epidermis.

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : The dorsiventral leaf the position of xylem is form when xylem is towards adaxial epidermis.
When xylem surrounds phloem this condition is called Concentric upto centric or Amphivasal.
When xylem is surrounded by phloem is called amphivasal vascular bundle.

195. The ability of plants to follow different pathways in response to environment leading to formation of different kinds of structures is called:
(a) Redifferentiation (b) Development
(c) Plasticity (d) Differentiation

NEET (Re-Exam)-04.09.2022

Ans. (c) : The ability of plants to follow different pathways in response to environment leading to formation of different kinds of structures is called Plasticity.
E.g :- Heterophylly in cotton, coriander and larkspur.

196. The side of flower facing the mother axis is called _____
(a) Anterior side (b) Posterior side
(c) Dorsal side (d) Ventral side

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : The side of flower facing the mother axis is called as posterior side.While the side of the bract is anterior side.

197. Integuments are absent in _____
(a) Helianthus (b) Loranthus
(c) Polygonum (d) Datura

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Each ovule has one or two protective envelops called integuments. Loranthus is a parasitic plant in which protective envelops i.e. integuments are absent which grow on the branches of woody trees.

198. Strobilanthes kunthiana flowers once in ____.
(a) 100 years (b) 30 years
(c) 12 years (d) 50 years

AP EAMCET-03.09.2021 Shift-II

Ans. (c) : Strobilanthes kunthiana is a shrub that found in the shola forests of the Western Ghats in Kerala. The purplish blue flower blossoms only once in 12 years, and gave the Nilgiri mountains range its name, from the Tamil Nil(blue) + giri (mountain).

199. Choose the correct statements of the following
(A) A bud is present in the axil of leaflets of the compound leaf
(B) *Casuarina* has limited growth of branches as *phylloclades*
(C) Sub aerial stem of *Oxalis* spread to new niches when old parts die
(D) Pericarp and seed coat fuse together in *caryopsis*
(a) A, B, C (b) A, C, D
(c) A, B, D (d) B, C, D

TS EAMCET-10.08.2021 Shift-I

Ans. (d) : Axillary bud is present in the axil of petiole of the compound leaf but not at the axil of leaflets of compound leaf.
- The *Casuarina* has limited growth of branches as phylloclades.
- Sub aerial stem of *oxalis* spread to new niches when old part die.
- The pericarp and seed coat fuse together in *caryopsis*.

@apna_pdf

200. Isobilateral leaf shows following difference with dorsiventral leaf, except _____
(a) Stomata are present on both sides
(b) Well differentiated mesophyll
(c) Bulliform cells
(d) Parallel venation

AP EAMCET-05.10.2021 Shift-I

Ans. (b) : isobilateral leaf shows difference with dorsiventral leaf except well differentiated mesophyll. In case of isobilateral leaf, the mesophyll tissue in the leaves is not differentiated.

201. Assertion (A) : In Nepenthes leaves are modified to trap insects
Reason (R) : Insects serve as nitrogen supplements
(a) Both A & R are true but R is not the correct explanation of A
(b) Both A & R are true and R is the correct explanation of A
(c) A is true R is false
(d) A is false R is true

AP EAMCET-25.09.2020 Shift-II

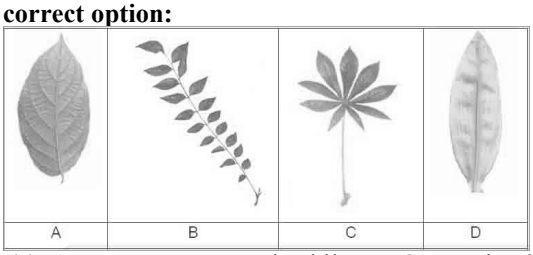
Ans. (b) : Nepenthes is an insectivorous plants. The plants modified their leaves to acquire nitrogen by capturing insects. Nepenthes capture prey with a pitfall trap that release on a microstructure, slippery surface.

202. A student observes grass and Hibiscus plants in his garden during noon. To his surprise, only the leaves of grass were found rolled inwards. The reason could be.
(a) presence of more number of stomata on the grass leaves.
(b) undifferentiated mesophyll in grass leaves
(c) presence of Bulliform cells in the grass leaves
(d) due to higher rate of transpiration.

Karnataka CET-2020

Ans. (c) : In grasses, certain adaxial epidermis have a large, empty, colourless cells, called bulliform cells. When the bulliform cells in the leaves have absorbed water and are turgid, the leaf surface is exposed. When they are flaccid due to water stress, they make the leaves curl inward to minimize water loss.

203. Identify the given diagrams and mark the correct option:



(a) A, D are compound while B, C are simple leaves
(b) A, D are simple while B, C are compound leaves
(c) A, B are simple while C, D are compound leaves
(d) A, B are compound while C, D are simple leaves

AIIMS-26.05.2019 Shift-I

Ans. (b) : A and D are simple leaf but B is pinnate compound leaf and C is palmately compound leaf type.
• A simple leaf is single leaf that is never divided into smaller leaflet units. It is always attached to a twig by its petiole. The compound leaf is a leaf whose leaflets are attached to the middle vein (rachis) but have their own stalks.
• Simple:- A leaf with one blade which may be entire or incised to any depth but not upto the mid-rip or petiole e.g:- *Crotalaria juncea*.
• Compound :- A leaf in which the blade in incised upto the mid-rip or petiole into two or more leaflets.
e.g:- *Clitoria ternatea.*

204. Which one of the following anatomical structures is involved in guttation?
(a) Cuticle (b) Hydathodes
(c) Lenticels (d) Stomata

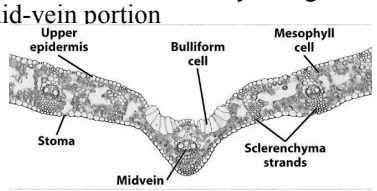
KVPY SA-2019

Ans. (b) : The loss of water in the form of droplets from margins of leaves is called as guttation.
The absorption of water exceeds that of the transpiration due to which, root pressure is increased in xylem and water comes out through hydathodes.

205. Grass leaves curl inwards during very dry weather. Select the most appropriate reason from the following:
(a) Flaccidity of bulliform cells
(b) Shrinkage of air spaces in spongy mesophyll
(c) Tyloses in vessels
(d) Closure of stomata

NEET-2019
DUMET-2011

Ans.(a) : Bulliform Cell - These cells are present in the upper surface of the leaf. They are generally present near the mid-vein portion



206. Match the following with respect to the morphology of the leaf:

(i)	**Simple**	**(p)**	**Zornia diphylla**
(ii)	**Bifoliate**	**(q)**	**Clitoria ternatea**
(iii)	**Trifoliate**	**(r)**	**Lablab purpureus**
(iv)	**Compound**	**(s)**	**Crotalaria Juncea**

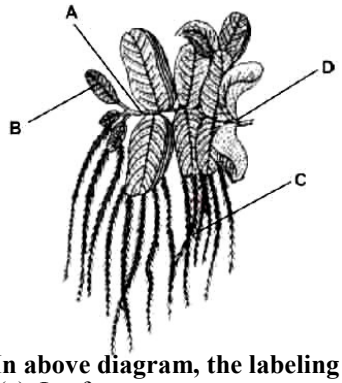
(a) s, p, r, q (b) p, q, r, s
(c) p, s, r, q (d) q, r, s, p

SRM JEEE-2019

Ans. (a) : Type of leaf :-
• Simple:- A leaf with one blade which may be entire or incised to any depth but not upto the mid-rip or petiole e.g:- *Crotalaria juncea*.
• Compound :- A leaf in which the blade in incised upto the mid-rip or petiole into two or more leaflets.
e.g:- *Clitoria ternatea.*
• Palmately compound :- Leaflets attached at the tip of the petiole as fingers of a hand.
(i) Unifoliate :- A leaf is reduced to a single terminal leaflet.
(ii) Bifoliate:- A leaf having two terminal leaflets.
e.g :- *Zornia diphylla.*
(iii) Trifoliate:- A leaf having three terminal leaflets.
e.g. :- *Lablab purpureus.*

@apna_pdf

207.



In above diagram, the labeling 'C' is?

(a) Leaf
(b) Intermodal cognation
(c) Third leaf is modified into root
(d) Rhizoid

AIIMS-27.05.2018 Shift-I

Ans. (c) : In the case of *Salvinia* behalf of above mentioned figure (C) is represented as third leaf is modified into root.

• In case of *Salvinia* three leaves are present at one node. Out of these two leaves are normal and third gets modified into adventitious roots which help in floating over the surface of water.

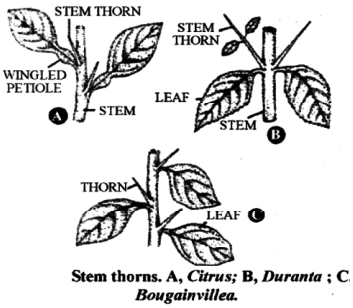
• The given diagram shows *Salvinia* an aquatic fern. The plant body consists of a floating stem bearing two rows of large green leaves on the upper surface and highly branched modified leaf roots on the lower surface.

208. In Bougainvillea thorns are the modifications of:

(a) Stipules (b) Adventitious root
(c) Stem (d) Leaf

NEET-2017

Ans. (c) : Stem gets modified to perform some specialized functions. The axillary bud of the stem is modified into thorns in Bougainvillea to protect them from their enemies.



Stem thorns. A, *Citrus*; B, *Duranta* ; C *Bougainvillea.*

209. A leafy vegetable which has ochraceous stipules

(a) Platanus (b) Amaranthus
(c) Mentha (d) Rumex

AP EAMCET-2002

Ans. (d) : A stipule is an outgrowth borne on both side of a leafstalk base. Membranous tubular stipules that sheath the axillary bud and a past of inter node is called an ochraceous stipule. It is formed by the union of two stipules e.g. :- **Polygonum** and **Rumex.**

210. Which one of the following has thorns, bearing leaves and flowers on them?

(a) Duranta (b) Artabotrys
(c) Carissa (d) Bougainvillea

AP EAMCET-2002

Ans. (a) : Thorns are sharp and stiff which lost their growing point. These are modified stem, leaf or bud structure which contain vascular bundle. Thorns protects the plants from animal and reduce the water loss. Duranta is fast growing evergreen shrub. Their flowers are light blue and its axillary bud is modified into thorns.

211. The leaf less stem of onion which is produced to bear flower is called :

(a) thalamus (b) scape
(c) torus (d) Pedicel

AFMC-2006

Ans. (b) : The leaf less stem of onion which is produced to bear flower is called scape. A scape is a single internode or just the basal internode of a peduncle in a stem without leaves and branches. Peduncle is a part of stem. Onion plants produce a leafless flowering stem which exhibits scape.

212. Unifacial leaves are found in:

(a) Cestrum (b) Allium
(c) Hibiscus (d) Eucalyptus

AP EAMCET-2000

Ans. (b) : Unifacial leaves are found in Allium (onion). Unifacial leaf is a leaf that develops from one side of the leaf primordium only and in consequence has only an encircling adaxial or abaxial epidermis.

• Unifacial leaf is also called as isobilateral or amphistomatic. The epidermis aids in the regulation of gas exchange.

• Stomata are present in upper and lower epidermis of unifacial leaves which are openin through which the exchange of gases takes place.

213. Bract is a modified:

(a) Petal (b) Sepal
(c) Leaf (d) Involucres

Rajasthan PMT-2009
Punjab MET-2009
CMC Vellore-2009

Ans. (c) : A bract is a modified leaf structure found on flower or cones. Bracts are usually different from foliage leaves. They may be smaller, larger or of a different color, shape or texture.

Petal:- Petals are the modified leaves which surround the flower. Petal is a modification of corolla.

Sepal : - Sepals are small leaf shaped green colour and outer most part of the flower. Sepals is a modification of calyx. Sepals provide support to the flower.

214. The following feature, is common in both *Balanophora* and *Casuarina* :

(a) parasitism (b) tree habit
(c) scale leaves (d) phyllode

AP EAMCET-1999

Ans. (c) : Scale leaves is common in both *Balanophora* and *Casuarina*. Scale leaves are small reduced leaves which are also known as cataphylls. It is not a photosynthetic structure but it provides storage function.

@apna_pdf

215. Desert grasses often roll their leaves due to presence of:
(a) oily surface (b) bulliform cells
(c) spines (d) Both (a) and (b)
(e) None of the above

CMC Vellore-2010
Punjab MET-2008

Ans. (b) : Desert grasses are monocot and in monocot leaves the epidermal cells are present in the upper surface. They prevent water loss and are responsible for curling up of leaf during water stress. Bulliform cells are types of epidermal cells, which are big sized, thin walled large vacuolated cells that frequently occurs towards the lower epidermis.

216. Which is absent in a leaf?
(a) Lenticels (b) Stomata
(c) Mesophyll (d) Chloroplast

BCECE-2008

Ans. (a) : Lenticels are present in the bark. Lenticels are tiny pores present on the surface of roots and stems. There pores facilitate gaseous exchange between the atmosphere and the plant.
Stomata:- Stomata regulate gas exchange between the plant and environment and control of water loss.
Mesophyll:- Mesophyll cell is present in the leaves
• Hence mesophyll cell of leaves are centres of photosynthesis.
• There are two types of mesophyll cell in leaves palisade and spongy mesophyll.
• Photosynthesis occurs in the chloroplast.

217. The number of stomata present per cm^2 of leaf is:
(a) 1000 to 60000 (b) Less than 100
(c) One million (d) None of these

AMU-2003

Ans. (a) : The number of stomata per cm^2 of a leaf typically falls within the range of 1000 to 60000. This variation is due to factors like plant species, environmental conditions, and the leafs position on the plant. The number of stomata per unit area of leaf is called stomatal frequency. Stomatal frequency of trees and shrubs is higher than those of herbs.

218. Arrange the following plants in the ascending order based on the number of leaflets in a leaf
I. Hardwickia **II. Gynandropsis**
III. Marsilea **IV. Citrus**
(a) I, III, II, IV (b) IV, I, III, II
(c) IV, I, II, III (d) II, IV, III, I

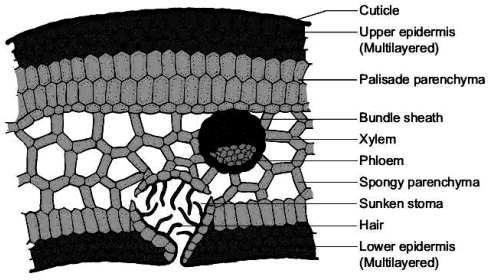
AP EAMCET-2007

Ans. (b) : Ascending order based on the number of leaflets in a leaf of plants is-
Citrus < Hardwickia < Marsilea < Gynandropsis

219. In which of the following plant sunken stomata are found : -
(a) Nerium (b) Hydrilla
(c) Mango (d) Guava

AIPMT-2001
AMU-2009

Ans. (a) : In Xerophytic plant the stomata are sunken as they are located in a Cup-shaped depression (eg:- Nerium). It is an adaptation to reduce the loss of water in xerophytic plants.
• Usually the stomata are placed at the same level as the adjoining epidermal cells (eg:- *Helianthus, Mangifera*).



T.S. of Nerium leaf

220. A compound leaf which appears as simple leaf due to the suppression of one or two leaflets is found in one of the following plants:
(a) Hardwickia (b) Parkinsonia
(c) Coriandrum (d) Citrus

AP EAMCET-2005

Ans. (d) : A compound leaf has a blade which is divided into small leaf like leaflets. Citrus plant contain compound leaf which looks like simple leave due to suppression of its one or two leaflets.
• Coriandrum leaves are alternate compound and most are pinnate or bipinnate.

221. Specific characteristic hydrochasy is stimulated by presence of special cells in upper epidermis of leaf in ?
(a) Mesophytic grasses (bulliform cells)
(b) Xerophytic grasses (bulliform cells)
(c) Halophytes (bulliform cells)
(d) Xerophytes (bulliform cells)

UP CPMT-2014

Ans. (b): Some xerophytic grasses possess specific hydrochasy characteristics. Their leaves contain special bulliform cell in upper epidermis. In xeric condition, due to excess evaporation of water these cells shrinks and roll down itself towards inside and reduce the rate of transpiration. Stomata are now closed and shift inside leaves.
e.g. :- **Ammophila**, **Agropyron**, etc.
• **Mesophytic grasses**– The leaves of mesophytic plants have a variety of leaf shapes, but they are generally flat, thin relatively large, and green in color.
• **Halophytes–** A plant adapted to growing in saline conditions, as in a salt marsh.
• **Xerophytes–** A plant which needs very little water.

222. The modification of petiole, which became specialised structure like leaf and carry out photosynthesis:
(a) Phylloclade (b) Cladode
(c) Phyllode (d) All of these

UP CPMT-2014

Ans. (c): The modification of petiole in leaf like flattened structure in some species of acacia perform photosynthesis. This modification of petiole is carried out due to absence of leaf lamina. This flatened petiole is known as phyllode.

@apna_pdf

• **phylloclade**– A phylloclade is a modification stem responsible for photosythesis.
• **Cladode**– Cladode is a form of modified stem, which is green and fleshy in nature.

223. Study the following lists

List I	List II
(A) Entire leaf modified into a spine	**1. Clematis**
(B) Leaf except stipules modified into a tendril	**2. Citrus**
(C) Stipules modified into a tendril	**3. Euphorbia**
(D) First leaf of axillary bud modified into a spine	**4. Lathyrus**
	5. Smilax

The correct match is

	A	B	C	D
(a)	3	4	5	2
(b)	3	1	4	2
(c)	2	3	1	5
(d)	5	2	1	3

AP EAMCET-2009

Ans. (a) : Entire leaf is modified into a spine in the phylloclade of Euphorbia.
• In **Lathyrus aphaca**, whole leaf is modified into tendril. Stipular tendrils are found in Smilax.
• First leaf of axillary bud is modified into spine in citrus.
• In Clematis, the petiole, the rachis and petiolules (stalk of leaflets) get modified into tendrils.
Lathyrus is a plant. People use it as medicine. Despite serious safety concern, **Lathyrus sativus is used in unleavened India bread**. Lathyrus seeds are eaten as food and used as animal fodder.
Euphorbia is a very large and diverse genus of flowering plant.

224. Which is absent in a leaf?
(a) Lenticels (b) Stomata
(c) Mesophyll (d) Chloroplast

UP CPMT-2006

Ans. (a): Lenticels- Leaves do not have lenticels. Lenticels are present in the bark. A lenticel is a tissue having intercellular space. Lenticels are lens-shaped opening in the trunk of woody dicotyledonous plant. It function as pathways for the direct exchange of gases between internal tissue and atmosphere through the bark, which is otherwise impermeable to gases.
• **Stomata-** A stomata, also called a **stomate** is a pore, found in the epidermis of leaves, stems and other organs, that controls the rate of exchange of gasses.
• **Mesophyll-** is the internal ground tissue located between the two epidermal cell layers of the Leaf
• **Chloroplast-** A chloroplast is an organelle within the cells of plants and certain algae that is the site of photosynthesis, which is the process by which energy from the sun is converted into chemical energy for growth.

225. A mature ligule, having prominent basal portion is called:
(a) Glossopodium (b) Rhizophore
(c) Trichome (d) None of these

BHU PMT (Mains)-2006

Ans. (a) : A mature ligule having prominent basal portion is called *Glossopodium*. The ligule is a leaf like structure which is present on the adaxial side of the leaf. The ligule is considered to be secretory organ for keeping the sporangium and young leaves moisture also considered as protective structure of sporangium and leaves.

226. Which of the following two are the resultant of stipule modifications
i. Spines in Ziziphus
ii. Tendrils in Smilax
iii. Tendrils in Nepenthes
iv. Spines in Argemone
v. Thorns in Bougainvillea
(a) i, iii (b) i, ii
(c) ii, v (d) iii,v

AP EAMCET-2008

Ans. (b) : Stipule is usually visible as an outgrowth that is borne on either side of the stalk. Modification of stipules are called as **stipular modification**. Zizyphus is a spiny shrub. In this, the stipules are modified into Spines. They help in protection of the plant. In Smilax, the stipules are modified into tendrils, used as climbing tendrils.

227. The bladders of Utricularia and pitchers of Nepenthes are modification of:
(a) stems (b) leaves
(c) roots (d) flowers

J&K CET-2004

Ans. (b) : The bladders of utricularia and pitchers of Nepenthes are modification of leaves. Nepenthes also called tropical pitcher plant or monkey cup. Pitcher plant the leaf of the pithcer plant is modified into a trapping device that looks like a pitcher.

228. The most common type of compound leaves occurring in nature are
(a) Bipinnate (b) Tripinnate
(c) Trifoliate (d) Decompound

UP CPMT-2013

Ans. (d) : The most common type of compound leaves occurring in nature are decompound. Leaf lets of several distinct part. The best example of this type of leaf is coriander.

229. Stipules remain persistent throughout the whole life of the leaves in:
(a) Michelia (b) Cassia
(c) Hibiscus (d) Oryza

UP CPMT-2013

Ans. (c) : Stipules remain persistent throughout the whole life of the leaves in Hibiscus. Stipules are foliar appendages at the base of the leaf sheath or hypo podium that are often paired and some times leafy.

230. Bulliform cells are found in upper epidermis of :
(a) cladodes (b) phylloclades
(c) monocot leaf (d) dicot leaf

BVP-2000
AIIMS-1995
Rajasthan PMT-2001

Ans. (c) : Bulliform cells are found in upper epidermis of monocot leaf. The vascular structures of monocot leaf from parallel veins. Monocot leaf differs from dicot leaves in several ways.

@apna_pdf

231. Perianth is represented by:
(a) glumes (b) lemma
(c) lodicules (d) palea

UP CPMT-2009
Punjab MET-2009
AP EAMCET-2011

Ans. (c) : Perianth is represented by lodicules. The perianth is the outer part of a flower that includes the calyx (sepals) and corolla (Petals).
• In family Gramineae (or poaceae), the perianth is represented by membranous scales called lodicules. The lodicules are situated above and apposite the superior palea.

232. In gloriosa, the tendrillar part is formed by:
(a) leaf petiole (b) stipule
(c) axillary bud (d) leaf apex

AIIMS-1996

Ans. (d) : In gloriosa, the tendrillar part is formed by leaf apex. Gloriosa are herbaceous perennials that climb or scramble over other plants with the aid of tendrils at the end of their leaves and can reach 3 meters in hight.

233. What type of sorus is present in Nephrolepis?
(a) Coenosorus (b) Simple
(c) Mixed (d) None of these

AIIMS-2011

Ans. (c) : In **Nephrolepis mixed sorus** is present because without any order of development sporangia arise. Sorus is a special structure and the outgrowth of the leaf helps in providing protection to the sporangia. In it the young and old sorus are indiscriminately mixed.

234. A leaf is identified by:
(a) flat green lamina
(b) presence of axillary buds
(c) presence of leaf blade and petiole
(d) none of the above

J&K CET-2000

Ans. (b) : A leaf is identified by flat green lamina. A broad expanded blade (the lamina) attached to the plant stem by a stalk like petiole. The axil of the leaf is the upper angle between the leaf and the stem. Structures located there are called axillary. It is often the location of a bud so that bud is known as axillary bud.

235. Leaves of grasses roll and unroll due to:
(a) hormonal change
(b) change in temperature
(c) change in turgor pressure
(d) presence of bulliform apparatus

JCECE-2006

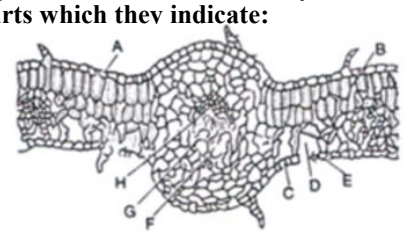
Ans. (d) : Leaves of grasses roll and unroll due to presence of bulliform apparatus. Bulliform cells are a group of large parenchyma cells that specifically exist on the upper surfaces of leaves of many monocots.

236. Leaves arise from which part of plant?
(a) Rhizome (b) Stem
(c) Internode (d) Node

AFMC-2003

Ans. (d) : Nodes are the points on a stem from which the buds and leaves arise. The distance between two nodes is called internode. A stem is a structural axis of a vascular plant, it support leaves, flowers and fruits, transports of water and other substance.
• Rhizome is a modified stem and horizontal underground plant stem capable of producing the shoot and root system of a new plant.

237. In the diagram of the portion of the TS of Helianthus leaf passing through the midrib given below, certain parts have been indicated by alphabets, choose the answer in which these alphabets have been correctly matched with the parts which thev indicate:



(a) A = Epidermis, B = Spongy parencyhyma, C = Palisade parenchyma, D = Stomata, E = Guard cells, F = Phloem.
(b) A = Epidermis, B = Palisade parenchyma, C = Spongy parenchyma, D = Sub - stomatal cavity, E = Guard cells, F = phloem, G = Metaxylem, H = Protoxylem,
(c) A = Epidermis, B = Palisade parenchyma, C = Spongy parenchyma, D = Stomata, E = Guard cells, F = Endodermis, G = Xylem, H = phloem,
(d) A = Epidermis, B =Palisade parenchyma, C = Spongy parenchyma, D= Stomata, E = Guard cells.

Karnataka CET-2001

Ans. (b) : Dicotyledonous leaves usually rounded with reticulate venation which be distinguished from monocotyledonous leaves in their structure and anatomy. A Typical dicot leaf consists of a leaf blade which is additionally called the lamina. The lamina is that the widest part of a leaf. In the dicot leaf, we have, Epidermis, Palisade parenchyma, spongy parenchyma, Sub-stomatal cavity, stomata, Phloem, ,Metaxylem and protoxylem.

238. Storage leaves occur in:
(a) Allium (b) Zizyphus
(c) Tricicum (d) Trapa

WB JEE-2007

Ans. (a) : Storage leaves occur in allium. Allium is a genus of monocotyledonous flowering plants with hundreds of species one loding the cultivated onion, garlic, scallion, shallat, leek, and chives. The generic name allium is the latin word for garlic and the type species for the genus is *Allium sativum* which means "cultivated garlic".

239. Two chief functions of the leaves are:
(a) photosynthesis and respiration
(b) photosynthesis and transpiration
(c) transpiration and respiration
(d) respiration and digestion

WB JEE-2007

Ans. (b) : The main function of leaves are photosynthesis, a leaf is to produce food for the plant by photosynthesis chlorophyll, the substance that gives plants their characteristic green color, absorbs only energy.
In actively growing plants, water is continuously evaporating from the surface of leaf cells exposed to air. This water is replaced by additional absorption of water

@apna_pdf

from the soil. Liquid water extends through the plant from the soil water to the leaf surface where it is converted from a liquid into a gas through the process of evaporation.

240. The leaves of some plants contain crystals of calcium carbonate in epidermal cells, giving appearance that of bunch of grapes are called:
(a) cystoliths (b) sphaeraphides
(c) raphides (d) otoliths
MGIMS Wardha-2015
Rajasthan PMT-1997,2001

Ans. (a) : The leaves of some plants contain crystals of calcium carbonate in epidermal cells, giving apperance that of bunch of grapes are called cystoliths. Calcium carbonate crystals have been reported from within the cells of banyan leaf and some members of families *Acanthaceae, cucurbitaceae, utricaceae* etc. Some cells contain star-shaped aggregation of crystals of calcium oxalate which are known as sphaeraphides.
Raphide is needle-shaped crystals calcium oxalate.
Otolith is granule of calcium carbonate in vertebrates inner ear.

241. In tamarind, the pinnate leaf is:
(a) bipinnate (b) tripinnate
(c) paripinnate (d) imparipinnate
Punjab MET-2011

Ans. (c) : In tamarind, the pinnate leaf is peripinnate. The tamarined leaf is the leaf of a tall shade tree native to Asia and Northern Africa and widely grown in India. Paripinnate leaf- Evenly paired pinnate leaves, the leaf lets are arranged in an opposite manner and rachis ends with two leaflets.

242. Match entities of List I with List II

List I	List II
(A) Bulliform	**(1) Stomata**
(B) Guard cells	**(2) Aerating pore**
(C) Lenticel	**(3) Accessory cells**
(D) Subsidiary	**(4) Isobilateral leaf**

(a) A-4 B-1 C-2 D-3
(b) A-1 B-4 C-2 D-3
(c) A-4 B-2 C-3 D-1
(d) A-1 B-2 C-3 D-4
Manipal-2014

Ans. (a) :
(A) Bulliform → Isobilateral leaf
(B) Guard cells → stomata
(C) Lenticel → Aerating pore
(D) Subsidiary → Accessory cells

243. Leaf blade is spinous in case of :
(a) Nerium (b) Ziziphus
(c) Argemone (d) Cannabis
Manipal-2005

Ans. (c) : Leaf blade is spinous in case of argemone. Argemone is a genus of flowering plants in the family papaveraceae commonly known as prickly poppies.
• These protect the plant from grazing animals and reduce the rate of transpiration in xerophytic plants.

244. Leaf lamina is modified into two toothed jaws in:
(a) Nepenthes (b) Dionaea
(c) Drosera (d) Utricularia
Haryana PMT-2001

Ans. (b) : Leaf lamina is modified into toothed jaws dionaea. It lamina is modified into two toothed jaws and form a trap.
• Dionaea muscipula commonly called venus fly trap, is perhaps the best known of the carnivorous plant species on earth.

245. The synthesis of florigen occurs in:
(a) Root (b) Leaf
(c) branch (d) Stem
Rajasthan PMT-1995

Ans. (b) : Florigen is systemically mobile signal that is synthesized in leaves and transported via the phloem to the shoot apical meristem (SAM) where it initiates flowering.

246. Thigmotropism is best observed in:
(a) Roots (b) Leaves
(c) Tendrils (d) Stems
BHU PMT (Screening)-2005

Ans. (c) : Thigmotropism is typically found in twining plants and tendrils, however plant biologists have also found thigmotropic responses in flowering plants and fungi. This behaviour occurs due to unilateral growth. Inhibition.

247. Heterophylly of Limnophila is
(a) Environmental (b) Developmental
(c) Habitual (d) Adaptive
BHU PMT (Mains)-2007

Ans. (d) : Heterophylly of limnophila is adaptive. Heterophylly is the development of different leaf forms in a single plant depending on the environment condition. It is usually 3 types- habitual heterophylly, Developmental, environmental.

248. I. Pulvinus leaf base is present in some leguminous plants.
II. Whorled phyllotaxy is seen in Calotropis.
III. In Australian acacia, the petioles expand, become green and synthesise food.
IV. A bud is present in the axil of leaflets of the compound leaf.
Of the above statements
(a) I and IV are correct but II and III are wrong.
(b) II and III are correct but I and IV are wrong.
(c) I and III are correct but II and IV are wrong.
(d) III and IV are correct but I and II are wrong.
(e) II and IV are correct but I and III are wrong.
Kerala PMT-2013

Ans. (c) : I and III are correct but II and IV are wrong. The swollen leaf base is called a pulvinus. It regulate the movement of leaf in plant, usually present in the leguminous plant. The arrangement of leaves on the stem or branch of plant is called phyllotaxy, whorled phyllotaxy found in Alstonia and Nerium.
In calotropis opposite phyllotaxy is present. A bud is present in the axil of petiole of simple and compound leaves. It is not present in the axial of leaf lets of compound leaf.

249. Cuticle is secreted by:
(a) epidermis (b) endodermis
(c) both (a) and (b) (d) hypodermis
Rajasthan PMT-2005

@apna_pdf

Ans. (a) : Cuticle is secreted by epidermis. In some higher plants the cuticle is a water impervious protective layer covering the epidermal cells of leaves and other parts and limiting water loss due to their waxy secretion.

250. Leaf tendrils are found in:
(a) peas (b) cucumber
(c) grape vines (d) all of theses

AMU-2015

Ans. (a) : Stem tendrils develop from the axillary buds.
• The tendrils are modified stem or leaf that has thread like shape which provides support to the climbing plant. A leaf tendril in peas are actually modified leaves that emerges through a leaf and it has wiry and coiled structure that surrounds and supports plant.

251. The spines of cacti are modified:
(a) scales (b) stems
(c) leaves (d) petioles

UP CPMT-2010

Ans. (c) : The spines of cacti are modified leaves. Most species of cacti have spines. It helps to prevent water loss. Spines are highly modified leaves that protect the plant from herbivores, radiate heat from the stem during the day.

252. The type of leaf in *Daucus carota* is :
(a) simple (b) bipinnate
(c) tripinnate (d) decompound

Uttarakhand PMT -2004
AMU -2005
Manipal-2004

Ans. (d) : Decompound type of leafs found in *Daucus carota.* The leaf rachis divided or more then three times and gives rise to small axis on which leaflets are arranged.
Example of this type of leaves are Parthenium, Coriander, Fennel etc.

253. Thick cuticle on the leaves are typical of plants growing in
(a) wet habitats (b) warm habitats
(c) dry habitats (d) cool habitats

BHU PMT (Mains)-2009

Ans. (c) : Thick cuticle on the leaves are typical of plants growing in dry habitats. The cuticle is the thick waxy coating present on leaf, which reduces the transpiration rate at high temperature so these plants belonging to dry region.

254. Which is correct match ?
(1) Opuntia - bulb
(2) Asparagus - cladodes
(3) Ruscus - phylloclade
(4) Citrus - stem thorns
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2005

Ans. (c) : Asparagus is example of cladodes and citrus is example of stem thorns.
Asparagus : cladodes are green photosynthetic stems that are generally one internode long.
The true leaves of the plants are reduced to scales or spines.
Citrus : Sometimes thorns are present in axil of the leaves or apex of stem. There are modified stem that perform the function of defence.

255. In Kalanchoe, the epiphyllous buds producing roots occur on :
(a) leaf margin only
(b) leaf margin and stem
(c) leaf petiole and stem
(d) leaf surface only

BHU PMT (Mains)-2005

Ans. (a) : In kalanchoe, the epiphyllous buds producing root occur on leaf margin only.
These buds are known as the Epiphyllous buds. This buds detach from the leaves and fall on the soil and grow into new plant.

256. Which one is a correct match about leaf modification?
(1) Fleshy leaves? Aloe, Agave, sedum
(2) Bladder? Utricularia stellaris
(3) phyllode ? Acacia , parkinsonia
(4) leaf spine ? cucurbica
(a) 1,2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (a) : Fleshy leaves: plants with fleshy leaves are called succulents and are usually found in areas like deserts there leaves are green and fleshy because they store water in them. ex- *Aloe, Agave, sedum.*
Leaf Bladder : The segments of the leafs are modified in bladders. These plants are found into water the inner wall is provided with digestive gland which helps in digesting the trap insect. ex- *Utricularia stellaris*
Phyllode : In some plant, petiole becomes flattened and it becomes like a leaf and green in colour are known as phyllode ex-*Acacia, parkinsonia* leaf.
Spine : leaf spines reduce water loss due to transpiration. There leaf modified into needle like structure which is known as spine. Ex. *Opuntia*

257. The leaves are modified into pitcher in:
(a) Drosera (b) Aldrovanda
(c) Sarracenia (d) Utricularia

BHU PMT (Mains)-2011

Ans. (c) : The leaves are modified into pitcher in *sarracenia*, also called trumpet pitchers.
Leaves of *sarracenia* has the largest pitcher. In pitchers the leaves are usually modified to form pitfall traps, this type of modification is observed in a pitcher plant.

258. In which of the following plants, leaf apex changes into tendril?
(a) Gloriosa (b) Smilax
(c) Pisum sativum (d) Australian Acacia

AFMC-2002
Manipal-2012

Ans. (a) : Leaf tips are modified into tendrils in *Gloriosa superba*. It is an angiosperm plant classified as monocot. There tendrils wrap around surrounding plants for support.
They also helps in attachment, support and cellular invasion of other plants.

@apna_pdf

259. The leaves without petiole are called:
(a) lamina (b) rachis
(c) petiolate (d) sessile
AMU-2011

Ans. (d) : A leaf without petiole is called sessile leaf. In that case, leaves or leaflet directly attach to the stem (without stalk). This kind of leaves known as apetiolate. Ex. *Oryza* (Rice)

260. Find the correct match.
(a) Mustard plant - Leaves are opposite
(b) Mustard plant - Leaves are alternate
(c) Guava plant - Leaves are alternate
(d) Guava plant - Leaves are whorled
AMU-2010

Ans. (b) : Leaves are important in plant as they make food by photosynthesis. Mustard plant have alternate leaf which are branched, petiolate, long and hairy on both sides, Example of Alternate phyllotaxy are china rose, sunflower.
Guava leaf are oval in shape the leaves grow in an opposite arrangement and have short petioles that join the leaf to the stem.

261. Goldfussia in which two different size of leaves are found is an excellent example of:
(a) Heterophylly (b) Anisophylly
(c) Distichous (d) None of these
AMU -2000

Ans. (b) : Anisophylly (The occurrence of two sizes of leaves). Anisophylly is term commonly referred to explain plant having pairs of leaves with the significant difference in their size between two leaves. Ex. Goldfussia *(Strobilanthes anisophyllus)*,Glomerata etc.
Heterophylly is the development of different leaf forms in a single plant depending on the environmental condition. Ex. ficus, Artocarpus
Distichous phyllotaxy, also called two ranke leaf arrangement.

262. Insectivorous plants usually survive in:
(a) water rich soil
(b) N_2 deficient soil
(c) N_2 rich soil
(d) sugar deficient medium
Manipal-2000

Ans. (b) : Insectivorous plants are also called carnivores plant, they are known as pitcher plants. They are grown in a regions where nitrogen deficient in soil and fulfill their nitrogen requirement by trapping small insects.

263. Swollen and spongy petioles are characteristic of:
(a) Trapa (b) Wolffia
(c) Ceratophyllum (d) Limnophila
AP EAMCET-2003

Ans. (a) : Swollen and spongy petioles keeps the water hyacinth plants float. They are commonly name as water chestnut. When filled with air provides the buoyancy to the water hyacinth so that it can float above the water without any support.

264. Exstipulate leaves are present in:
(a) Althea rosea
(b) Tridax procumbens
(c) Hibiscus rosa-sinensis
(d) Tephrosia purpurea
AP EAMCET-2003

Ans. (b) : Leaves of some plants have two lateral appendages on either side of the leaf base known as stipules. The stipules are most commonly present in dicot plants. Very few monocot plants posses stipules.
Leave without stipules is called an ex-stipulate leaf. Ex. Solanaceae.
Exstipulate leaves are present in *Tridax procumbens*. It belongs to the family Asteraceae.

265. Modification of petiole into leaf like structure is called:
(a) cladode (b) phylloclade
(c) phyllode (d) pistillode
BVP-2013
CG PMT-2009
Haryana PMT-2009

Ans. (c) : Phyllode is a modified petiole that has become flattened and green to perform the functions of a leaf. It is a xerophytic adaptation.
Its main function is to reduce the rate of transpiration.

266. Flowers and lateral branches arise from the:
(a) lateral buds (b) Lenticels
(c) Stomata (d) Cuticle
HP CET-2012

Ans. (a) : Lateral buds are those which occur on the side of stems, it's called axillary buds. The flower and lateral branches usually develops as a branch from a bud growing in the axil of a small leaf like structure known as bract, such buds are known as lateral buds.

267. Identify the wrong expression from the following statements:
(a) A plant that bears male, female and bisexual flowers is polygamous.
(b) An actinomorphic flower can be dissected into two equal haves from any place.
(c) Superior ovary is found in hypogynous flowers.
(d) That side of the flower towards the bract is called the posterior side.
AP EAMCET-2005

Ans. (d): Bract is considered a modified leaf. It bears a peduncle or petiole in its axile. Bract occurs towards the anterior side of a flower while mother axis or floral axis of a flower occurs towards the posterior side. The branch bearing flower is called as the mother axis.

268. Opening of flower is an example of :
(a) Spontaneous movement
(b) Hyponastic movement
(c) Epinastic movement
(d) Cleistogamous movement
UPCPMT-2002

Ans. (c): Epinastic movements are generally observed in leaves, flowers, petals and buds. In these structures at some stage of development, growth in one surface is more than the growth on the other surface. There is two types a movement-epinasty and hyponasty.
■ A nastic movement in which a plant part such as a flower petal is bent outward and often down ward. An example for epinasty is the opening of a flower and the drooping of a bud.
■ In hyponastic movement, there will be more growth on the lower surface of sepals and petals, the flower will close.

@apna_pdf

E. Venation and Phyllotaxy

269. Circinate vernation is found :
(a) Cycas (b) Fern
(c) Both (a) and (b) (d) None of these
CG PMT-2007
BVP-2013
MGIMS Wardha-2004
UPCPMT-2002

Ans. (c) : Circinate vernation is a type of vernation in which a fern frond is produced. It is tightly curled and it has a tender growing tip. There is a coil in which the growing tip is protected. Circinate refers to leaves or fronds are rolled up with the tip in the centre.
These type of vernation is found in Cycas and fern.

270. The reason for the similar size of vascular bundles in Monocot leaf
(a) Modification of epidermal cells
(b) mesophyll
(c) Bundle sheath
(d) Parallel venation
AP EAPCET-22.05.2023, Shift-I

Ans. (d) : The main different between monocot and dicot leaf is Parallelvenation found in monocot leaf while Reticulate venation found in dicot leaf Parallel venation may be divergent such as Banana and convergent type like rice, Maize, Sugarcane etc.
The parallel venation is main reason for the similar size of vascular bundles in monocot leaf.

271. Family Fabaceae differs from Solanaceae and Liliaceae. With respect to the stamens, pick out the characteristics specific to family Fabaceae but not found in Solanaceae or Liliaceae.
(a) Epiphyllous and Dithecous anthers
(b) Diadelphous and Dithecous anthers
(c) Polyadelphous and epipetalous stamens
(d) Monoadelphous and Monothecous anthers
NEET (UG) 07.05.2023

Ans. (b) : Diadelphous when stamens are united Partially and are present in two bunches, they are called diadelphous. Ex Pea.
- Diadelphous condition is the characteristics feature of fabaceae family.
- Swallen placenta persistent Calyx is the characteristic feature of solanaceae family.
- Liliaceae family is a monocot family

272. Frequency of recombination between gene pairs on same chromosome as a measure of the distance between genes to map their position on chromosome, was used for the first time by
(a) Henking
(b) Thomas Hunt Morgan
(c) Sutton and Boveri
(d) Alfred Sturtevant
NEET (UG) 07.05.2023

Ans. (d) : Alfred Sturtevant used the frequency of recombination between gene pair on the same chromosome as a measure of the distance between genes and mapped their position on the chromosome.
- Alfred Henry Sturtevant was an American geneticist conducted the first genetic map on a chromosome in 1911. He worked with Thomas hunt Morgan on the organism *Drosophila melenogaster.*

273. The pattern of arrangement of leaves on the stem is known as:
(a) heterophylly (b) phyllode
(c) phyllotaxy (d) phylloclade
J&K CET-2014

Ans. (c) : The pattern of arrangement of leaves on the stem or branch is known as **phyllotaxy**. This is usually of three types- alternate, opposite and whorled.

274. 120^{o} phyllotaxy is found in:
(a) tristichous (b) pentastichous
(c) distichous (d) octastichous
Manipal-2015

Ans. (a) : 120° phyllotaxy is found in tristichous. In tristichous phyllotaxy, there are three leaves in one spiral.
The mode of arrangement in the 1st, 4th, 7th and 10 th leaf remains in one row while the 3rd, 6th, 9th and 12th in the second row and 2nd, 5th, 8th and 11th are in the third row. For ex. *Cyperus rotundus*.

275. Which of the following shows both opposite decussate and opposite superposed phyllotaxy?
(a) Psidium (b) Quisqualis
(c) Calotropis (d) Ixora
AP EAMCET-2001
VMMC-2014

Ans. (a) : When successive pair of leaves placed at right angle (90°) of preceding pair of the leaves and there are four vertical rows.
Example : - Calotropis, ocimum
Opposite superposed - The successive pair of leaves are placed in vertical plane of the preceding pairs of the leaves and there are two vertical rows.
Example:- Guava, Jamun (*Eugenia jambulina*)
- In the Guava (*Psidium*) horizontal branches have superposed and vertical branches shows decussate opposite phyllotaxy.

276. Circinate vernation in leaves is caused due to:
(a) epinasty (b) hyponasty
(c) apostrophe (d) None of these
BHU PMT (Screening)-2011

Ans. (b) :
Hyponasty - The hyponasty is an upword folding or untwisting of leaves that results from greater lower side growth which helps to cool the leaves. Because of hyponasty circinate ptyxis is present only in fern leaves.

277. Alternate phyllotaxy in which the sixth leaf lies above the first leaf after completing two circles is known as:
(a) distichous (b) tristichous
(c) pentastichous (d) octastichous
AP EAMCET-2002
AMU-2008
VMMC-2008

Ans. (c) : Phyllotaxy is defined as the arrangement of leaves or mature leaves on branches or the stem in a distinct pattern. Pentastichous phyllotaxy is also called as 2/5 phyllotaxy. It is seen in Hibiscus. In this the sixth leaf base lies above the first one after completing two circles similarly the seventh leaf base lies above the second leaf base.

278. The leaves of *Smilax* and *Colocasia* show:
(a) parallel vernation (b) reticulate vernation
(c) forward vernation (d) lateral vernation
Haryana PMT-2003

@apna_pdf

Ans. (b) :
Reticulate vernation - Leaves of monocot plant shows parallel vernation and dicot leaves shows reticulate vernation. However there are exception in monocots like smilex and colocasia they show reticulate vernation.
In reticulate vernation veins are arranged in the form of a network on the surface of the lamina.

279. Which one of the following plants exhibits an example of anisophylly, where the different size of leaves are present in opposite phyllotaxy?
(a) *Ranunculus aquatilis*
(b) *Gold fussia*
(c) *Limnophila heterophyllum*
(d) *Vallisneria spirilis*

AMU-1996
AMU -2000
AMU-1995

Ans. (b) : *Ranunculus aquatilis* is aquatic plant, growing in mats on the surface of water .
• **Goldfussia** is an example of anisophylly, where the different size of leaves are present in opposite phyllotaxy generally the opposite leaves of a plant are of the same size.
• Limnophila heterophyllum is marsh weed light green leaves contrast.

280. Whorled, simple leaves with reticulate venation are present in :
(a) Alstonia (b) Calotropis
(c) Neem (d) China Rose

AIPMT (Mains)-2011
NEET (Odisha)-2019

Ans. (a) : Whorled simple leaves with reticulate venation are present in Alstonia.
• In leaves of **Alstonia** are simple elliptical or ovate linear to lanceolate and wedge-shaped at the base these are leathery and sessile. The leaf blade is dorsiventral and arranged in a whorl with the entire margin.
• The leaf venation is pinnate, with numerous veins ending in a marginal vein.

281. How many plants among China rose, Ocimum, sunflower, mustard, Alstonia, guava, Calotropis and Nerium (Oleander) have opposite phyllotaxy?
(a) Two (b) Three
(c) Four (d) Five

NEET (Karnataka)-2013

Ans. (b) : The pattern and arrangement of leaf, on stem or branch of plant is called Phyllotaxy.
• Ocimum, Guava and Calotropis have opposite phyllotaxy
• China rose, sunflower, grass, Mustard shows alternate phyllotaxy
• Alstonia, Hydrilla, Nerium (Oleander) show whorled phyllotaxy.

282. Identify the pair that exhibit 'Circinate vernation''.
(a) Equisetum and Selaginella
(b) Psilotum and Riccia
(c) Riccia and Nephrolepis
(d) Nephrolepis and Cycas

Karnataka CET-2010

Ans. (d): Nephrolepis and Cycas exhibit circinate vernation. Circinate vernation is the manner in which the frond emerges, as the fern frond is tightly curled so that the tender growing tip of the fronds is protected within a coil. The fronds unwind from the tightly coiled structure that was formed in the overwintering bud.

283. Identify the wrong statement:
(a) Stipules in *Lathyrus* are persistent.
(b) Phyllotaxy in *Trillium* is alternate.
(c) Venation in *Caulophyllum* is parallel.
(d) Caulline leaves are found in Cocos.

AP EAMCET-2013

Ans. (b) : Phyllotaxy-In Trillium is alternate is wrong answer because-
In alternate phyllotaxy, consecutive leaves are produced in a spiral manner around the stem. This is seen in rose plant.
(a) Stipules in *Lathyrus* are persistent- The stipules remain attached to the leaf for the entire life of the leaf. In Lathyrus, the stipules are present in the form of large leaf.
(c) Venation is the arrangement of veins on the leaves. It is either parallel or reticulate. In Calophyllum, the venation is parallel.
(d) Leaves arising from the main stem are called cauline leaves. Example include rose, cocos, maize.

284. Identify the correct pair of combinations :
(I) Vallisneria - Long stalked female flowers - Hydrophily
(II) Tribulus - Annual - Root succulent
(III) Hydrilla - Submerged rooted hydrophytes - Aerenchyma
(IV) Casuarina - Perennil - Phylloclades
(a) (III, IV) (b) (II, III)
(c) (I, IV) (d) (I, III)

TS EAMCET-2015

Ans. (c) : Correct pair of combinations is-
(1) Vallisneria → long stalked female flowers hydrophily.
(2) Casuarina → Perennial - Phylloclades.

285. Multicostate parallel type of venation is found in the leaves of
(a) Grasses and palms
(b) Banana and Canna
(c) Castor and china Rose
(d) Mango and Peepal
(e) Castor and Tapioca

Kerala PMT-2009

Ans. (a) : Multicostate parallel type of venation is found in the leaves of Grasses and palms.
It refers to presence of more than one principal vein. It is two type- Convergent, Divergent.

286. The reticulate venation is commonly found in the leaves of :
(a) monocot plants (b) dicot plants
(c) bryphytes (d) thallophytes

J&K CET-2005

Ans. (b) : The reticulate venation is commoly found in the leaves of dicot plant. The dicotyledons, also known as dicot plants.

@apna_pdf

287. Among flowers of Calotropis, Tulip, Sesbania, Asparagus, Colchicine, Sweet pea, Petunia, Indigofera, Mustard, Soyabean, Tobacco and groundnut how many plants have corolla with valvate aestivation?

(a) Five (b) Six
(c) Seven (d) Eight

NEET (Karnataka)-2013

Ans. (c) : • Family Solonaceae and Liliaceae, Valvate aestivation are present.
• Family Fabaceae, vexillary aestivation are present. Valvate Aestivation is found in calotropis, Tulip, Asparagus, Colchicine, Petunia, Mustard, Tobacco.
• Vexillary aestivation is found in Sweet pea, Groundnut, Soyabean, Indigofera and Sesbania.

F. Inflorescence and its type

288. Catkin inflorescence is characteristic of

(a) Morus (b) Triticum
(c) Ficus (d) All of these

MGIMS Wardha-2011
Haryana PMT-2011
Rajasthan PMT-2011
JIPMER-2011

Ans. (a) : Catkin inflorescence is similar to spike, floral axis becomes thin and weak.
Unisexual inflorescence, usually deciduous and usually drop down like pendulum except - **Salix (willow)**
Example:- *Morus alva* (mulberry), oak, etc.

289. The part of cauliflower which is eaten is:

(a) flower (b) inflorescence
(c) fruit (d) leaf

Assam CEE-2014
AFMC-2005
Uttrakhand-2005
AIIMS-2000
Rajasthan PMT-1995

Ans. (b) : Compound corymb –It is a modified raceme with relatively a short main axis, in which the lower flowers have much elongated pedicels so that the flowers come to the same level. Typical example - **Cauliflower**

290. Floral formula of Allium cepa

(a) Br Ebrl ⊕ ♀ $P_{(3+3)}$ A_{3+3} $\underline{G}_{(3)}$
(b) Br Ebrl ⊕ ♀ $P_{(3+3)}$ A_5 $\underline{G}_{(3)}$
(c) Br Ebrl ⊕ ♀ P_5 A_{3+3} $\underline{G}_{(3)}$
(d) Br Ebrl ⊕ ♀ P_6 A_6 $\overline{G}_{(3)}$

TS EAMCET 10.05.2023 Shift-I

Ans. (a) : The floral formula of Allium cepa.

Br Ebrl ⊕ ♀ P_{3+3} A_{3+3} $G_{(3)}$

The Allium cepa belong in the family Liliaceae the Liliaceae have 16 gerera and 635 species the Liliaceae family usually have six segmentaed flower and three chambered capsular fruits occasionally the fruits are barriers.
The leaves are cluster at the base of the plant but many alternate along the stem or be arranged in whorls.

291. Chromosome with the fewest genes in human beings is

(a) X - chromsome (b) Y - chromosome
(c) Chromosome - 1 (d) Chromosome - 21

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : • Y-chromosom in human have fewest genes about 231 gene.
• Y and X - Chromosomer are sex chromosomes.
• Male have X and Y chromosomes while female have X and X chromosomes.
• On the chromosomes 21 disorder is cause down syndrome.

292. Which of the following plant examples are wrongly paired with their type of inflorescence.
A. Hamelia and Solanum – Dichasial cyme
B. Bougainvillea and Jasmine – Cymule
C. Hibiscus and Datura – simple Raceme
D. Cauliflower and Cassia – corymb
E. Achyranthes and Grass – Umbel

(a) A, B & D (b) A, C & E
(c) C, D & E (d) B, C & D

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : (B) • Bougainvillea inflorescence is branched axillary or terminal panicles.
• The inflorescence of Jasmine is cymose clusters.
(C) • Hibiscus inflorescence type of solitary cyme.
• The inflorescence in the Datura flower is a dichasial cyme.
(D) • The inflorescence of Cauliflower is compound corymb.
• The Cassia inflorescence an axillary, pendulous, Lax receme, 20-40(–60) cm long, many flowered.

293. Identify the plants based on the given characters in sequence.
(A) Peduncle is unbranched.
(B) Flowers appear to have arisen from the same point.
(C) The main axis continues to grow.

(a) Datura – Carrot – Crotalaria
(b) Carrot – Crotalaria – Datura
(c) Cocos – Tridax – Carrot
(d) Cocos – Crotalaria – Carrot

TS EAMCET-31.07.2022 Shift-II

Ans. (a) : Datura peduncle is unbranched because peduncle terminates into a single flower and there is no further development at floral branches in carrot flowers appear to have arisen from same point and the main axis continues to grow in crotalaria.

@apna_pdf

294. Choose incorrect statement:

(a) Hypanthodium of ficus has irregularly arranged flowers
(b) Head inflorescence of sunflowers has centrifugally arranged flowers
(c) Racemose inflorescence of crotalaria has its flowers arranged in acropetal order
(d) Cymose of Jasmine has basipetally arranged flowers.

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Simple racemose inflorescence is that indefinite inflorescence in which the peduncle is un-branched. Caesalpinia is an example of racemose inflorescence in a flowering plant, a cluster of flowers on its branches is called an inflorescence.
Acropetal order means that flowers at the bottom are older than the ones on the top. Flowers can also be seen arranged in a centripetal order.

295. Match the following :

	List-I		List-II
(A)	**Solitary cyme**	**(I)**	**Ipomoea**
(B)	**Monochasial cyme**	**(II)**	**Bougainvillea**
(C)	**Polychasial cyme**	**(III)**	**Datura**
(D)	**Dichasial cyme**	**(IV)**	**Solanum**
(E)	**Cymose**	**(IV)**	**Nerium**

The correct match is
Options:

	A	B	C	D	E
(a)	III	IV	I	V	II
(b)	III	I	IV	V	II
(c)	II	V	III	IV	I
(d)	III	IV	V	I	II

TS EAMCET-30.07.2022 Shift-I

Ans. (d) :

A.	Solitary →	Datura
B.	Monochasial cyme →	Solanum.
C.	Polychasial cyme →	Nerium
D.	Dichasial cyme →	Ipomoea
E.	Cymose →	Bougainvillea

296. Identify the inflorescence in which the flowers arise from same point of the peduncle and covered by a whorled of Bracts?

(a) Spike (b) Head inflorescence
(c) Corymb (d) Umbel

AP EAPCET-12.07.2022 Shift-I

Ans. (d) : Umbel- Flower arising from one point due to condensation of axis, with oldest flower the center as in family - ***Apiaceae.***
• Compound umbel has branching bearing crowded sessile flower as in ***Acasia*** and ***Mimosa.***

297. Find the wrong statements among the following

(A) In cyathium bisexual, achlymadeous flowers are present
(B) If calyx and corolla are not distinct they are called perianth
(C) In nut, pericarp is stony
(D) The thin membranous structure in the axil of leaf is called bracteole

(a) A, C (b) B, D
(c) A, D (d) B, C

TS EAMCET-10.08.2021 Shift-I

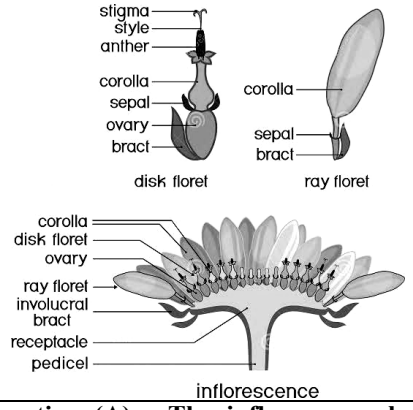
Ans. (c) : Bracteole is a small leaf like structure which is subtends a flower or inflorescence. The stalk of the bracteole is itself sustended by a bract. A bract is a leaf like structure from the axile out of which can grow a flower.
• **Cyathium** is one of the special pseudanthia (false flower) forming the inflorescence of plants in genus Euphorbia.

298. Ray florets have:

(a) Superior ovary
(b) Hypogynous ovary
(c) Half inferior ovary
(d) Inferior ovary

NEET-2020 Phase-I

Ans. (d) : Ray florets are neutral flowers of capitulum inflorescence of the family Asteraceae.



299. Assertion (A) : The inflorescence begin with dichasial cyme but turns as one branch each time, forming around the node is called verticellaster.
Reason (R) : The pollination of these plants takes place by insects called Blastophaga and after fertilization the whole inflorescence become a fruit.
The correct option among the following is.

(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-29.09.2020 Shift-I

Ans. (c) : In verticillaster type inflorescence plant mainly have cross pollination.
• Blastophaga insects pollinate figs or other associated with figs.

300. Match the following

a.	**Polychasial cyme**	**i.**	**Ipomea**
b.	**Solitary cyme**	**ii.**	**Datura**
c.	**Monochasial cyme**	**iii.**	**Nerium**
d.	**Dichasial cyme**	**iv.**	**Solanum**

@apna_pdf

(a) (a – i) (b – ii) (c – iii) (d – iv)
(b) (a – iii) (b – ii) (c – iv) (d – i)
(c) (a – ii) (b – iii) (c – iv) (d – i)
(d) (a – iii) (b – ii) (c – i) (d – iv)

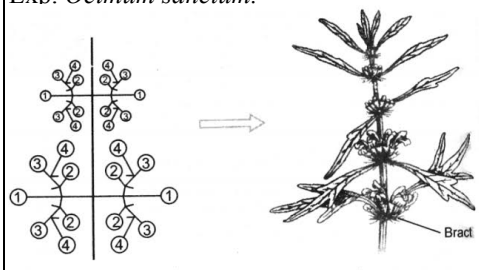
AP EAMCET-25.09.2020 Shift-II

Ans. (b) : Ipomea is the larges genus in the flowering plant conolvulaceae. Inflorescence - Polychasial.
Polychasial - More than two lateral branches arises from the base of first flower, Floral Axis terminates into the flower. This process is reapeated successively.
• **Datura** is a shrub like annual or perinneal herb.
Inflorescence - Solitary and axillary cyme.
Solitary is a large and diverse genus of flowering plants inflorescence - Monochasial
• **Polychasial** - Floral axis terminates in a single flower which is large and old. From the base of the flower arises single lateral branch and form the node, which also terminate into single flower.
Nerium oleander- is a shrub or small tree in the dogbane family Apocyanaceae.
Inflorescence - cymule

301. Verticillaster inflorescence is found in:
(a) mustard (b) Ocimum
(c) China rose (d) sunflower

JIPMER-2019

Ans. (b) : Verticillaster - This type inflorescence characteristic of family ***Lamiaceae.***
• It is condensed cymose inflorescence, each occurs in the axil of opposite leaves having sessile or slightly stalked flowers.
• Each node of the inflorescence bears two opposite clusters of cymes, subsequently become monochasial as the no. of flower in each cluster exceeds three.
• Due to the condensation of axis, flowers of different age appear to form a fasle whorls or vertical.
Exp. *Ocimum sanctum.*



Verticillaster inflorescence of family labiatae (lamiaceae)

302. Edible part of mango is:
(a) Receptacle (b) Epicarp
(c) Mesocarp (d) Endocarp

HP CET-2018

Ans. (c) : Edible part of mango is mesocarp. The mesocarp is the fleshy middle layer of the pericarp of a fruit.

303. The water of coconut is:
(a) Liquid mesocarp (b) Liquid endocarp
(c) Liquid endosperm (d) Liquid nucellus

HP CET-2018

Ans. (c) : The water of coconut is liquid endosperm. Coconut water, the clear liquid inside young green coconuts fruits of the coconut palm is liquid endospermic.

304. Which of the following is not a single flower?
(a) China rose (b) Petunia
(c) Sunflower (d) Holy hope

HP CET-2018

Ans. (c) : The flower is mainly the reproductive. The sunflower is not a single flower at all but a whole booquet.
Sunflower belongs to family compositae. In this family the flowers do not grow individually rather they grow in bunches or clusters.

305. The inflorescence found in Jasmine is a:
(a) Polychasial cyme (b) Cymose
(c) Dichasial cyme (d) Monochasial cyme

TS EAMCET-02.05.2018 Shift-I

Ans. (b) : *Jasmine*, and *Drosera* cymose inflorescence is found. In cymose inflorescence the floral axis steps, the growth after the formation of flower and opening of flower is basipetal (from apex to base).
Cymose- the main axis has limited growth and then new branch arises that also has limited growth.

306. Which of the following is not an example of racemose inflorescence?
(a) Raceme (b) Corymb
(c) Spike (d) Solitary terminal

Tripura JEE-2018

Ans. (d) : In racemose inflorescence the axis, is of unlimited growth apical bud continues to grow. Thus oldest flowers are found at the base and youngest towards the top.
These are different types such as racemes, panicle , spike, spadix etc. Ex. *Delphinium, Brassica campestris, Caesalpinia.*
• In solitary terminal type of inflorescence, single flower are located at the tip of the main stem and the branches. Ex. Poppy.

307. Centripetal, Acropetal and irregular arrangement of sessile flowers are seen in the inflorescences of these plants respectively:
(a) Tridax, Musa and Ficus
(b) Achyranthes, Cocos and Leucas
(c) Carrot, Colocasia and Euphorbia
(d) Hamelia, Crotalaria and Solanum

AP EAMCET-25.04.2018 Shift-II

Ans. (c) : In centripetal inflorescences, older flowers are present in the periphery and younger flowers are located at the centre, ex. – Carrot.
In acropetal inforescences, younger flowers are present at the base and older flowers are located at the center, ex. – Colocasia.
Irregular arrangement of flowers follows no definite pattern of inflorescences. ex. – Euphorbia

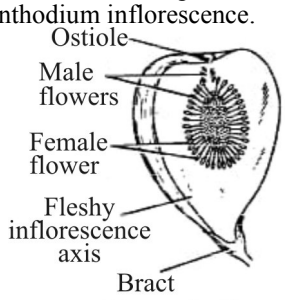
308. Inflorescence of which one of the following sets completely develop into composite fruits?
(a) Spike, corymb, hypanthodium
(b) Spike, female catkin, hypanthodium
(c) Umbel, catkin, spadix
(d) Female catkin, corymb, spike

AIIMS-2017
BVP - 2002
AIPMT-1994

@apna_pdf

Ans. (b) : The fruit is a ripened ovary. The main function of fruit is to protect the seeds. The composite fruit is a type of fruit which is developed from entire inflorescence rather than a single flower. All composite fruits are false fruit.

• Simple, aggregate, and composite are three kinds of fruits. Composite fruits develop from the spike, female catkin or hypanthodium inflorescence.



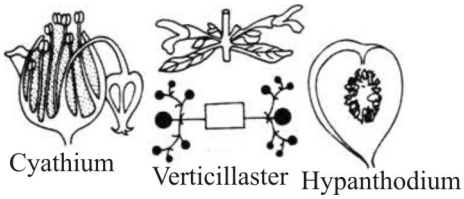
Hypanthodium

309. Which one of the following option is not correctly matched?

(a)	**Cymose**	**Acacia**
(b)	**Hypanthodium**	**Babyan**
(c)	**Cyanthium**	**Euphorbia**
(d)	**Verticillaster**	**Calotropis**

AIIMS-2017

Ans. (d) : The inflorescence of Calotropis is an example of multiparous cymose (Polychasial Cyme).
Verticillaster is a modified, condensed and dichasial cyme inflorescence.



Ex - Salvia, Ocimum and Coelus etc.

310. An inflorescence which contains gall flowers is:

(a) verticillaster (b) cyathium
(c) hypanthodium (d) capitulum

AP EAMCET-2001
AMU -2000
Rajasthan PMT-2000

Ans. (c) : Hypanthodium:- In this type, a hollow spere - like receptacle (Syconium) is formed by the fusion of the rachis of three closely placed cymes.

• The spherical receptacle is like a closed fleshy vessels with a small opening at the apex.

• Three types of unisexual flower (Male fertile female sterile) are arranged on the inner surface of the receptacle in cymose group.

Ex. *Ficus cunia* and banyan, *Ficus benghalensis*.

311. The type of inflorescence in Tulsi:

(a) cyathium (b) hypanthodium
(c) verticillaster (d) None of these

CG PMT-2006

Ans. (c) : A kind of in inflorescence in which the flowers are aligned in a seeming whorl, comprising a pair of opposite auxillary, generally sessile cymes is verticillaster inflorescence.
Example:- Lamiaceae (Tulsi) family.

Hypanthodium Inflorescence The receptacle becomes cup shaped or pear shaped receptacle fleshy with close vessel at top of receptacle. Their opening is called ostiole.
Example:- Ficus

Cyathium inflorescence - Central large female flower surrounded by many flowers, represented by stamens and whole inflorescence represented by a whorl of bract called involucre which is cup shaped and has the nectar glands
Example:- Euphorbia, pulcherrima

312. In Musa, inflorescence is:

(a) spadix (b) corymb
(c) capitulum (d) polychasial cyme

WB JEE-2006
BCECE-2003

Ans. (a) : Spadix is similar to the spike inflorescence but floral axis becomes thick and fleshy surrounded by one or more bract called spathe.
Musa pavadisiaca (banana) etc.

Corymb - inflorescence:-
Rachis shortened flower pedicilate, lower flower have longer pedicle, All the flower almost at the same level.
example:- Cassia, Iberis (candytuft) etc.

Capitulum inflorescence:-
• Flower axis flattened called receptacle opening of flower are centripetal from periphery to center.
• Flower monomorphic or diamorphic when inflorescence is surrounded by whorl of bract called - involucre.
Example:- dahlia, sunflower,

Polychasial cymose inflorescence:-
In this inflorescence - more than two lateral branches arise from the base of first flower, also terminate into the flowers this process repeated successively
Example:- *Calotropis, Hamelia*

313. Assertion: The type of inflorescence in sphaeranthus is cyathium.
Reason: In cyathium type of inflorescence, the flowers are achlamydeous.

(a) Both Assertion and Reason are true and Reason is the correct explanation of Assertion
(b) Both Assertion and Reason are true but Reason is not the correct explanation of Assertion
(c) Assertion is true but Reason is false
(d) Assertion is false but Reason is true

VMMC-2011

Ans. (d) : Assertion is false but Reason is true
Cyathium inflorescence contain pedicillate, achlamydeous flowers of both male and females. The female flower is single and centrally placed while male flower are many numbers and arranged centrifugally e.g- Euphorbia. Sphaeranthus belongs to family Asteraceae in which head capitulum inflorescence is found.

314. Umbel inflorescence is found in :

(a) Musa (b) Colocasia
(c) Coriander (d) Helianthus

Uttarakhand PMT-2004
Manipal-2004

@apna_pdf

Ans. (c) : Coriandrum
Umbel inflorescence is found in the members of umbelliferae (apiaceae) family example coriandrum, carrot, allium etc. It is a type of raceme in which flowers are present at the same surface and stalk of all flowers are originated at the same point. Umbel inflorescence contain a very shortened and suppressed axis.

315. The head inflorescence is considered as the most perfect type of inflorescence, because (1) numerous small sized flowers occur on the receptacle (2) flowers are protected by various structures like involucre (3) single visit of insect is sufficient for pollination (4) flowers are dull and colourless
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2009

Ans. (a) : 1,2 and 3 are correct
Capitulum or head inflorescence is a feature of family - Asteraceae or compositae. The main axis or peduncle becomes flattened and is turned receptacle. It bears numbers of sessile, bract containing centripetally arranged flowers or florates. At the base of the receptacle, a whorl of bract is also present which forms in the involucre, so , a single visit of insects is sufficient for pollination, flowers are brightly coloured and usually scented to attract the pollinators.

316. The florets in capitulum of sun flower are arranged in a manner :
(a) centrifugal (b) centripetal
(c) acropetal (d) basipetal

BHU PMT (Mains)-2005

Ans. (b) : The opening of a flower in the racemose inflorescence is in a centripetal manner. This means the centripetal manner of flower opening from the centre to the outside of the inflorescence. For Ex. Sunflower.

317. The type of inflorescence where in the main axis has limited growth and ends in a flower is termed
(a) racemose (b) cymose
(c) hypanthodium (d) cyathium

JIPMER-1999

Ans. (b) : Cymose:- Inflorescence, on the other hand, the main axis has limited growth, being terminated by the formation of a flower. And as each level of branching bear one flower, there are generally a limited number of flower, and oldest flower is either in the centre, or flowers or different ages are mixed up.
Ex. *Solanum nigrum, Calortropis*

318. Cyathium and hypanthodium resemble each other in possessing:
(a) involucres (b) dioecious nature
(c) receptacle (d) None of these

AMU-2011
Punjab MET-2011

Ans. (d) : None of these
Cyathium and hypanthodium resemble in having inflorescence of three types of flowers.
The receptacle is fleshy and form hollow ball like structure with an apical opening. Three types of flowers develop on the inner surface of the receptacle. The female flowers are towards the base, male flowers are in between. Cyathium contains a cup - shaped involucre provided with nectar - secreting glands. There are no nector glands in hypanthodium.

319. Capitulum inflorescence is found in :
(a) Compositae (Asteraceae)
(b) Cruciferae (Brassicaceae)
(c) Solanaceae
(d) Malvaceae

MGIMS Wardha-2004
Haryana PMT- 2003

Ans. (a) : Capitulum:-Flat - topped inflorescence like head but with distinct ray florets and disc florets surrounding by involucre bracts as found in the family. Asteraceae (Compositae).
When floral axis branched and flowers are born on the branches it is called- compound spike.

320. The morphological nature of the organ, which helps in climbing in Cardiospermum is:
(a) inflorescence axis (b) leaf apex
(c) terminal bud (d) axillary bud

AP EAMCET-2003

Ans. (a) : Inflorescence axis
Cardiospermum (balloon vine) belongs to family sapindaceae. Tendrils are found which are formed from the apices of inflorescence axis. The weak plant climbs up with the help of tendrils. The arrangement of flowers on the floral axis is termed as inflorescence.

321. Inflorescence axis is called:
(a) rachis (b) pedicel
(c) petiole (d) peduncle

Haryana PMT-2007

Ans. (d) : Peduncle
The stalk holding the complete inflorescence and bearing the flowers or fruit, in a flowering plant is known as the peduncle.
• Peduncle is the main axis of an inflorescence or the axis bearing a flower or fruit.
• Petiole is the cylindrical stalk that joints the leaf base with leaf blade or lamina.
• Pedicle is a stem that attaches a single flower to the inflorescence.

322. An inflorescence in which flowers arise from different points but reach the same level is known as?
(a) Catkin (b) Corymb
(c) Umbel (d) Spadix

Manipal-2015

Ans. (b) : The corymb is a simple racemose (indeterminate) inflorescence that has a flat topped or convex shape. Ex. *Candytuft and Capsella*
The inflorescence is the arrangement of the flower. If the main axis is shortened and lower flower possess longer stalk so that all flowers are brought to the same level such type of inflorescence is called as corymb.
• But if main axis is short and flower possess stalk of equal length so that flowers are seen to spread out from a common point and such type of inflorescence is called as umbel.
• Catkin is the modified spike inflorescence that possess unisexual flowers.
• Spadix is also a modified inflorescence with the fleshy axis.

@apna_pdf

323. In a spadix inflorescence the spathe encloses a:
(a) umbel (b) biparous cyme
(c) catkin (d) spike

JIPMER-2000

Ans. (d) : Spadix inflorescence show a racemose orientation and is enclosed within a broad leaf like bract or sheath called a **spathe.**
Thus, in a spadix inflorencence a spathe encloses the spike of flowers. Ex. Banana
Umbel inflorescence has flowers with pedicels of almost equal length and appears to arise from a common point due to the reduction in the main axis. It is the characterstics of the umbelliferae family.
Biparous or Dichasial cyme inflorescence is that in which growth of the flowering axis is continued by two branches. When the growing point of parent axis is changed into a flower.
Example :- *Dianthus or Bougainvillea*
Catkin inflorescence is a compact unisexual spike that often hangs.
Example:- *Mulberry*

324. Elongated peduncle bearing pedicellate flower continuously in acropetal order is
(a) corymb (b) umbel
(c) raceme (d) head

AMU-2008

Ans. (c) : Raceme is the simple type of racemose inflorescence. In this type of arrangement the pedicellate, bisexual flowers are borne in acropetal succession on the elongated Rachis.
Example:- Crucifereae (mustard, Radish etc.)
When the floral axis is branched and flowers are born on the branches it is called the compound raceme or panicle.
Example:- Yucca, Gulmohur (*Delonix regia*), etc.

325. Which is true?
(a) Umbel is racemose inflorescence-where stalked flower aggregate on a flat receptacle
(b) In raceme the main axis is shortened and flowers are borne acropetally
(c) Spadix is a pendulous spike with main axis much flattened
(d) Spike is a racemose inflorescence having sessile flowers

AMU-2008
VMMC-2008
AIIMS-2009

Ans. (d) : Spike is a racemose inflorescence in which grows **sessile flowers** in the acropetal fashion, e.g. – *Achyranthes* (Chiffon flower), *Callistemon* (Bottle brush), *Adhatoda vasica, Amaranthus*.
• The compound spike is known as the **spike** of spikelets. Sessile flowers (spikeletes) are present on the branched main axis, e.g.– Wheat, Barley, Sorghum, Oats etc.
Spike is a racemose inflorescence having sessile flowers.
In umbel flowers are arranged centripetally, In Raceme flowers are arranged acropetally. Spadix is modification of catkin in which the peduncle is thick and fleshy with upper part style.

326. The flowers in a cyathium resemble the ray florets of sunflower in being :
(a) sessile (b) imperfect
(c) neuter (d) bisexual.

AMU-1997

Ans. (b) : Cyathium: This type of inflorescence is found in genus euphorbia of family-Euphorbiaceae, also found in genus pedilanthus of the family.
• In this inflorescence there is a cup-shaped involucres (formed by fused bracts), often provided with necter secreting glands.
• The single female flower, represent by a pistil, in the centre, situated on a long stalk.

327. The most highly evolved and perfect type of inflorescence is
(a) hypanthodium (b) spadix
(c) capitulum (d) poylchasial cyme

AMU-1997

Ans. (c) : Capitulum : flat-topped inflorescence like head but with distinct ray florets and disc florets, surrounding by involucres bracts as found in the family; Asteraceae (compositae).
The advantage of capitulum are :-
(i) A single insect can pollinate numerous florets.
(ii) Compactness of flowers make the condition more attractive. hence - much more changes of pollination.

328. In general, the feature common to the flowers of spadix, cyathium and hypanthodium is that they are
(a) monandrous (b) synandrous
(c) diclinous (d) achlamydeous

AMU-1997

Ans. (c) : The common feature between the flowers of spadix, Cyathium and hypanthodium are diclinous flowers.
• Diclinous in flowering plants. The occurrence of stamen and carpels in separate flowers on the same plant or different plants.

329. Edible part of the apple is
(a) Mesocarp (b) Calyx
(c) Thalamus (d) Pericarp

AMU-2009

Ans. (c) : The fruit of apple is known as pome. It is a false fruit because it is developed by fleshy thalamus, which is also its edible part.
False fruit or pseudocarp is derived from the accessory floral part other than ovary.

330. In cyathium inflorescene the ratio between male and female flowers is:
(a) one : many (b) many : one
(c) one : one (d) one: two

AP EAMCET-2002, 1997

Ans. (b) : Cyathium: This type of inflorescence is found in genus euphorbia of family-Euphobiaceae, also found in genus pedilanthus of the family.
• In this inflorescence there is a cup-shaped involucres (formed by fused bracts), often provided with necter secreting glands.
• The single female flower, represent by a pistil, in the centre, situated on a long stalk.

331. Inflorescence is edible is Brassica oleracea:
(a) var. botrytis (b) var. capitate
(c) var. gangyloides (d) var. germifera

VMMC-2008
AMU-2008

@apna_pdf

Ans. (a) : Vegetative bud is a structure with a short young stem with embryonic leaves which is edible leaves are also an edible part of *Brassica oleracea* as in cabbage.
• The edible cauliflower is *Brassica oleracea botrytis*. The inflorescence or the head of the flower is edible and is known as curd. Cauliflowers have undifferentiated flowers which remains functionless during their first year of growth.
In its second year, the stored nutrients are used to produce a flower spike.

332. Scorpioid cyme is seen in
(a) Hamelia (b) Heliotropium
(c) Clerodendron (d) Nerium
J&K CET-2007

Ans. (b) : Scorpioid cyme:- Successive branches (each forming one flower) are borne on alternate sides. In rhipidium found in *solanum* nigrum.
• Scorpiod is a type of monochasial cyme. Its axis is curved and has lateral branches alternately on both sides of the axis. ex- *Gossypium, Heliotropium, Drosera* (sundew), fressia etc.

333. A racemose type of inflorescence with its main axis almost flat is called:
(a) Corymb (b) Umbel
(c) Spike (d) Capitulum
Rajasthan PMT-2011
J&K CET-2005

Ans. (d) : Capitulum:-Flat - topped inflorescence like head but with distinct ray florets and disc florets surrounding by involucre bracts as found in the family. Asteraceae (Compositae).
It is a type of racemose inflorescence as in the sunflower.

334. Modification of bract in Typhonium is:
(a) seale (b) spathe
(c) involucre (d) glume
AP EAMCET-1999

Ans. (b) : In typhonium the Bracts are modified into enlarged leaves called as **spathe**. These spathe cover the entire inflorescence of typhonium.
Typhonium is a genus in the family Araceae. The plant is harvested from the wild for local use as a medicine as antidiarrheal, anti-inflammatory and food.

335. Inflorescence in Jatropha is:
(a) monochasial scorpioid cyme
(b) polychasial cyme
(c) dischasial cyme
(d) solitary flower
AP EAMCET-1999

Ans. (c) :Dichasial (biparous) cyme:- Two branches arising below the apical flower at each level so that the flower is between the fork of two branches, as in *Stellaria* and *Dianthus*
• Dichasial cyme inflorescence is present in the Jatropha. Jatropha is a medicinal plant and is member of family **Euphorbiaceae.**

336. Rhipidium inflorescence in Solanum nigrum is modification of :
(a) uniparous cyme (b) multiparouschyme
(c) scorpioid (d) capitulum
Haryana PMT-2011

Ans. (c) : Scorpioid cyme:- Successive branches (each forming one flower) are borne on alternate sides. In rhipidium found in *Solanum* nigrum.
• Scorpiod is a type of monochasial cyme. Its axis is curved and has lateral branches alternately on both sides of the axis. ex- *Gossypium, Heliotropium, Drosera* (sundew), fressia etc.
• Capitulum also called racemose head in which peduncle is flattened that form receptacle that holds centripetally arranged sessile flowers or florets surrounded by an involucre of bracts.
Example :- Sunflower
• In multiparous cyme, the main branch converts into flower, the old flower at the center and younger at the periphery while it produces lateral branch as well.
Example - Calotropis

337. The fleshy receptacle of syconus of fig encloses a number of :
(a) achenes (b) samaras
(c) berries (d) mericarps
JIPMER-2012

Ans. (a) : Syconus develop from hypanthodium type of inflorescence. The flask shaped fleshy receptacle encloses female flower which produces small achene like fruitlets and has a small pore protected by scale leaves. After pollination the florets develop into achenes and drupes, which encloses the seeds.

338. Cymose inflorescence is present in:
(a) Trifolium (b) Brassica
(c) Solanum (d) Sesbania
AIPMT (Screening)-2012

Ans. (c) : Cymose Inflorescence is also called definite or determinate inflorescence.
Growth of the peduncle is indefinite. Here, the terminal bud is modified into a flower.
Flowers develop in basipetal succession, i.e. mature flowers are towards the base.
Flower open in centrifugal sequence, i.e. flowers open from centre to the periphery of the inflorescence eg. *Solanum, Ranunculus*, Datura, *Gossypium* etc.

339. Inflorescence is racemose in:
(a) Soyabean (b) Brinjal
(c) Tulip (d) Aloe
NEET (Karnataka)-2013

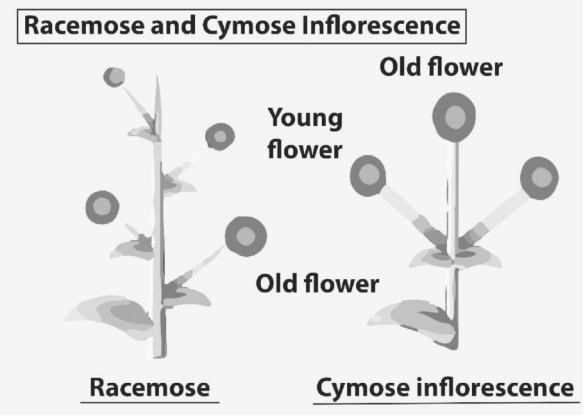
Ans. (a) : Soyabean belongs to fabaceae family which having racemose inflorescence.
• Racemose inflorescene is also called indefinite and indeterminate type. Growth of the peduncle is indefinite. Here the terminal bud will not modify into a flower. Flowers develop in acropetal succession i.e. mature flowers are towards the base and the younger ones towards the tip of the peduncle. Flower open in centripetal succession i.e. opening of flowers proceeds from the periphery to the centre of the inflorescence. Peduncle may be unbranched or branched.

340. In a cymose inflorescence the main axis:
(a) Terminates in a flower
(b) Has unlimited growth
(c) Bears a solitary flower
(d) Has unlimited growth but lateral branches end in flowers
NEET (Karnataka)-2013

@apna_pdf

Ans. (a) : Cymose inflorescence is also called definite or determinate inflorescence. Growth of the peduncle is definite. Here the terminal bud is modified into a flower.

- Flower develop in basipetal succession i.e. mature flowers are towards the apex and young flower bud are towards the base.
- Flowers open in centifugal sequence i.e. flowers open from centre to the periphery of the inflorescence e.g. *Solanum, Ranunculus,* Datura, *Gossypium* etc.



341.The ovary is half inferior in flower of :

(a) Guava (b) Peach
(c) Cucumber (d) Cotton

AIPMT (Screening)-2011

Ans. (b) : The flower in which ovary and floral parts are arises from the same point called, perigynous and ovary semi-superior, Ex- Rosaceae family.

- In Guava and cucumber, both are epigynous (ovary fused with thalamus and other floral part found in top of ovary.)
- Cotton belongs to family malvaceae in which ovary is Superior, flower is, Actinomorphic with axile placentation.

342. Flowers are Zygomorphic in :

(a) Datura (b) Mustard
(c) Gulmohar (d) tomato

AIPMT (Screening)-2011

Ans. (c) : Symmertrical flowers are of two types:

- **Zygomorphic (%)** flower can be divided into two equal half (mirror image). These flowers can be cut into two halves only in a single vertical plane. It exhibit Bilateral symmetry. Gulmohur is a zygomorphic flower.
- **Actinomorphic** - ⊕ flowers show Radial symmetry i.e. cut any side of flower it will give rise two equal halves. Examples are rose, tulip, mustard, tomato, datura etc.

343. From the following, identify the plants having inflorescences with male, female and sterile flowers.

I. Casuarina **II. Vernonia**
III.Colocasia **IV. Ficus**

(a) I, II (b) II, III
(c) III, IV (d) I, IV

AP EAMCET-2010

Ans. (c) : Colocasia and Ficus plant have inflorescence with male female and sterile flower.

- In **Ficus**, the receptacle becomes pear shaped and contain a hollow central cavity and hairy opening called ostiole at their anterior side. The hollow cavity bear male flower at the outside between these two type of flower, sterile flower with short style are situated. These sterile flowers are called gall flower.
- **Colocasia**:- inflorescence consist a spadix subtended by persist spathe female flower at the base of spadix male flower at apex with sterile flower between them.

344. A student observed 34 inflorescences in Bougainvillea and 42 inflorescences in Poinsettia. Find out the number of flowers in Bougainvillea and the number of female flowers in Poinsettia respectively.

(a) 34, 126 (b) 68, ∞
(c) 204, 164 (d) 102, 42

AP EAMCET-2011, 2009

Ans. (d) : In Bougainvillea, inflorescence is dichasial cyme, where medianly situated peduncle itself finishes in a flower and bears two lateral floral branches at the base of its origin. Hence, in 34 inflorescences, the number of flowers are 102. In Poinsettia, inflorescence is cyathium, in which a single central female flower remains surrounded by numerous male flowers in a cup formed by the fusion of involucres. So in 42 inflorescences, the number of female flowers are 42.

Bougainvillea : - Inflorescence-cyme
No. of flowers in each inflorescence-3
Total no. of flowers in 34 inflorescence = 34 × 3 = 102
Ponsettia:- Inflorescence - cyathium (but 3 carpels in one flower)
No. of flowers in each inflorescence - 1
Total no. of flowers in 42 inflorescence = 42 × 1 = 42

345. Study the following lists:

	List-I		List-II
A.	Gall flowers	1.	Spikelet
B.	Involucre	2.	Hypanthodium
C.	Spathe	3.	Cyathium
D.	Lemma	4.	Umbel
		5.	Spadix

The correct match is:

	A	B	C	D
(a)	2	4	5	3
(b)	3	4	2	5
(c)	2	3	5	1
(d)	3	4	2	1

AP EAMCET-2005

Ans. (c) : List –I	List-II
A. Gall Flowers	2. Hypanthodium
B. Involucre	3. Cyathium
C. Spathe	5. Spadix
D. Lemma	1. Spikelet

- **Gall flower** is a short style containing female flower occurs in hypanthodium inflorescence.
- **Involucre** is a cup shaped structure formed due to fusion of 4 or 5 bracts.
- It occurs in cyathium inflorescence, **spathe** is a colored leaf-like structure which occurs in spadix inflorescence.
- **Lemma,** one of two bracts that protects the flower of grasses in which spikelet inflorescence occurs.

@apna_pdf

346. The type of inflorescence in a plant showing polygamous condition and lateral style is:
(a) Compound corymb
(b) Compound umbel
(c) Compound head
(d) Compound receme

AP EAMCET-2013

Ans. (a) : Compound corymb –It is a modified raceme with relatively a short main axis, in which the lower flowers have much elongated pedicels so that the flowers come to the same level. Typical example - **Cauliflower**

• **Compound umbel** - In a compound umbel, **all the umbel inflorescences arise from a common point** and appear to be at about the same level (example-wild carrot, coriander)

This organization is the same for compound spikes, catkins, corymb, and heads.

• **Compound head-** A dense concave, convex, spherical or flat - topped inflorescence of numerous sessile flower clustered on a common disc or receptacle. A capitulum is usually subtended by an involucre of bracts. Eg. Compositae (Asteraceae) family.

• **Compound raceme-** A compound raceme, also called a panicle, had a branching main axis. Examples of racemes occur on mustard (*genus Brassica*) and radish (*genus Raphanus*) plants.

347. Which of the following pairs is not correct ?
(a) Corymb-candytuft
(b) Capitulum-sunflower
(c) Catkin-mulberry
(d) Raceme-wheat

J&K CET-2004

Ans. (d) : A raceme or racemoid is an unbrached intermediate type of inflorescence bearing flowers having short floral stalks along the shoots that bear the flowers. So raceme is a flower not wheat.

348. A taxon belonging to order sapindales has a single fleshy fruit with edible mesocarp and stony endocarp. The number of carpels in the flower of this taxon is
(a) 3 (b) 5
(c) 1 (d) 2

TS EAMCET-2015

Ans. (c) : A taxon belonging to order spindales has a single fleshy fruit with edible mesocarp and stony endocarp the number of carpels in the flower of this taxon is 1, because the fruit of this taxon is develops from a monocarpellary ovary.

349. The characteristic inflorescence of family - Asteraceae is:
(a) Umbel (b) Spadix
(c) Catkin (d) Capitulum

UP CPMT-2013

Ans. (d) : The distinguishing characteristic of Asteraceae is their inflorescene, a type of specialised, composite flower head or pseudanthium, technically called a capitulum, that may look superficial like a single flower.

350. Inflorescence with universal sessile flower is:
(a) spike (b) spikelet
(c) catkin (d) spadix

J&K CET-2002
AMU-2014

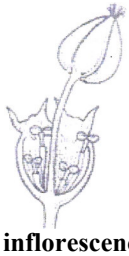
Ans. (a) : Spike- It is similar to the raceme but flowers are sessile born in acropetal succession on eleongated Rachis as Polyaltha, Adhatoda.

351. The type of arrangement of flower and mode of distribution of flower on a shoot of palm tree is:
(a) Spikelet
(b) Spadix
(c) Spike of spikelets
(d) Compound spadix

CMC Vellore-2013

Ans. (d) : The type of arrangement of flower and mode of distribution of flower on a shoot of plam tree is compound spadix. When spadix is branched called spadix and surrounded by boat shaped spathe. E.g. coconut.

352.



The above inflorescence is a:
(a) Cyathium (b) Dichasial cyme
(c) Umbel (d) Panicle
(e) Verticillaster

Kerala PMT-2009

Ans. (a) : A cyathium is one of the specialised Pseudanthia forming the inflorescence of plants in the genus Euphorbia. A cyathium consists of five bracteoles. These are small united bracts, which form a cup-like involucre. Their upper tips and free and in the begining cover the opening of the involucre.

353. In an inflorescene, two types of small, sessile flowers were observed. They are arranged in centripetal manner and have reduced hair like sepals. Which pair of the following character are not associated with such flowers?
i. Nectar glands at the base of the corolla
ii. Axile placentation
iii. Superior ovary
iv. Scaly bracts
The correct pair is
(a) ii, iii (b) iii, iv
(c) i, ii (d) i, iv

AP EAMCET-2008

Ans. (a) : In capitulum inflorescene, two types of centripetally arranged sessile flowers with hair-like sepals occurs. The gynoecium has inferior ovary with basal placentation. Nectar glands at base of corolla and scaly bracts is associated with them.

354. Study the following table.

i.	False whorl like inflorescence	Many sessile bisexual flowers	Leonotis
ii.	Single flower like inflorescence	Many stalked staminate and pistillate flowers	Poinsettia

@apna_pdf

iii.	Fruit-like inflorescence	Many sessile staminate flowers on the top and pistillate flowers at the base and sterile flowers in between	Ficus
iv.	Fleshy axis of inflorescence	Many stalked staminate flowers at the base and pistillate flowers on the top and sterile flowers in between	Colocacia

The correct pair is:
(a) i, iii (b) i, iv
(c) ii, iii (d) ii, iv

AP EAMCET-2008

Ans. (a) :

False whorl like Inflorscence → **Many sessile bisexual flower** → Leonotis

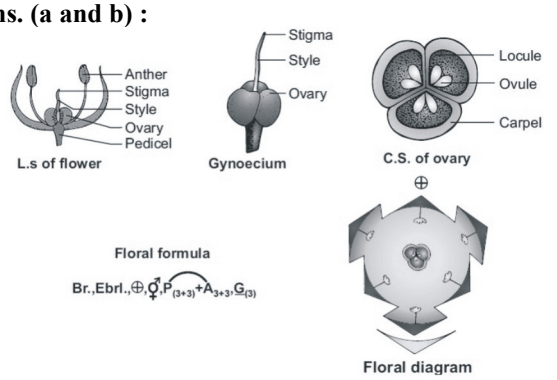
Fruit like Inflorscence → Many sessile staminate flowers on the top and pistillate flowers at → Ficus
The base and sterile flower in between.

• **Poinsettia** → The poinsettia is a commercially important plant species of the diverse Spurge family. Indigenous to Mexico and Central America, the poinsettia was first described by Europeans in 1834. It is particularly well knwon for **its red and green foliage** and is widely used in christmas floral displays.

355. Inflorescence of Liliaceae is:
(a) Actinomorphic (b) Trimerous
(c) Pentamerous (d) Imperfect

AIIMS-2011

Ans. (a and b) :



Liliaceae Floral formula:

$$Br, Ebrl, \oplus, \male\female, P_{(3+3)}, A_{3+3}, G_{(3)}$$

'Br' represents bracteate condition and 'Ebrl' represented by Ebracteolate, '⊕' represents actinomorphic condition, '♂♀' represents bisexual condition.

'$P_{(3+3)}$' represents perianth with tepals arranged in two whorls. 'A_{3+3}' represents six stamens.
The flowers of Liliaceae show epiphyllous condition (Stamens attached to tepals).
$G_{(3)}$ represents tricarpellary syncarpous gynoecium.
•When we use the term inflorescence we actually talk about the flower head or all the parts of a plant that bear the flower. In the case of the lily, the inflorescence may include an umbel, a raceme or just a solitary terminal flower.

356. The most advanced type of inflorescence is:
(a) Corymb (b) Catkin
(c) Spadix (d) Capitulum

WB JEE-2007

Ans. (d) : In capitulum inflorescence flower axis flattened called receptacle. Opening of flower are centripetal i.e- from periphery to center. E.g. Marigold

357. All given statements regarding cymose inflorescence are correct except:
(a) Main axis terminate in a flower
(b) Development of flowers basipetal
(c) Opening of flowers is centrifugal
(d) Unlimited growth of axis

MGIMS Wardha-2015

Ans. (d) : Unlimited growth of axis.
The floral axis stop the growth after the formation of flower and opening of flowers is- Basipetal (from apex to base)
• If rachis flattened called Receptacle and opening of flowers centrifugal (from center to periphery).

358. Cyathium is a type of :
(a) Alga (b) Fungus
(c) Bactrium (d) Inflorescence

Manipal-2001

Ans. (d) : Cyathium- This type of inflorescence is found in genus **Euphorbia** of family - Euphorbiaceae, also found in genus pedilanthus of the family.
• In this inflorescence there is a cup- shaped involucre (formed by used bracts) often provided with nectar secreting glands.
• The single female flower, represented by a pistil, in the centre, situated on a long stalk.

359. Identify the right combination
(a) Carrot - Tuberous root -Head inflorescence
(b) Onion – Bulb - Corymb
(c) Colocasia - Rhizome - Spadix
(d) Bougainvillea -Thorns - Cymule

AP EAMCET-2015

Ans. (d) : Right combination is:- In same plant stem modified the stiff, hard, sharp, pointed structure called the throns, means for defence.
Bougainvillea- Thorns-cymule.
Thorns of bougainvillea are modified stem, present in the axil of leaves of thas cymule inflorescchec which is a small cyme with one terminal and two lateral flowers borne in basipetal order.

360. In a plant the peduncle is elongated and it bears pedicillate flowers. The older flowers lie towards the base and the younger ones near the apex. The growth of the peduncle continues and more flowers are added. the inflorescence is:

@apna_pdf

(a) raceme (b) corymb
(c) umbel (d) head

BCECE-2012
J&K CET-2003

Ans. (a) : Raceme is a simple type of racemose inflorescence in this type of arrangement unbranched, elongated peduncle bearing pedicellate or stalked flower acropetally.
Ex.*Brassica.*

361. Cyathium is characterised by (1) single female flower surrounded by many male flowers (2) as involucres of bracts enclosing all the flowers (3). fleshy inflorescence axis with a pearshaped cavity inside (4) single male flower surrounded by many female flowers
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (b) : Cyathium is characterised by -
(1) Single female flower surrounded by many male flowers.
(2) As involucres of bracts enacts enclosing are the flowers.
So, 1 and 2 correct.

362. The inflorescence found in Ficus is known as :
(a) Cyathium (b) Catkin
(c) Syconus (d) Hypanthodium

Punjab MET-2004

Ans. (d) : Hypanthodium- In this type, a hollow sphere- like receptacle (syconium) is formed by the fusion of the rachis of three closely placed cymes.
• The spherical receptacle is like a closed fleshy vessels with a small opening at the apex.
•Three types of unisexual flowers (male fertile and female sterile) are arranged on the inner surface of the receptacle in cymose groups.
E.g. ***Ficus cunia*** and banyan, ***Ficus benghalensis.***

363. Hairs are found in the inflorescences of *Zea mays* are the modification of:
(a) Style (b) Stigma
(c) Spathe (d) Filaments

AIPMT-2000

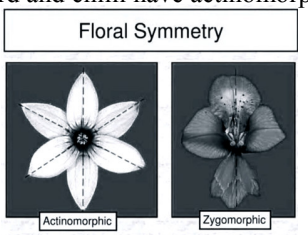
Ans. (a) : The common name of *Zea mays* is corn or maize. It is used as a cereal and is found in the family **Poaceae**. In maize, style is very long. It comes out of the cob to expose stigma for wind pollination. These are collectively known as silk.

G. Flower and Symmetry of Flower

364. The flowers are Zygomorphic in:
(A) Mustard (B) Gulmohar
(C) Cassia (D) Datura
(E) Chilli
Choose the correct answer from the options given below:
(a) (C), (D), (E) Only
(b) (A), (B), (C) Only
(c) (B), (C) Only
(d) (D), (E) Only

NEET-2022
CMC Vellore-2009
Rajasthan PMT-2009
Punjab MET-2009
UP CPMT-2009

Ans. (c) : Zygomorphic flowers (%) are the flowers which can be divided into two equal halves by only one vertical division, these flowers have bilateral symmetry. Datura, mustard and chilli have actinomorphic flowers.



365. Anthesis means
(a) growth of pollen tube inside the carpel
(b) dehiscence of anthers
(c) opening of floral bud
(d) emergence of anthers

JCECE-2009
AFMC-2008
MGIMS Wardha-2007
Manipal-2007

Ans. (c) : Anthesis is the period during which a flower is fully open & functional. Anthesis means the opening of floral buds. It may also refer to the onset of that period. Flowers with diurinal anthesis are generally bright in colour to attract insects during day and flowers with nocturnal anthesis are generally white or less colourful. to attract insects at night.

366. A flower which can be divided into two equal halves by using only plane is:
(a) actinomorphic (b) complete
(c) incomplete (d) zygomorphic

VMMC-2015
WB JEE-2011
J&K CET-2002
Rajasthan PMT-2001

Ans. (d) : When a flower can be divided by a single plane into two equal part of mirror images of each other it is called a zygomorphic flower. They posses bilateral symmetry and are often irregular. Actinomorphic flowers have radial symmetry, Two equal halves are formed by any type of vertical division which passes through the center and flower are regular.

367. Example for asymmetric flower
(a) Gulmohar (b) Cassia
(c) Canna (d) Pea

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : It a flower can not be devided into two similar halves by any vertical plane passing through the centre is called asymmetric flower, as in Canna.
Pea, Gulmohar and Cassia are zygomorphic flowers, it can be devided into two similar halves only in one particular vertical plane.

368. Assertion (A) : Pollen banks can be used in crop breeding programs.
Reason (R) : pollen grains can be stored for Many years in liquid nitrogen.
(a) A and R are true and 'R' is the correct explanation to 'A'
(b) A and R are true but 'R' is not the correct explanation to 'A'

@apna_pdf

(c) A is true but R is false
(d) A is false but R is ture

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Pollen banks can be used in crop breeding programmes, similar to seed banks. It is possible to store pollen grains of a large number of species for many years in liquid nitrogen (–196°C) for maintain viability of pollen. The period for which pollen grain remains highly viable depends on prevailing temperature and humidity.

369. State this condition and plant that prevents both autogamy and geitonogamy in this plant
(a) Male and female plants mature at different times - Hibiscus
(b) Male and female flowers on the same plant - Gloriosa
(c) Separate male plant and female plants - Papaya
(d) Male and female flowers on the same plant with different heights - Datura

AP EAPCET-22.05.2023, Shift-I

Ans. (c) : Transfer of pollen grain from anther to stigma of another flower of same plant is called geitonogamy while autogamy is achieved within the same flower. In several species such as Papaya, male and female flowers are present on different plants, this condition prevents both autogamy and geitonogamy.

370. The following plant is characterized by trimerous flowers, superior and trilocular ovary with axile placentation.
(a) Solanum nigrum
(b) Yucca gloriosa
(c) Capsicum frutiscens
(d) Petunia alba

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : Trimerous flowers, superior and trilocular ovary with axile plancentation is characteristic of Liliaceae family. Many plants belonging to this family are good ornamentals eg. tulip and gloriosa. In this family calyx and corolla are not distinct and are termed as perianth.

371. Identify the group of plants belong to the same family based on the floral formula given below

$$\text{Br Ebrl}\oplus\ \male\ \overset{\frown}{P_{(3+3)}+A_{3+3}}G_{(3)}$$

(a) Atropa belladona, Asparagus racemosus, Allium cepa
(b) Cestrum nocturmum, Datura metel, Nicotiana tabaccum
(c) Allium cepa, Gloriosa superba, Dracaena angustifolia
(d) Colchicum autumnale, Petunia alba, Nicotiana tabaccum

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : • Allium cepa, Gloriosa superba, Dracaena angustifolia are belong to family liliaceae commonly called 'Lily family'. The floral formula given as–

$$\text{Br}\oplus\ \male\ \overset{\frown}{P_{(3+3)}}A_{3+3}\ \underline{G_3}$$

• Common characteristics include large flowers with six coloured petaloid tepals that means petals and sepals are not differentiate.

372. Given below are two statements : One is labelled as Assertion A And the other is labelled as Reason R :
Assertion A : A flower is defined as modified shoot wherein the shoot apical meristem changes to floral meristem.
Reason R: Internode of the shoot gets condensed to produce different floral appendages laterally at successive nodes instead of leaves.
In the light of the above statements, choose the correct answer from the options given below :
(a) A is false but R is true.
(b) Both A and R are true and R is the correct explanation of A.
(c) Both A and R are but R is NOT the correct explanation of A.
(d) A is true but R is false.

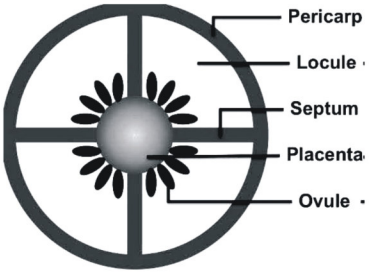
NEET (UG) 07.05.2023

Ans. (b) : Goethe defined the flower is a modified part of shoot.
• Flowers are modified version of the shoot of the plant in which leaves are modified into floral structure.
• Node are located on the stems from where new flowers grow. Internodes are also important because they provide the appropriate distance between two nodes. Internodes are important in plants because they help grow new branches leaves, and flowers. The length of the internodes varies differently.
• The place from where the leaves arises is known as node. The space between the two consecutive nodes is known as internode.

373. Axile placentation is observed in
(a) China rose, Petunia and Lernon
(b) Mustard, Cucumber and Primrose
(c) China rose, Beans and Lupin
(d) Tomato, Dianthus and Pea

NEET (UG) 07.05.2023

Ans. (a) : Placentation is a type of ovule arrangement in which the ovules arise from placental tissue derived from the appices of the septa of a locute.
• Axile placentation occurs in syncarpous pistils.
• China rose shows axile placentation belongs to family malvaceae.
• Petunia belongs to solanaceae family and show axile placentation.
• Lemon belongs to Rutaceae family and it also shows axile placentation.



Axile placentation

374. The ovary is half inferior in :
(a) Mustard (b) Sunflower
(c) Plum (d) Brinjal

NEET-2020 Phase-I

@apna_pdf

Ans. (c) : Plum, Peach and Rose flowers are perigynous and ovary is half inferior.

- Plum belongs to Rosaceae family.
- Brinjal belongs to Solanaceae family, Superior ovary with swollen oblique placenta.
- Sunflower belongs to family Asteraceae family, inferior ovary with basal placenta.
- Mustard belongs to family Brassicaceae family, superior ovary with parietal placentation.

375. The term 'polyadelphous' is related to which among the following?

(a) Gynoecium (b) Androecium
(c) Corolla (d) Calyx

AP EAMCET-25.09.2020 Shift-II

Ans. (b) : Androecium is the male reproductive part. They have filaments when these filaments are joined to make groups but the anther remain separated, that condition is called polyadelphous. It happens in citrus.

376. Which of the following is correct:

(a) Perigynous – plum, peach, rose
(b) Epigynous – guava and cucumber
(c) Hypogynous – mustard, rose
(d) Both (a) and (b)

AIIMS-25.05.2019 Shift-II

Ans. (d) : The floral parts are arises at the same point of ovary is called perigynous flower and ovary is semi-superior or semi-inferior.
Ex - Peech, Rose, plum etc.

• Epigynous flowers are having floral parts (such as the petals and stamens) attached to or near the upper part of the ovary, as in the flower of the apple, cucumber, and guava, the ovary is inferior.

• In hypogynous flowers, the perianth and stamen are attached to the receptacle below the gynoecium. The ovary is superior hypogynous flowers are found in tomato, tulip.

Classification of Flower Based on Position of Ovary

Hypogynous *(Ovary Superior)* | **Perigynous** *(Ovary Half-inferior)* | **Epigynous** *(Ovary Inferior)*

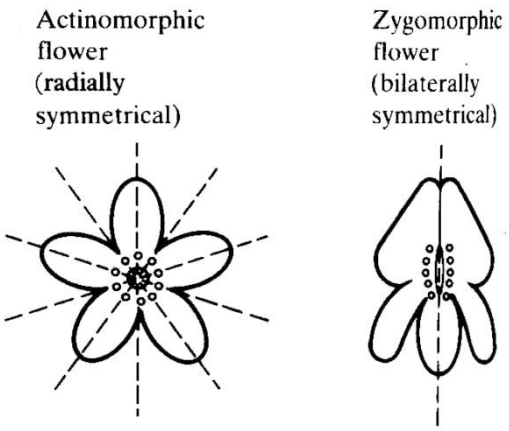
377. Which of the following represent zygomorphic symmetry:

(a) Canna, Mustard, Chilli, Datura
(b) Mustard, Canna, Pea, Datura
(c) Pea, Bean, Cassia, Gulmohar
(d) Pea, Bean, Canna, Chilli

AIIMS-25.05.2019 Shift-II
Rajasthan PMT-2011

Ans. (c) : Generally the **Zygomorphic symmetry** is also called as **bilateral symmetry** occurs in a flower through which it can pass only one plane of symmetry that will divide it into two parts.
Ex- Fabaceae family.

• Pea, Bean, Cassia and Gulmohar belong to Fabaceae. So, the correct answer is Pea, Bean, Cassia, Gulmohar.



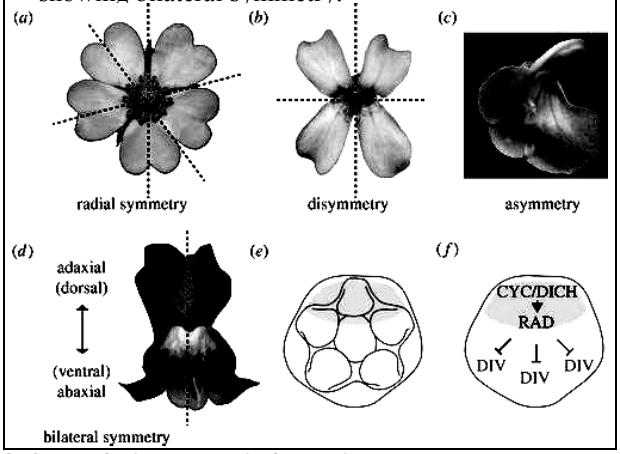
378. Radial Symmetry is found in the flowers of.

(a) Brassica (b) Trifolium
(c) Pisum (d) Cassia

Tripura JEE-2017
NEET-2016 Phase-II

Ans. (a) : The Brassica flowers can be cut into two equal halves from any plane. So, it shows the radial symmetry. These flowers are referred to as actinomorphic flowers. Radial symmetry is found in flowers like Mustard, Datura and Chilli.

- Pisum, Trifolium and Cassia are the members of Fabaceae family having zygomorphic flower showing bilateral symmetry.



379. Inferior ovary is found in

(a) Carrot (b) Rose
(c) Citrue (d) Cucumber

Tripura JEE-2017
UP CPMT-2013

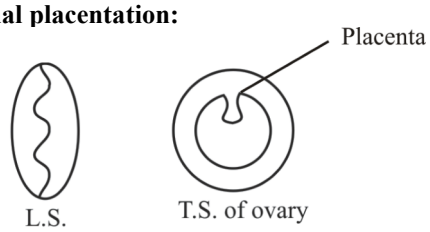
Ans. (d) : Imbicate aestivation: It is an arrangement in which sepal and petals are internal and they are lying overlapped on both the margins. In this one sepal or petals are external and overlapping with each other.

The family compositae or asteraceae is characterised by presence of inferior ovary. In this ovary thalamus is flattened and the other floral organs. The flower that have inferior ovary called epigynous flower.

@apna_pdf

380. In a flower of a plant the number of carpels is equal to the number of inner whorl of perianth lobes and cotyledons 1/3 of carpel number. What is the arrangement of ovules on placenta of the flower of that plant?
(a) Axile (b) Marginal
(c) Basal (d) Parietal
TS EAMCET-2015

Ans. (a) : Axile placentation: When the placenta is axile and the ovules are attached to it in a multilocular ovary, the placentation is said to be axile in multicarpellary syncarpous ovaries, the carpels fuse to form septa which form a central axis. The ovules are arranged on the axis. **ex:** Malvaceae, Solanaceae , Lilliaceae.
Marginal placentation:



It develops form monocarpellary & unilocular ovary, placenta born at the margin as Leguminaceae.
Basal placentation: It develops form monocarpellary to tricarpellary but unilocular ovary placenta develops from the based usually shaded as- Gramineae/Poaceae, compositae.
Parietal Placentation: It develops from bicarpellary to multicarpellary but unilocular ovary.
Except Crucifer:- Where false septum develops called as Replum.
Placenta develops on the periphery.

381. Anemophilous flowers have :
(a) sessile stigma
(b) small and smooth stigma
(c) colored flower
(d) large and feathery stigma
WB JEE-2006
BHU PMT-2001

Ans. (d) : In Anemophilus flowers, pollination is carried out by wind. The plants which is pollinated in this manner are grasses, which have insignificant flowers with large, often feathery stigma.
Anemophilous flowers have large feathery stigma to easily trap the air born pollen grains. Anemophily is quite common in grasses, maize, wheat, sugarcane, bamboo etc.

382. Which is present in monocot flowers?
(a) Sepals (b) Petals
(c) Tepals (d) None of these
BVP-2012
MGIMS Wardha-2007

Ans. (c) : If the perianth is relatively undifferentiated, or if its components intergrade in form, the individulas leaf- like parts are called as tepals.
• Green tepals are called as sepaloid and coloured tepals are called as petaloid.
• Tepals are individual parianth segment. The parianth is collective name as undifferentiated sepals and petals these are found in monocot flowers. The parianth segment of Gramineae are called lodicules.

383. Irregular flowers are
(a) asymmetrical (b) symmetrical
(c) achlamydous (d) All of these
Manipal-2011

Ans. (*) : Irregular flower are those in which some of the floral leaves in any one series have a different shape from the other for example, the petals of pea or violet. They have only one plane of symmetry.
These flowers are bilaterally symmetrical i.e - they are divisible into equal halves about one plane only. The irregular flower is also called the zygomorphic flower.

384. When gynoecium is present in the topmost position of thalamus, the flower is known as :
(a) Inferior (b) Epigynous
(c) Perigynous (d) Hypogynous
Uttarakhand PMT-2004
Manipal-2004
AMU-2005

Ans. (d) : The gynoecium is situated at the top of the thalamus. If upper part of thalamus is slightly swollen and forms a cushion like a disc. Thalamlus is basically the receptacle found in angiosperms.
Ex- Hibiscus *rosa sinensis*, *ranunculus*, Brassica, Brinjal etc.

385. Assertion : Insects visit flower to gather honey.
Reason : Attraction of flowers prevents the insects from damaging other parts of the plant
(a) Both assertion and reason are true and reason is the correct explanation of assertion
(b) Both assertion and reason are true but reason is not correct explanation of assertion
(c) Assertion is true but reason is false
(d) Both assertion and reason are false
HP CET-2011

Ans. (d) : Attraction to flower can't prevent the insects from damaging other parts as only those insects are attracted to the flowers, which help in pollination not gather honey, such as bees, moth etc.
Nectar and pollen grains are the usual floral rewards provided by the flower to the insect and the body of the animal get a coating of pollen grain which are generally sticky in animal pollinated flowers. These pollen grains are burst of when the insect body comes in contact with a receptive stigma.
Thus, both assertion & reason are false.

386. The smallest flower is that of the :
(a) Onion
(b) Mustard
(c) Fig
(d) Wolffia microscopia
JIPMER-1999

Ans. (d) : Wolffia species are the smallest flowering plants on earth with 2mm measurements. They are commonly called as watermeal or duckweed. Wolffia species are free floating plants without roots. The flower has one stamen and one pistil.
Rafflesia is largest flower with the measurement of 60 cm to 80 cm.

387. The order of opening of flower parts from the periphery towards the centre is called
(a) acropetal (b) centripetal
(c) centrifugal (d) basipetal
J&K CET-2009

@apna_pdf

Ans. (b) : In general the order of opening of floral parts from the periphery towards the center is called centripetal, while from centre towards the periphery is called centrifugal.

• **Acropetal** order is a flower arrangement in which the new flowers are at the top, and the older flowers are at the bottom.

• **Basipetal** The arrangement of older flowers at the apex and fresh flowers and buds at the base is known as basipetal flower.

388. Opening of floral buds into flowers is a type of
(a) autonomic movement of locomotion
(b) autonomic movement of variation
(c) paratonic movement of growth
(d) autonomic movement of growth

Rajasthan PMT-2010

Ans. (d) : Opening of floral buds into flower is a type of autonomic movement of growth (Nastic movement). This is a non directional movement in which the response is determined by the structure of the responsive organ and not to the direction of stimulus. Greater growth on one side causes the organ to bend to the opposite side.

389. Cleistogamous flowers
(a) open at dusk (b) open at dawn
(c) open during noon (d) never open

AMU-2011

Ans. (d) : Cleistogamous flowers never open, only self pollination occurs within the bud. Bisexual flowers which do not open at all are called cleistogamous. In such flowers anthers and stigma lie close to each other. When the anthers dehiscence in flower buds, pollen grains come in contact with the stigma and pollination occurs.
Cleistogamous flowers are found in *Arachis hypogea*.

390. There are certain plant species, which flowering occurs only once in their life span. This condition is named as
(a) Polygamous (b) Polycarpic
(c) Monocarpic (d) Pericarpic

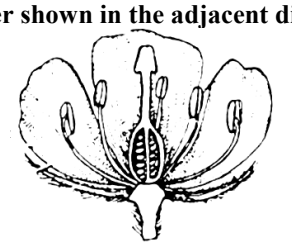
Uttarakhand PMT-2009
AMU -2000

Ans. (c) : Monocarpic plant is that which flowering and fruiting occurs only once in life. All annuals and biennials are monocarpic, Ex - Agave, Bambusa tulda, Melocanna bambusoides. They die after bearing fruit.

• In polygamous condition unisexual (male + female), bisexual and neuter flowers are present on the same plant, Ex - Mango, Ray florets of sunflower.

• Polycarpic are those perennial plants, which bear fruits every year after attaining maturity Ex - Mango, Litchi, Guava, Lemon, Orange etc

391. The flower shown in the adjacent diagram is :



(a) Homochlamydeous unisexual and hypogynous
(b) Homochlamydeous bisexual and epigynous
(c) Dichlamydeous bisexual and hypogynous
(d) Heterochlamydeous bisexual and epigynous

Karnataka CET-2003

Ans. (c) : The flower shown in the diagram has two whorls of perianth, when the calyx and corolla are distinct the condition is called dichlamydeous. It is bisexual because both sex organs (stamens and ovary) are present together and hypogynous because ovary is superior.

392. Which one of the following is a monocarpic tree?
(a) *Bambusa vulgaris*
(b) *Corypha umbraculifera*
(c) *Phoenix dactylifera*
(d) *Elaeis guineensis*

Karnataka CET-2003

Ans. (a) : Monocarpic plants are exactly opposite to the polycarpic plants. It produce flower and seeds once in their life span.
Example:- *Bambusa vulgaris* (bamboo), Rice, Radish etc.

393. Empty glumes are
(a) petals (b) bracts
(c) anthers (d) carpels

AMU-2007

Ans. (b) : Bracts are often different from foliage leaves. They may be smaller, larger or of a different colour, shape or texture, typically they also look different from the parts of the flower, such as the petals or sepals.

• Glumes are basal, membranous, outer sterile husk or bract in the flower of grasses (Poaceae) and sedges (Cyperaceae). A bract is a modified or specialized leaf, specially one associated with a reproductive structure such as a flower, inflorescence axis or cone scale.

394. Which one of the following is correct match?
(a) Monarch – Nicotiana tabacum
(b) Diarch – Trapa natans
(c) Triarch – Pisum sativum
(d) Tetrarch – Ricinus communis

AP EAMCET-2003

Ans. (c) : In roots, the xylem is solid core with ridge like projections extending towards the pericycle. In relation to number of xylem ridges present in the roots, xylem may be called as monarch.
Ex- Trapa natans
Diarch - Nicotiana tabacum
Triarch - Pisum sativum
Tetrarch - Ricinus communis

395. Arrange the following genera in the increasing order of number of carpels in each flower:
1. Abutilon 2. Bauhinia
3. Allium 4. Nicotiana
The correct answer is:
(a) 2 4 3 1 (b) 2 3 4 1
(c) 4 2 3 1 (d) 1 3 4 2

AP EAMCET-2004

Ans. (a) : (i) Abutilon belongs to family Malvaceae. Gynoecium is pentacarpellary or polycarpellary, syncarpus but stigma free, so gynoecium is incompletely syncarpous.

@apna_pdf

(ii) Bauhinia belongs to family Fabaceae.
Gynoecium is monocarpellary with marginal placentation
(iii) Allium belongs to family Liliaceae,
(iv) Nicotiana belongs to family Solanaceae.
Gynoecium is bicarpellary, syncarpous, ovary superior, biloculor. The decreasing order of number of carpels in each flower is-
Bauhinia >Nicotiana > Allium > Abutilon.

396. Clove the commonly used spice is obtained from the parts of plant
(a) stem (b) flower bud
(c) root (d) fruit
VMMC-2014

Ans. (b) : Clove, commonly used as spices is obtained from the *Syzygium aromaticum* flower bud of plant, belong to family Myrtaceae. These flower buds are pale in color at first and gradually become green and brown and bright red at the collecting time.

397. Which one of the following is an advanced floral feature?
(a) Hypogyny (b) Bisexuality
(c) Apocarpy (d) Zygomorphy
AP EAMCET-2001

Ans. (d) : The advanced floral characteristics are - Zygomorphy has evolved more than once in mono cotyledons.
- Zygomorphic or bilateral symmetry.
- Epigynous ovary (inferior). Flower part are united with each other.
- Flower parts like sepals, petals, stamens, pistils are few (less than 10), Dichlamydeous (fused stamens)
- Albuminous seed and Simple leaves.

398. Umbel inflorescence is found in
(a) Musa (b) Colocosia
(c) Coriandrum (d) Helianthus
AMU-2005

Ans. (c) : Umbel inflorescence is found in *Coriandrum sativum*. In this type of inflorescence flowers appears to develop from a common point and pedicillate. A group of bracts are involucre, which is always associated with the umbel and each flower arises from the axis of bract. In coriandrum compound umbel is present, when flower axis is branched called the compound umbel.

399. Floral diagram fails to indicate
(a) epiphylly and epipetaly
(b) aestivation and placentation
(c) position of ovary on the thalamus
(d) cohesion of carpels and stamens
AMU-1997

Ans. (c) : Floral formula is a convenient way to store the retrieved information about plants. Floral diagram represent the number of a flower, their general structure arrangement, aestivation, adhesion, cohesion, position with respect to mother axis.
Therefore floral diagram fails to indicates the position of the ovary on the thalamus whether superior or inferior.

400. Largest flower is
(a) Rafflesia arnoldii
(b) Helianthus annuus
(c) Welwitschia mirabilis
(d) Nelumbo nucifera
AMU-2009
BHU PMT(Screening)-2005

Ans. (a) : Rafflesia arnoldii is noted for producing the largest individual flower on earth. *Rafflesia arnoldii* is a species of flowering plant in the parasitic genus Rafflesia. It has a very strong and horrible odour of decaying flesh, and nicknamed "corpse flower".

401. One of the following is not a flower
(a) Shoe flower (b) Passion flower
(c) Sunflower (d) May flower
MGIMS Wardha-2011
BVP-2002

Ans. (c) : This inflorescence is known as capitulum or head inflorescence. Two kinds of florets are recognised in sunflower.
Sunflower (Helianthus annuus) is a member of the Asteraceae family. Its flower is not real flower but it is a whole inflorescence having a group of many small flowers.
(i) **Ray florets** arranged on the receptacle having distinct yellow and strap shaped petals. These florets are female, sterile and are always zygomorphic and may be arranged in one or many whorls.
(ii) **Disc florets** grouped in the center are bisexual and actinomorphic.

402. A hyaline bisexual and self-fertilized flower that does not open at all is
(a) Chasmogamous (b) Apogamous
(c) Cleistogamous (d) polygamous
MGIMS Wardha-2009

Ans. (c) : A hyaline, bisexual and self fertilized flower that never open is called Cleistogamous flower, while chasmogamous flower expose their mature stigma and anthers to the pollinating agents.

403. Syngenesious condition means
(a) anthers fused and filaments free
(b) both anthers and filaments fused
(c) filaments fused and anthers free
(d) filaments fused with carpels
AMU -2011, 2000
BHU PMT (Screening)-2011

Ans. (a) : Syngenesious is an exceptional feature of family asteraceae (compositae)
- The syngenecious or synandrous condition of androecium is a feature of the family Asteraecae where the anther of the filaments are fused to form the tubular mass or group and their filaments remains free.

404. Identify the wrong expression from the following statements.
(a) A plant that bears male, female and bisexual flowers is polygamous
(b) An actinomorphic flower can be dissected into two equal halves from any plane
(c) Superior ovary is found in hypogynous flowers
(d) The side of the flower towards the bract is called the posterior side
VMMC-2010

Ans. (d) : Bract occurs towards the anterior side of a flower while mother axis is or floral axis of a flower occurs towards the posterior side.
Bract is considered as a modified leaf, it bears a peduncle or petiole in its axis.

@apna_pdf

405. Elongated peduncle bearing pedicellate flower continuously in acropetal order is:
(a) Corymb (b) Umbel
(c) Raceme (d) Head
VMMC-2008

Ans. (c) : In this type of arrangement unbranched, elongated, peduncle bearing pedicillate or stalked flower acropetally e.g, Delphinium, Raphanus, Lunaria and Lupinus.
Raceme is a simple type of racemose inflorescence.

406. Spathe is present in the flowers of:
(a) Banana (b) Rice
(c) Marigold (d) Sunflower
Rajasthan PMT-2011

Ans. (a) : The bract or spathe exposes a cluster of female flowers that are normally arranged in two rows.
Spathe is present in banana flowers. Spathes are boat - shaped bracts that are brightly coloured, larger and spirally arranged structures that protect the flowers. They roll back and fall when flowers open up.

407. Epigynous flowers are present in:
(a) Mustard (b) Brinjal
(c) China rose (d) Cucumber
Rajasthan PMT-2011
JIPMER-2011

Ans. (d) : In epigynous types of flowers that thalamus encloses the ovary entirely and fuses with it.
The sepals petals and stamens arise from the top of ovary. Such flowers known as epigynous and ovary is inferior. Ex- Oenothera, Cucurbita.

408. Keel is the characteristic feature of flower of:-
(a) Indigofera (b) Aloe
(c) Tomato (d) Tulip
AIPMT-2015

Ans. (a) : The flowers of family Papilionaceae have butterfly shaped corolla, the outermost petal is called **standard** or **vexillum**, two lateral petals are similar and clawed, they are called **wings** or **alae** and two anterior petals are called a **keel** this type of petal arrangement is found in the bean, gram, pea, indigofera.
Keel are formed when two anterior small petals are fused at the base. When the keel is formed it forms a concave shape.

409. Night flowers are mostly:
(a) White (b) Green
(c) Red (d) Blue
BCECE-2015

Ans. (a) : In general the dark, due to limited vision, white colour will stand out and the strong fragrance also help to attract the pollinators. That is why night blooming flowers have relatively more fragrance and is generally white in colour.

410. A flower which can be divided into equal vertical halves by more than one plane of division is:
(a) Actinomorphic (b) Zygomorphic
(c) Heteromophic (d) Cyclic
J&K CET-2004

Ans. (a) : Actinomorphic flower: A flower that can be divided in to two equal/identical halve from any plane passing through the central axis of flower. The type of symmetry found in such flower called radial symmetry.
e.g. - Roses, Lilies and Butter cups.

411. The maize plant is monoecious and the flowers are
(a) Cleistogamous (b) Unisexual
(c) Bisexual (d) Neutar
Uttarakhand PMT-2011

Ans. (b) : The maize plant is monoecious and the flowers are unisexual but on the same plant.
Unisexual flowers:- They have only male or female reproductive parts i.e. either stamen or carpels are present
Ex-Bitter gourd, Papaya, Pumpkin & Cucumber.

412. When the flower is regular and radially symmetrical, it is called
(a) Zygomorphic (b) Asymmetric
(c) Unisexual (d) Actinomorphic
UP CPMT-2013

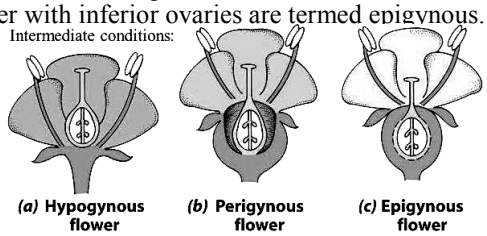
Ans. (d) : When the flower is regular and radially symmetrical, it is called actinomorphic. eg. petunia wild rose and butter cup.
Differences in size or shape of the whorl's part make the flower irregular.
Example - Asiatic day flower & Canna.
A flower that can be divided into two equal / identical halves from any plane passing through the central axis of flower and symmetry is called radial symmetry.
Examples - Mustard, lily, datura etc

413. National flower of India is :
(a) Lotus (b) Lily
(c) Rose (d) Sunflower
BVP-2000

Ans. (a) : National flower of India is Lotus (Nelumbo nucifera). It is one of the important National Symbols of India.

414. Among China rose, mustard, brinjal, potato, guava, cucumber, onion and tulip, how many plants have superior ovary?
(a) Four (b) Five
(c) Six (d) Three
AIPMT (Re-Exam)-2015

Ans. (c) : China rose, Musturd, Brinjal, Potato, Onion and Tulip have superior ovary while guava and cucumber have inferior ovary.
Superior ovary is an ovary attached to the receptacle above the attachment of other floral parts.
A superior ovary is found in types of fleshy fruits such as true Berries, Drupes etc.
Flower with inferior ovaries are termed epigynous.



415. Among bitter gourd, mustard, brinjal, chinarose, pumpkin, lupin, cucumber, sunn hemp, gram, guava, bean, chilli, plum, petunia, tomato, rose, withania, potato, onion, aloe and tulip how many plants have hypogynous flower?
(a) Eighteen (b) Six
(c) Ten (d) Fifteen
NEET-2013

@apna_pdf

Ans. (d) : In hypogynous flowers, the perianth and stamens are attached to the receptacle below the gynoecium, the ovary is superior to these organs, and remaining floral organs arise from below the point of origin of the carpel. The ovary in such flowers is said to be superior, e.g- mustard, brinjal and china rose etc.

416. In china rose the flowers are :
(a) Zygomorphic, epigynous with twisted aestivation
(b) Actinomorphic, hypogynous with twisted aestivation
(c) Actinomorphic, epigynous with valvate aestivation
(d) Zygomorphic, hypogynous with imbricate

NEET-2013

Ans. (b) : China rose flower is hypogynous with twisted aestivation and actinomorphic.
In hypogynous flowers, the perianth and stamens are attached to the receptacle below the gynoecium, the ovary is superior to these organs, and the remaining floral organs arise from below the point of origin of the carpel.
In twisted aestivation margin of a petal covers adjacent petal and the other margin is covered by another petal.
Actinomorphic is a type of flower symmetry where it is distinguished by being radically symmetrical and capable of division by any longitudinal plane into essentially symmetrical halves.

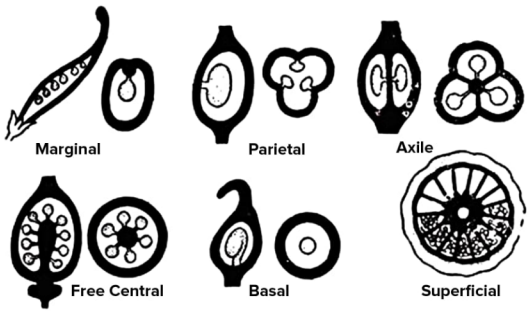
417. How many plants in the list given below have marginal placentation
Mustard, Gram, Tulip, Asparagus, Arhar, Sunn hemp, Chilli, Colchicine, Onion, Moong, Pea, Tobacco, Lupin
(a) Six (b) Three
(c) Four (d) Five

AIPMT (Mains)-2012

Ans. (a) : In the given list six plants have marginal palcentation.

Placentation	Example
Axile	Tomato, Onion, Asparapus, Tabacco, Chilli, Tulip, Calchium.
Parietal	Mustard.
Marginal	Gram, Arhar, Moong, Pea, Lupin, Sunn hemp.

Placentation :-
- It is defined as the arrangement of ovules within the ovary (Placenta).
- Several different forms of placentation can be seen in flowering plants.



418. Which of the following plants has the floral characters like zygomorphic flower vexillary aestivation, diadelphous androecium and marginal placentation ?
(a) Pisum (b) Belladonna
(c) Brinjal (d) Asparagus
(e) Aloe

Kerala PMT-2011

Ans. (a) : Pisum sativum plants have the floral characters like zygomorphic flower, vexillary aestivation, diadelphous androecium and marginal placentation. Pisum belongs to the family Fabaceae.

419. The flower in which the gynoecium occupies the highest position on the thalamus leaving other parts below is called:
(a) hypogynous (b) perigynous
(c) epigynous (d) none of these

J&K CET-2005

Ans. (a) : The flower in which the gynoecium occupies the highest position on the thalamus leaving other parts below is called hypogynous flower.

420. A scorpioid cyme having all the flowers in the same plane is:
(a) Rhipidium (b) Bostryx
(c) Cincinnus (d) Dreponium

AMU-2014

Ans. (a) : Rhipidium: A scorpioid cyme having all the flowers in the same plane.
Ex- *Solanum nigrum.*
Bostryx helicoids cyme: A determinate cyme in which the branches develop only one side due to the abortion of opposing paired.
Cincinnus: A tight, modified helicoids cyme in which the pedicel are very short or a scorpioid cyme or cincinnus is a monochasium in which the branches develop on alternating side of each sequential axis, typically resulting in a geniculate (Zig -Zag) appearance **e.g.** Gossypium (cotton), Drosera (sundew).

421. Plants who flowers single time in their life cycle is known as :
(a) monocarpic (b) holocarpic
(c) polocarpic (d) eucarpic

Rajasthan PMT-1999

Ans. (a) : Plants who flowers single time in their life cycle is known as monocarpic.
Ex – Bamboo plant, Agave.
• **Polycarpic plants:** Plant that produce flower and fruit many times or every year. They are generally biennial or perennial.
Ex- Mango, Litchi, Guava, Lemon and Orange.
• **Holocarpic:** The entire thalamus is converted into reproductive cell – chyteridiomycota.
• **Eucarpic:-** Applied to a fungus in which only part of the thallus differentiates to form a reproductive structure or structures e.g.:- Most of the fungus are eucarpic.

422. Bracts enclosing a cluster of flowers are known as :
(a) bracteate (b) Involucre
(c) petaloid (d) polysepalous

Rajasthan PMT-2003

@apna_pdf

Ans. (b) : Involucre: Involucres is used for only cluster of flower protecting the reproductive structures.
Petaloid flower: Petaloid means when sepals resemble petals. **Ex-** Lily, Anemone, Hellebore flowers etc.
Poly sepalous: A condition in flowers that possesses a calyx, consisting of separate sepals.
Spathe: A large bract or pair of bracts forming a sheath to enclose the flower cluster of such plants as palms, arums, crocuses and day flowers (commelina).

423. Study of flower is called :
(a) Anthology (b) Spermology
(c) Malacology (d) Agrostology

Rajasthan PMT-2001

Ans. (a) : Anthology: The study of flower in the form of morphology and anatomy.
Spermology: The study of seed is known as spermology.
Agrostology: The branch of Botany concerned with the study of grasses, especially their classification.
Malacology: It's the field of science which studies the (phylum) mollusca which includes familiar groups of invertebrate including snail and slug, clam and mussels, squids, octopuses, oesters and chitons.

424. Cleistogamous flowers are:
(a) Bisexual flowers which remain opened
(b) Bisexual flowers which remain closed
(c) Open female flower
(d) Open male flower

WB JEE-2014

Ans. (b) : Cleistogamous flower are the ones that do not open and show self pollination. The advantage of a cleistogamous flower is that they are dependent on pollinators, hence producing seed in all conditions.

425. Gall flowers of figs are:
(a) Staminate (b) Pistillate
(c) Neutar (d) Naked

CMC Vellore-2011

Ans. (c) : Gall flower of figs are neutar.
Neutar: Gall flowers are usually neutar and it is used as food for gall wasps which are specific pollinators of hypanthodium inflorescence.
Staminate:- Unisexual flower that bear only male reproductive parts that stamen called staminate flower **ex-** cucumber, chrysanthemum.
Pistillate:- A flower that lack stamens is pistillate and female part called pistillate flower.

426. In guava, cucurbits flowers are:
(a) Hypogynous (b) Epigynous
(c) Perigynous (d) Both (a) and (b)

WB JEE-2008

Ans. (b) : In guava and cucumber inferior ovary is present i.e rest parts are present above the gynoecium.

427. In floral formula(K) denotes:
(a) Polysepalous (b) Gamosepalous
(c) Polypetalous (d) Gamopetalous

WB JEE-2008

Ans. (b) : Gamosepalous (the number of sepals in the calyx) is symbolized by the letter 'K' in a floral formula.

428. The arrangement of the ovules on the placentae developed from the central axis of the ovary is called:
(a) parietal placentation
(b) axile placentation
(c) basal placentation
(d) marginal placentation

J&K CET-2005

Ans. (b) : The arrangement of the ovules on the placenta developed from the central axis of the ovary is called axile placentation, ex- China rose, Lemon, Tomato.

429. The glumes are modified
(a) petals (b) sepals
(c) tepals (d) bracts

MP PMT-2013
Haryana PMT-2011

Ans. (d) : In the family Graminae at the base of spikelet 2 sterile or empty bract called the glume.
Bracts are specialized leaves present in axis of flower small, dry scaly bracts are called as glumes.
ex- Wheat and grass.
Glume is a scale at the base of each flower is spikelet. Glumes may be similar in form to the lemnas.

430. Perigynous flowers are found in :-
(a) Cucumber (b) China rose
(c) Rose (d) Guava

AIPMT-2015
Manipal-2010

Ans. (c) : Perigynous flower are found in rose. Perigynous, flowers are located on the rim of thalamus almost at the same level, the ovary here is said to be half inferior. This type of flowers are found in plum, rose, peach.
- In cucumber and guava epigynous flowers are found.
- Hypogynous flowers are present in China rose.

431. The partial floral formula of a flower is $K_{(5)}\ C_5\ A_{(\infty)}\ \underline{G}_{(5)}$. Which of the following set of information is conveyed here?
(a) Gamosepalous, polypetalous, syncarpous and superior ovary
(b) Polysepalous, polypetalous, syncarpous and inferior ovary
(c) Gamosepalous, gamopetalous, polycarpous and superior ovary
(d) Gamosepalous, polypetalous, syncarpous and inferior ovary

WB JEE-2014

Ans. (a) : A condition in flowers in which sepals are united or fused called as gamosepalous.
Polypetalous - having separate petals.
Syncarpous: A condition in which the carpels of the gynoecium are united in a compound ovary.

432. Which one of the following diagrams represents the placentation in Dianthus

(a) (b)

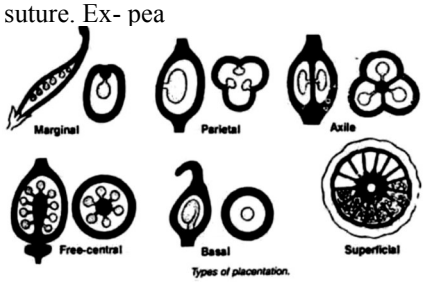
(c) (d)

AIPMT (Mains)-2011

@apna_pdf

Ans. (c) : Dianthus belongs to the family Caryophyllaceae that shows the free-central type of placentation.

- In this type of ovules are arranged on the central axis which is not attached with the ovary by any kind of septum.
- Parietal placentation is an arrangement in which ovules develop on the inner wall of the ovary. Ex- Brassica
- Marginal placentation is a type of placentation in which the placenta forms a ridge or margin along the ventral suture. Ex- pea



433. The example for trimerous, unisexual flowers is……..

(a) Tamarind (b) Pea
(c) Cocos nucifera (d) Hibiscus

Karnataka CET-2004

Ans. (c) : Cocos nucifera.

Trimerous flowers have floral organ three or in multiples of three and these are characteristicfeatures of monocots. The plant is dioceious and the flower are unisexual because staminate and pistillate flowers occurs separately on the different plants.

- Tamarind has bisexual and pentamerous flowers.
- Pea has bisexual flowers and pentamerous flowers.
- Hibiscus has bisexual flower and pentamerous flowers.

H. Part of Flower

434. Select the correct statements

I. Ovary, style and stigma are united in Hibiscus.
II. Loranthus show ategmic ovule
III. Geitanogamy is genetically similar to autogamy
IV. Entry of Pollen tube through the micropyle is called Mesogamy

(a) II and IV (b) I and II
(c) II and III (d) III and IV

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : • In some ovules nucellus is not enclosed by integuments these are called antegmic ovule, e.g.- Loranthus.

• Geitonogamy is functionally cross pollination involving a pollinating agent, genetically it is similar to autogamy since pollen grains come from the same plant.

• Entry of pollen tube though micropyle is called progamy. Mesogamy is the phenomenon of the entry of pollen tube into ovule through integument.

435. Match the following:

List-A		List-B	
A)	Stigma	I)	Style
B)	Seat of ovules	II)	Tip of the style
C)	Basal part of Gynocium	III)	Placenta
D)	Elongated tube	IV)	Ovary

A B C D
(a) IV, III IV, II
(b) IV, II III I
(c) IV, IV, III, I
(d) II, III, IV, I

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : The gynoecium is consist of pistils. Each pistil has three parts, the stigma, style and ovary. The tip of style is called stigma serves as landing platform of pollen grain. The basal bulged part of the pistil is ovary. The style is the elongated slender part between stigma and ovary. Placenta is located inside the ovarian cavity.

436. Name the cells of mature pollen grain when you observe under microscope with the following characters respectively.
(A) Bigger cell with abundant food reserve and large irregular shaped nucleus.
(B) Small, dense cytoplasm with nucleus.

(a) Generative cell, Gametes
(b) Vegetative cell, Gametes
(c) Vegetative cell Generative cell
(d) Generative cell, Vegetative cell

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : When pollen grain is mature it contains two cells, the vegetative cell and generative cell. The vegetative cell is bigger, has abundant food reserve and a large irregularly shaped nucleus. The generative cell is small and floats in cytoplasm of vegetative cell. It is spindle shaped with dense cytoplasm and a nucleus. In over 60 percent of angiosperms, pollen grain are shed at this 2-celled stage.

437. Stalk of the stamen is

(a) Petiole (b) Filament
(c) Peduncle (d) Pedicel

Karnataka CET-2022

Ans. (b) : The presence of long stalk in stamen is called filament. Filament provide support to anthers and they carry nutrients to anther where pollen develop.

Petiole - The stalk of the leaf when present leaf described as petiole. When absent leaf is called sessile petiole is winged, swollen, spongy.

In Acacia petioles are modified into green leaf like structure and perform the function of leaf called - phyllode.

Pedicel - The pedicel is a stalk or stem that supports a single flower. It connects the single flower to the inflorescence.

The flowers without pedicels are called sessile. (for example - sunflower).

Peduncle - The peduncle is the main stalk that supports a solitary flower or an inflorescence later it also supports the fruits.

@apna_pdf

438. In floral formula, 'K' and 'C' stands for ____.
(a) K - corolla, C - calyx
(b) K - calyx, C - corolla
(c) K - calyx, C - calyx
(d) K - corolla, C - corolla

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : In the floral formula, K stands for calyx and C stands for corolla.

439. (i) When carpels are free, they are called "A"
(ii) When the carpels fused, they are called "B"
Here, A and B refers to ————
(a) A– syncarpous, B– apocarpous
(b) A– apocarpous, B– syncarpous
(c) A– monocarpous, B– multicarpous
(d) A– multicarpous, B– monocarpous

AP EAMCET-03.09.2021 Shift-I

Ans. (b) : Gynoecium is the female reproductive part of the flower. It is made up of one or more carpels. When carpels are free it is called as apocarpous as: Lotus, Rose.

When carpels are fused termed as syncarpus as: Tomato, Mustard.

440. When the stamens remain united with petals, then it is called
(a) Epipetalous (b) Episepalous
(c) Gynandrous (d) Synandrous

Tripura JEE-2021

Ans. (a) : Epipetalous is a condition when the filaments of stamens are attached to the petals of corolla. Corolla is the next cohort after calyx toward the apex composed of units called petals, which are typically thin, soft and colored to attract animals that help in the process of pollination.
Epipetalous condition found in Malvaceae and Solanaceae family.

441. Match the following lists.

List-I	List-II	List-III
A. Leathery Epicarp	i. Oblique growth	I. Cladophylls
B. Apocarpous gynoecium	ii. Limited growth branch	II. Papery mesocarp
C. Lateral branch of underground stem	iii. Superior ovary	III. Mesocarp of fruitlet is edible
D. Asparagus	iv. Aggregate fruit	IV. Chrysanthemum

The correct match is:-

	A	B	C	D
(a)	ii, I	iii, III	iv, IV	i, II
(b)	iii, II	iv, III	i, IV	ii, I
(c)	iii, II	ii, IV	iv, III	i, I
(d)	i, IV	iii, III	ii, II	iv, I

TS EAMCET-09.08.2021 Shift-II

Ans. (b) :

List-I	List-II	List-III
A. Leathery epicarp	Superior ovary	Papery Mesocarp
B. Apocarpous gynoecium	Aggregate fruit	Mesocarp of fruitlet is edible
C. Lateral branch of underground stem	Oblique growth	Chrysanthemum
D. Asparagus	Limited growth branch	Cladophylls

442. In angiospermic flowers, the filament of stamen is attached to the anther by_____.
(a) placenta (b) hilum
(c) funicle (d) connective

MHT CET-04.10.2020 Shift-I

Ans. (d) : In angiosperm flowers, the filament of stamen is attached to the anther by connective It is the portion of sterile tissue of the anther between and inter connecting the two thecae which forms a body with them and holds them together. Its function is supports, protects and gives structure to other tissues and organ in the body.

443. Stamens of a flower may be united with other parts such as petals or among themselves. Identify the correct statements from the following
i. The stamens are united into one bunch as in pea
ii. The stamens that are attached to the petals, are called epipetalous as in brinjal
iii. The stamens are united into more than two bundles as in china rose
iv. Stamens are attached to the perianth in lily
The correct is:
(a) ii, iv (b) i, iii
(c) ii, iii (d) iii , iv

TS EAMCET-09.05.2019 Shift-I

Ans. (a) : (i) The stamens are united in two bundles, called diadelphous condition, as is in pea.
(ii) Epipetalous stamens are those in which stamens are attached to the petals.
(iii) The stamens are united in one bundle, called monadelphous condition as in China rose.
(iv) In perianth, each floral part is known as tepals. When the stamen is attached or adnate to petals is called epiphyllous. The following condition is observed in lily.

444. Match the placental types (column-I) with their examples (column-II).

Column-I	Column-II
(A) Basal	(i) Mustard
(B) Axile	(ii) China rose
(C) Parietal	(iii) Dianthus
(D) Free central	(iv) Sunflower

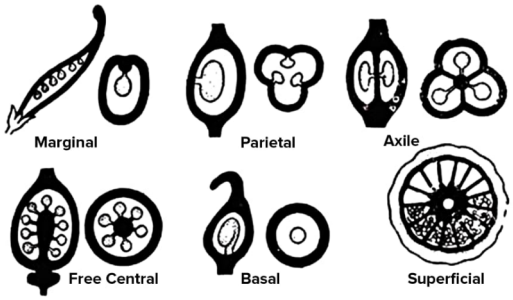
Choose the correct answer from the following options :
(a) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)
(b) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(c) (A)-(i), (B)-(ii), (C)-(iii), (D)-(iv)
(d) (A)-(iv), (B)-(ii), (C)-(i), (D)-(iii)

NEET (Odisha)-2019

Ans. (d) : Basal – Sunflower
Basal : The ovary is unilocular and a single ovule is born at the base of ovary.
2) **Axile – China rose**
Axile: It is found in multicarpellary syncarpous gynoecium. The fusion margin of carpels grow in whorl and meet in the centre of the ovary.
3) **Parietal – Mustard**
Parietal – This placentation is found in the unilocular syncarpous ovary. In this type of placentation the ovule develops on the inner wall of the ovary or on the peripheral part.
4) **Free central – Dianthus**

@apna_pdf

Free central placentation found in syncarpous gynoecium. In it the ovary is unilocular and the ovules are borne on the axis in the centre of the ovary.



445. Where the pollen grains are develop in anther during microsporogenesis?
(a) Epidermis (b) Sporogenous tissue
(c) Endothecium (d) Tapetum

GUJCET-2018

Ans. (b) : Young anther of plant contains sporogenous tissue. An anther lobe has 4 cavities (pollen sac) and has outer most epidermis. Pollen grains develops from sporogenous tissue in angiosperms. Pollen grains develop in the anthers of the stamens.
(a). Epidermis – The epidermis play a protective role in anther development.
(c). Endothecium – The endothecium is responsible for anther dehiscence to dispersed pollen when they are mature.
(d).**Tapetum –** Tapetum provides nutrition for developing microspore development and material for pollen wall formation.

446. Monadelphous condition of stamens is found in
(a) pea (b) China Rose
(c) Citrus (d) none of the above

Tripura JEE-2018
AMU-2015
Rajasthan PMT-1997

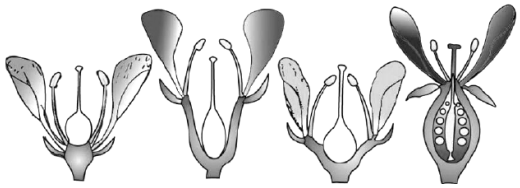
Ans. (b) : Monadelphous:- When stamens of a flower are united as a tube around the style of the carpel. It is the characteristic feature of family malvaceae.
example:- China rose
• The stamens are arranged in bundles of two in the pea flowers and it is termed diadelphous.
• Citrus has polyadelphous stamens.

447. Example for a monadelphous androecium is
(a) Pisum (b) Solanum
(c) Dracaena (d) Crotalaria

TS EAMCET-02.05.2018 Shift-I

Ans. (d) : Monadelphous androecium is found in Crotalaria, family fabaceae.
In monadelphous androecium, all the filaments are united in a single bundle but anthers are free from each other.

448. Diagram of hypogynous, perigynous, epigynous are given respectively



(A) (B) (C) (D)

Find out the correct option for the above diagrams a,b,c,d that has correct examples
(a) A–Mustard, B–Rose, C–Plum, D–Guava
(b) A–Cucumber, B–Plum, C–Rose, D–Brinjal
(c) A–China rose, B–Guava, C–Rose, D–Mustard
(d) A–Mustard, B–Rose, C–Plum, D–Brinjal

AIIMS-27.05.2018 Shift-II

Ans. (a) : The diagram of flowers are mentioned as hypogynous, perigynous and epigynous are arranged in respectively manner.
(A) Mustard- The flowers are hypogynous i.e. occupies the highest position while the other part are situated below it. In such flowers, the ovary is said to be superior.
For e.g., China rose and Brinjal.
(B) Rose- The flowers are perigynous. The ovary here is said to be half inferior.
For e.g., Plum, Rose and Peach.
(C) Plum- The flowers are perigynous, i.e., gynoecium is situated in the centre and other parts of the flower are located on the rim of the thalamus. The ovary is said to be half inferior.
For e.g., Rose, Plum and Peach.
(D) Guava- The flowers are epigynous i.e. the margin of thalamus grows upward enclosing the ovary completely and getting fused with it, the ovary is said to be inferior.
For e.g., Cucumber, Guava and the Ray florets of Sunflower.

449. Assertion (A) : Herkogamy is common in Datura plants.
Reason (R) : In Herkogamy, anther and stigma are placed at different positions so that the pollen cannot come into contact with the stigma of the same flower.
Which of the following is true?
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : The anthers and stigma are physically separated from each other by means of a barrier or simply by space eg: Lima beans, Calotropis. In Datura plants herkogamy is not occurs.
Herkogamy: Herkogamy is one of the strategies adapted by many bisexual plants to avoid self-pollination.

450. Intercalary meristem occurs in:
(a) mint (b) grasses
(c) both (a) & (b) (d) none of these

J&K CET-2004

Ans. (c) : Intercalary meristem occurs in mint, grasses.
Intercalary meristem: It is a type of primary meristematic tissue containing cells that can divide and promote the growth of the plant. They are located at the base of internode.
Function: Promote the lengthening of the stem and increase the height of the plant.

@apna_pdf

451. Indentify the plant which is not having unilocular ovary

(a) Cucumber (b) Cashew
(c) China rose (d) Chilli

TS EAMCET-2015

Ans. (c) : The locules refer to the chamber or cavities in the ovary. China rose belongs to the family Malvaceae, the gynoecium is pentacarpellary with syncarpous ovary having many locule, so the ovary is multilocular with the axile placentation, hence the correct answer is china rose.

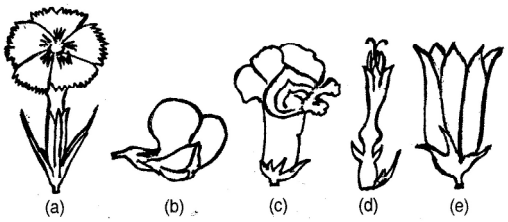
452. Perianth is reduced to lodicules in

(a) Liliaceae (b) Poaceae
(c) Orchidaceae (d) Musaceae

Uttarakhand PMT-2011

Ans. (b) : Perianth: Perianth is a non productive & vegetative part of a flower that protects and supports the reproductive parts. Sepal and petal do not take part in reproduction but just support reproduction, hence they are a part of perianth.
ex: Lily, Onian etc.
Perianth occur in family Poaceae, the perianth is reduced and represented by lodicules.

453. The correct sequence of types of corolla in the figure given below is



(a) (a) caryophyllaceous (b) papilionaceuos (c) bilabiate (d) tubular (e) bell-shaped
(b) (a) papilionaceuos (b) bilabiate (c) tubular (d) bell-shaped (e) caryophyllaceous
(c) (a) bilabiate (b) papilionaceous (c) caryophyllaceous (d) bell-shaped (e) tubular
(d) (a) caryophyllaceuos (b) bilabiate (c) papilionaceuos (d) tubular (e) bell-shaped
(e) (a) tubular (b) bell-shaped (c) caryophyllaceous (d) bilabiate (e) papilionaceus

Kerala PMT-2008

Ans. (a) : Caryophyllaceous: When five petals are clawed and have their limbs spreading outside.
Papillionaceous: It is an irregular, polypetalous corola with its five petals arranged so as to resemble a butterfly
Bilabiate: A bilabiate (means two lipped) corolla is a zygomorphic, sympetalous corolla with the limb divided in two lips. Lamiaceae (the mint family) have bilabiate corollas.
Tubular corolla: They are regular, gamopetalous corolla with their petals fused to form a tube as in disc floret of compositae.
ex: Asteraceae family
Bell shaped: Bell shaped corolla is called campanulate.
Corolla tubes have a bell- shaped base that gradually widens upward.
It is observed in Physalis plant, various cucurbita and the Campanulaceae family

454. Which of the following are technically not correct names for a floral whorl?

I. Androecium
II. Carpel
III. Corolla
IV. Sepal

(a) I and IV (b) III and IV
(c) II and IV (d) I and II

Assam CEE-2014

Ans. (c) : A flowering plant consist of four whorls - calyx, corolla, androecium and gynoecium.
Technically carpel and sepals are incorrect names for a floral whorl.

455. Persistent calyx forming a cover around the fruit is found in :

(a) Argemone mexicana
(b) Ageratum conyzoides
(c) Withania somnifera
(d) Brassica campestris

Uttarakhand PMT-2006

Ans. (c) : Persistent calyx forming a cover around the fruit is found in *Withania somnifera*.
It is a characteristic feature of family Solanaceae.
When the ovary transforms into a fruit and floral parts wither away, but in the family of Solanaceae.
Sepals persist even after fruit formation, such a calyx is said to be persistent.

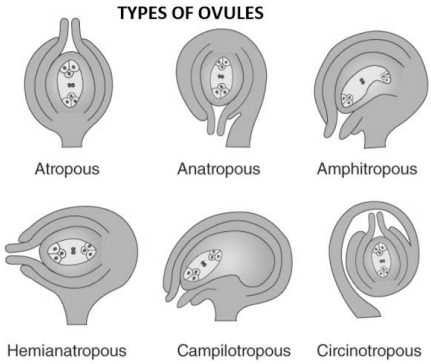
456. An ovule which becomes curved so that the nucellus and embryo sac lies at right angles to the funicle is :-

(a) Campylotropous (b) Anatropous
(c) Orthotropous (d) Hemitropous

AIPMT-2004

Ans. (d) : An ovule which becomes curved so that the nucellus and embryo sac lies at right angles to the funicle is a hemitropous ovule. The body of the ovule is placed transversely at right angles to the funicle and the micropyle and chalaza lie in one straight line in hemitropous ovules.

- Ovule have been separated into (6) categories based on their shapes.



457. Pappus is modified

(a) calyx (b) corolla
(c) bracts (d) gynoecium

BHU PMT (Screening)-2005
JIPMER-2010

@apna_pdf

Ans. (a) : The Pappus is modified calyx or sepals. In Asteraceae the pappus is the part of an individual floret that surrounds the base of the corolla tube in flower.

458. Trimerous flower, superior ovary and axile placentation is characteristics of

(a) Liliaceae (b) Cucurbitaceae
(c) Solanaceae (d) Compositae

JIPMER-2010

Ans. (a) : Trimerous flower, superior ovary and axile placentation is characteristics of Lilliaceae. The plants owned by this family are monocotyledonous plants. They are extensively distributed worldwide.
Trimerous flowers have floral appendages or whorls in threes, like three petals, three sepals etc. In axile placentation the placenta is present in axial position and the ovules are attached to in the multilocular ovary.

459. In a tetradynamous androecium, one of the following is seen.

(a) Outer whorl of four smaller stamens and inner whorl of two larger stamens
(b) Outer whorl of two larger stamens and inner whorl of four smaller stamens
(c) Outer whorl of four larger stamens and inner whorl of two smaller stamens
(d) Outer whorl of two smaller stamens and inner whorl of four larger stamens

JCECE-2010

Ans. (d) : The common name of *Brassica campestris* is mustard.
It is a characteristic of Brassica family and found in *Brassica campestris*. Tetradynamous is a floral condition in which the flower contains 6 staments out of which 4 are longer and two are shorter.

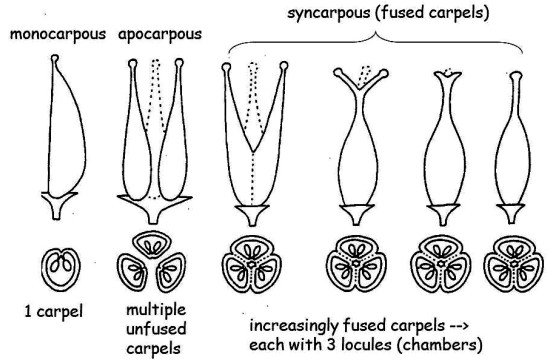
460. Match column I with column II and select the correct option using the codes given below.

Column-I		Column-II	
A.	**Pistils fused together**	**1.**	**Gametogenesis**
B.	**Formation of gametes**	**2.**	**Pistillate**
C.	**Hyphae of higher ascomycetes**	**3.**	**Syncarpous**
D.	**unisexual female flower**	**4.**	**Dikaryotic**

(a) A-4 B-3C-2D-1 (b) A-2 B-1 C-4 D-3
(c) A-1 B-2 C-4 D-3 (d) A-3 B-1 C-4 D-2

NEET-2016 Phase-II

Ans. (d) : Syncarpous is the condition in which carpels of the gynoecium unite to form compound ovary.
It also contains more than one carpel and carpels are fused.



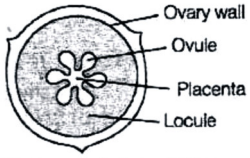
- Gametogenesis is the process of formation of gametes. It is of two types: Microsporogenesis (formation of male gametes) and Megasporogenesis (formation of female gametes).
- Hyphae of higher ascomycetes are dikaryotic in nature.
- Pistillate are unisexual flowers consisting of only carpels or pistils. They do not have stamens.

461. Free-central placentation is found in.

(a) Dianthus (b) Argemone
(c) Brassica (d) Citrus

NEET-2016 Phase-II
Rajasthan PMT-2011

Ans. (a) : Dianthus shows free central placentation in its ovary. In such ovary, ovules are attached on the main axis of the placenta.
- Argemone and Brassica show parietal placentation in which ovules develop on the inner wall of the ovary or on the peripheral part.
- **Citrus** fruits shows axile placentation in which the ovules are borne to the central placenta.



Free-central placentation

462. The term 'polyadelphous' is related to

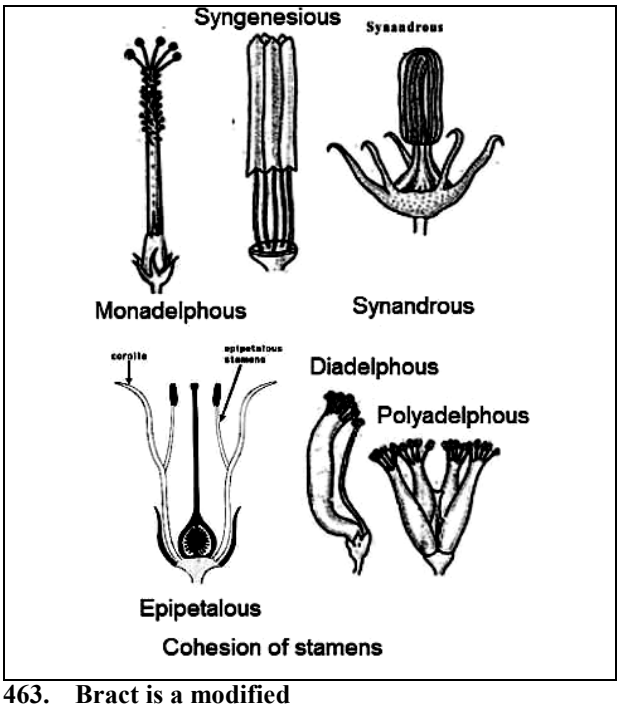
(a) gynoecium (b) androecium
(c) corolla (d) calyx

NEET-2016 Phase-II

Ans. (b) : Polyadelphous stamen :– Filaments are united forming a number of bundles but the anthers remain free.
e.g.- Lemon.
- Polyadelphous is the condition in which stamens are present in more than two groups but their anthers are seperate. It is found in Castor, Citrus, Bombax, Myristica malabarica etc.
- Monadelphous stamen, Filaments of all stamens are united forming a single bundle but the anthers are free.

e.g.- Cotton.
- Diadelphous stamens have Filaments which are united forming a number of bundles and anthers are free. e.g.- Pea.

@apna_pdf



463. Bract is a modified
(a) petal (b) sepal
(c) leaf (d) involucre

UP CPMT-2009

Ans. (c) Bracts are usually, different from foliage leaves, they may be smaller larger or a different color, shape or texture.
Bract is modified or specialized leaf, especially one associated with a reproductive structure such as a flower, inflorescence axis or cone scale.

464. Long filamentous threads protruding at the end of a young cob of maize are-
(a) Anthers (b) Styles
(c) Ovaries (d) Hairs

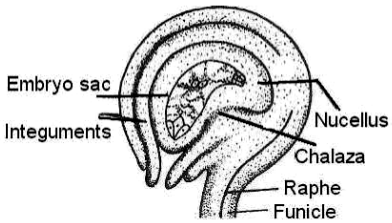
AIPMT-2006

Ans. (b) : In maize the male inflorescence occupies the terminal position on the main axis, whereas the female inflorescence (ear or cob) is borne on modified lateral branches in the axils of leaves.
The ear producing branch has short internodes and bears a female spike at its apex. Each spikelet has a pair of small membranous glumes and two florets.
The feathery styles of the female florets are long and emerge out of the cobs to expose stigma for wind pollination.

465. Which one of the following represents an ovule, where the embryo sac becomes horse- shoe shaped and the funiculus and micropyle are close to each other –
(a) Amphitropous (b) Anatropous
(c) Circinotropous (d) Atropous

AIPMT-2005

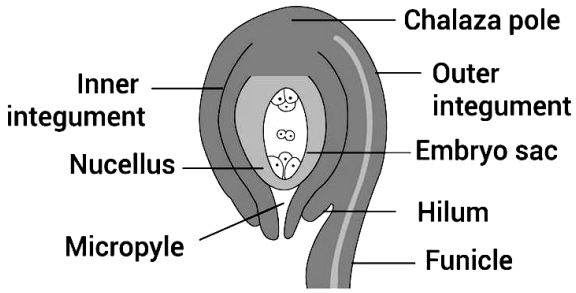
Ans. (a) : The condition of amphitropous ovule, the embryosac become horse-shoe shaped and the funiculus and micropyle are closed to each - other as in Alismataceae, butomaceae families.



466. What is the direction of micropyle in anatropous ovule :-
(a) Upward (b) Downward
(c) Right (d) Left

AIPMT-2002

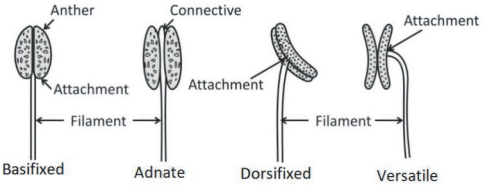
Ans. (b) : In the anatropous ovule the micropyle is inverted so the micropyle in the lower side (downward). It is closer to the hilum. Get rotated 180º, the funicle lies parallel to the body of ovule and micropyle. The Chalazal end present at the top.



467. When the filament runs along the back of anther, it is called
(a) Adnate (b) Longitudinal
(c) Versatile (d) Syngenecious.

AIIMS-2002

Ans. (a) : The attachment of filament to the anthers determines the classification of stamens. When the filament is attached along the entire/Whole length of the anther, it is called adnate. It is seen in **Nicotiana, Magnolia, Mechelia (Champa).**
- In dorsifixed condition, filaments are attached to the dorsal side of the anthers.
- In basifixed condition, filaments are attached to the base of the anthers.
- In versatile condition, filaments are attached to a point on the connective so that anthers can swing freely.



468. Clove is a part of
(a) Flower bud
(b) Thalamus of a flower
(c) Auxiliary bud
(d) Seed.

AIIMS-2001

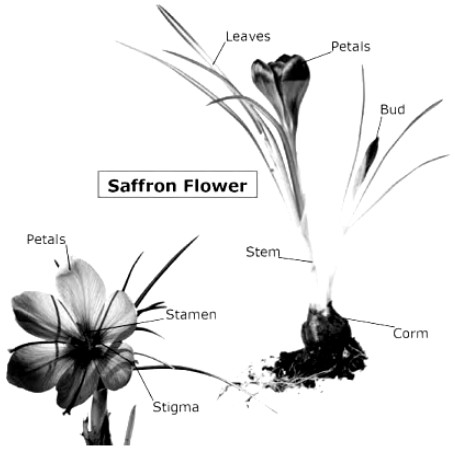
@apna_pdf

Ans. (a) : The highly priced, medicinally valued clove is an aromatic flower bud of *Syzygium aromaticum* of the family Myrtaceae.
• Cloves are the aromatic flower buds of a tree.
• It is commonly used as spices, flavoring or fragrance agent in consumer products, like toothpaste etc.

469. Saffron or kesar is extracted from:
(a) entire carpel
(b) seeds and calyx
(c) stamens and petals
(d) top of the style and stigma

J&K CET-2000

Ans. (d) : Saffron or kesar is extracted from top of the style and stigma. The style & stigma of crocus plant are called saffron. These are used as condiments. The vivid crimson stigma & style are called threads, are collected and dried for use mainly as a coloring ingredient in food.



470. The condition in which gynoecium occupy lower position while other flower parts are situated on or above thalamus, the flower is termed as
(a) epigynous (b) perigynous
(c) hypogynous (d) superior

BVP-2014
Uttarakhand PMT-2006

Ans. (a) : The condition in which gynoecium occupy lower position while other flower parts are situated on or above thalamus, the flower is termed as epigynous.
In perigynous flower the thalamus is expanded to become disc shaped, cup shaped with androperianth being attached to the margins.
Ex- Pea, Rose etc.
In the hypegynous flower gynoecium occupies the highest position while the other parts are situated below it.
Ex - China rose, mustard, brinjal etc.

471. The plant having monadelphous stamens and axile placentation is :
(a) Lemon (b) Pea
(c) Tomato (d) Cucumber
(e) China rose

Kerala PMT-2011

Ans. (e) : The plant having monadelphous stamens and axile placentation is China rose. In this condition of flowers all the filaments of stamens are united in single bundle to form a tube like structure but anthers remain free. ex.– China rose.
It is a characteristic feature of Malvaceae family.

472. The example for polypetalous, zygomorphic corolla is:
(a) Ocimum (b) Crotalaria
(c) Rose (d) Mustard

Karnataka CET-2001

Ans. (b) : The example for polypetalous, zygomorphic corolla is Crotalaria.
Crotalaria is a plant of family leguminaceae or fabaceae, sub family papilionoideae, in which presence of polypetalous & zygomorphic corolla is the characteristic feature of this family.

473. Role of calyx and corolla in fruit formation is
(a) promotory (b) ineffective
(c) essential (d) all of these

Rajasthan PMT-2003

Ans. (a) : During fruit maturation, the fruiting calyx expands and inflates, enveloping the fruit entirely.
Corolla color or size can influence pollinators attraction, with bright or large flowers attracting more pollinators than dark or small flowers. Their role in fruit formation is promotory.

474. The edible part of cauliflower is
(a) mesocarp (b) cotyledons
(c) endosperms (d) inflorescence

UP CPMT-2004
